1335-7670

Instructions to Authors

Catathelasma publishes original and reviewed contributions to the better knowledge of fungi preferably in Slovakia and central Europe. Papers should be on diversity (mycofloristics), ecology, taxonomy and nomenclature, conservation of fungi, and book reviews and notices. Manuscripts have to be submitted in English with a Slovak or Czech summary.

Elements of an article submitted to Catathelasma

- title: informative and concise
- author's name: full first and last name
- author's mailing and e-mail addresses
- key words: max. 5 words, not repeating words in the title
- text: written in Arial, without any special type of text formatting except for italic and bold options, not exceeding 15 pages
- figures: line drawings, photographs, diagrams and/or graphs (scanned and "jpg" or "tif" formatted) with their legends should be self-explanatory; legends to the figures must be written at the end of the text file
- abstract/summary in Slovak or Czech: max. 10 lines (starting with author's name and the title of the article); the journal is responsible for the translation of abstracts into Slovak for foreign authors
- studied voucher specimens should be kept in the public herbaria
- list of references:
 - **journal article:** Kučera, V. 2011. Cudoniella acicularis. *Catathelasma* 13: 25–27.
 - **book:** Dennis, R. W. G. 1978. British Ascomycetes. Vaduz.
 - **book chapter:** Verbeken, A. & Vesterholz, J. 2012. Lactarius Pers. In: Knudsen, H. & Vesterholz, J. (eds.), *Funga Nordica*, p. 118–144, Copenhagen.

Zajac, M., Zajacová, J., Kunca, V. & Cechová, M. 2016. Genus *Hygrocybe* in Kysuce region, northwestern Slovakia, part II. *Catathelasma* 17: 5–23. Twenty-one species of the genus *Hygrocybe* were recorded during the mycological research in 2013–2014 in the Kysuce region (Jablunkovské medzihorie, Javorníky, Kysucké Beskydy and Turzovská vrchovina Mts). For the studied area, three new unpublished species (*H. nitrata*, *H. phaeococcinea* and *H. spadicea*) were identified. One new species (*H. subpapillata*) and two new varieties (*H. glutinipes* var. *rubra* and *H. chlorophana* var. *aurantiaca*) were identified during the revision of the herbarium specimens collected in the first part of research in 2008–2012. In our paper, we adduce the main identification characters of all taxa, we rate the frequency of their occurrence, and complete the list of the localities in the Kysuce region.

Zajac, M., Zajacová, J., Kunca, V. & Cechová, M. 2016. Rod *Hygrocybe* na Kysuciach, severozápadné Slovensko. II. časť. *Catathelasma* 17: 5–23. Počas mykologického výskumu rodu *Hygrocybe* na Kysuciach (Jablunkovské medzihorie, Javorníky, Kysucké Beskydy a Turzovská vrchovina) sa v rokoch 2013–2014 zistilo celkovo 21 druhov. Pre skúmanú oblasť boli identifikované tri nové druhy (*H. nitrata*, *H. phaeococcinea* a *H. spadicea*). Jeden nový druh (*H. subpapillata*) a dve nové variety (*H. glutinipes* var. *rubra* and *H. chlorophana* var. *aurantiaca*) boli identifikované počas revízie herbarových exsikátov nájdených v období predošlého výskumu v rokoch 2008–2012. V príspevku uvádzame základné rozlišovacie znaky všetkých zistených taxónov, hodnotíme frekvenciu ich výskytu a doplníme zoznam lokalít na Kysuciach.

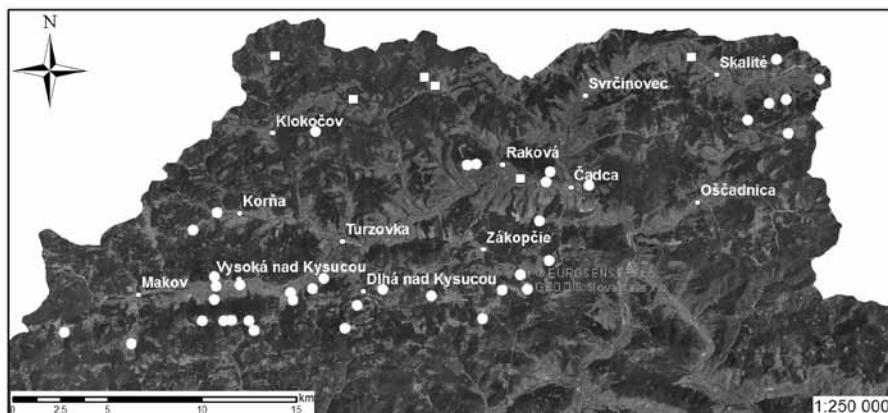

Key words: Agaricomycotina, *Hygrophoraceae*, grasslands, peat bogs

Introduction

We are presenting the second part of the mycological research of the genus *Hygrocybe* in the Kysuce region. We are following our research realized in 2008–2012 (Zajac & Zajacová 2013) and the presented results represent a part of graduation thesis by Zajacová (2015). Our research complements knowledges of 18 species of the genus *Hygrocybe* in the Kysuce area recorded before 2008 (Šebek 1977, Kuthan 1987, 1989, Škubla 2003).

Material and Methods

The research was provided in four geomorphological units of the Kysuce region (Jablunkovské medzihorie, Javorníky, Kysucké Beskydy and Turzovská vrchovina Mts) in 2013–2014. The total number of localities of the genus *Hygrocybe* recorded during complete research in 2008–2014 counts 45 (39 grasslands, 6 peat bogs, Map). The macromorphological characters were observed in fresh material. The micromorphological structures were observed in fresh and dried material using a light microscope. Taxonomic concept, nomenclature, determination characteristics, ecology of taxa and frequency in Europe follow Boertmann (2010). For each taxon, localities are listed alphabetically within the geomorphological units. At each locality, the name of the nearest village, type of habitat, altitude, geographic coordinates, square grid number (Q), date and name(s) of collector(s) are adduced. Position, geographic coordinates and altitude were determined by GPS navigation Garmin e-Trex 30. Only one herbarium specimen, most often with several basidiomata, was annually collected on each locality. Species frequency is estimated in accordance with the following scale: 1 locality – very rare species, 2–4 localities – rare species, 5–8 localities – common species, 9 and more localities – very common species. The specimens are deposited in Slovak National Museum herbarium (BRA).

Map. Research localities of the genus *Hygrocybe* in the Kysuce region visited in the years 2008–2014 (circles: grasslands, squares: peat bogs).

Results

Hygrocybe calyptiformis (Berk.) Fayod

A species with medium to large-sized basidiomata, rose, conical cap and pale whitish stem (see page 1). Although this species is included among 33 threatened fungi in Europe (Dahlberg & Croneborg 2003) and in the Red list of fungi of Slovakia (Lizoň 2001), it is very common in the Kysuce region.

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 758 m, $49^{\circ} 30' 26.6''$ N, $18^{\circ} 55' 54.3''$ E, Q 6479d, 22 August 2014, M. Zajac. **Javorníky**, Čadca, Vojty, old pasture, without management, alt. 693–700 m, $49^{\circ} 24' 11.90''$ N, $18^{\circ} 46' 27.82''$ E, 21 August 2014, Q 6578d, J. Zajacová, M. Zajac. – Čadca, Vojty, mesic meadow, mowed, alt. 616 m, $49^{\circ} 30' 39.14''$ N, $18^{\circ} 51' 49.30''$ E, 21 August 2014, Q 6578d, J. Zajacová, M. Zajac. **Kysucké Beskydy**, Skalité, Kýčera, mesic meadow, mowed, alt. 778 m, $49^{\circ} 29' 6.5''$ N, $18^{\circ} 56' 27.4''$ E, Q 6579b, 23 August 2014, M. Zajac, M. Čechová. – Skalité, Firkova Kýčera, mesic meadow, mowed, alt. 760 m, $49^{\circ} 29' 17.1''$ N, $18^{\circ} 55' 45.2''$ E, Q 6579b, 11 October 2014, M. Zajac, M. Čechová. – Skalité, Drobiská, mesic meadow, mowed, alt. 566 m, $49^{\circ} 28' 41.7''$ N, $18^{\circ} 54' 57.5''$ E, Q 6579a, 11 October 2014, M. Zajac, M. Čechová.

Hygrocybe cantharellus (Schwein.) Murrill

A species with small, reddish or orange basidiomata, dry squamulose cap and decurrent gills. It is a common species in Europe. In the Kysuce region, we recorded it only at three localities during the previous research (Zajac & Zajacová 2010). However, in 2013–2014, *H. cantharellus* was found in 15 other localities and it belongs among the very common species in the Kysuce region.

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 758 m, 49° 30' 26.6" N, 18° 55' 54.3" E, Q 6479d, 22 August 2014, M. Zajac, M. Čechová. **Javorníky**, Čadca, Vojty, old pasture, without management, alt. 693 m, 49° 24' 11.90" N, 18° 46' 25.6" E, Q 6578d, 21 August 2014, J. Zajacová, M. Čechová. **Turzovská vrchovina**, Raková, Bukovina, mesic meadow, mowed, alt. 505 m, 49° 26' 47.22" N, 18° 43' 10.37" E, Q 6578c, 31 October 2014, J. Zajacová, M. Zajac.

Hygrocybe ceracea (Sowerby) P. Kumm.

A species with small, yellow basidiomata, lubricous cap, dry stem and adnate to decurrent gills. It is common species in Europe and very common species in the research area. We think that it is often undistinguished or neglected.

Javorníky, Turzovka, over the Semeteš road, near the forest, mesic meadow, mowed, alt. 570 m, 49° 22' 35.92" N, 18° 35' 45.31" E, Q 6677b, 27 August 2014, J. Zajacová, M. Zajac. – Zákopčie, Holých, mesic meadow, mowed, alt. 700 m, 49° 23' 40.7" N, 18° 45' 37.6" E, Q 6678b, 28 September 2013, J. Zajacová, M. Zajac. **Kysucké Beskydy**, Oščadnica, Vreščovka, mesic meadow, mowed, alt. 664 m, 49° 28' 21.0" N, 18° 56' 41.5" E, Q 6579b, 11 October 2014, M. Zajac.

Hygrocybe chlorophana (Fr.) Wünsche

A species with medium-sized, yellow to orange-yellow basidiomata, viscid cap, smooth, finely squamulose on top, dry or moist stem and adnexed gills. It belongs to the very common species in the Europe and in the research area.

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 758 m, 49° 30' 26.6" N, 18° 55' 54.3" E, Q 6479d, 22 August 2014, M. Zajac, M. Čechová. **Javorníky**, Čadca, Kýčerka, mesic meadow, mowed, alt. 527 m, 49° 25' 23.2" N, 18° 45' 47.9" E, Q 6578d, 31 October 2014, J. Zajacová, M. Zajac. – Dlhá nad Kysucou, Kamenité, mesic meadow, mowed, alt. 830 m, 49° 21' 54" N, 18° 38' 03" E, Q 6677b, 26 October 2013, J. Zajacová, M. Zajac. – Makov, Kršlisko, mesic meadow, mowed, alt. 779 m, 49° 21' 02.3" N, 18° 25' 59.6" E, Q 6676b, 11 October 2014, J. Zajacová, M. Zajac. – Turzovka, under the Kýčerka hill, mesic meadow, mowed, alt. 612 m, 49° 23' 01.1" N, 18° 36' 58.8" E, Q 6677b, 7 October 2014, M. ***Hygrocybe chlorophana* var. *aurantiaca* Bon**

This variety differs from the nominate variety of the species in orange or reddish colours of cap and stem. It was found only once with the nominate variety in 2010 and additionally identified from the photos in 2014.

Javorníky, Vysoká nad Kysucou, Dučkov, mesic meadow, mowed, alt. 719 m, 49° 21' 38.30" N, 18° 31' 49.24" E, Q 6677a, 2 October 2010, M. Zajac.

***Hygrocybe citrinovirens* (J. E. Lange) Jul. Schäff.**

A species with medium to large-sized, lemon yellow to greenish-yellow, non-blackening and dry basidiomata, radially fibrillose and conical cap and a smooth or finely fibrillose stem. It is presented as a rare species in Europe and it is listed in the IUCN Red List of Threatened Species (Kautmanová et al. on-line). In 2014, it was found on 11 new localities and it was one of the most common species in our study area this year. It belongs to the very common species in the Kysuce region.

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 758 m, 49° 30' 26.6" N, 18° 55' 54.3" E, Q 6479d, 22 August 2014,

Hygrocybe conica (Schaeff.) P. Kumm.

A species with variable-sized, yellow, orange to red basidiomata, ± conical cap with yellowish fibrillose stem that always becomes black when handled or with age. It is a very common species in Europe and in the study area. It generally grows singly, or in the small groups, often in the intensified meadows.

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 758 m, 49° 30' 26.6" N, 18° 55' 54.3" E, Q 6479d, 22 August 2014, M. Zajac, M. Hygrocybe flavipes (Britzelm.) Arnolds

A medium-sized species with greyish to greyish-brown cap, whitish stem with yellowish base and decurrent gills (see page 2 down). It is a very rare species in Europe and it grows only on the well-preserved, *Hygrocybe* species-rich grasslands. With a total number of 5 localities, it is a common species in the research area, but in Slovakia was collected only rarely.

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 758 m, $49^{\circ} 30' 26.6''$ N, $18^{\circ} 55' 54.3''$ E, Q 6479d, 22 August 2014, M. Zajac, M. Čechová. **Kysucké Beskydy**, Skalité, Drobiská, mesic meadow, mowed, alt. 566 m, $49^{\circ} 28' 41.7''$ N, $18^{\circ} 54' 57.5''$ E, Q 6579a, 11 October 2014, M. Zajac, M. ***Hygrocybe glutinipes* (J. E. Lange) R. Haller Aar.**

A species with small, yellow to yellow-orange basidiomata, viscid cap and stem and adnate to subdecurrent gills. It is a rare species in Europe, but common in the study area. It could be often undistinguished or probably often neglected because of its small sized basidiomata.

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 758 m, $49^{\circ} 30' 26.6''$ N, $18^{\circ} 55' 54.3''$ E, Q 6479d, 22 August 2014, M. Zajac, M. ***Hygrocybe glutinipes* var. *rubra* Bon**

This variety has similar basidiomata as *H. glutinipes* var. *glutinipes*, but with reddish or scarlet colours on the cap and stem. It was collected only once in 2010, but unpublished and additionally identified only in 2014 from the herbarium specimen.

Turzovská vrchovina, Raková, Bukovina, mesic meadow, mowed, alt. 495 m, 49° 26' 46.87" N, 18° 42' 51.27" E, Q 6578c, 9 October 2010, J. Zajacová, M. Zajac.

Hygrocybe ingrata J. P. Jensen & F. H. Møller

A medium-sized species with reddish-brown to orange-brown cap, cream coloured stem and gills. It smells nitrous and the flesh is reddening after cut. It is a rare species in Europe, listed in the IUCN Red List of Threatened Species (Kautmanová et al. on-line). In 2014, we collected it on several localities and it belongs among the very common species in the Kysuce region.

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 758 m, 49° 30' 26.6" N, 18° 55' 54.3" E, Q 6479d, 22 August 2014, M. Zajac, M. Čechová. – Zákopčie, Holých, mesic meadow, mowed, alt. 640 m, 49° 23' 41.4" N, 18° 45' 37.6" E, Q 6678b, 21 August 2014, J. Zajacová, M. Zajac. **Javorníky**, Turzovka, over the Semeteš road, near the forest, mesic meadow, mowed, alt. 570 m, 49° 22' 35.92" N, 18° 35' 45.31" E, Q 6677b, 27 August 2014, J. Zajacová, M. Hygrocybe insipida (J. E. Lange) M. M. Moser

A small species with orange or yellowish basidiomata characterised by lubricous cap, moist stem and decurrent or subdecurrent gills. This species is common in Europe and also in our study area, but undistinguished, sometimes neglected and especially in adverse weather hardly determinable in the field (Boertmann 2010).

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 758 m, 49° 30' 26.6" N, 18° 55' 54.3" E, Q 6479d, 22 August 2014, M. Zajac, M. Čechová. **Javorníky**, Turzovka, under the Kýčerka hill,

Kysucké Beskydy, Skalité, Skaňanka, mesic meadow, mowed, alt. 684 m, $49^{\circ} 29' 57.9''$ N, $18^{\circ} 58' 08.7''$ E, Q 6579b, 18 August 2014, M. Zajac, M. Čechová.

Hygrocybe irrigata (Pers.) Bon

A species with brownish or greyish coloured basidiomata, viscid on both cap and stem. This species is rarer in Europe, but as it was found on many localities in fair weather in 2014, it belongs to the very common species in the Kysuce region.

Javorníky, Dlhá nad Kysucou, Vircovci, mesic meadow, mowed, alt. 709 m, $49^{\circ} 22' 58.9''$ N, $18^{\circ} 39' 11.0''$ E, Q 6677b, 26 October 2013, J. Zajacová, M. ***Hygrocybe laeta* (Pers.) P. Kumm.**

A species with small or medium-sized basidiomata. The viscid basidiomata smell like burnt rubber and they are characteristic by dull brownish-orange cap and stem and whitish, decurrent gills. Generally, it does not belong to the rarest species in Europe, nevertheless it is very rare in our research area.

Javorníky, Čadca, Vojty, old pasture, without management, alt. 693 m, 49° 24' 11.90" N, 18° 46' 25.6" E, Q 6578d, 31 October 2013, J. Zajacová, M. Zajac.

***Hygrocybe miniata* (Fr.) P. Kumm.**

A small to medium-sized species with reddish basidiomata, dry and finely squamulose cap and broadly adnate gills. In Europe, it is a very common species, but in the Kysuce region it was found only on two localities by our research (one locality in the recent research). However possibly could be more common.

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 758 m, 49° 30' 26.6" N, 18° 55' 54.3" E, Q 6479d, 22 August 2014, M. Zajac, M. Cechová.

***Hygrocybe nitrata* (Pers.) Wünsche**

A species with medium sized greyish-brown basidiomata, clearly nitrous smell and usually with a squamulose or fibrillose cap. The fruitbodies are without colour changes (reddening). It belongs to the very rare species in Europe, much like in our study area.

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 743 m, 49° 30' 20.1" N, 18° 55' 34.9" E, Q 6479d, 22 August 2014, M. Zajac, M. Cechová.

Hygrocybe phaeococcinea (Arnolds) Bon

A species with a small, dry, dark red cap with black coating in the centre and deep orange or reddish gills. It belongs to the rare species in Europe and also in the Kysuce region, but it could be often undistinguished, neglected or incorrect identified.

Javorníky, Turzovka, under the Veľká lúka hill, old pasture, without management, alt. 531 m, 49° 23' 14.7" N, 18° 37' 03.2" E, Q 6677b, 7 October 2014, M. Zajac. **Turzovská vrchovina**, Raková, Bukovina, mesic meadow, mowed, alt. 459 m, 49° 26' 39.6" N, 18° 43' 01.5" E, Q 6578c, 24 October 2014, (only one fruitbody), J. Zajacová, M. Zajac.

Hygrocybe pratensis (Fr.) Murrill

A species with medium or large basidiomata, with pale to dull orange cap and decurrent gills. It is common outside Europe and very common in our study area.

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 758 m, 49° 30' 26.6" N, 18° 55' 54.3" E, Q 6479d, 22 August 2014, M. Zajac, M. Čechová. **Javorníky**, Čadca, Kýčerka, mesic meadow, mowed, alt. 530 m, 49° 25' 23.2" N, 18° 45' 47.9" E, Q 6578d, 31 October 2013, M. Zajac. – Čadca, Vojty, old pasture, without management, alt. 693 m, 49° 24' 11.90" N, 18° 46' 25.6" E, Q 6578d, 21 August 2014, J. Zajacová, M. Zajac. – Dlhá nad Kysucou, Vircovci, mesic meadow, mowed, alt. 709 m, 49° 22' 58.9" N, 18° 39' 11.0" E, Q 6677b, 26 October 2013, J. Zajacová, M. ***Hygrocybe psittacina* (Schaeff.) P. Kumm.**

A species with small to medium-sized basidiomata, green, yellowish or pinkish, viscid cap and stem. Generally, it is a widely distributed species in Europe and also very common in our study area.

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 758 m, 49° 30' 26.6" N, 18° 55' 54.3" E, Q 6479d, 22 August 2014, M. Zajac, M. ***Hygrocybe punicea* (Fr.) P. Kumm.**

A species with a medium to large basidiomata, dark red lubricous to viscid cap and coarsely fibrillose stem. It grows only in the meadows with highly conservation value (McHugh et al. 2001), often together with many

other *Hygrocybe* species. It belongs to the rare species in Europe and common species in the Kysuce region.

Javorníky, Turzovka, over the Semeteš road, near the forest, mesic meadow, mowed, alt. 570 m, 49° 22' 35.92" N, 18° 35' 45.31" E, Q 6677b, 26 October 2013, J. Zajacová, M. Zajac. – Zákopčie, Holých, mesic meadow, mowed, alt. 640 m, 49° 23' 41.4" N, 18° 45' 37.6" E, Q 6678b, 28 September 2013, J. Zajacová, M. Zajac. **Turzovská vrchovina**, Vysoká nad Kysucou, Klinkovský vrch, meadow without management, alt. 560 m, 49° 22' 52.68" N, 18° 32' 13.80" E, Q 6677a, 16 November 2013, J. Zajacová, M. Zajac.

***Hygrocybe spadicea* (Scop.) P. Karst.**

A species with a medium-sized basidiomata, dark brown and radially fibrilose, sometimes slightly viscid cap and yellow stipe and gills (see page 2 up). It belongs to the rarest species in Europe and, simultaneously, it is a very rare species recorded in our study area, collected only once. It is also listed in the Red List of Fungi of Slovakia (Lizoň 2001).

Turzovská vrchovina, Čadca, Sihelník, mesic meadow, mowed, alt. 418 m, 49° 26' 28.81" N, 18° 45' 56.92" E, Q 6578d, 26 October 2013, J. Zajacová, M. Zajac.

***Hygrocybe subpapillata* Kühner**

A species with small, reddish or orange basidiomata, lubricous, often papillate cap, dry stem and broadly adnate gills. It belongs to the rare species in Europe, but sometimes it is hard to identify it and it could also be often neglected. It is very rare also in our study area, collected only once in 2012. It was additionally identified in 2014 from the herbarium specimen.

Javorníky, Vysoká nad Kysucou, Janetkovský potok, mesic meadow, intensively grazed, alt. 590 m, 49° 22' 14.97" N, 18° 32' 06.41" E, Q 6677a, 20 August 2012, J. Zajacová, M. Zajac.

***Hygrocybe virginea* (Wulfen) P. D. Orton & Watling**

A species with small to medium-sized, white basidiomata, slightly lubricous cap and decurrent gills. It is relatively tolerant to the change of natural conditions in the biotopes and it belongs to the very common species in Europe and also in our study area.

Jablunkovské medzihorie, Skalité, Poľana, mesic meadow, mowed, alt. 758 m, $49^{\circ} 30' 26.6''$ N, $18^{\circ} 55' 54.3''$ E, Q 6479d, 22 August 2014, M. Zajac, M. Discussion

We recorded 22 species of the genus *Hygrocybe* during our research in the Kysuce region in 2013 and 2014 (Table). In comparison with our previous research in 2008–2012 (we recorded 25 species and 2 varietes at that time), we have found three new species for the region (*Hygrocybe nitrata*, *H. phaeococcinea* and *H. spadicea*). We have also collected *Hygrocybe laeta* known from previous research before 2008 (CR4933

and CR4990, J. Kuthan 1966 and 1967 in BRA), but not found in 2008–2012. One new species (*Hygrocybe subpapillata*) and two new varieties (*Hygrocybe glutinipes* var. *rubra* and *H. chlorophana* var. *aurantiaca*) found in the first part of research in 2008–2012 were additionally identified after revision of herbarium specimens in 2014.

Table. The taxa of the genus *Hygrocybe* recorded in the Kysuce region

Column I – taxon. **Column II** – taxon recorded before 2008 (Šebek 1977, Kuthan 1987, 1989, Škubla 2003). **Column III** – taxon recorded in 2008–2012 with number of localities (Zajac & Zajacová 2013). **Column IV** – taxon recorded during the recent research with number of localities (this paper)

<i>Hygrocybe ingrata</i>	✓	2	7	<i>Hygrocybe virginea</i>	-	11	12
<i>Hygrocybe irrigata</i>	✓	6	9				

We recorded four very rare species (*Hygrocybe acutoconica*, *H. laeta*, *H. nitrata*, *H. spadicea*, *H. subpapillata*), 2 rare species (*Hygrocybe miniata*, *H. phaeococcinea*), two common species (*H. flavipes*, *H. punicea*) and 14 very common species (*Hygrocybe calyptiformis*, *H. cantharellus*, *H. ceracea*, *H. citrinovirens*, *H. coccinea*, *H. conica*, *H. glutinipes*,

H. chlorophana, *H. ingrata*, *H. insipida*, *H. irrigata*, *H. pratensis*, *H. psittacina*, *H. virginea*) in our study area. The most common species (*Hygrocybe conica*, *H. chlorophana*, *H. pratensis* and *H. virginea*) occurring also in the intensified meadows. We recorded also several new localities of rarer species (*Hygrocybe citrinovirens*, *H. ingrata*) in fair weather year 2014. The species richest localities are Čadca, Sihelník (16 species); Čadca, Vojty (16); Skalité, Poľana (15); Vysoká nad Kysucou, Klinkovský vrch (15) and Vysoká nad Kysucou, Vrchriecka (15). These grasslands are mowed or extensively pastured for decades, without ploughing or manuring. The *Hygrocybe* species are occurred in the Kysuce region mainly in small area (localities under one hectare) and also very fragmentary, only in the well-preserved parts of the meadows or pastures.

Hygrocybe spadicea, a very rare species in Europe (Boertmann 2010), was recorded only the fifth time in Slovakia (Škubla 2003), last time in 1988 from "Važecké lúky, Soliská" in foothill of High Tatras (Kuthan 1989). Approximately 10 basidiomata were found on the mowed meadow in Čadca, Sihelník locality together with 15 other species of the genus *Hygrocybe* (*H. calyptriformis*, *H. cantharellus*, *H. ceracea*, *H. citrinovirens*, *H. coccinea*, *H. conica*, *H. flavipes*, *H. chlorophana*, *H. ingrata*, *H. insipida*, *H. irrigata*, *H. pratensis*, *H. psittacina*, *H. punicea* and *H. virginea*). Moreover, new localities of species, which are considered to be very rare in Europe (Boertmann 2010), were discovered during one research: four localities for *H. calyptriformis*, eleven for *H. citrinovirens*, five for *H. flavipes*, seven for *H. ingrata*, one for *H. nitrata* and two for *H. phaeococcinea* new localities recorded in our recent research.

Acknowledgements

We are grateful to Robert Podoba for creating the map and to Eva Zajacová for helping with English. The reviewer, Martin Kříž (Praha), is thanked for reading and commenting the manuscript. The research was partly financially supported by the KEGA project 007TU Z-4/2015.

BOOK NOTICES

Soňa Jančovičová

N. P. Pridiuk. 2015. **Flora gribov Ukrayny. Boľbitievye i koprinovye griby.** [Flora of the fungi of Ukraine. *Bolbitiaceae* and *Coprinaceae*]. Nacionaľnaja akademia nauk Ukrayny, Institut botaniki im. N. G. Gholodnovo, Kiev, [1]-600 p., hardcover, price not available, ISBN 978-966-02-7328-3.

If you want to know more on fungi of the families *Bolbitiaceae* and *Coprinaceae* by N. P. Pridiuk, you should be able to read the Cyrillic. If you are not, never mind, the line drawings are so beautiful that it is worth to have this book just because of them.

The monograph has two parts – a general and a taxonomic part. The general part includes chapters like delimitation of studied area, material and methods, general characteristics of macroscopical and microscopical features, ecology and distribution and practical usage of fungi of the families *Bolbitiaceae* and *Coprinaceae*.

In the taxonomic part, there are the keys for identification of taxa (species and infraspecific taxa) of the appropriate genera resp. sections. Within the *Bolbitiaceae* family, they are the taxa of the genera *Galeropsis* (1 taxon), *Bolbitius* (4 taxa), *Conocybe* (22) and *Pholiotina* (26). Within the *Coprinaceae* family, they are the taxa of *Coprinus* (99), *Lacrymaria* (3), *Psathyrella* (45), *Panaeolus* (7) and *Panaeolina* (1). Each taxon is provided with the synonyms, references to illustrations(s), description of macroscopical and microscopical features (including the diagnostic features), ecology, distribution in Ukraine as well in the world.

A yellow-green hard cover of the book protects 600 pages of original knowledge on fungi of the families *Bolbitiaceae* and *Coprinaceae* from Ukraine. Anyway, the best protection for data on those fungi is their dissemination among the community – and it was started by publication of this book. It should be on the shelf of all those who are interested in dark spored agarics.

FIELD IDENTIFICATION OF SOME MELANOLEUCA SPECIES (AGARICOMYCOTINA, TRICHOLOMATACEAE)

Ďuriška, O., Tomšovský, M., Antonín, V. & Jančovičová, S. 2016. Field identification of some *Melanoleuca* species. *Catathelasma* 17: 25–33.

Identification of most taxa of the genus *Melanoleuca* is very complicated, requiring complex of micromorphological and molecular analyses. Within the genus, there are also some taxa that are determinable relatively easily in the field: *M. cognata*, *M. julianna var. julianna*, *M. strictipes* and *M. verrucipes*. In this paper, we present descriptions of morphological characters of these taxa, with emphasis on their field features, as well as their actual or supposed occurrence in Slovakia in the years 2012–2015.

Ďuriška, O., Tomšovský, M., Antonín, V. & Jančovičová, S. 2016. Určovanie niektorých druhov rodu *Melanoleuca* v teréne. *Catathelasma* 17: 25–33.

Určovanie väčšiny taxónov rodu *Melanoleuca* je veľmi komplikované, vyžadujúce zložité mikromorfologické a molekulárne analýzy. V rámci tohto rodu sú však aj taxóny, ktoré sú určiteľné relatívne ľahko priamo v teréne: *M. cognata*, *M. julianna var. julianna*, *M. strictipes* a *M. verrucipes*. V predkladanom článku uvádzame opisy morfológických znakov uvedených taxónov, s dôrazom na ich terénné znaky, a prezentujeme ich aktuálny alebo predpokladaný výskyt na Slovensku v rokoch 2012–2015.

Key words: Slovakia, morphology, *Melanoleuca cognata*, *M. julianna var. julianna*, *M. strictipes*, *M. verrucipes*

Introduction

The genus *Melanoleuca* Pat. Is a morphologically well-defined genus of agaricomycetous fungi, family *Tricholomataceae*. It is characterized by the spores with amyloid verrucose ornamentation and the absence of clamp connections (e.g. Vesterholt 2012). Morphological characters are, however, insufficient for identification at species level. The most *Melanoleuca* species have basidiomata coloured in indistinct and variable shades of brown and grey; micromorphological characters are often unspecific and overlapping (e.g. Moser 1978, Bon 1991, Boekhout 1999). Application of molecular methods is therefore not only helpful, but in many cases the only solution how to identify the species of the genus *Melanoleuca* (Vizzini et al. 2011, Ďuriška et al. 2013a, 2013b).

In years 2012–2015 we made a taxonomic revision of the genus *Melanoleuca* in Europe using morphological and molecular methods (Ďuriška et al. 2013a, Ďuriška et al. 2013b, Antonín et al. 2014, Antonín et al. 2015). Our studies resulted in the identification of 28 taxa of the genus *Melanoleuca* in Europe, 21 of them in Slovakia. Our field experiences also enabled us to recognise four taxa that can be identified only based on their macromorphological characters. They are *M. cognata* (Fr.) Konrad & Maubl., *M. julianna* Rimóczi, Antonín, L. Nagy & Tomšovský var. *julianna*, *M. strictipes* (P. Karst.) Jul. Schäff. and *M. verrucipes* (Fr.) Singer, and we present them in this paper. Each taxon is provided with note on its field identification, photo of basidiomata, as well as full description of macromorphological and micromorphological characters. The occurrence of these taxa in Slovakia in years 2012–2015 is also commented.

Material and Methods

The studied material includes specimens collected in Slovakia, Hungary, Romania and USA. The specimens are kept in the institutional herbaria SLO, BP and BRNM. The herbarium acronyms follow Thiers (2016). Taxonomic concept and nomenclature of included *Melanoleuca* taxa follows Kirk (2016).

The macromorphological characters were observed on fresh basidiomata. The micromorphological characters were observed on dried specimens using a Leica DM 1000 and Olympus BX41 light microscopes with an oil-immersion lens at a magnification of 1000. Microscopic mounts were

prepared in water and in 5% aqueous solution of KOH. For accentuate individual structures, the Melzer reagent and Congo red were used. Statistic calculations of spores are based on 30 measurements per specimen and given as minimum, maximum (in parentheses), average \pm standard deviation and average (av.) values. Statistic calculations of other characters are based on 20 measurements per specimen and given as minimum and maximum.

Abbreviations: Q = ratio of length and width of spores, L = number of lamellae reaching the point of attachment, I = number of lamellulae between each pair of lamellae. Descriptive terminology is adopted from Vellinga (1988) and Vizzini et al. (2011).

Results

***Melanoleuca cognata* (Fr.) Konrad & Maubl.**
(see page 75 up)

Field identification: *Melanoleuca cognata* is an easily determinable species by its pale orange or salmon-orange colour of lamellae. Pileus, stipe and context are usually also coloured in some shades of orange. No other European *Melanoleuca* species possess such orange colouration which is typical just for *M. cognata*.

Description: Pileus 50–80 mm broad, applanate, plano-convex to convex, with central umbo, with straight or slightly undulate margin, not hygrophanous, not striate, not pruinose, smooth, glabrous, pale brown-orange, darker in centre. Lamellae rather close, L = 60–65, I = 3–4, emarginate with decurrent tooth, up to 6 mm wide, pale orange or salmon-orange. Stipe 50–80 × 7–12 mm, cylindrical, slightly broadened at apex or clavate, up to 17 mm broad at base, longitudinally fibrillose or striate, finely pruinose, especially at apex, beige or pale brown with orange tones, darker towards base. Context whitish with orange tones or pale orange, sometimes grey-brown under the pileipellis, without any smell or with slightly sweetish smell and mild taste.

Spores (7)7.1–9.3(10) × (4.5)4.7–5.3(6) μm , av. 8.2 × 5 μm , Q = (1.27)1.39–1.83(2.0), av. Q = 1.61, broadly ellipsoid, ellipsoid or narrowly ellipsoid, ornamentation verrucose, amyloid. Basidia 4-spored, 25–32 × 7–9 μm , clavate. Cheilocystidia of the macrocystis type (despite taxonomic position of this species in the subgenus *Urticocystis*), abundant, 33–55 × 10–13 μm , non-septate, without apical crystals or

sometimes with inconspicuous crystals at apex. Pleurocystidia rare, similar to cheilocystidia. Caulocystidia of the macrocystis type, abundant, $38\text{--}62 \times 8\text{--}13 \mu\text{m}$, non-septate or with one septum, with apical crystals. Pileipellis a cutis transient to a trichoderm, composed of cylindrical, thin-walled, up to $10 \mu\text{m}$ wide hyphae.

Occurrence in Slovakia in years 2012–2015: As *Melanoleuca cognata* is a taxonomically relatively clear species, we did not focus our research to collect this material. Might be because of this, we collected it only at one locality in Slovakia in the years 2012–2015.

Specimens studied: Slovakia, Vysoké Tatry Mts., Podbanské village, Tichá dolina valley, 950 m a. s. l., in grass and other herbs, on soil with wood debris, 26 October 2012, leg. S. Jančovičová (SLO 1560). – Slovakia, Biele Karpaty Mts., Chvojnica village, 600 m a. s. l., in grass, on soil with wood debris, 14 April 2006, leg. V. Ridzoň (SLO1953).

Melanoleuca julianna* Rimóczi, Antonín, L. Nagy & Tomšovský var. *julianna

(see page 75 down)

Field identification: *Melanoleuca julianna* var. *julianna* is typical by its blue to violet colour of context in the base of stipe. The shades of blue or violet can be recognized also on surface of stipe and sometimes also in context of pileus. These features are unique in the genus *Melanoleuca* and typical just for *M. julianna* var. *julianna*. As epithet “decolorans” said, the variety *M. julianna* var. *decolorans* Antonín & Tomšovský lacks the typical blue or violet colour and its field identification is impossible.

Description: Pileus 20–95 mm broad, slightly convex then applanate to slightly infundibuliform with small central umbo and involute margin when young, dull, smooth, rarely slightly felty at centre, otherwise innately fibrillose, especially when old. Not striate or slightly striate in old specimens, dark greyish brown when young, then melleous to pale deer-brown with darker centre. Lamellae medium to almost close, $L = 55\text{--}65$, $I = 2\text{--}4$, narrowly to broadly adnate, $2\text{--}6(8)$ mm wide, off-white to pale beige or pale grey, but may have slight blue tinge when old. Stipe 20–70 \times 2–7 mm, straight, cylindrical, sometimes slightly broadened at apex and/or at base, floccose-felty at apex, longitudinally fibrillose to fibrillose-squamulose, pale yellow-brown, darker towards base with \pm distinct greyish blue or steel blue tinge, sometimes blue colour ascending towards stipe apex, at base with poor pallid tomentum. Context very thin and soft

in pileus, fibrillose-stuffed, then hollow in stipe, off-white when young, then becoming pale greyish beige under pileipellis and near lamellae, silky white in stipe in very young specimens, then quickly turning pale brownish grey in upper part and darker greyish brown towards base; at base, the colour becomes gradually violaceous-blue and then almost blackish-blue at very base; dark blue colour of stipitipellis often runs upwards; bluish colour of the stipe context is also distinct in exsiccates. Smell and taste indistinct.

Spores (7)8–10(12) × 5–7 µm, av. 9 × 6 µm, Q = (1.43–)1.57–1.64, ellipsoid, ellipsoid-fusoid, or subovoid, ornamentation verrucose, rarely with small ridges, amyloid. Basidia 4-spored, 32–41 × 9–13 µm, clavate. Cheilocystidia urticoid, 28–49 × 6–11 µm, of two types: the exscissa type more common, the brevipes type less frequent. Pleurocystidia absent. Pileipellis an ixocutis composed of radially arranged, ± thin-walled, gelatinized, up to 9 µm wide hyphae. Caulohymenium of (a) 20–40 × 9–12 µm, clavate, cylindrical, thin-walled cells, (b) 32–46 × 8–13 µm, urticoid caulocystidia similar to cheilocystidia, and (c) 24–32 × 10–13 µm, caulobasidia, 4-spored, cylindrical to clavate; urticoid caulocystidia and caulobasidia may be rare or even absent (for original description see Antonín et al. 2014).

Occurrence in Slovakia in years 2012–2015: *Melanoleuca juliannaee* var. *juliannaee* is relatively new taxon described from Hungary in 2014, where it was found at six localities on sandy soil in *Festucetum vaginatae stipetosum*, *Junipero-Populetum albae*, and secondary *Brometum tectorum*. Typical for them are loose sandy soils poor in humus (1–2 %), with xeric surface soils rich in chalk (Antonín et al. 2014). Ecologically similar localities exist in southern part of Slovakia: Čenkovská step, Čenkovská lesostep, Marcelovské piesky and Chotínske piesky. Despite our extensive field research on these localities, we did not confirm the occurrence of *M. juliannaee* var. *juliannaee* in Slovakia. The presence of this taxon at our territory is probable.

Specimens studied: Hungary, Budapest, Rákospalota, on loose sandy soils poor in humus in *Festucetum vaginatae stipetosum*, *Junipero-Populetum albae*, and secondary *Brometum tectorum*, 29 November 2013, leg. I. Rimóczi (BP 104371 and BRNM 751957). – Hungary, Kiskunság National Park, Örkény, on loose sandy soils poor in humus in *Festucetum vaginatae stipetosum*, *Junipero-Populetum albae*, and secondary *Brometum tectorum*, 30 September 2005, leg. I. Rimóczi (BP 104372 and BRNM 751958).

Melanoleuca strictipes (P. Karst.) Jul. Schäff.
(see page 76 up)

Field identification: *Melanoleuca strictipes* is characterized by its white or whitish basidiomata and growth on mountain pastures, less frequently in broad-leaved forests. A rare albino form of *M. diverticulata* could be confused with *M. strictipes*, but it does not prefer mountain pastures and has different type of cystidia (urticoid cystidia).

Description: Pileus 60–115 mm broad, applanate, plano-convex to convex, with central distinct to indistinct umbo, with straight or slightly reflexed margin, sometimes slightly striated, not pruinose, smooth, glabrous, not hygrophanous, white to whitish, in centre darker, whitish to creamy or beige. Lamellae rather close, L = 50–70, I = 3–4, emarginated, up to 13 mm wide, white to whitish. Stipe 40–100 ´ 6–11 mm, cylindrical, slightly broadened at base, up to 17 mm, longitudinally fibrillose, not pruinose, whitish, sometimes creamy to beige. Context white, without any smell or with slightly earthy smell and mild taste.

Spores (7)7.4–9.5(10) × (4)4.3–5.5(6) µm, av. 8.5 × 4.9 µm, Q = (1.5)1.58–1.87(2.0), av. Q = 1.73, ellipsoid to narrowly ellipsoid, ornamentation verrucose, amyloid. Basidia 4-spored, 19–29 × 6–9 µm, clavate, sometimes cylindrical. Cheilocystidia of the macrocystis type, abundant, 18–65 × 9–17 µm, non-septate, without apical crystals or rarely with inconspicuous crystals at apex. Pleurocystidia rare or sometimes absent, 32–58 × 8–13 µm, non-septate, without apical crystals or rarely with inconspicuous crystals at apex. Caulocystidia absent. Pileipellis a cutis transient to ixocutis, composed of cylindrical, thin-walled, up to 10 µm wide hyphae.

Occurrence in Slovakia in years 2012–2015: Despite our intensive field research in years 2012–2015, we found *Melanoleuca strictipes* only at one locality in Slovakia, namely in the Západné Tatry Mts. In the past, the species probably occurred more frequently, e.g. Kubička (1957, 1976) referred to numerous records from the Vysoké Tatry Mts. The decrease of abundance of *M. strictipes* can relate with a decrease of grazing in Slovak mountains during the last years.

Specimens studied: Slovakia, Západné Tatry Mts., Zuberec village, Sedlo pod Osobitou, 1680 m a. s. l., on soil in grass, 11 October 2014, leg. O. Ďuriška (SLO 1669). – Romania, Gilăului Mts., Someșu Rece, on soil in grass, 4 October 2014, leg. S. Jančovičová, (SLO 1661, SLO 1662, SLO 1663).

Melanoleuca verrucipes (Fr.) Singer
(see page 76 down)

Field identification: With the presence of dark brown to black squamules on its whitish or creamy stipe, *Melanoleuca verrucipes* is a unique and unambiguous species within the genus *Melanoleuca*.

Description: Pileus 35–120 mm broad, low convex to applanate, and broadly funnel-shaped, with usually prominent central umbo, margin inflexed, costate to ± irregular especially when old, lustrous, smooth or finely concentrically rugulose (like *Russula olivacea*), glabrous, sometimes slightly tomentose or leathery at centre, white or pale cream coloured, with ochraceous or brownish centre. Lamellae moderately close, L = 60, I = 2–4, emarginate and attached with small tooth, white, later cream coloured (4A2), edge concolorous, later darker, uneven, pubescent. Stipe 50–100 × 7–20 mm, cylindrical, with broadened base (up to 30 mm broad), slightly broadened at apex, white, covered with dense brown-black or black squamules. Context white, with unpleasant rancid-farinaceous smell and mild taste.

Spores (7)7.8–9.2(10) × (4)4.4–5.3(6) µm, av. 8.5 × 4.9 µm, Q = (1.4)1.54–2.0(2.25), av. Q = 1.77, ellipsoid to narrowly ellipsoid, rarely broadly ellipsoid, ornamentation verrucose, amyloid. Basidia 4-spored, 25–32 × 7–9 µm, clavate. Cheilocystidia urticoid, 42–55 × 5–10 µm, with one septum, with or sometimes without apical crystals. Pleurocystidia rare or absent, similar to cheilocystidia. Caulocystidia very rare or absent, cylindrical, non-septate, with apical crystals, 40–50 × 4–8 µm. Pileipellis a cutis, composed of cylindrical, thin-walled, up to 7 µm wide hyphae.

Occurrence in Slovakia in years 2012–2015: Despite our intensive field research, we did not find *Melanoleuca verrucipes* in Slovakia in years 2012–2015. On the webpage nahuby.sk (Baranovič on line), however, there are two references on its occurrence in Slovakia in that period, namely in Zvolenská kotlina and in Liptov region. *Melanoleuca verrucipes* seems to be a very rare species in Slovakia.

Specimens studied: Czech Republic, České Švýcarsko National Park, Doubice, close to a site called Panenská jedle, 7 June 2012, leg. V. Antonín and S. Komíková (BRNM 737663). – Czech Republic, Svitavy, vicinity of the Rosnička pond, 12 Aug. 2014, leg. J. Zedník (BRNM 761965). – Czech Republic, Kukle, forest called “Brand” (the same forest complex as previous locality), on wooden and bark remnants, 23 September 2015, leg. J. Zedník (BRNM 772089). – Czech Republic, Brno, Lužánky

park, on a mulched flower-bed, 19 May 2014, leg. F. Kučera (BRNM 761866). – USA, Connecticut, Derby, in grass on soil, 16 May 2010, leg. M. Melicharová (SLO 1677).

Acknowledgements

The study was funded by the grant agencies: Comenius University Grant Agency UK/82/2016; APVV SK-CZ-0052-11; VEGA 02/0075/14; and the studies of the third author were enabled by the support provided to the Moravian Museum by the Ministry of Culture of the Czech Republic as part of its long-term conceptual development programme for research institutions (DKRVO, ref. MK000094862). We would like to thank the reviewer, Petr Hrouda (Brno), for reading the manuscript and making several useful suggestions.

BOOK NOTICES

Soňa Jančovičová

Arne Aronsen & Thomas Læssøe. 2016. **The genus Mycena s. l.** (Fungi of Northern Europe – vol. 5.). Svampetryk, Tilst, [1]-376 p., hardcover, 105 eur, ISBN 978-87-983581-2-1.

“The genus *Mycena* s.l.” is the fifth volume in the series of “Fungi of Northern Europe”. Comparing with the previous volumes (vol. 1. the genus *Hygrocybe* 1995 and 2010, vol. 2. the genus *Lactarius* 1998, vol. 3. the genus *Hebeloma* 2005, vol. 4. the genus *Tricholoma* 2013), the *Mycena* book has three superlatives: it is the heaviest (it weighs 1097 g), the most voluminous (it has 376 pages) and includes the most species (113 northern European species of *Mycena* s.l., including *Resinomycena*, *Roridomyces*, *Atheniella* and *Phloeomana*).

As said in the authors preface, the present volume is somewhat less scientific than the preceding *Tricholoma* volume, where all accepted taxa had been sequenced. Nevertheless, two new species are introduced – *Mycena mucoroides* and *M. pasvikensis* – and some new synonyms are given. There has been no phylogenetic treatment running in parallel with the writing of this identification manual.

The book provides three identification keys: the key to ± mycenoid genera (and species), the key to species mainly based on macroscopical characters, and the key based on microscopical characters. The keys are followed by the most extensive part – “Descriptions and illustrations of the species”. Each species is provided with the description of macroscopical and microscopical features, ecology and distribution and discussion (mostly focused on confusion with similar species). Colour photographs of high quality are catching both – field habitus of basidiomata and details on basidiomata concerning with the differentiating characters. There do not lack the drawings of microstructures. Texts are clear and understandable also because of the general and very useful introduction chapters on the genus *Mycena*, such as Generic description, Conservation, Toxicity, Parasites on *Mycena* fruitbodies and others.

The authors, Arne Aronsen (Norway) and Thomas Læssøe (Denmark), are smiling on the photograph at back cover of the book. They look like young happy boys despite the book have taken / have given them more than 30 years of experience with this fascinating group of often tiny but beautiful agarics.

ASCOMYCETEN, EXSICCATAE COLLECTION BY H. REHM.**2. INDEX OF TAXA ISSUED IN FASCICLES 1–11 (1–550)¹**

Pavel Lizoň

Slovak Academy of Sciences, Institute of Botany, Dúbravská cesta 9, 845 23 Bratislava, Slovakia; pavel.lizon@savba.sk

Lizoň, P. 2016. Ascomyceten, exsiccatae collection by H. Rehm. 2. Index of taxa issued in fascicles 1–11 (1–550). *Catathelasma* 17: 35–74.

Index of specimens and taxa published in 11 fascicles of the exsiccatae collection.

Lizoň, P. 2016. Ascomyceten, exsikátová zbierka H. Rehma. 2. Index taxónov uverejnených v zošítach 1–11 (1–550). *Catathelasma* 17: 35–74. Index položiek a taxónov uverejnených v prvých 11 zošítach exsikátovej zbierky.

Key words: list, types, new taxa, new combinations, references to fungaria

Labels

Labels for fasc. 1–20 (no. 1–1000) and fasc. 27 (no. 1301–1350) were handwritten. Labels for the rest of fascicles were printed. All have heading “Rehm: Ascomyceten” and description of the collection site, substrate, date and collectors name. No description of new taxa were included so new names presented on labels are not validly published there (*nomina nuda*).

Descriptions of new taxa

Descriptions for new taxa issued in first 2 fascicles were published by Winter (1872) and repeated later by Rehm (1881). Rehm’s paper has also list and descriptions for fascicles 3–11.

Extra numbers

Simultaneously with specimens carrying basic numbers were issued numerous extra specimens. They appeared in irregular order at later dates (together with later fascicles) and represented usually the same taxon as basic number. Comments on these extra specimens can be found at the end of published accounts of Rehm’s exsiccatae. In this index extra numbers are listed together with the basic numbers (with reference in which fascicle they were issued).

¹ 1st part: Bibliography and contributors. *Catathelasma* 16: 27–40. 2015.

Location of Rehm's Ascomyceten

An undistributed set of this exsiccatae has BPI² (**seen**, incomplete, here marked as BPI Rehm), FH, DAOM and ILL (Pfister 1985³ and Stevenson 1971⁴). Probably incomplete set distributed in the general collection has S (**seen**), BPI, CUP, UPS, C, PC, BM, HBG (Pfister 1985), M (acquired with F. Arnolds collections), E, NY, K(M). It seems that no fungarium houses a fully complete set (from no. 1 to no. 2175).

It should be noted that numerous collections were issued simultaneously in another exsiccatae, such as North American Fungi (J. B. Ellis and B. M. Everhart) and Mycotheca universalis (F. de Thümen).

How to read the index

Each entry is arranged in this order: consecutive number of the specimen, original name as presented on the label, collection(s) acronym with accession number⁵ (**boldfaced** indicates the type⁶) + notes stored with the specimen (all in parentheses), double slash // is followed by the name published in Rehm's list. When the name on the label and in the published list is the same it is not repeated after double slash; but it is repeated (and followed by the reference) if representing a new name (**boldfaced**) or new combination (*italicized*, reference supplemented by the basionym). Available data about recent taxonomical treatments and/or lectotypifications are noted but relevant references were not specifically searched.

The names of taxa are presented here as originally written/printed on labels and published in the lists. Corrected was only the spelling of names. Names of authorities of taxa are presented as used by Rehm (even if incorrectly); only their abbreviations are unified to standard forms. For dates of issue of exsiccatae see Catahelasma 16: 29-32, 2015.

2 acronyms of collections follow Index herbariorum, <http://sweetgum.nybg.org/science/ih>

3 A bibliographic account of exsiccatae containing fungi. Mycotaxon 23: 1-139, 1985 (corrections: Mycotaxon 25: 141-145, 1986)

4 An account of fungus exsiccatai. Beih. Nova Hedwigia (36): [i]-viii, 1-563

5 Collections at BPI (US National Fungus Collections, Beltsville) and at S (Naturhistoriska riksmuseet, Stockholm) were studied on site. Specimens missing in there two fungaria were searched in on-line collection databases. Specimens that may not be issued within Ascomycetes are marked by question mark (?).

²⁶ note by Olariaga: The material was distributed in 1870 without description. When validly published in 1881 with a description, a legitimate name that should have been adopted is cited as synonym, *Sclerotinia batschiana*. Therefore, *Ciboria pseudotuberosa* could be interpreted as a superfluous name
²⁷ listed also in the list for fasc. 45

317. *Hypoderma vincetoxici* (Duby) (BPI Rehm; UPS F-663708) //
318. *Hypoderma smilacis* (Schwein.) Duby (BPI Rehm; S F277999;

66 marked by Carpenter (1979) as lectotype

67 according to Carpenter (Mem. New York Bot Gard. 33: 46, 1981): lectotype S, isolectotypes: K, NY 68 Protologue (*Hedwigia* 14: 83, 1875; Bull. Buffalo Soc. Nat. Sci. 2: 295, 1875) has no direct reference to Rehm's Ascomyceten so it is questionable if no. 307 represents a syntype for this taxon. Issued also *Mycotheca universalis* and North American fungi.

69 Bull. Torrey Bot. Club 6[1875-1879](24): 133, 1876 (no reference to Ascomyceten); issued also in *Mycotheca universalis* and North American fungi
