# Vegetation survey of Mlele Beekeeping Zone in 2018

Dr. Urs Bloesch

Evilard, 1 May 2019

## Acknowledgements

I sincerely thank ADAP Geneva for entrusting to us the vegetation survey of Mlele Beekeeping Zone. I am deeply grateful to Inyonga Beekeepers Association (IBA) and to the ADAP Project Supervisor Shabani Halfani and his team for their generous hospitality and support throughout the mission. I would like to express my warmest thanks to the Village Game Scout (VGS) team including Dicksoni Malembeka, Johni Gervasi, Felesiano Futakamba.

My special thanks go to Lucile Daudet who later finished the two vegetation transects together with the VGS team and to Frank Mbago for his field assistance and the plant identification at the Herbarium of the University of Dar es Salaam. Finally, I am grateful to the Project driver Yahya Ally for careful driving and tolerance during field work. The field work would not have been possible without the tireless commitment of all team members.

## Abstract

A vegetation survey of Mlele Beekeeping Zone (BKZ) in Inyonga District has been conducted in 2018. The objective of the survey was a) to detect possible vegetation changes within the Mlele BKZ and b) to assess the current stage of the vegetation of the whole Mlele BKZ and its current threats (baseline).

13 plots out of the 30 vegetation plots from the 2004 survey have been resurveyed during this assessment. The species richness of the Mlele BKZ comprises 83 species for the 2018 vegetation survey. The 13 vegetation plots resurveyed will serve as permanent plots for monitoring and evaluating any vegetation changes at site level.

Moreover, two vegetation transects of about 10 km length each have been outlined and 800 vegetation points have been sampled with the Point-Centered Quarter Method (PCQM). Tree density, basal area, dominant tree height, and estimated standing volume are significantly higher on upper land compared to the miombo woodlands below the escarpment.

The most frequent trees/shrubs in Mlele BKZ in the lower diameter class ( $DBH < 20\text{cm}$ ) are *Diplorhynchus condylocarpon*, *Pseudolachnostylis maprouneifolia*, and *Pterocarpus angolensis*. These species are quite fire-tolerant what may explain their prevalence in the annually burnt Mlele BKZ. In the upper diameter class ( $DBH \geq 20\text{cm}$ ) *Julbernardia globiflora* and *Brachystegia manga/utilis* are the most frequent tree species in Mlele BKZ. Young *Pterocarpus angolensis* from the lower diameter class ( $DBH < 20\text{cm}$ ) are widespread in Mlele BKZ and are amongst the five most frequent and dominant species.

The vegetation surveys in 2018 allowed completing substantially the former tree/shrub list for Mlele BKZ from Mwanguango (2004). The checklist now includes in total 123 trees/shrubs with their scientific and Konongo names including also species identified from opportunistic sampling.

In total 28 human site disturbances have been assessed including 34 trees cut (many of them *Pterocarpus angolensis*) along the two transects covering roughly an area of 160 ha. About 80% of the disturbances happened on the lower land what may be explained by the proximity of the principal road Inyonga to Mpanda.

The use of the PCQM along the vegetation transects is an appropriate and quite simple method to assess the vegetation baseline and in addition also all human disturbances along the transects. It is suggested to use this method also for the neighbouring protected areas what would allow to compare ecosystem (vegetation) health of protected areas under different managements.

The Miombo habitats of Mlele BKZ are well protected. No sign of recent poaching was detected and no logging happened in the last five years in the two belt transects as a result of the participatory management of the beekeeping zone with regular patrolling, support of beekeeping activities and awareness raising campaign by the Project.

## 1) Introduction

Following a transfer of management rights negotiated with the government in 2010, the Mlele Beekeeping Zone (BKZ) is managed by the Inyonga Beekeepers Association (IBA) in collaboration with the District authorities and the villages. Since 2002, ADAP (Association for the Development of Protected Areas) is supporting IBA in beekeeping activities and conservation of natural resources in general of the BKZ. ADAP is a Swiss NGO based in Geneva founded in 1997. Its objective is to generate additional incomes for local communities in order to gain their support for environmental conservation.

The current forest resources of the Mlele BKZ and their threats are not well known. According to the National Forest Policy 1998 as well as the Forest Act, No. 14 of 2002, a forest management plan, including a harvesting plan, needs to be established for all forest reserves. The current harvesting plan for Mulele Hills FR was established in 2014 relying heavily on the former forest inventory conducted by the Ministry of Natural Resources and Tourism (MNRT) through the Forestry and Beekeeping Division in 2005 and on other secondary data from 2006-2014 such as annual district forest harvesting reports, tree felling licences, transit passes and illegal harvesting reports (TFS 2014). No field survey has been carried out to verify and to update these secondary data. Therefore, the current harvesting plan of the Mulele Hills FR might not be realistic.

In 2004, ADAP has mandated a tree survey of Mlele BKZ in order to know the melliferous trees and their abundance, the use of forest products and the human disturbances (Mwangulango 2004). A discussion with Oscar Malembeka, a retired Village Game Scout (VGS) who accompanied the late Nathan Mwangulango in the vegetation survey allowed clarifying their methodology used. A main objective of the 2004 survey was to establish 30 permanent vegetation plots for monitoring vegetation changes over time. Unfortunately, this objective was not respected in the second vegetation survey carried out in 2013 (Kayombo et al. 2013) where new 42 new plots were established following a different methodology. Therefore, any direct comparison of the results of the tree survey of 2013 with 2004 is hampered and any possible vegetation change cannot be detected.

The **objective** of the new vegetation survey in 2018 was twofold:  
a) to detect possible vegetation changes within the Mlele BKZ and  
b) to assess the current stage of the vegetation of the whole Mlele BKZ and its currents threats (baseline).

To establish any possible vegetation changes we decided to resurvey only vegetation plots from the 2004 survey. This choice was based on the following reasons:

- Longer time period for detecting vegetation changes (2004-2018);
- The regeneration potential of the plots (trees/shrubs < 20 cm have only been recorded in 2004 (Mwangulango 2004);
- Exact location of plots (coordinates) not clear in the 2013 vegetation survey (Kayombo et al. 2013);
- Unfortunately we could not meet the authors of the 2013 vegetation survey to clarify their methodology applied.

The vegetation plots from 2004 have been established mostly along roads often nearby the boundary where access is easier. Possible vegetation changes in individual plots are barely representative for the whole area of Mlele BKZ.

Therefore, we decided in addition to the survey of permanent vegetation plots from 2004, to outline two vegetation transects of about 10 km length each for improving the data set and

having a sound baseline for 2018. Thereby, also all human disturbances could be assessed along the transects.

This third vegetation survey has been assessed by two field trips. Dr. Urs Bloesch led the team composed of Frank Mbago (22 June to 26 June 2018) and the VGSs Dicksoni Malembeka, Johni Gervasi, and Felesiano Futakamba in the first field trip from 22 June to 2 July 2018. Lucile Daudet together with the VGS completed in a second field trip from 9 to 14 September 2018 the two vegetation transects.

The rainfall was exceptionally high in the preceding rainy season resulting in very tall and dense grass layer. Some of the larger Mbugas<sup>1</sup> were still flooded but most of the few existing tracks were passable by car during the first field trip while during the second field trip towards the end of the dry season in September the grass layer and the soil were dry along the transects.

## 2) Study area

Miombo woodland is the dominating vegetation type of unimodal rainfall areas in southeastern Africa (Smith & Allen 2004). Miombo woodlands are the most extensive vegetation type in Tanzania (Shirima et al. 2014) thereby playing a key role as carbon source and sink. Miombo woodlands are characterized by a distinct and often continuous grass layer and an open to closed tree canopy layer and often annually burnt. Miombo are dominated by the genera *Brachystegia* and *Julbernadia* with *Brachystegia spiciformis* and *Julbernadia globiflora* as the most common tree species (Frost 1996).

Usually we distinguish between floristically rich “wetter miombo” of the higher rainfall areas (>1000 mm per annum) and floristically more poor “drier miombo” (<1000 mm per annum). Miombo woodlands have a low soil nutrient content, are well drained, highly leached, acidic and low in organic matter (Frost 1996). The timber and non-timber products from the miombo woodlands are essential for the livelihoods of millions of people living inside and outside the miombo woodlands (Malaisse 1997).

The BKZ in Mlele District is located northwest of Inyonga township, along the main road to Mpanda and the road to Rukwa Game Reserve Headquarters covering an area of about 850,000 ha. Mlele BKZ is surrounded by a dense network of protected areas in Katavi Region (see Fig. 1). The altitude of Mlele BKZ ranges between 1200 to 1500 m a.s.l. from the lower land in the northeast to the upper land (hilltop, plateau) in the southwest separated by the escarpment.

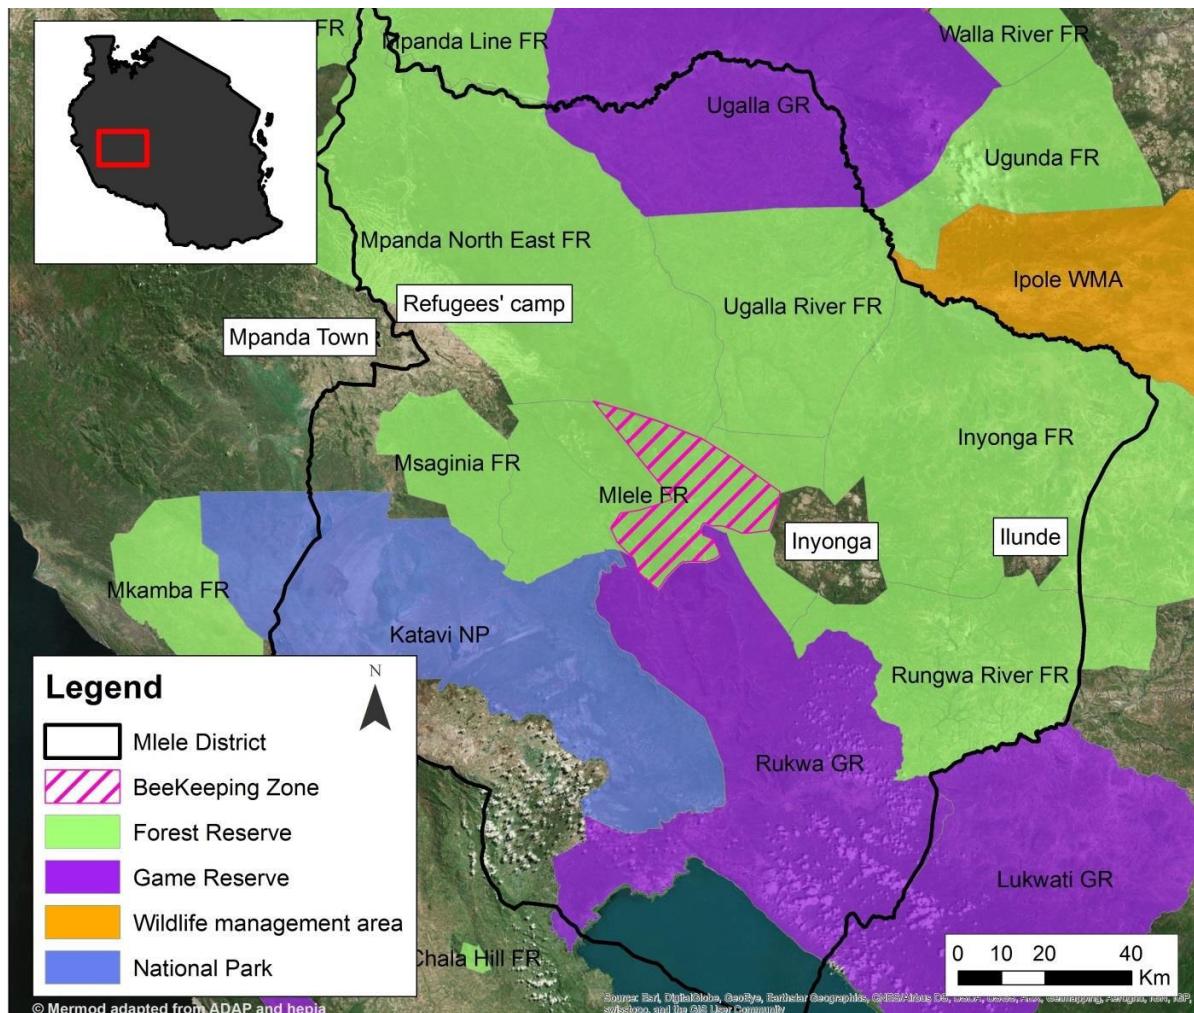

Miombo woodlands are the predominating vegetation type in Mlele BKZ (Mwangulango 2004, Kayombo et al. 2013) covering more than 90% of the area. The average annual rainfall is estimated to oscillate between 1000 and 1200 mm. The miombo type is transitional between “drier” and “wetter” miombo. The seasonally waterlogged mbugas are mainly covered with grasslands and occasionally with few trees and shrubs (wooded grasslands). Narrow riverine forests occur along the permanent and seasonal streams and some evergreen forest patches exist on deeper soils in depressions (south of Ngaramira area and at Masigo according to Kayombo et al. 2013).

Mlele BKZ is part of the Mulele Hills Forest Reserve of 519,295 ha which was gazetted in 1953 (TFS 2014). Based on the memorandum of understanding (MoU) with the Ministry of

---

<sup>1</sup> Seasonally waterlogged grasslands and grass savannas; term frequently used in Tanzania.

Natural Resources and Tourism (MNRT) in 2010, IBA is managing the beekeeping zone on behalf of the MNRT. The MoU is currently under revision as requested by the Tanzania Forest Services Agency (TFS). TFS was established in 2011 as an executive agency with the mandate of managing national forests (natural and plantations) and bee resources in a sustainable manner by ensuring sustainable supply of various forest and bee products and services, stable ecosystem and maintaining biological diversity. Mlele FR is also a Game Controlled Area (GCA) under the auspice of the Tanzania Wildlife Management Authority (TAWA) from the MNRT. Moreover, hunting companies which have also anti-poaching and road maintenance tasks are active in Mlele FR.

**Fig. 1.** Beekeeping zone and other protected areas of Mlele District, in Katavi Region (Mermod 2016).

The Wakonongo are the original tribe of Mlele District. Traditionally they were hunter-gatherer practising slash-and-burn agriculture having an intimate relation with the miombo woodlands (Mermod 2016).

## 3) Methods

### 3.1 Data collection

#### Vegetation plots

13 plots out of the 30 vegetation plots from 2004 (Mwanguango 2004) have been resurveyed from 23 to 28 June (see Appendix A and D). For time reasons, facility in access was considered in the selection of the plots for this survey.

As far as possible the methodology from 2004 was respected. Note that Mwanguango (2004) did not explicitly specify the minimal Diameter at Breast Height (DBH<sup>2</sup>) recorded for the lower diameter < 20 cm class (probably DBH  $\geq$  7 cm); we recorded all trees with a DBH  $\geq$  3 cm. Unfortunately, Mwanguango (2004) gives only the total number of tree species of the upper and lower diameter class without indicating the exact DBH of each tree recorded. Therefore, the basal area and the class diameter distribution for each tree species could not be established for the 2004 vegetation survey.

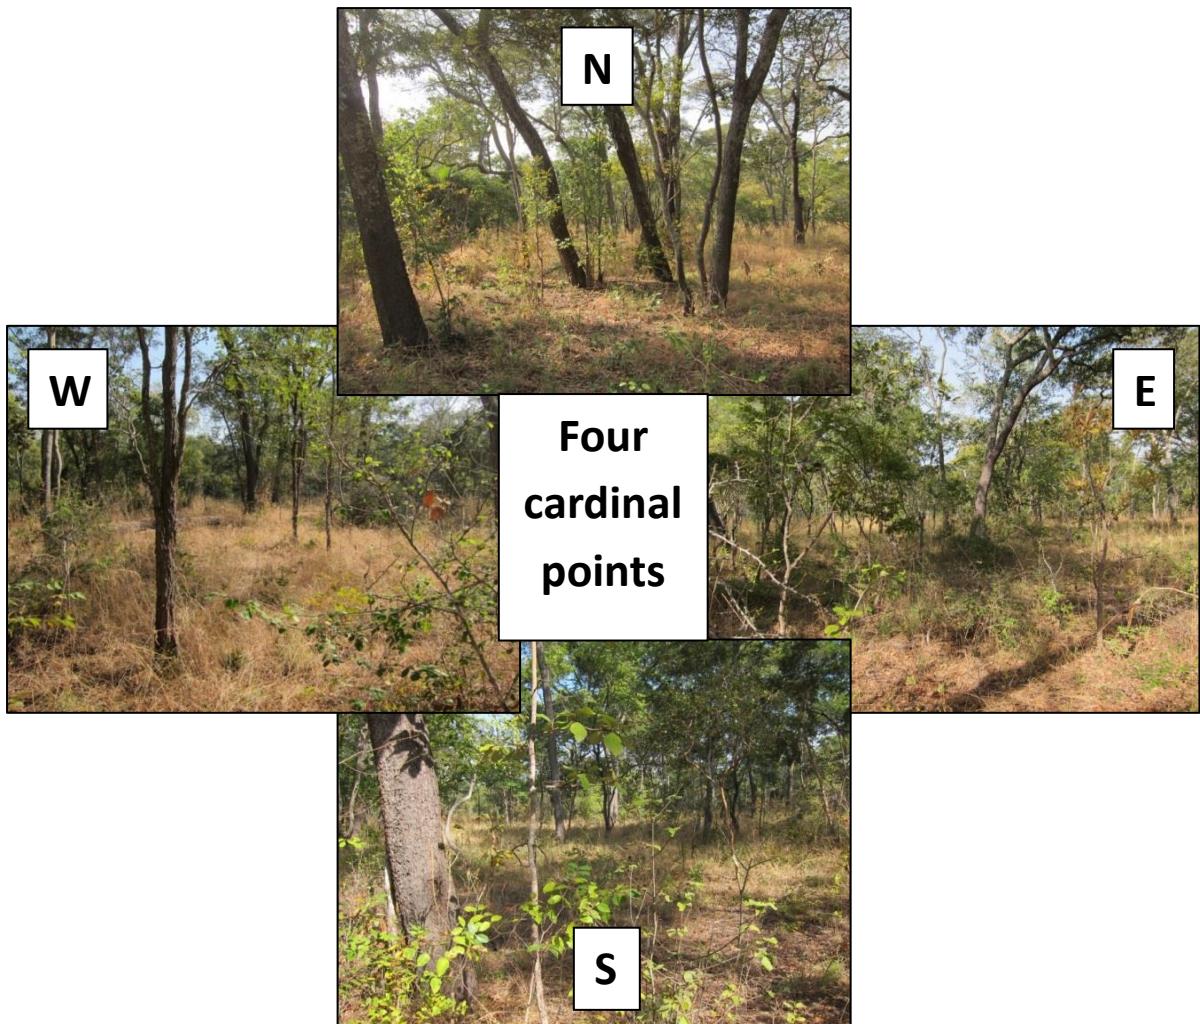

For time and practical reasons the size of the vegetation plots from 2004 was reduced to a circular sample plot of 0.1 ha (radius of 17.85m). Recording of all trees and shrubs in a rectangular plot of 100 x100 m (plot numbers 1 - 15) or 50 x 50 m (plot numbers 16 – 30) as in the 2004 survey seemed to us very difficult to realise and is also very time-consuming. Therefore, we used smaller and circular plots which are easier to survey using a measure tape from the centre of the plot. Finally, the 2018 survey recorded the following parameters:

- Location and general site description: we use a handheld GPS (Garmin 12 XL) to find the coordinates of the centre of the 2004 plot and to record the elevation; the nearest tree was selected and marked with white colour (in 2004 blue colour was used to mark the trees of the plot); slope and slope exposure were determined with a Büchi compass (P3252).
- Systematically, each plot centre was photographed in each cardinal direction (Canon powershot S95) resulting in 52 photographs in total (see example in Fig.2).
- Each tree/shrub species with a DBH  $\geq$  3 cm has been identified and its diameter recorded. This allows establishing for each species the diameter class distribution. The diameter of multi-stemmed trees has been taken for each single stem (DBH  $\geq$  3 cm) for calculating the basal area (ba). For calculating the tree density per ha, multi-stemmed trees are considered as one tree.
- The height of the dominant trees has been estimated visually (ocular estimation) using a levelling rod of 2 m height as a reference at the base of the trunk.
- The canopy cover<sup>3</sup> of the dominant trees and of the understorey has been recorded assuming that all trees/shrubs are in full foliage; in addition the vegetation cover of the herbaceous layer has been estimated and the dominant species recorded according to the cover-abundance scale from Braun-Blanquet (1964).

---

<sup>2</sup> Diameter at breast height, or DBH, is a standard method of expressing the diameter of the trunk or bole of a standing tree at 1.3m height.

<sup>3</sup> Percentage of the soil surface covered by vertically projected tree and shrubs crowns.

**Fig. 2.** Example of visual illustration through photographs from the centre of the plot in each cardinal direction (here vegetation plot 3).

## Transects

Google Earth has been used for locating the transects. The main vegetation types (canopy cover) within Mlele BKZ and possible access constraints for sampling along the transects have been quickly identified. Transects should be outlined perpendicular to the main mountain ridges thereby following a variable slope gradient with different vegetation types. Finally, two transects have been established with an azimuth of  $47^\circ$  or  $227^\circ$  considering possible access by existing tracks (see Appendix D). The first transect is located on the upper land starting at the boundary road about 300 m southeast from the IBA camp (azimuth of  $47^\circ$ ). A nearby track east of the transect was facilitating the access for the first five kilometres. A second transect was located on the lower land starting from the main Mpanda road (azimuth of  $227^\circ$ ). The nearby German road has similar direction thereby facilitating access the sampling on transect for about ten kilometers.

Along the transects the Point-Centered Quarter Method (PCQM) has been used (Mueller-Dombois, & Ellenberg 1974). Four quarters are established at the sampling point through a cross formed by two lines. One line is the compass direction ( $47^\circ$  or  $227^\circ$ ) and the second a line running perpendicular to the compass direction through the sampling point. The distance

to the mid-point of the nearest tree from the sampling point is measured in each quarter (see Fig. 3). The interval between two sampling points has been set at 300 steps systematically.

50 points have been recorded along each transect resulting in a transect length of about 10 km. The first 27 points of the first transect on upper land have been recorded from 29 June to 1 July 2018, while the remaining 23 points have been recorded from 13 to 14 September 2018. The second transect on lower land nearby German road has been recorded on 2 July 2018 (first 8 points) and completed for the remaining points (9 – 50) from 9 to 12 September 2018. This plotless method has the advantage in that they do not require laying out plot boundaries what saves considerable time.

We used a handheld GPS (Garmin 12 XL) to record the coordinates of each sampling point. All tree/shrub species and their DBH were recorded separately for two size categories: larger trees ( $DBH \geq 20$  cm) and smaller trees/shrubs ( $3 \geq DBH < 20$  cm). The height of the dominant trees has been estimated visually (ocular estimation) using a levelling rod of 2 m height as a reference at the base of the trunk. Slope and slope exposure were determined with a Büchi compass (P3252). Systematically, each direction of the cross marking the four quarters was photographed from the sampling point (Canon powershot S95) resulting in 200 photographs for each transect (see example in Fig. 2). The data for the two transects are given in Appendix B.

The parameters obtained with the PCQM method are (Mueller-Dombois, & Ellenberg 1974):

- Species;
- Density (from mean distance);
- For each tree its diameter class diameter distribution;
- Basal area (ba) and dominance for each species;
- Absolute frequency (as the occurrence of a species at a sampling point).

The tree basal area<sup>4</sup> of the surrounding stand was also estimated additionally in a simple but efficient way using the Bitterlich method (1948). Please note that the Bitterlich method was only applied in the vegetation survey from 22 June to 2 July 2018.

The Bitterlich method counts trees (shrubs) in a circle from the sampling point with an angle-gauge (wooden stick of 50 cm length with a fixed small metal sheet with four angular widths at its end). Only trees (shrubs) that are larger in diameter than the smallest angular width (counting factor  $k = 1$ ) are included in the count.

---

<sup>4</sup> Tree basal area is the cross-sectional area (over the bark) at breast height (1.3 metres above the ground) measured in square meters.

**Fig. 3.** PCQM method: Distance to the mid-point of the nearest tree from the sampling point is measured in each quarter and tree species and diameter is recorded.

All human ecosystem disturbances have been recorded on both sides along the transects by two VGSs (total sampling width of 80 m). Each VGS surveyed one half (i.e. 40 m) of the total width of the belt transect. Disturbances could include logging (saw pits, stumps), tree barking (for bee hives, ropes), trapping, infrastructures (camps), encroachments, and grazing by cattle. Please note that fire signs were not recorded since most of the miombo woodlands are burnt annually.

### 3.2 Data analysis

If plants could not be identified in the field, voucher specimens were identified by Frank Mbago at the herbarium of the University of Dar es Salaam. A plant list of all recorded specimen has been elaborated (see Appendix C).

For the permanent vegetation plots, mean  $\alpha$ -diversity (mean number of species of subunits),  $\gamma$ -diversity (total species diversity for the landscape and  $\beta$ -diversity ( $\beta = \gamma / \alpha$ ) were defined (see Whittaker 1970).

For the vegetation transects, absolute frequency i.e., the occurrence of a species at the sampling points has been calculated as follows:

(N points with species/total points) x 100.

Moreover, the species dominance as product of mean ba and number of species per ha has been calculated.

As an example the diameter class distribution of the highly searched Mninga (*Pterocarpus angolensis*) timber species has been established in a diagram.

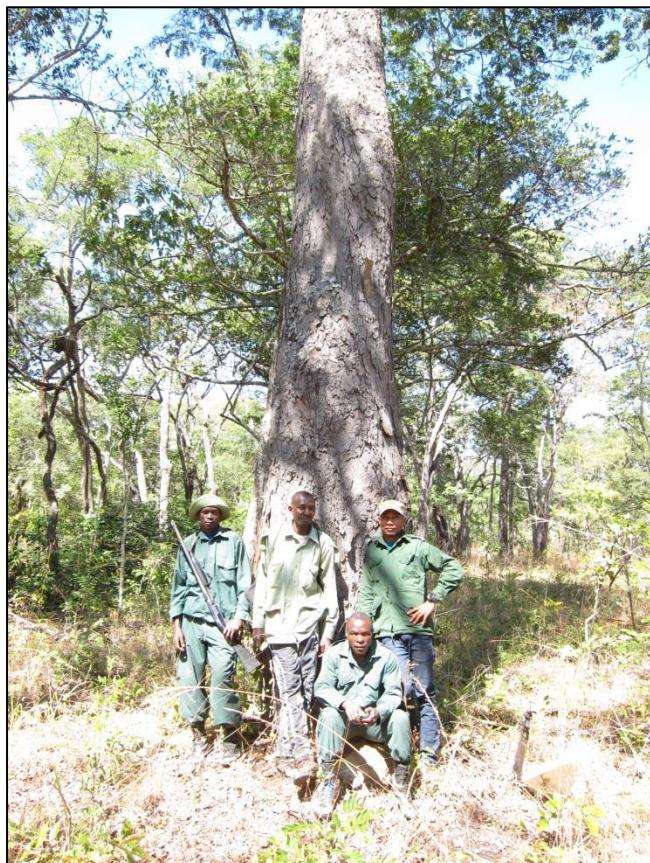

## 4) Results

### Vegetation plots 2004 / 2018

The vegetation data of the 13 permanent vegetation plots resurveyed in 2018 are presented in Appendix A (data 2004 and 2018). Most of the marked trees of the resurveyed vegetation plots from 2004 had still their blue marks.

As outlined a direct comparision between the vegetation surveys of the permanent plots from 2018 and 2004 is difficult and not possible for some parameters due to:

- a) Different size of the plots in 2004 and 2018;
- b) The 2004 survey distinguishes only between DBH smaller or larger (equal) 20 cm and do not indicate the exact DBH of a tree/shrub (basal area cannot be defined);
- c) Minimal diameter for the lower diameter class not specified in the 2004 survey.

**Fig. 4.** Large *Brachystegia spiciformis* tree on the upper land.

Table 1 below shows different diversity indices of the species richness for the vegetation surveys in 2004 and 2018.

**Table 1: Species diversity indices**

Species diversity indices	Survey 2004 (plot size 1 ha and 0.25 ha)	Survey 2018 (plot size 0.1 ha)
Mean $\alpha$ -diversity	34.2	19.4
$\beta$ -diversity	3.2	4.3
$\gamma$ -diversity	108	83

Table 2 below lists the tree/shrub density for the vegetation surveys in 2004 and 2018.

**Table 2: Tree and shrub density**

Tree/shrub density	Survey 2004 (plot size 1 ha and 0.25 ha)	Survey 2018 (plot size 0.1 ha)
Mean tree/shrub density (DBH < 20 cm) per ha	<sup>5</sup>	508 (317 <sup>6</sup> )
Mean tree density (DBH $\geq$ 20 cm) per ha	141 (30)	118 (42 <sup>6</sup> )

### Vegetation baseline using transects

Table 3 below includes the tree/shrub density, the mean basal area, estimated mean tree height, and estimated standing volume per ha for the miombo landscape on upper land (transect 1) and lower land (transect 2).

**Table 3: Forest parameters**

	Transect 1 upper land			Transect 2 lower land		
	$\emptyset < 20\text{cm}$	$\emptyset \geq 20\text{cm}$	Total	$\emptyset < 20\text{cm}$	$\emptyset \geq 20\text{cm}$	Total
Tree/shrub density/ha	414.77	84.3		324.2	50.4	
Mean basal area/ha ( $\text{m}^2$ )	2.69	8.91	11.60	2.43	4.95	7.38
Estimated mean tree height (m) <sup>7</sup>	6	11		5	8	
Estimated standing volume/ha ( $\text{m}^3$ ) <sup>8</sup>	8.1	49.0	57.1	6.1	19.8	

<sup>5</sup> Minimal diameter recorded not specified.

<sup>6</sup> Standard deviation

<sup>7</sup> Mean tree height for the canopy and the understorey on upper land estimated at 11 m (from mean dominant tree height: 14.6 m) and 6 m, respectively; mean tree height for the canopy and the understorey on lower land estimated at 8 m (from mean dominant tree height: 9.6 m) and 5 m, respectively.

<sup>8</sup> The standing volume was estimated using a mean tree coefficient of 0.5.

The absolute frequency of the first five tree/shrub species for the lower (DBH < 20cm) and the upper diameter class (DBH ≥ 20cm) is presented for both transects in tables 4 and 5 below.

**Table 4: Absolute frequency for transect 1 on upper land**

$\emptyset < 20\text{cm}$		$\emptyset \geq 20\text{cm}$	
Species	Absolute frequency	Species	Absolute frequency
<i>Brachystegia glaucescens</i>	28	<i>Julbernardia globiflora</i>	48
<i>Diplorhynchus condylocarpon</i>	28	<i>Brachystegia spiciformis</i>	46
<i>Pseudolachnostylis maproun.</i>	26	<i>Parinari curatellifolia</i>	28
<i>Hexalobus monopetalus</i>	24	<i>Brachystegia manga/utilis</i> <sup>9</sup>	18
<i>Pterocarpus angolensis</i>	22	<i>Anisophyllea pomifera</i>	18

**Table 5: Absolute frequency for transect 2 on lower land**

$\emptyset < 20\text{cm}$		$\emptyset \geq 20\text{cm}$	
Species	Absolute frequency	Species	Absolute frequency
<i>Diplorhynchus condylocarpon</i>	32	<i>Brachystegia manga/utilis</i>	38
<i>Pseudolachnostylis maproun.</i>	32	<i>Brachystegia glaucescens</i>	32
<i>Brachystegia manga/utilis</i>	22	<i>Julbernardia globiflora</i>	32
<i>Pterocarpus angolensis</i>	22	<i>Pterocarpus angolensis</i>	22
<i>Combretum fragrans</i>	20	<i>Pericopsis angolensis</i>	16
<i>Hymenocardia acida</i>	20		

The dominance values for the first five tree/shrub species for the lower (DBH < 20cm) and the upper diameter class (DBH ≥ 20cm) is presented for both transects in tables 6 and 7 below.

**Table 6: Species dominance for transect 1 on upper land**

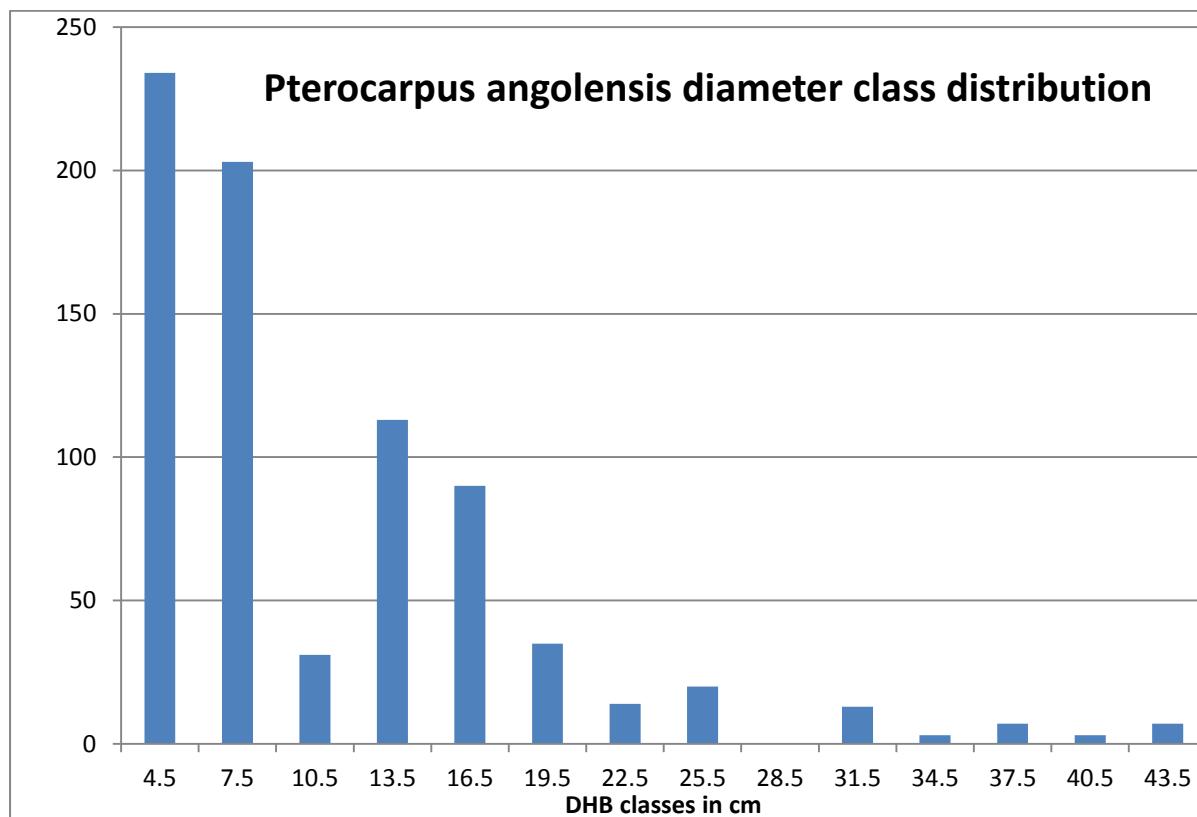

$\emptyset < 20\text{cm}$		$\emptyset \geq 20\text{cm}$	
Species	Ranking	Species	Ranking
<i>Pterocarpus angolensis</i>	1	<i>Brachystegia spiciformis</i>	1
<i>Pseudolachnostylis maproun.</i>	2	<i>Julbernardia globiflora</i>	2
<i>Brachystegia glaucescens</i>	3	<i>Brachystegia manga/utilis</i>	3
<i>Phyllocosmus leimareanus</i>	4	<i>Parinari curatellifolia</i>	4
<i>Brachystegia spiciformis</i>	5	<i>Erythrophleum africanum</i>	5

**Table 7: Species dominance for transect 2 on lower land**

$\emptyset < 20\text{cm}$		$\emptyset \geq 20\text{cm}$	
Species	Ranking	Species	Ranking
<i>Diplorhynchus condylocarpon</i>	1	<i>Brachystegia glaucescens</i>	1
<i>Pseudolachnostylis maproun.</i>	2	<i>Brachystegia manga/utilis</i>	2
<i>Brachystegia manga/utilis</i>	3	<i>Julbernardia globiflora</i>	3
<i>Oldfieldia dactylophylla</i>	4	<i>Pterocarpus angolensis</i>	4
<i>Pterocarpus angolensis</i>	5	<i>Pericopsis angolensis</i>	5

<sup>9</sup> The species is either *Brachystegia manga* or *Brachystegia utilis*.

The diameter class distribution of Mnenga (*Pterocarpus angolensis*) is shown in Fig. 5 below.

**Fig. 5.** Diameter class distribution of *Pterocarpus angolensis*.

The vegetation surveys in 2018 allowed completing substantially the former tree/shrub list for Mlele BKZ from Mwanguulango (2004). The checklist now includes in total 123 trees/shrubs with their scientific and Konongo names including also species identified from opportunistic sampling (see Appendix C). This quite exhaustive plant list including for most species the vernacular name will be very useful for any vegetation work in future.

All human disturbances recorded on a width of 80 m along transect 1 on upper land and transect 2 on lower land are summarised in tables 8 and 9 below.

**Table 8: Human disturbances along transect 1 on upper land**

Type of disturbances	Magnitude (quantitiy)	Position along the transect
Logging	1 <i>Pterocarpus a.</i> cut (>10 yrs) 1 <i>Monotes katangensis</i> recorded cut for pole 1 <i>Pterocarpus a.</i> cut (>10 yrs) (10 steps)	Point 3, +75 steps Point 10 Point 12, +10 steps
Building constructions	Beekeepers' camp	Point 3, +30 steps
Tree cutting for harvesting wild honey	1 <i>Pterocarpus angolensis</i> cut for wild honey harvesting (4 yrs) 1 tree cut for honey	Point 25, +130 steps Point 46, +20 steps
Total disturbances	6 site disturbances, 5 trees cut	

**Table 9: Human disturbances along transect 2 on lower land**

Type of disturbances	Magnitude (quantitiy)	Position along the transect
Logging	3 <i>Pseudolachnostylis m.</i> cut for poles ( $\varnothing$ 12-15 cm; >5 yrs) 5 <i>Pterocarpus angolensis</i> cut for timber (>5 yrs) (90 steps) 1 <i>Julbernardia g.</i> tree barking for bee hives ( $\varnothing$ 30 cm; >5 yrs) 1 <i>Pterocarpus angolensis</i> cut for timber ( $\varnothing$ 35 cm; >5 yrs) 1 <i>Julbernardia globiflora</i> cut for timber? ( $\varnothing$ 25 cm; >5 yrs) 1 tree cut for timber (>10 years) 1 tree cut for timber (>10 years)	Point 6, +30-50 steps Point 6, +90 steps Point 6, +145 steps Point 7, +190 steps  Point 9, +280 steps Point 10, +20 steps Point 11, +10 steps Point 11, +64 steps Point 11, +130 steps Point 11, +175 steps Point 11, +240 steps Point 14, +28 steps

## 5) Discussions

### Vegetation plots 2004 / 2018

The species composition of the Mlele BKZ is rather typical for the wetter Miombo type. *Combretum* and *Acacia* species typical for the drier Miombo are not very abundant. The species richness of the Mlele BKZ comprises 83 species for the 2018 vegetation survey (108 in 2004). This  $\gamma$ -diversity is quite similar with the 86 trees and shrubs recorded by Backéus et al. (2006) in their survey of miombo woodlands in Kilosa District having similar rainfall.

The higher mean  $\alpha$ -diversity and  $\gamma$ -diversity of the 2004 vegetation plots is certainly codetermined by the considerably larger plot size of 1 ha (plots 1 – 15) respectively 0.25 ha (plots 16 – 30) what results also in a higher total species richness ( $\gamma$ -diversity). The mean tree density per ha for the upper diameter class (DBH  $\geq$  20 cm) is quite similar in the 2004 and 2018 vegetation surveys with 141 and 118 trees, respectively.

The 13 vegetation plots resurveyed will serve as permanent plots for monitoring and evaluating any vegetation changes at site level.

### **Vegetation baseline using transects**

In total 800 trees and shrubs have been recorded by the PCQM. The two transects have been recorded within ten days, i.e. in average 10 points were sampled per day. The VGSs have been trained on the spot and they mastered the different steps of the methods quite quickly.

Tree density, basal area, dominant tree height, and estimated standing volume are significantly higher on upper land compared to the miombo woodlands below the escarpment (see table 3). This may point to higher soil fertility on upper land and to more and longer inundated wetlands (Mbugas) at the foothill of the escarpment. The higher tree density in the vegetation plots compared to the area covered by the transects might be explained by the selection of the vegetation plots which were placed in 2004 in rather closed and undisturbed miombo vegetation (see table 2 and 3).

The most frequent trees/shrubs in Mlele BKZ in the lower diameter class (DBH < 20cm) are *Diplorhynchus condylocarpon*, *Pseudolachnostylis maprouneifolia*, and *Pterocarpus angolensis* (see tables 4-5). According to Backéus et al. (2006) these three species are quite fire-tolerant what may explain their prevalence in the annually burnt Mlele BKZ. In the upper diameter class (DBH ≥ 20cm) *Julbernardia globiflora* and *Brachystegia manga/utilis* are the most frequent tree species in Mlele BKZ.

The diameter class distribution of *Pterocarpus angolensis* in Fig. 5 shows a distinct underrepresentation for DBH > 18 cm. This IUCN near-threatened species is highly sought for timber (see Jew et al. 2016 and Schwartz et al. 2002). On the other hand, the regeneration of *Pterocarpus angolensis* is quite abundant apart from the 10.5 cm diameter class. Young *Pterocarpus angolensis* from the lower diameter class (DBH < 20cm) are widespread in Mlele BKZ and are amongst the five most frequent and dominant species (see tables 4-7). This is line with Backéus et al. (2006) who reported a good natural regeneration capacity of Mnenga, possibly because individuals below logging size have a good seed set. By contrast Boaler (1966) and Schwartz et al. (2002) reported very low recruitment levels for Mnenga.

### **Ecosystem health**

The vegetation surveys revealed that the Miombo habitats of Mlele BKZ are intact. Natural regeneration of key species is quite abundant. In addition, the survey along the belt transects of about 20 km length and 80 m width allowed to assess all human disturbances within an area covering roughly 160 ha. We believe that the location and the total length of transects may give quite representative results for Mlele BKZ.

Fires are the prevailing disturbance in Mlele BKZ but their signs have not been recorded during the survey since most of Mlele BKZ is burnt annually including early and late dry season fires. It seems that there is no clear prescribed burning management by IBA for Mlele BKZ. The VGSs are applying both early and late dry season burning although their impact on the tree:grass ratio is adverse thereby either favouring grazers or browsers (see Bloesch 1999, 2008). Moreover, hot late dry season fires may affect melliferous trees and their natural regeneration.

In total 28 human site disturbances has been assessed including 32 trees cut (many of them *Pterocarpus angolensis*) along the two transects. About 80% of the disturbances happened on the lower land what may be explained by the proximity of the principal road Inyonga to Mpanda.

It is remarkable that all recorded human disturbances occurred several years back. No sign of recent poaching was detected and no logging happened in the last five years in the two belt transects. This is quite amazing considering the greatly increased human pressure in recent years on protected areas of the Katavi/Rukwa ecosystem. Illegal activities such as poaching, logging of high value hardwood timber trees, encroachment of farmers's fields, and grazing by Sukuma cattle are more and more threatening the ecosystems (Mermod 2016). As a result, most of these protected areas managed by the central government are increasingly degraded.

On the other hand, the joint management of Mlele BKZ between IBA (ADAP) and the MNRT based on a strong participatory approach with the local communities has allowed an effective protection of the ecosystems in the beekeeping zone. It would be interested to further analyse to what extent this is the result of the efficient protection system in place with regular patrolling of Mlele BKZ by the VGSs or the Project's support of income generation activities (mainly modern beekeeping) and awareness raising.

## 6) Conclusions

The use of the PCQM along the vegetation transects is an appropriate and quite simple method to assess the vegetation baseline and in addition also all human disturbances along the transects. This method can now also be applied by the trained VGSs to monitor and evaluate changes in the vegetation and in human disturbances. It is suggested to use this method also for the neighbouring protected areas what would allow to compare ecosystem (vegetation) health of protected areas under different managements.

The Miombo habitats of Mlele BKZ are well protected. No sign of recent poaching was detected and no logging happened in the last five years in the two belt transects as a result of the participatory management of the beekeeping zone with regular patrolling, support of beekeeping activities and awareness raising campaign by the Project.

Regarding the management of Mlele BKZ it is suggested to elaborate a vegetation map with the main vegetation units. The vegetation map is an important management tool and will also serve to elaborate a fire management plan for the zone. This map could be also an important planning tool for the district authorities.

## 7) Recommendations

Based on the observations of the field mission the following recommendations to IBA / ADAP are made:

- 1) Use the transect methodology for monitoring and evaluating any vegetation changes at site level.
- 2) Put the coordinates of the PCQM points on a map to localise the two transects.

- 3) Elaborate a vegetation map of Mlele BKZ with its main vegetation units. The vegetation data from the 2018 field campaign could be used as ground truth for elaborating the map.
- 4) IBA in consultation with TFS should elaborate a fire management plan for Mlele BKZ including a seasonal prescribed burning plan.
- 5) We suggest using the transect methodology with the PCQM for the planned vegetation assessment of Rungwa FR. Appropriate transects should be located using google earth. The trained VGSs from Mlele BKZ will participate at the beginning of the survey until the VGSs from Rungwa FR have been trained on the spot in the methodology.
- 6) Amend the ecological information of the Miombo species and assess the use of the Miombo trees/shrub species for the adjacent local communities (importance for their livelihoods).
- 7) It is suggested to include Tanzanian students in joint BSc/MSc studies with Swiss students.
- 8) Elaborate a paper for a research journal with a focus on the transect methodology using PCQM and its potential for rapidly establishing the vegetation baseline for monitoring and evaluating the vegetation.

### Vegetation plot 17 (recorded 28/6/2018)

Coordinates: S 6.70926° / E 31.93098° (white-marked *Pterocarpus angolensis*);

Location: Ulaya

Elevation: 1205 m.a.s.l.; slope: 0-2%, slope exposure: 220°

Dominant tree height: 16 m;

Vegetation cover: canopy (8-16 m): 30%; understorey (2-8m): 15%; herbaceous layer (0-2m): 75%

Herbaceous layer: *Hyparrhenia newtonii* 3, *Combretum molle* 1

Photos: 6000, 6001, 6002, 6003

Remark: Along the border plot *Combretum molle* (5) and *Pseudolachnostylis maprouneifolia* (1) cut for poles; 1 large termitaria (*Macrotermes*)

### Vegetation plot 21 (recorded 24/6/2018)

Coordinates: S 6.72350° / E 31.74830° (white-marked *Pterocarpus angolensis*)

Location: Kikusi area

Elevation: 1500 m.a.s.l.; slope: +/- flat

Dominant tree height: 10(12) m;

Vegetation cover: canopy (6-10{12}m): 30%; understorey (2-6m): 20%; herbaceous layer (0-2m): 15%

Herbaceous layer: *Anthephora elongata* 1, *Andropogon schirensis* 1, *Zonetriche inamoena* 1

Photos: 5943, 5944, 5945, 5946

Remark: Several *Pterocarpus angolensi* debarked, two of them in vegetation plot

## Appendix B: Vegetation transects

### **Transect 1: Upper land (above escarpment)**

Starting point road: S 6°80616 / E 31°66380; azimuth: 47° (towards vegetation plot 21)

#### **Sampling point 1:**

Coordinates: S 6°80492 / E 31°66522

Slope: 5%, slope exposure: 110°

Dominant tree height: 11 m

Basal area (Bitterlich, k=1): 10 m<sup>2</sup>

Photos: 6004, 6005, 6006, 6007

Disturbances/notes: stony blocks (boulders)

Diameter class	Nearest species in the each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Brachystegia microphylla</i>	22	6.80
	<i>Pterocarpus angolensis</i>	24	20.90
	<i>Pseudolachnostylis maprouneifolia</i>	26	26.50
	<i>Combretum molle</i>	25	26.20
DBH < 20 cm	<i>Vitex payos</i>	12	4.05
	<i>Parinari curatellifolia</i>	5	4.00
	<i>Combretum collinum</i>	8	2.00
	<i>Strychnos innocua</i>	5	2.24

#### **Sampling point 2:**

Coordinates: S 6°80370 / E 31°66665

Slope: 8%, slope exposure: 80°

Dominant tree height: 22 m

Basal area (Bitterlich, k=1): 16 m<sup>2</sup>

Photos: 6008, 6009, 6010, 6011

Disturbances/notes (2-3): old traditional bee hive on the ground (290 steps)

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Parinari curatellifolia</i>	23	6.84
	<i>Brachystegia microphylla</i>	21	6.00
	<i>Julbernardia globiflora</i>	24	9.11
	<i>Parinari curatellifolia</i>	37	13.11
DBH < 20 cm	<i>Parinari curatellifolia</i>	6	2.41
	<i>Uapaca kirkiana</i>	14	3.60
	<i>Julbernardia globiflora</i>	7	4.45
	<i>Brachystegia microphylla</i>	15	2.65

#### **Sampling point 3:**

Coordinates: S 6°80225 / E 31°66787

Slope: 3-4%, slope exposure: 340°

Dominant tree height: 20 m

Basal area (Bitterlich, k=1): 14 m<sup>2</sup>

Photos: 6012, 6013, 6014, 6015

Disturbances/notes (3-4): beekeepers camp (30 steps); 1 *Pterocarpus* a. cut (>10 yrs) (75 steps)

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Pterocarpus angolensis</i>	38	27.16
	<i>Pseudolachnostylis maprouneifolia</i>	21	2.60
	<i>Pericopsis angolensis</i>	38	5.58
	<i>Brachystegia microphylla</i>	30	6.51
DBH < 20 cm	<i>Hexalobus monopetalus</i>	5	5.50
	<i>Pseudolachnostylis maprouneifolia</i>	13	2.16
	<i>Hexalobus monopetalus</i>	5	3.15
	<i>Hexalobus monopetalus</i>	3	13.88

#### Sampling point 4:

Coordinates: S 6°80085 / E 31°66928

Slope: +/- flat, slope exposure: 335°

Dominant tree height: 18 m

Basal area (Bitterlich, k=1): 10.5 m<sup>2</sup>

Photos: 6016, 6017, 6018, 6019

Disturbances/notes: -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Parinari curatellifolia</i>	21	13.56
	<i>Brachystegia utilis</i>	37	5.55
	<i>Brachystegia utilis</i>	33	3.15
	<i>Brachystegia glaucescens</i>	21	16.65
DBH < 20 cm	<i>Pterocarpus angolensis</i>	6	7.91
	<i>Parinari curatellifolia</i>	19	7.76
	<i>Uapaca kirkiana</i>	9	8.77
	<i>Uapaca kirkiana</i>	9	6.96

#### Sampling point 5:

Coordinates: S 6°79929 / E 31°67060

Slope: 3-4%, slope exposure: 320°

Dominant tree height: 18 m

Basal area (Bitterlich, k=1): 9 m<sup>2</sup>

Photos: 6020, 6021, 6022, 6023

Disturbances/notes: -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Julbernardia globiflora</i>	46	8.45
	<i>Brachystegia utilis</i>	36	16.24
	<i>Parinari curatellifolia</i>	41	11.73
	<i>Parinari curatellifolia</i>	62	8.56
DBH < 20 cm	<i>Phyllocosmus leimareanus</i>	12	5.08
	<i>Brachystegia utilis</i>	5	4.70
	<i>Pterocarpus angolensis</i>	16	3.55
	<i>Uapaca kirkiana</i>	5	2.08

#### Sampling point 6:

Coordinates: S 6°79778 / E 31°67186

Slope: 3-4%, slope exposure: 360°

Dominant tree height: 18 m

Basal area (Bitterlich, k=1): 10 m<sup>2</sup>

Photos: 6024, 6025, 6026, 6027

Disturbances/notes: -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Pseudolachnostylis maprouneifolia</i>	20	15.85
	<i>Brachystegia utilis</i>	59	12.95
	<i>Vitex doniana</i>	35	8.00
	<i>Brachystegia utilis</i>	32	13.40
DBH < 20 cm	<i>Bobgunnia madagascariensis</i>	15	10.10
	<i>Pterocarpus angolensis</i>	3	3.51
	<i>Diplorhynchus condylocarpon</i>	5	10.15
	<i>Brachystegia utilis</i>	4	2.35

### Sampling point 7:

Coordinates: S 6°79645 / E 31°67337

Slope: 3-4%, slope exposure: 360°

Dominant tree height: 18 m

Basal area (Bitterlich, k=1): 13 m<sup>2</sup>

Photos: 6028, 6029, 6030, 6031

Disturbances/notes: -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Julbernardia globiflora</i>	33	9.21
	<i>Pseudolachnostylis maprouneifolia</i>	32	4.70
	<i>Julbernardia globiflora</i>	25	8.85
	<i>Julbernardia globiflora</i>	29	7.70
DBH < 20 cm	<i>Brachystegia glaucescens</i>	5	5.30
	<i>Brachystegia glaucescens</i>	15	8.88
	<i>Burkea africana</i>	3	5.61
	<i>Diplorhynchus condylocarpon</i>	5	1.04

### Sampling point 8:

Coordinates: S 6°79527 / E 31°67500

Slope: 2-3%, slope exposure: 360°

Dominant tree height: 15 m

Basal area (Bitterlich, k=1): 13 m<sup>2</sup>

Photos: 6032, 6033, 6034, 6035

Disturbances/notes: -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Brachystegia utilis</i>	24	11.57
	<i>Uapaca nitida</i>	21	13.80
	<i>Bobgunnia madagascariensis</i>	22	13.51
	<i>Julbernardia globiflora</i>	43	9.82
DBH < 20 cm	<i>Uapaca nitida</i>	8	2.03
	<i>Julbernardia globiflora</i>	3	4.21
	<i>Bobgunnia madagascariensis</i>	10	1.86
	<i>Pseudolachnostylis maprouneifolia</i>	3	6.06

### Sampling point 9:

Coordinates: S 6°79413 / E 31°67652

Slope: 1-2%, slope exposure: 340°

Dominant tree height: 15 m

Basal area (Bitterlich, k=1): 7 m<sup>2</sup>

Photos: 6036, 6037, 6038, 6039

Disturbances/notes: -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Monotes katangensis</i>	22	13.89
	<i>Brachystegia glaucescens</i>	22	20.15
	<i>Uapaca kirkiana</i>	27	11.40
	<i>Brachystegia utilis</i>	21	25.75
DBH < 20 cm	<i>Albizia antunesiana</i>	11	1.50
	<i>Pterocarpus angolensis</i>	14	3.31
	<i>Brachystegia glaucescens</i>	12	2.38
	<i>Pterocarpus angolensis</i>	5	5.32

### Sampling point 10:

Coordinates: S 6°79270 / E 31°67792

Slope: 3-4%, slope exposure: 330°

Dominant tree height: 16 m

Basal area (Bitterlich, k=1): 13.5 m<sup>2</sup>

Photos: 6040, 6041, 6042, 6043

Disturbances/notes: \* 1 *Monotes katangensis* recorded cut for pole

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Albizia antunesiana</i>	52	15.30
	<i>Brachystegia glaucescens</i>	27	6.50
	<i>Pterocarpus angolensis</i>	20	13.98
	<i>Pterocarpus angolensis</i>	30	8.97
DBH < 20 cm	<i>Monotes katangensis</i>	9	0.70
	<i>Brachystegia glaucescens</i>	5	4.21
	* <i>Monotes katangensis</i>	10	2.35
	<i>Monotes katangensis</i>	18	5.75

### Sampling point 11:

Coordinates: S 6°79131 / E 31°67926

Slope: +/- 1%, slope exposure: 320°

Dominant tree height: 14 m

Basal area (Bitterlich, k=1): 9 m<sup>2</sup>

Photos: 6044, 6045, 6046, 6047

Disturbances/notes: -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Brachystegia utilis</i>	70	9.38
	<i>Combretum molle</i>	24	10.00
	<i>Brachystegia utilis</i>	41	4.91
	<i>Brachystegia utilis</i>	24	11.42
DBH < 20 cm	<i>Terminalia mollis</i>	14	10.99
	<i>Terminalia kaiseriana</i>	8	9.52
	<i>Diplorhynchus condylocarpon</i>	3	1.05
	<i>Terminalia kaiseriana</i>	10	5.21

### Sampling point 12:

Coordinates: S 6°78970 / E 31°68052

Slope: 1-2%, slope exposure: 310°

Dominant tree height: 16 m

Basal area (Bitterlich, k=1): 6 m<sup>2</sup>

Photos: 6048, 6049, 6050, 6051

Disturbances/notes (12 – 13): 1 *Pterocarpus angolensis* cut (>10 yrs) (10 steps)

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Brachystegia spiciformis</i>	21	10.76
	<i>Erythrina abyssinica</i>	75	8.93
	<i>Combretum molle</i>	23	11.20
	<i>Ziziphus mucronata</i>	24	12.82
DBH < 20 cm	<i>Brachystegia glaucescens</i>	8	10.49
	<i>Annona senegalensis</i>	8	8.23
	<i>Combretum molle</i>	7	1.02
	<i>Azanza garckeana</i>	7	3.70

### Sampling point 13:

Coordinates: S 6°79801 / E 31°68150

Slope: 3%, slope exposure: 280°

Dominant tree height: 17 m

Basal area (Bitterlich, k=1): 15 m<sup>2</sup>

Photos: 6052, 6053, 6054, 6055

Disturbances/notes: -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Erythrophleum africanum</i>	21	10.59
	<i>Brachystegia spiciformis</i>	20	5.13
	<i>Erythrophleum africanum</i>	33	5.49
	<i>Brachystegia spiciformis</i>	40	8.65
DBH < 20 cm	<i>Pseudolachnostylis maprouneifolia</i>	5	3.01
	<i>Brachystegia glaucescens</i>	3	4.62
	<i>Terminalia mollis</i>	8	5.16
	<i>Terminalia kaiseriana</i>	7	4.81

### Sampling point 14:

Coordinates: S 6°78626 / E 31°68255

Slope: 1-2%, slope exposure: 330°

Dominant tree height: 17 m

Basal area (Bitterlich, k=1): 15 m<sup>2</sup>

Photos: 6056, 6057, 6058, 6059

Disturbances/notes: -

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Brachystegia spiciformis</i>	36	9.60
	<i>Brachystegia spiciformis</i>	75	16.90
	<i>Brachystegia spiciformis</i>	22	15.85
	<i>Monanthotaxis discolor</i>	27	2.47
DBH < 20 cm	<i>Vitex doniana</i>	5	4.40
	<i>Combretum collinum</i>	7	7.68
	<i>Brachystegia spiciformis</i>	6	2.31

	<i>Vitex mombassae</i>	13	3.40

### Sampling point 43

Coordinates: S 6°61250 / E 31°77320

Slope: +/- flat

Dominant tree height: 10-12 m

Basal area (Bitterlich, k=1): not recorded

Photos: 4026 / 4027 / 4028 / 4029

Disturbances/notes:

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Brachystegia manga</i>	34	16.80
	<i>Brachystegia manga</i>	35	10.65
	<i>Lannea schimperi</i>	28	28.00
	<i>Pterocarpus tinctorius</i>	57	13.10
DBH < 20 cm	<i>Pterocarpus angolensis</i>	6	4.60
	<i>Pseudolachnostylis maprouneifolia</i>	19	3.88
	<i>Julbernardia globiflora</i>	5	3.66
	<i>Brachystegia manga</i>	4	1.90

### Sampling point 44

Coordinates: S 6°61356 / E 31°77159

Slope: +/- flat

Dominant tree height: 6-8 m

Basal area (Bitterlich, k=1): not recorded

Photos: 4031 / 4032 / 4033 / 4034

Disturbances/notes:

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Brachystegia manga</i>	30	20.47
	<i>Brachystegia manga</i>	31	36.30
	<i>Brachystegia glaucescens</i>	48	14.38
	<i>Combretum molle</i>	25	42.30
DBH < 20 cm	<i>Julbernardia globiflora</i>	10	2.86
	<i>Flacourtie indica</i>	4	2.00
	<i>Julbernardia globiflora</i>	4	2.90
	<i>Julbernardia globiflora</i>	4	4.68

### Sampling point 45

Coordinates: S 6°61569 / E 31°76971

Slope: +/- flat

Dominant tree height: 10-12 m

Basal area (Bitterlich, k=1): not recorded

Photos: 4042 / 4043 / 4044 / 4045

Disturbances/notes: + 180 steps (1) tree cut for honey (>3 years)

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Julbernardia globiflora</i>	22	23.05
	<i>Pericopsis angolensis</i>	54	5.70
	<i>Julbernardia globiflora</i>	82	15.63
	<i>Julbernardia globiflora</i>	61	8.50
DBH < 20 cm	<i>Combretum fragrans</i>	3	4.81
	<i>Diplorhynchus condylocarpon</i>	12	3.72
	<i>Pseudolachnostylis maprouneifolia</i>	13	4.96
	<i>Diplorhynchus condylocarpon</i>	9	3.75

### Sampling point 46

Coordinates: S 6°61701 / E 31°76800

Slope: +/- flat

Dominant tree height: 10-12 m

Basal area (Bitterlich, k=1): not recorded

Photos: 4046 / 4047 / 4048 / 4049

Disturbances/notes:

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Monotes africanus</i>	29	21.70
	<i>Monotes africanus</i>	25	7.34
	<i>Brachystegia manga</i>	37	15.05
	<i>Monotes africanus</i>	38	8.25
DBH < 20 cm	<i>Julbernardia globiflora</i>	6	1.63
	<i>Pseudolachnostylis maprouneifolia</i>	10	6.04
	<i>Brachystegia manga</i>	4	6.59
	<i>Julbernardia globiflora</i>	4	3.45

### Sampling point 47

Coordinates: S 6°61835 / E 31°76674

Slope: +/- flat

Dominant tree height: 10-12 m

Basal area (Bitterlich, k=1): not recorded

Photos: 4053 / 4054 / 4055 / 4056

Disturbances/notes:

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Erythrophleum africanum</i>	23	12.75
	<i>Borassus aethiopum</i>	55	17
	<i>Brachystegia manga</i>	80	17.80
	<i>Brachystegia spiciformis</i>	50	17.35
DBH < 20 cm	<i>Flacourtie indica</i>	13	3.65
	<i>Phyllocosmus leimareanus</i>	5	5.40
	<i>Lannea schimperi</i>	16	2.47
	<i>Hymenocardia acida</i>	4	1.80

### Sampling point 48

Coordinates: S 6°61998 / E 31°76550

Slope exposure: SW avec azimuth 227 (N)

Dominant tree height: 10 m

Basal area (Bitterlich, k=1): not recorded

Photos: 4064 / 4065 / 4066 / 4067

Disturbances/notes:

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Brachystegia manga</i>	25	16.20
	<i>Brachystegia manga</i>	23	13.05
	<i>Brachystegia manga</i>	44	14.60
	<i>Brachystegia manga</i>	53	9.90
DBH < 20 cm	<i>Flacourtie indica</i>	6	8.00
	<i>Ximenia caffra</i>	4	10.33
	<i>Brachystegia manga</i>	4	2.10
	<i>Combretum molle</i>	18	2.48

### Sampling point 49

Coordinates: S 6°62115 / E 31°76402  
 Slope exposure: SW avec azimuth 227 (N)  
 Dominant tree height: 12-14 m  
 Basal area (Bitterlich, k=1): not recorded  
 Photos: 4068 / 4069 / 4070 / 4071  
 Disturbances/notes:

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Combretum collinum</i>	26	10.47
	<i>Monotes africanus</i>	45	10.77
	<i>Julbernardia globiflora</i>	29	3.80
	<i>Kigelia africana</i>	30	22.71
DBH < 20 cm	<i>Diplorhynchus condylocarpon</i>	13	3.40
	<i>Diplorhynchus condylocarpon</i>	6	2
	<i>Ximenia caffra</i>	3	3.90
	<i>Pseudolachnostylis maprouneifolia</i>	15	7.30

### Sampling point 50

Coordinates: S 6°62278 / E 31°76323  
 Slope exposure: NORD  
 Dominant tree height: 10 m  
 Basal area (Bitterlich, k=1): not recorded  
 Photos: 4072 / 4073 / 4074 / 4075  
 Disturbances/notes:

Diameter class	Nearest species in each quarter	DBH (cm)	Distance (m)
DBH ≥ 20 cm	<i>Pterocarpus angolensis</i>	32	6.70
	<i>Brachystegia microphylla</i>	39	20.00
	<i>Brachystegia microphylla</i>	25	17.05
	<i>Julbernardia globiflora</i>	29	16.65
DBH < 20 cm	<i>Hymenocardia acida</i>	5	3.70
	<i>Brachystegia microphylla</i>	7	0.86
	<i>Brachystegia microphylla</i>	5	2.04
	<i>Terminalia kaiseriana</i>	15	3.20

## Appendix C: Tree and shrub checklist Mlele BKZ (27/3/2019)

### Plant list revised and amended from Mwangulango 2004

Scientific name	Kikonongo
<i>Acacia gerrardii</i>	Ulula
<i>Acacia polyacantha</i>	Muwombwe
<i>Acacia stuhlmannii</i>	Nunga?
<i>Afzelia quanzensis</i>	Mkola
<i>Albizia antunesiana</i>	Mpilipili
<i>Albizia glaberrima</i>	
<i>Albizia grandibracteata</i>	
<i>Albizia gummosa</i>	
<i>Albizia harveyi</i>	
<i>Albizia versicolor</i>	Masako
<i>Anisophyllea pomifera</i>	Msindwi
<i>Annona senegalensis</i>	Mfilafila
<i>Antidesma membranaceum</i>	Msekela
<i>Azanza garckeana</i>	Mtowo
<i>Bauhinia thonningii</i>	Mfundwa mbogo
<i>Bobgunnia madagascariensis</i>	Kasanda
<i>Borassus aethiopum</i>	Sandala
<i>Brachystegia boehmii</i>	
<i>Brachystegia floribunda?</i>	Msilanga
<i>Brachystegia glaucescens</i>	Myombo
<i>Brachystegia microphylla</i>	Mkongolo
<i>Brachystegia spiciformis</i>	Mtundu / Umtundu
<i>Brachystegia stipulata</i>	
<i>Brachystegia utilis/floribunda/manga?</i>	Msilanga
<i>Brachystegia taxifolia</i>	Kapepe
<i>Bridelia duvigneaudii</i>	
<i>Bridelia scleroneura</i>	
<i>Burkea africana</i>	Mgandosinsi
<i>Cassia abbreviata</i>	Mzoka
<i>Cassia singueana</i>	Mzoka
<i>Cassipourea mollis</i>	Mlugala
<i>Catunaregam spinosa</i>	Mpongole
<i>Chrysophyllum bangweolense</i>	
<i>Combretum collinum</i>	Mlandala
<i>Combretum fragrans</i>	Mlozyaminze / Mluziaminzi
<i>Combretum molle</i>	Mlama
<i>Combretum zeyheri</i>	Msana
<i>Commiphora africana</i>	Mponda
<i>Crossopteryx febrifuga</i>	Msanza
<i>Dalbergia nitidula</i>	Kapondalampassa, Mzoka?
<i>Dichrostachys cinerea</i>	Kasunzulu
<i>Diospyros cornii</i>	Mnumbulu
<i>Diplorhynchus condylocarpon</i>	Msonga
<i>Dombeya rotundifolia</i>	Mlalila
<i>Ekebergia capensis</i>	Mtuza
<i>Elaeodendron schweinfurthianum</i>	
<i>Entada abyssinica</i>	Mfutwamvula / Kamchicha
<i>Eriosema sp.</i>	
<i>Erythrina abyssinica</i>	Kamchicha
<i>Erythrophleum africanum</i>	Mgandongoye
<i>Euphorbia matabelensis</i>	Kiponda

<i>Flacourtie indica</i>	Msungu
<i>Friesodielsia obovata</i>	Msalansi
<i>Garcinia huillensis</i>	Myeye
<i>Grewia bicolor</i>	Mkoma
<i>Hexalobus monopetalus</i>	Mukua, Mukwa?
<i>Hymenocardia acida</i>	Kapala
<i>Isoberlinia angolensis</i>	Mnembela
<i>Julbernardia globiflora</i>	Muva
<i>Kigelia africana</i>	Mdungwa
<i>Lannea schimperi</i>	Mgumbu
<i>Lonchocarpus capassa</i>	Mvalevale
<i>Maprounea africana</i>	
<i>Maranthes floribunda</i>	Mwasha
<i>Markhamia obtusifolia</i>	Mpapa
<i>Maytenus senegalensis</i>	Mwesia
<i>Memecylon flavovirens</i>	Mseweye
<i>Monanthotaxis discolor</i>	Mshenene
<i>Monotes africanus</i>	Mkokote
<i>Monotes katangensis</i>	Mukokoti
<i>Multidentia crassa</i>	Mukukumba
<i>Mundelea sericea</i>	
<i>Mystroxylon aethiopicum</i>	Kasela
<i>Ochna afzelii ssp. afzelii</i>	
<i>Ochna holstii</i>	
<i>Ochna inermis</i>	
<i>Ochna oxyphylla</i>	
<i>Olax obtusifolia</i>	Mtundwa
<i>Oldfieldia dactylophylla</i>	Mliwamfwengi
<i>Ozoroa insignis subsp. reticulata</i>	Mkalakala
<i>Parinari curatellifolia</i>	Mbula/Mhula
<i>Pavetta stuhlmannii</i>	
<i>Pericopsis angolensis</i>	Mbanga
<i>Phyllanthus engleri</i>	Mng'ongomtandala
<i>Phyllocosmus leimareanus</i>	Msonifya
<i>Pleurostylia africana</i>	
<i>Protea madiensis</i>	
<i>Pseudolachnostylis maprouneifolia</i>	Mtungulu
<i>Psorospermum febrifugum</i>	Mvivi
<i>Pterocarpus angolensis</i>	Mninga
<i>Pterocarpus tinctorius</i>	Mkulungu
<i>Rhus longipes</i>	Msilanswagalo
<i>Rhus vulgaris</i>	Kankiningi
<i>Rytigynia decussata</i>	
<i>Rytigynia uhlriegii</i>	Msongwansimba
<i>Rothmannia engleriana</i>	Mlozirozi
<i>Schrebera trichoclada</i>	Mputeka
<i>Sclerocarya birrea</i>	
<i>Securidaca longepedunculata</i>	Mteywe
<i>Sterculia africana</i>	Msawala
<i>Sterculia quinqueloba</i>	Mkungulanga / Msavala / Msawala
<i>Stereospermum kunthianum</i>	
<i>Strychnos innocua</i>	Mkulwa
<i>Strychnos potatorum</i>	Mnyekenyewe, Mgwegue
<i>Strychnos pungens</i>	Mkome?
<i>Strychnos spinosa</i>	Katonga, Mwaye
<i>Syzygium guineense</i>	Kashamongo
<i>Tamarindus indica</i>	
<i>Terminalia kaiseriana</i>	Kazima

<i>Terminalia mollis</i>	Mfufu
<i>Trichilia emetica</i>	Mkalya
<i>Uapaca kirkiana</i>	Mkusu
<i>Uapaca nitida</i>	Mkokofinyo
<i>Vangueria madagascariensis</i>	Mgelelya
<i>Vitex doniana</i>	Mfurū
<i>Vitex fischeri?</i>	
<i>Vitex madiensis</i>	Mfululegea
<i>Vitex mombassae</i>	Mfululegea
<i>Vitex payos</i>	Mtalali
<i>Xeroderris stuhlmannii</i>	
<i>Ximenia americana?</i>	Mtundwa
<i>Ximenia caffra</i>	Kaguaguva
<i>Ziziphus mucronata</i>	Kagaole

## Appendix D: Vegetation survey 2018 of Mlele Beekeeping Zone
