

specimens, and biometric measurements are used to key out the species. After this point, the color of the conidial cells, number and peculiarities of the genus [Fig. 1b,c; Fig. 2b,c].

What is *Quijnque*, or *Sexloculata* section of the genus [Fig. 1b,c; Fig. 2b,c].

Multi-cellular cells will total 4, 5, or 6 cells, thus placing the specimen in either the *coerulea* or *exterior* extreme *hyalinae* cells added to the number of the conidia.

The exterior or extreme *hyalinae* cells added to the number of the conidia? [Fig. 1a,c; Fig. 2e,f]. Does the specimen belong to *Monochaeitia* or *Pestalotia*? Does the conidia provide with one, or more than the specimen recognized. Are the conidia provided with one, or more than the specimen in the author's scheme of classification should

The position of the specimen under the microscope. The specimen should be completely reorganized. Are the conidia provided with one, or more than the conidia? The specimen is a glass slide and covered for examination under the microscope.

A bit of fungous or conidial material is placed in a drop of water on a glass slide and covered for examination under the microscope.

The fruitifications aids in the removal of the conidia without the loss of their characteristics. A smear of water applied to the specimen should

be applied to the identification of the species, and a crest of setulae are into the matrix. The pedicels, exterior *hyaline* cells, and crest of setulae are fruiting areas is treated with a spec of water which is allowed to soak through the peristomes. A bit of fungous or conidial material is placed in a drop of water on a glass slide and covered for examination under the microscope.

The fruiting peristomes are not significant in the definition of species.

but the arrangement, number, distribution, and even size of the peristomes, but the arrangement, number, distribution, and even size of the peristomes, and without order. A punctiform arrangement in leaf spots appears somewhat swollen; later at the summit of the conidia the

dead, paper, and other plant materials. Their distribution is usually irregular, and they appear in spots or dead areas on leaves, bark, leaves or bimocular, and they appear in the naked eye, or better with a hand lens in black coils or masses, leaving a black sooty deposit over the area.

The black peristomes can be observed with the naked eye, or better with a hand lens in black coils or masses, leaving a black sooty deposit over the area.

The contents are aggregated, and some times densely aggregated. The contents are contained or conchuent, and sometimes densely aggregated. They are black, carbonaceous,

impure or the epidemics or covering tissue. The matrix and are freed by the fruitifications are usually borne in the matrix and are freed by the

fruitifications. There are exceptions. In general, the fruitifications are not considered significant in the definition of species.

In general, the fruitifications in vitro and considerable variation in vitro. The fruitifications show variation in vivo and considerable variation in vitro. The fruitifications show variation in vivo and considerable variation in vitro.

The fruitifications in an apothecial structure. There is considerable uniformity among the fruitifications and enveloping the base and sides of the sporogenous layer as to

underlying and enveloping the least stroma, or none of it, and the 6-celled conidial forms the most. The stroma in the 6-celled conidial forms can be extensive, forms the most. The stroma in the 6-celled conidial forms can be extensive,

conidial forms show more or less stroma formation. The 4- and 5-celled conidial forms they show the least stroma, or none of it, and the 6-celled conidial forms the most.

Generally the fruitifications of *Monochaeitia* and *Pestalotia* are acervuli.

## EXAMINATION OF SPECIMENS AND USE OF KEYS

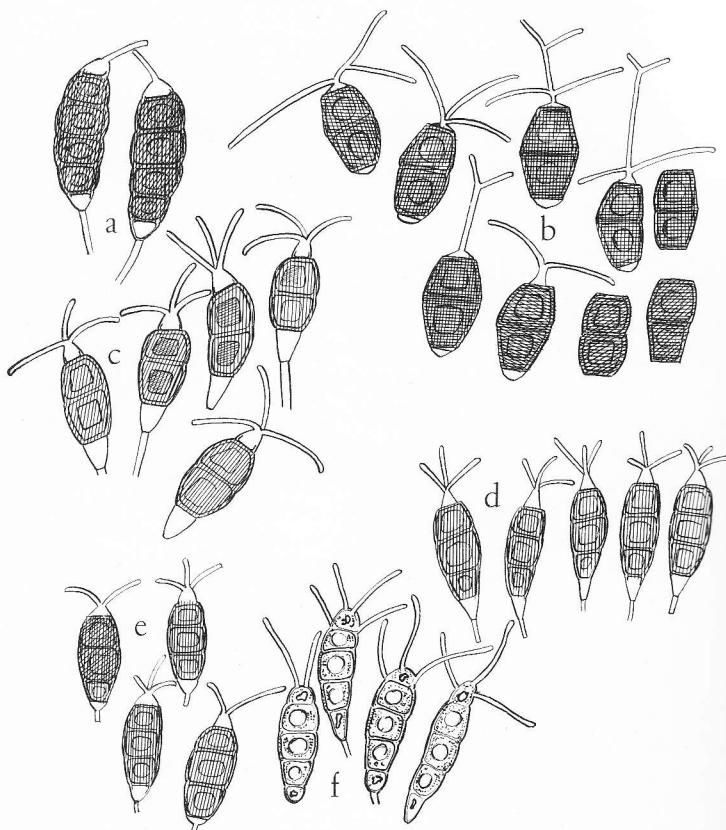

FIG. 1. Conidia of (a) *Monochaetia unicornis*, (b) *Pestalotia hartigii*, (c) *P. stevensoni*, (d) *P. micheneri* (=*P. microspora*), (e) *P. cryptomeriae*, (f) *Pestalozzina unicolor*.

rant conidia and characters should be disregarded. Figures 1-4 will serve to illustrate the variation in number, form, and color of conidial cells and variations of the setulae.

The exterior or terminal cells of the conidia are hyaline or usually so. Rarely are they dilute yellow or faintly colored. The coloration of the intermediate cells is an important diagnostic character. These cells may be faintly colored, brown or yellow-brown, and equally colored (concolorous) [Fig. 1c,d,e]. They may be of two colors or versicolored and slightly or strongly contrasted. The upper two colored cells may be brown or umber in contrast to the pale or yellow-brown color of the lowest of the three colored cells [Fig. 3b,f,g]. These color contrasts appear only among the 5-celled conidial forms with three intermediate colored cells. The upper two colored cells may be dark brown or nearly black and opaque (fuliginous) and most

the specimen belongs in the section *Concolorae*, *Olivace-Pallidae*.  
brown cells of a given specimen have concolorous oliveaceous or pale  
oliveaceous or yellow-brown, then the specimen belongs in the section *Versi-*  
and the lowest colored cells of the conidia under observation may show a slight contrast in  
the specimen can obscure the septum dividing the two upper colored cells.

FIG. 2. Conidia of (a) *Monochetia setridioidea*, (b) *Pestalotia cornu-cervae*, (c) *P.*

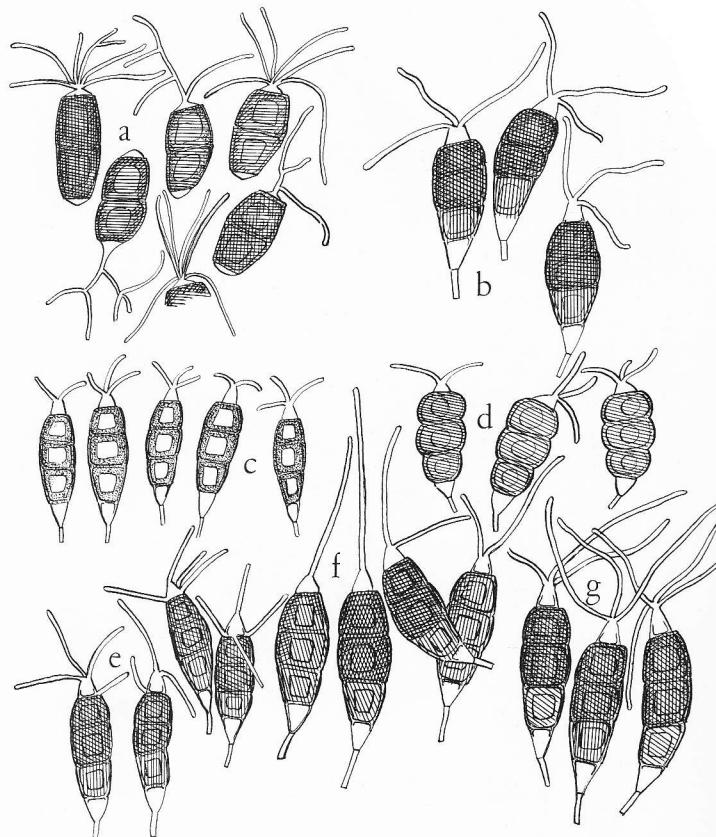

FIG. 3. Conidia of (a) *Pestalotia caulincola*, (b) *P. oleandri*, (c) *P. podocarpi*, (d) *P. torulosa*, (e) *P. gravesii*, (f) *P. monochaetoides*, (g) *P. conigena*.

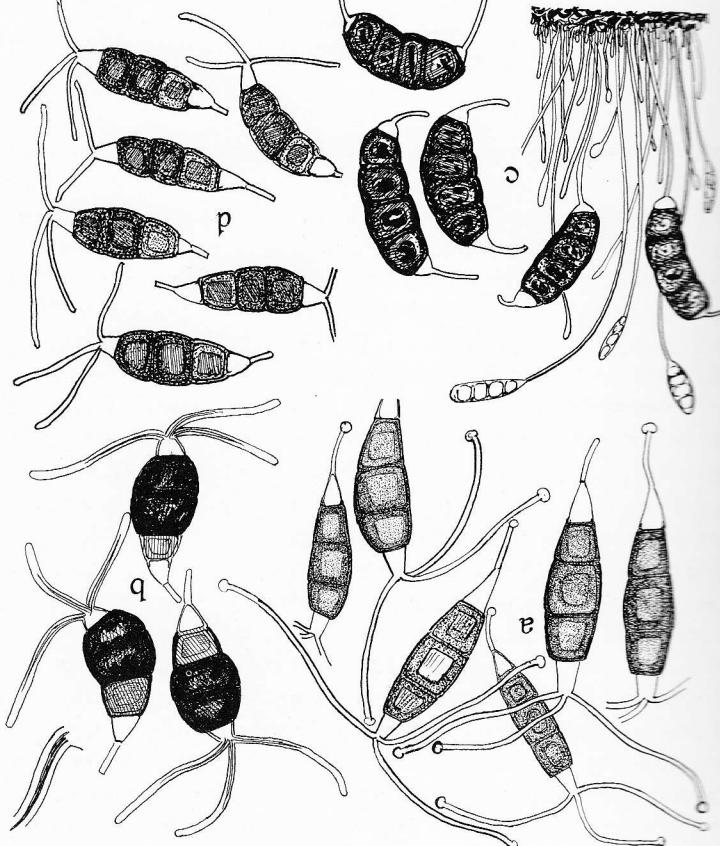

*colorae, Umbrae-Olivae.* If the contrast is extreme, that is, the upper two colored cells usually swollen, of an intense or chocolate brown color (fuliginous) and even opaque, the lowest colored cell olivaceous or yellow-brown, then the specimen belongs in the section *Versicolorae, Fuliginae-Olivae.* In addition, the conidia may be strongly constricted at the septa dividing the colored cells [Fig. 3d], or usually the fuliginous and the olivaceous colored cells [Fig. 4b]. These color contrasts are illustrated in the text by figures of conidia of representative species embraced within the three categories of the author's system of classification.

The conidia are of different forms. In some species they are clavate, in others narrow fusiform. The exterior hyaline cells may be acute, long or short, cylindric, turbinate, or conic. These peculiarities are useful distinguishing characters in defining species.

The setulae, in addition to number and size, may show other peculiarities. They may arise together at the summit of the apical cells or they may be disseminated. They may arise from the bases of the apical cells [Fig. 3e]. The setulae may be slope or even extended backward. If coarse and thick, they may show a lumen extending and flexuous or coarse and rigid, projecting forward and widely divergent or simple or branched, or both. The length of the setulae and their number, the shape of the base of the setulae toward their middle point [Fig. 4b]. They may be acute, long or be clavate, in

the upper two of them brown orumber, the lowest one oliveaceous or pale brown. The upper two of them brown orumber, the lowest one oliveaceous or pale brown. (d) *Pestalotia*: conidia with hyaline exterior cells, sporeogenous layer; conidia with hyaline exterior cells and four filigreeous or dark brown and opaque; stout setulae with lumen. (e) *Monocheatia cerea*: conidia with three versicolored intermediate cells, the upper two of them lightbrown or pale brown intermediate cells; setulae with knobbed or spatulate extremities.

FIG. 4. Variation in form and color of conidia. (a) *Pestalotia rheae*; three concolorous

the setulae may be capitate or spatulate [Fig. 4a]. Consideration of all the features appears in the keys to the species and the species descriptions.

Units of measure can be useless if the calibration of the microscope is inaccurate or if low-power lenses are used. Measurements are changed by the culture of the fungus on different substrata and they are increased by growth on artificial nutrient media. The subject of variation of the species and the influence of substrate on the form and dimensions of the conidia have been treated by numerous investigators and recently by Tandon (Proc. Nat. Acad. Sci. India 25, 1-2, 11-14, 1956) and Gambogi (Nuovo Gior. Bot. Ital. n.s. 63, 2-3, 248-256, 1956). Therefore, latitude must be recognized in employing the measurements in the text, and small differences in width and length between descriptions and specimens are insignificant. With this approach the keys should be helpful in the identification of specimens and in discouraging the erection of superfluous species.

There are still too many species of *Pestalotia*. The specimen must be distinctly different from anything that is recognized to be considered new. To the student disposed to naming new species, let me advise caution and judgment. If the traditional system of describing new species continues, then some bolder plan of regulation and administration more effective than the present method is necessary to curb the practice. Otherwise a monographic study can be futile and virtually impossible of accomplishment in view of the magnitude of the work and the inaccessibility of type material.

*Pestalotiopsis* Steyaert, Bull. Jard. Bot. État Bruxelles 19(3),300,1949.

Fruiting bodies black, carbonaceous, varying from simple acervuli without stromatic area to stromatic apothecoid structures, pycnidia and pseudopycnidia, rarely with a true ostiole and rarely as loose fertile hyphae without a distinct stratum or stroma. Conidia fusiform, straight or curved, 4-6-celled or loculate and crowned with 2 or more, rarely 1 and more simple or branched setulae, their extremities sometimes spatulate or knobbed, sometimes arising from the slope or base of the apical cells; exterior cells hyaline or rarely dilutely colored, rarely with contents; intermediate cells equally or variably colored pale brown to almost black, guttulate; pedicels hyaline, simple, rarely branched, attached to the base of the conidia.

### Section *Quadriloculatae*

d. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 92. *P. esparallaria*  
e. Setulae 2-3, up to 16  $\mu$  . . . . . 93. *P. fibricola*  
f. Setulae mostly 2, 10-19  $\mu$ , acro-  
g. Setulae 2-4, usually 3, 15-20  $\mu$  . . . . . 94. *P. senegalensis*  
h. Intermediate colored cells branched . . . . . 95. *P. citri*
8. *P. javanica*
- a. Intermediate colored cells branched . . . . . 96. *P. distincta*  
b. Hyaline cells obscure . . . . . 97. *P. fuchsiae*
9. *P. theae*
- a. Setulae 6-16  $\mu$  . . . . . 98. *P. guelpini*
10. *P. annulata*
- a. Setulae 10-24  $\mu$  sometimes faintly . . . . . 99. *P. clavariata*  
b. Setulae 15-21  $\times$  4-5-7  $\mu$  . . . . . 100. *P. capitata*
11. *P. elastica*
- a. Conidia 14-18  $\times$  6.5-8.5  $\mu$  . . . . . 101. *P. flet*
12. *P. annulata*
- a. Conidia 15-21  $\times$  4-5-7  $\mu$  . . . . . 102. *P. annulata*  
b. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 103. *P. phoenicis*  
c. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 104. *P. javanica*  
d. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 105. *P. theae*
13. *P. spathulariae*
- a. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 106. *P. spathulariae*
14. *P. olivacea*
- a. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 107. *P. olivacea*
15. *P. 76-90*
- a. Some of the conidia some times with faintly contrasted colored cells;  
b. Intermediate colored cells concolorous, oliveaceous or pale brown,  
c. Intermediate colored cells concolorous (Non-Spathulariae), Nos. 91-258  
d. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 108. *P. 76-90*
16. *P. annulata*
- a. Some of the conidia some times with faintly contrasted colored cells;  
b. Intermediate colored cells concolorous, oliveaceous or pale brown,  
c. Intermediate colored cells concolorous (Non-Spathulariae), Nos. 91-258  
d. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 109. *P. annulata*
17. *P. annulata*
- a. Some of the conidia some times with faintly contrasted colored cells;  
b. Intermediate colored cells concolorous, oliveaceous or pale brown,  
c. Intermediate colored cells concolorous (Non-Spathulariae), Nos. 91-258  
d. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 110. *P. annulata*
18. *P. annulata*
- a. Some of the conidia some times with faintly contrasted colored cells;  
b. Intermediate colored cells concolorous, oliveaceous or pale brown,  
c. Intermediate colored cells concolorous (Non-Spathulariae), Nos. 91-258  
d. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 111. *P. annulata*
19. *P. annulata*
- a. Some of the conidia some times with faintly contrasted colored cells;  
b. Intermediate colored cells concolorous, oliveaceous or pale brown,  
c. Intermediate colored cells concolorous (Non-Spathulariae), Nos. 91-258  
d. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 112. *P. annulata*
20. *P. annulata*
- a. Some of the conidia some times with faintly contrasted colored cells;  
b. Intermediate colored cells concolorous, oliveaceous or pale brown,  
c. Intermediate colored cells concolorous (Non-Spathulariae), Nos. 91-258  
d. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 113. *P. annulata*
21. *P. annulata*
- a. Some of the conidia some times with faintly contrasted colored cells;  
b. Intermediate colored cells concolorous, oliveaceous or pale brown,  
c. Intermediate colored cells concolorous (Non-Spathulariae), Nos. 91-258  
d. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 114. *P. annulata*
22. *P. annulata*
- a. Some of the conidia some times with faintly contrasted colored cells;  
b. Intermediate colored cells concolorous, oliveaceous or pale brown,  
c. Intermediate colored cells concolorous (Non-Spathulariae), Nos. 91-258  
d. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 115. *P. annulata*
23. *P. annulata*
- a. Some of the conidia some times with faintly contrasted colored cells;  
b. Intermediate colored cells concolorous, oliveaceous or pale brown,  
c. Intermediate colored cells concolorous (Non-Spathulariae), Nos. 91-258  
d. Conidia 12-18  $\times$  4-6  $\mu$  . . . . . 116. *P. annulata*

- e. Setulae 2 or usually 2, 4–11  $\mu$ 
  - Setulae 4–8  $\mu$  ..... 99. *P. quercicola*
  - Setulae 6–11  $\mu$  ..... 100. *P. bromelicola*
  - Setulae 6–11  $\mu$  ..... 101. *P. aletridis*
  - Setulae 6–11  $\mu$  ..... 102. *P. sorbi*
- e. Setulae 2–3, usually 3, 4–16  $\mu$ 
  - Conidia hardly constricted at septa ..... 103. *P. calabae*
  - Conidia strongly constricted at septa ..... 108. *P. torulosa*
  - Setulae 3, 10–20  $\mu$  ..... 109. *P. flavidula*
- c. Conidia 18–26  $\times$  4–5  $\mu$ 
  - Setulae 3, 5–10  $\mu$  ..... 110. *P. kawakamii*
- c. Conidia 18–26  $\times$  5–8  $\mu$ 
  - Setulae 1–3, up to 16  $\mu$ , when 3 up to 10  $\mu$  ..... 111. *P. algeriensis*
  - Setulae similar, 9–22  $\mu$ , one attenuated ..... 112. *P. heterocornuta*
  - Setulae 2
    - Setulae 8–15  $\mu$  ..... 113. *P. bicilia*
    - 8–21  $\mu$  ..... 114. *P. lawsoniae*
    - 10–23  $\mu$  ..... 115. *P. vismiae*
    - 12–26  $\mu$  ..... 116. *P. carveri*
  - Setulae usually 3, 6–15  $\mu$ 
    - Conidia narrow ..... 117. *P. eugeniae*
    - Conidia elliptic ..... 118. *P. illicicola*
    - Conidia narrow ..... 119. *P. microspora*
    - Conidia elliptic ..... 120. *P. podocarpi*
    - Conidia narrow ..... 121. *P. breviseta*
    - Conidia elliptic ..... 122. *P. sinensis*
  - Setulae usually 3, 8–23  $\mu$ 
    - Conidia narrow ..... 123. *P. uvicola*
    - Conidia elliptic ..... 124. *P. neglecta*
    - Conidia narrow ..... 125. *P. disseminata*
  - Setulae usually 3, 14–32  $\mu$ 
    - Conidia narrow ..... 126. *P. carissae*
    - Conidia elliptic ..... 127. *P. olivacea*
  - Setulae 3–4 often branched, acrogenous ..... 128. *P. bicolor*

- PESTALOTIA**
- Setulae 3-4, simple, acropelurogenous ..... 129. *P. gravisii*  
 Setulae up to 11  $\mu$  ..... 129. *P. gravisii*  
 Setulae 12-26  $\mu$  ..... 130. *P. montellica*  
 Setulae usually 4, irregularly exserted ..... 131. *P. gauae*  
 Setulae 4, apical, up to 15  $\mu$  ..... 132. *P. eleagni*  
 Setulae 3-5, 10-22  $\mu$  ..... 133. *P. weinmanniae*  
 Conidinia 18-26  $\times$  7-9.5  $\mu$  ..... 134. *P. lespedeziae*  
 Conidinia 22-30  $\times$  5-8  $\mu$  ..... 135. *P. quadrifolia*  
 Conidinia narrow ..... 137. *P. osyridis*  
 Conidinia elliptic ..... 138. *P. mayumbensis*  
 Conidinia elliptic ..... 140. *P. mangifolia*  
 Conidinia narrow ..... 139. *P. cocculi*  
 Conidinia elliptic ..... 141. *P. suffocata*  
 Conidinia elliptic ..... 142. *P. galactis*  
 Conidinia narrow ..... 143. *P. caroliniana*  
 Conidinia 2-5, 10-15  $\mu$  ..... 144. *P. conglomerata*  
 Conidinia 3-5, stout, with lumen ..... 145. *P. barrenensis*  
 Conidia 22-30  $\times$  7-10  $\mu$ , wide or more ..... 146. *P. rosae*  
 Setulae 3-6, filiform, 6-20  $\mu$  ..... 147. *P. monochaeotoides*  
 When I up to 70  $\mu$  ..... 147. *P. monochaeotoides*  
 Setulae 1-4, usually 2, up to 40  $\mu$  ..... 148. *P. subsessilis*  
 Setulae 15-32  $\mu$  ..... 149. *P. macrochaeta*  
 Setulae 3, up to 20  $\mu$  ..... 150. *P. fumigera*  
 Setulae simple ..... 151. *P. multisetosa*  
 Setulae similar, acropelurogenous ..... 152. *P. thujiae*  
 Setulae usually 3, 19-24  $\mu$  ..... 153. *P. caudata*  
 Conidia monomorphic ..... 154. *P. heterospora*  
 Conidia polymorphic ..... 155. *P. setulosa*  
 Conidia 25-35  $\times$  6-7  $\mu$  ..... 156. *P. heteropoda*
