Roller burnishing

overview

Cogsdill Roll-a-Finish tools offer you a fast, clean, and economical method of sizing and finishing metal parts to exacting specifications. The tools can be operated on any spindle. Parts of virtually any configuration and material are accurately sized within "tenths," with surface finishes as fine as 2 micro-inches (0.05 micrometers)... *in seconds!* An additional benefit: roller burnishing work hardens the part surface, producing a dense, compacted, wear-resistant surface for longer part life. Parts are improved, with faster production, and at a lower cost.

Burnishing Tools & MACHINES

Turning-Holder Style

CX® External Roller Burnishing Machines

We are pleased to offer the

widest array of standard burnishing products in the industry, supported by the broadest range of experience in application engineering and custom tool design. Let us provide you with burnishing solution on s to meet your sizing and finishing needs, with faster production and at a lower cost.

Roller burnishing is a surface finishing technique in which hardened, highly polished steel rollers are brought into pressure contact with a softer piece part. As the pressure generated through the rollers exceeds the yield point of the piece-part material, the surface is plastically deformed by cold flowing of subsurface material. The result is a mirror-like finish and a tough, work-hardened surface with load-carrying characteristics which make the burnished surface superior to finishes obtained by abrasive metal-removal methods.

A roller burnished surface is smoother and more wear-resistant than an abraded surface of the same profilometer reading. Profilometers measure roughness height. Abrasive finishing processes remove metal by cutting or tearing it away, and while this usually lowers the roughness profile, it leaves sharp projections in the contact plane of the machined surface.

Roller burnishing displaces metal, rather than removing it. Material in microscopic "peaks" on the machined surface is caused to cold flow into the "valleys," creating a plateau-like profile in which sharpness is reduced or eliminated in the contact plane. A burnished surface is therefore smoother than an abraded surface with the same roughness height measurement. The burnished surface will last longer under working conditions in contact with a mating part.

Peak/Valley Surface Condition Ra Ra Total height Total height Total height

Process advantages and benefits of burnishing

There are *four primary benefits* of the roller burnishing process:

- Improved surface finish as fine as 2 to 4 microinch (Ra)
- 2 Improved size control tolerances within .0005 inch (.01mm) or better
- Increased surface hardnessup to 5 to 10% or more
- 4 Improved fatigue life as much as 300% or better

Other benefits include:

- Reduced friction
- Reduced noise level
- Enhanced corrosion resistance
- Elimination of tool marks and minor surface imperfections
- Replaces expensive secondary operations, such as grinding, honing, or lapping
- Cleaner than honing or other abrasive operations
- Faster production, at a lower cost, as compared to other finishing processes – parts are sized, finished, and work-hardened... in seconds!

burnishing tools

Roll-a-Finish® tools for all types of part configurations

Cogsdill Roll-a-Finish tools are applied to a wide variety of part configurations, including:

- Inside diameters (holes)
- Outside diameters (shafts)
- Flat surfaces
- Tapers
- Spherical surfaces and contours
- Fillets (radii at shoulders)

Standard Roll-a-Finish tools are available from stock for inside diameters from .187 to 4.000 inches (4.75 to 101.6mm), and for outside diameters from .062 to 2.000 inches (1.57 to 50.8mm). The tools are easily adjustable over a typical range of .040 inch (1.02mm). Special designs are available for larger and smaller diameters, and for tapers, faces, contours, and virtually any part configuration.

Other Cogsdill burnishing tool products

In addition to Roll-a-Finish tools for IDs, ODs, and special part configurations, Cogsdill offers several other burnishing products and related items, including:

- Bearingizing Tools, for burnishing IDs in parts with thin walls or irregular wall thicknesses, or in applications where porosity retention or extremely close tolerances are required
- CX® External Roller Burnishing Machines, for sizing, finishing, and work-hardening cylindrical surfaces of any length
- Diamond Burnishing Tools, for generating mirror finishes on ODs, large IDs, or faces of virtually any diameter
- Universal Burnishing Tools, for burnishing ODs, large IDs, faces, tapers, contours, and irregular surfaces with a single roll
- The KB Knurling-Burnishing Process, for salvaging out-oftolerance bores and shafts: a twostep process using Cogsdill knurling tools and Roll-a-Finish tools

Internal Roll-a-Finish® tools

SR Series

Offered in three styles:

- Through-hole style with nohelix cage (machine-feeding)
- Through-hole style with helix cage (self-feeding)
- Bottoming-style for blind hole, with no-helix cage (machinefeeding)

... with up to four work lengths:

- Two inch (SR)
- Four inch (SR-4)
- Six inch (SR-6)
- **Eight inch (SR-8)**

... and available from stock:

- for hole sizes from .187 to 2.500 inches (4.75 to 63.5mm).
- Tools are adjustable in increments of .0001 inch (.002mm).

Internal Roll-a-Finish® tools

U series

For hole diameters from 2.500 to 4.000 inches (63.5 to 101.6mm). Work length is unlimited; extension adapters can be used to increase work length.

Offered in $\it two\ styles:$

- Through-hole style with helix cage (self-feeding)
- Bottoming-style for blind hole, with no-helix cage (machine-feeding)

... and available from stock.

Bearingizing tools

The Bearingizing Tool combines roller burnishing with peening action. As the tool is rotated at a high speed the rolls spin, rise, and fall over a cammed arbor, delivering up to 200,000 rapid fire blows per minute to the work surface. The peaks and valleys of the machined surface are compacted into a smooth, hardened, and ultrafine surface finish.

The Bearingizer *may* be the tool of choice where the following conditions exist:

- Parts with thin walls Bearingizing eliminates barrel-shaping of the part.
- Parts with irregular wall thicknesses the Bearingizing tool will produce a very round hole, whereas the Roll-a-Finish® tool might generate a slightly egg-shaped hole, due to variations in wall thickness.
- Applications where porosity is an issue (e.g., oil-impregnated bearings) the smaller "footprint" of the Bearingizing roll leaves pores in the surface intact.
- Applications where *Very tight tolerances* must be held the Bearingizer reduces springback in the work surface material. The Bearingizing tool can, in some materials and with proper part preparation, hold size as close as ±.0001 inch (.002mm), while the Roll-a-Finish tool can achieve tolerances of ±.00025 inch (.006mm).
- (1) the relatively wide adjustment range of the Roll-a-Finish tool, which is typically .040 inch (1.01mm), and
- (2) the ease of adjustment, with the castellated adjusting collar on the Roll-a-Finish tool.

The Bearingizing tool features a greater number of rolls, and rolls of a smaller diameter, as compared to the Roll-a-Finish tool, and can only be adjusted by change of rolls. The Bearingizer also requires a closer presize than the Roll-a-Finish tool.

But where the above conditions *do* exist, the Bearingizing tool should be considered.

While the Roll-a-Finish Tool increases surface hardness by about 5 to 10%, Bearingizing increases hardness by 10 to 30%, but with less surface penetration.

Bearingizing tools provide three roll positions over the cammed arbor (see below). When the forward (#1 position) of cam becomes worn, the roll cage can be repositioned to the # 2 and # 3 positions by exchanging positions with the moveable collars. This presents NEW cam surfaces and original BUILD-UP. After all positions

on the cam are worn beyond producing acceptable parts, oversize rolls can be used to further extend tool life. Roll sizes are available in increments of .0001 inch (.0025 mm) and the tool will accommodate a range of roll sizes up to .002 inch (.0508 mm).

For through-hole, semibottoming, or bottoming applications.

Bearingizing Tools .188 to 1.250 in. (4.76 to 31.75mm)

Selection & ordering information

To select a tool for the part and material to be Bearingized, determine the proper tool *build-up*. The build-up is the effective tool diameter required to produce a certain size in a given material. It is measured with the rolls diametrically opposed on the high surfaces of the cam.

The build-up is equal to the maximum finished hole diameter plus a spring-back allowance — see chart. The maximum diameter (high side of tolerance) is used to allow for tool wear and still maintain part size within tolerance limits.

Standard tool sizes

Tools are stocked in diameters of .187 inch (4.7625mm) through 2.000 inch (50.80mm). Each tool provides a build-up range of .004 inch (.1016mm). The required build-up must be within the range of the tool size shown — otherwise select non-stocked tool. See ordering information at right.

EXAMPLE

 Stainless Steel part
 .5010/5008 inch

 (12.725/12.720mm) tolerance
 .5010

 Add Stainless Steel spring-back allowance
 +.0010

 Build-up
 .5020

Since a .5020 inch (12.75mm) build-up falls within a range of .4990-.5030 inch (12.67-12.78mm), order a standard .500 inch (12.7mm) through-hole Bearingizing tool and rolls ... or order through-hole Bearingizing tool with .5020 inch (12.75mm) build-up — Cogsdill will furnish proper tool and rolls.

Roll Sizes

To determine the roll size for a standard tool, subtract the cam diameter from the build-up and divide by two (2). This establishes the single roll diameter.

EXAMPLE

Build-up required for part .5020 inch (12.75mm) Subtract cam diameter of .500 inch (12.75mm) tool ___3450 inch (8.76mm) .1570 inch (3.99mm)

Divided by 2 $.1570 \text{ inch } \div 2 = .0785 \text{ inch } (1.99 \text{mm})$ Single roll size .0785 inch (1.99 mm)

Order .500 inch (12.77mm) Bearingizing tool with .0785 inch (1.99mm) rolls.

Spring-Back Allowances	.188 to .5 (4.76 to 1		.500 & up (12.7 mm & up)		
	IN.	mm	IN.	mm	
Stainless	.0008	.0203	.001	.0254	
Steel	.0008	.0203	.001	.0254	
Cast Iron	.0005	.0005 .0127		.0203	
Sintered Iron	.0005	.0127	.0008	.0203	
Aluminum	.0002	.0050	.0004	.0102	
Brass	.0005	.0127	.0008	.0203	
Sintered Bronze	.0001	.0025	.0002	.0051	
Oilite	.0001	.0025	.0002	.0051	

Note: Above are recommended starting points only. Final build-up can best be determined by actual trial and several extra sets of rolls in increments of .0001 inch (.0025mm) are recommended.

Ordering stocked tools

1 Specify tool size and roll diameter, or specify hole size and material.

2 Specify tool style:through-hole, semi-blind or blind-hole tool. Through-hole tools use chamfered rolls; semi-blind or blind-hole tools use radius rolls. Blind-hole tools have a special roll retainer which permits finishing within .025 inch (.635mm) of the bottom.

3 Extra sets of rolls in increments of .0001 inch (.002mm) are recommended with initial orders to allow for final size adjustment and compensate for eventual tool wear.

Ordering non-stocked tools

Intermediate sizes

Sizes that do not fall within the range of stocked tools are ordered by build-up only. Cogsdill will design tool and specify roll size.

Tools over 1.250 inch (31.75mm) in diameter

Order by build-up diameter. Cogsdill will design tool and specify roll size. We suggest that part print be furnished with inquiry. This will enable Cogsdill engineers to quote on any special features that may be desirable, such as extended front pilot, etc.

Re-ordering tools and parts

Re-order stocked tools and parts by fractional tool size shown on shank – except roll sizes, which should be determined by the required build-up. Re-order non-stocked tools and parts, including rolls by BT number shown on shank. If cams are worn, larger rolls may be required (available in increments of .0001 inch (.0025mm). Cogsdill will also re-grind cams and supply rolls to maintain original build-up.

Operation & maintenance

Machines

Any machine capable of rotating the tool — e.g. drill press, speed lathe, or turret lathe — may be used.

Material

Any ductile or malleable material — powdered, laminated, cast, forged, extruded, sintered or hardened (maximum Rc 38) can be bearingized. Steel, stainless, alloy, cast iron, aluminum, copper and brass are examples.

Procedure

Proper part preparation is essential in order to obtain precise results. Cogsdill will recommend the surface preparation and amount of stock to leave for Bearingizing, but some trials may be required to determine these factors for optimum results.

Since the change in dimension is partly governed by the character of the prepared surface, usually coarser preparation will permit a greater change in dimension than is possible with finer preparation. The consistent pattern obtained from boring will produce the best finish.

The other major factor in dimensional change is the ability of

the material to grain-flow without flaking. The total change may vary from .0001 inch (.0025mm) on harder materials to as much as .003 inch (.0762mm) on sintered self-lubricating bushings. Less than .001 inch (.0254mm) stock for Bearingizing generally provides a good starting point for trials.

Tool diameter changes

Bearingizing rolls are manufactured in increments of .0001 inch (.0025mm). Bearingizing Tools are adjustable by roll change only. One set of rolls can be removed and a new set of a different size installed, thus effectively changing the size of the tool — or compensating for tool wear. The working diameter of any tool can be changed over an approximate .004 inch (.1016mm) range by installing different sets of rolls. The rolls are diametrically opposed and available in .0001 inch (.0025mm) increments, therefore the effective tool diameter can be changed in .0002 inch (.0051mm) increments. (Refer to preceding page "Ordering Stocked Tools.")

Lubrication

For most metals use any standard grade of lightweight, low viscosity lubricating oil, or any mineral, sulphur or soluble oil that is compatible with the alloy or metal to be burnished and is recommended for fine surface finishing.

For aluminum or magnesium alloys, use a highly refined oil-based coolant with low viscosity.

For cast iron a mineral seal or water soluble solution is ideal — flooding the part is recommended.

Cleaning

The Bearingizing tool should be cleaned periodically with a light-bodied oil of about 100 Saybolt universal scale, similar to a light spindle oil. A few drops applied with squirt can or brush to the rolls and cage (with cage stopped) will wash metal dust particles out when tool is operated, keeping the cam surfaces and roll pockets clean.
