

Checklist of genus *Septoria* (*Mycosphaerellaceae*) in Uzbekistan

Islomiddinov ZSh*, Teshaboyeva ShA and Mustafaev IM

Laboratory of Mycology, Institute of Botany, Academy of Sciences of the Republic of Uzbekistan, Tashkent, Uzbekistan

Islomiddinov ZSh, Teshaboyeva ShA, Mustafaev IM 2022 – Checklist of genus *Septoria* (*Mycosphaerellaceae*) in Uzbekistan. Asian Journal of Mycology 5(1), 91–106, Doi 10.5943/ajom/5/1/8

Abstract

Uzbekistan is blessed with a rich ecosystem diversity, however, only a small fraction of the diverse flora and fauna in the country is known. Recently, there has been a growing demand for a systematic database based on the latest data that completely covers the mycobiota of Uzbekistan. This study provides an update on the available data on *Septoria* species throughout Uzbekistan. This study is based on the literature published between 1926 and 2021 and the latest research in the country on herbarium specimens held in the Tashkent Mycological Herbarium. The current checklist contains information on 117 species of *Septoria* in the region from 163 host species belonging to 40 families and 104 host genera, among which they are distributed.

Keywords – Ascomycetous – biodiversity – fungi – host plant – mycobiota – *Mycosphaerellales*

Introduction

Although many scientists estimate that there are about 1.5 million species of fungi, about 130,000 species have been identified so far around the world (Hawksworth & Lucking 2017; Cheek et al. 2020; Hyde et al. 2020). However, in countries with high biodiversity, it can be considered that knowledge about fungi is not enough, or fungal species have not been studied in depth. As a result, we are still unable to make a list of species due to the lack of information about them (Gafforov et al. 2020). Uzbekistan is one of the countries where the number of such fungal species has not yet been studied sufficiently.

Uzbekistan is located in Central Asia, east of the Caspian Sea, directly south of Kazakhstan, north of Turkmenistan, and on the western borders of Tajikistan and Kyrgyzstan (Fig. 1). The area of Uzbekistan is 447,400 square kilometers, of which 425,400 square kilometers is the land surface. The territory of Uzbekistan is a desert zone with the western ends of the Tien Shan and Pamir-Alai mountain systems, including the foothill plains, entering the territory of the republic, forming an altitudinal zone. Within this area, moisture content increases with height, which is associated with an increase in humus content and soil leaching. Mountainous areas occupy 15% of the territory of Uzbekistan, and forests cover 0.8% (Gafforov et al. 2020). Uzbekistan is a region rich in animals, plants and fungi. More than 4500 species of higher plants have been identified, of which 334 are endemic (Turginov et al. 2019). Despite the high biodiversity in the region, the number of species in need of protection is also increasing. For example, 314 species of higher plants and three species of fungi (*Polyporus frondosus* (Dicks), *Gastrum fimbriatum* Fr., *Tuber aestivum* Vittad.) are listed in the Red Book of Uzbekistan.

Septoria is a large genus of asexual morphs of *Ascomycota*, causing leaf spot and blight diseases in field crops, vegetables, ornamentals and wild plants. Host specificity has long been a

decisive criterium in species delimitation in *Septoria*, mainly because of the paucity of useful morphological characters and the high level of variation therein (Shin & Sameva 2002; Verkley et al. 2013; Quaedvlieg et al. 2013). Many scientific research was carried out on the diversity of fungi, and data were collected on the species of *Septoria* (*Mycosphaerellales, Ascomycota*) (Zaprometov 1926, 1928; Golovin 1947, 1949a, b, 1950; Kleyner 1958; Lebedeva 1958; Gaponenko 1965; Baymuratova 1963; Panfilova & Gaponenko 1963; Usmonov 1965; Axmedova 1966; Kuchmi 1970; Kirgizbaeva 1972, Soliyeva 1989; Kamilov 1991; Kirgizbaeva et al. 1997; Nuraliyev, 1998, Gafforov 2005; Sherqulova et al. 2019; Mustafaev 2018).

Several checklists on fungi in some regions of Uzbekistan were provided by Gafforov (2017), Gafforov et al. (2017, 2020), Mustafaev et al. (2019) and Abdurazakov et al. (2021). However, there are no generalized data on the diversity and the number of fungi in Uzbekistan. Information on the taxonomy of fungi is updated year by year, and after studying many types of fungi based on modern mycological methods, it becomes clear that they are synonymous with other types of fungi. Therefore, carrying out mycological studies in unexplored regions of Uzbekistan and compiling a generalized list of mycobiota is one of the urgent tasks. This study is the first taxonomy-based checklist of *Septoria* species in Uzbekistan. In this research, we have compiled a list of *Septoria* species in Uzbekistan. This list serves as one of the main resources for fungi in the Republic of Uzbekistan.

Fig. 1 – Study area. Regional division of Uzbekistan.

Materials & Methods

This checklist includes the results of field surveys carried out in the Botanical-Geographical Region of Northern Turkestan in 2018-2020, as well as all published literature on fungi found in Uzbekistan from 1926 to March 2021. Furthermore, a thorough examination of the herbaria stored at the Tashkent Mycological Herbarium Fund (TASM) was also conducted. The unpublished data and fungi identified up to the genus level have not been included in this checklist. Some species

names reported in their cited publications have been replaced with their currently accepted name according to Index Fungorum (2021) and Wijayawardene et al. (2020). The name of the host species given in the original citation is sometimes changed to be consistent with the current taxonomy based on Plants of the world online (www.pwrc.kew.org).

Many samples of *Septoria* were collected from 1926 to 2021 in different habitats of Uzbekistan, which are designated in the checklist by the following abbreviations: ADR – Andijan region, BR- Bukhara region, FR – Fergana region, JZR – Jizzakh region, KK – Karakalpakstan, NMR – Namangan region, NVR – Navoi region, QDR – Qashqadaryo region, SDR – Surxondaryo region, SMR – Samarcand region, SRR – Syrdarya region, TSR – Tashkent region, XR – Khorezm region.

Results

A checklist of 117 *Septoria* species is arranged alphabetically by *Septoria* species, host plants, distribution places, and references (Table 1). There are 163 host plants belonging to 40 families from 104 genera. The majority of the *Septoria* species distributed in the region reported from the *Poaceae* family (on 28 host plants, 19 fungal species) as pathogens, followed by members of the families *Lamiaceae* (on 12 host plants, 12 fungal species), *Fabaceae* and *Rubiaceae* (on 11 host plant, 8 fungal species each), and *Asteraceae* (on 8 host plant, 7 fungal species). Collectively, these families host about 46% of *Septoria* species present in the study area, while other plant families host one to six *Septoria* species (Table 3).

The highest number of *Septoria* species was reported in the following host genera: *Galium* and *Elymus* (five species each, 4.3% of the total species number), *Astragalus*, *Thinopyrum* (four species each, 3.4% of the total species number), *Salvia*, *Rubia* and *Carex* (three species each, 2.3% of the total species number), *Phlomoides*, *Phlomis*, *Cruciata*, *Datisca*, *Convolvulus*, *Dianthus*, *Lonicera*, *Phragmites*, *Eremopyrum*, *Geranium*, *Daucus*, *Gentiana*, *Crataegus*, *Polygonum*, *Salix*, *Fraxinus* and *Vitis* (two species each, 1.7% of the total species number), while other plant genera host one *Septoria* species per genus (Fig. 2).

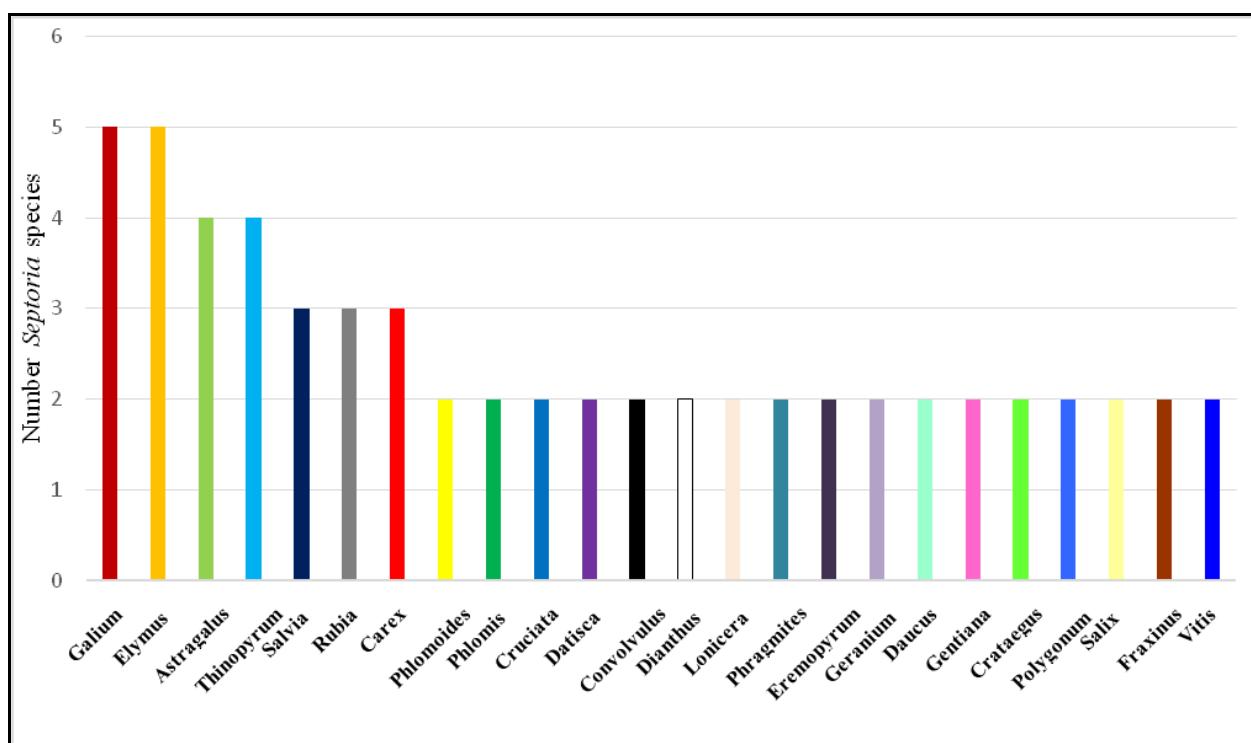

Fig. 2 – Occurrence numbers of genus *Septoria* species on most representative host genera.

Table 2 Distribution of *Septoria* species by regions of Uzbekistan.

No.	Regions	<i>Septoria</i> species	Host plants	No.	Regions	<i>Septoria</i> species	Host plants
1	Andijan Region	1	1	8	Navoi Region	1	1
2	Bukhara Region	14	16	9	Qashqadaryo Region	21	22
3	Fergana Region	5	5	10	Samarqand Region	4	5
4	Jizzakh Region	19	21	11	Surxondaryo Region	19	21
5	Karakalpakstan	2	2	12	Syrdarya Region	9	10
6	Khorezm Region	1	1	13	Tashkent Region	66	78
7	Namangan Region	14	17				

Among the *Septoria* species, 20 were associated with a wide range of plant hosts. For example, *Septoria ferulicola*, *S. bromi* isolated from six host species each; *Septoria lepidii*, *S. eremuri*, *S. caricis* isolated from five host species each; *Septoria simplex*, *S. serebrianikowii*, *S. quevillensis*, *S. polygonorum*, *S. galiorum*, *S. fraxini*, *S. elymi* isolated from four host species each; *Septoria potentillica*, *S. ligulariae*, *S. cruciatae*, *S. crataegicola*, *S. convolvuli*, *S. cannabis*, *S. agropyri* and *S. acerella* isolated from three host species each. The other 97 *Septoria* species were isolated from one to two host species each.

Table 3 The number of the host families, genera, and species and number of *Septoria* species on the host family in the study area.

Host family	No. of host genera	No. of host species	No. of <i>Septoria</i> species	Host family	No. of host genera	No. of host species	No. of <i>Septoria</i> species
Poaceae	20	28	19	Plantaginaceae	2	2	2
Lamiaceae	8	12	12	Caryophyllaceae	1	1	2
Fabaceae	6	11	8	Datiscaceae	1	1	2
Rubiaceae	4	11	8	Oleaceae	1	1	2
Asteraceae	7	8	7	Asphodelaceae	1	5	1
Apiaceae	5	10	6	Amaryllidaceae	1	1	1
Rosaceae	5	9	5	Sapindaceae	1	3	1
Caprifoliaceae	3	6	4	Anacardiaceae	1	1	1
Cyperaceae	2	5	4	Apocynaceae	1	1	1
Polygonaceae	4	4	3	Betulaceae	1	1	1
Ranunculaceae	3	4	3	Cannabaceae	1	1	1
Amaranthaceae	3	3	3	Ephedraceae	1	1	1
Compositae	3	6	3	Malvaceae	1	1	1
Vitaceae	2	2	3	Menyanthaceae	1	1	1
Brassicaceae	2	6	2	Paeoniaceae	1	1	1
Convolvulaceae	1	3	2	Primulaceae	1	1	1
Gentianaceae	1	1	2	Solanaceae	1	1	1
Geraniaceae	1	3	2	Urticaceae	1	1	1
Salicaceae	1	3	2	Verbenaceae	1	1	1
Campanulaceae	2	2	2	Zygophyllaceae	1	1	1

The distribution of *Septoria* species in host plants is given based on the regions of Uzbekistan in which they are distributed (Table 2). The largest number of *Septoria* species and host plants were found in the Tashkent region, followed by the Kashkadarya region (on 22 host species, 21 *Septoria* species), Surkhandarya region (on 21 host species, 19 *Septoria* species), Jizzakh region (on 21 host species, 19 *Septoria* species), Namangan region (on 17 host species, 14 *Septoria* species), Bukhara region (on 16 host species, 14 *Septoria* species), and Syrdarya region (on 10 host species, 9 *Septoria* species). In other regions, such as Andijan, Fergana, Karakalpakstan, Khorezm, Navoi and Samarkand, 1 to 5 *Septoria* species have been identified on their host plants.

Discussion

The checklist gives an overview of *Septoria* species in Uzbekistan from different sources of data. Mycological research in Central Asia, including Uzbekistan, began in the second half of the 19th century (Borshchov 1865). As a result of studies carried out in 1926–1997, 120 species of *Septoria* were found in Uzbekistan (Kirgizbaeva et al. 1997). Later, 18 new *Septoria* species were identified from 22 host plants as novel records in Uzbekistan during 1997–2021 (Nuraliyev 1998; Gafforov 2005; Mustafaev 2018; Sherqulova et al. 2019). When all 138 identified *Septoria* names were re-examined according to the current nomenclature of fungi, 24 *Septoria* species (*Septoria aceris*, *S. apallens*, *S. atriplicis*, *S. berberidis*, *S. bubakii*, *S. calamagrostidis*, *S. exotica*, *S. ferulae*, *S. fraxini*, *S. fuckelii*, *S. fusispora*, *S. hyperici*, *S. longispora*, *S. meliloti*, *S. phlomidis*, *S. podagrariae*, *S. populi*, *S. rosae*, *S. rubi*, *S. silenes*, *S. stellariae*, *S. stipae*, *S. salicicola*, *S. tritici*) were transferred to other genera (Index Fungorum 2021; Wijayawardene et al. 2020). The fungal

diversity reported here for Uzbekistan is much lower than that in other regions where the diversity of *Septoria* species is well explored. For example, 223 *Septoria* species were reported in Kazakhstan (Bizova et al. 1970). The low species number in Uzbekistan is partly due to the relatively small area, but also due to the lack of systematic field surveys and thorough identification with the aid of molecular sequencing.

Since 1926, fungi have been studied in the regions or separate territories of Uzbekistan (Table 2). For example, fungi of the Bukhara region were studied by Gaponenko. Of the 396 species found, 17 belonged to *Septoria* (Gaponenko 1965). As a result of mycological studies conducted in the mountainous regions of Uzbekistan (Jizzakh, Namangan, Kashkadarya and Surkhandarya), 17 to 22 *Septoria* species have been identified on vascular plants. In addition, the mycobiota of Surkhandarya (Soliyeva 1989, Gafforov 2017), Kashkadarya (Nuraliyev 1998; Sherqulova et al. 2019), Namangan (Gafforov 2005), Jizzakh (Mustafaev 2018) regions were studied. Baymuratova (1963) identified nine *Septoria* species on 10 vascular plants distributed in the Syrdarya region during the study of hungry steppe regions of Uzbekistan. The largest number of *Septoria* species were found in the Tashkent region, which is located in the north-eastern part of Uzbekistan, between the Syrdarya and Western Tianshan Mountains. Therefore, the diversity of vascular plants in the region is high (Tojibaev et al. 2020). This may ensure an increase in the diversity of the *Septoria* species. Therefore much more research may have been done in the Tashkent region compared to other regions (Panfilova & Gaponenko 1963; Axmedova 1966; Kamilov 1991; Kirgizbaeva et al. 1997). As a result, 66 *Septoria* species were identified on 76 vascular plants in the Tashkent region (Table 2). It was found that no systematic studies of the fungal biota were carried out in the Andijan, Fergana, Karakalpakstan, Khorezm, Navoi and Samarkand regions of Uzbekistan (Table 2).

During our survey in the Jizzakh region, ten *Septoria* species were found. Even though previous studies found *S. distachya* on *Ephedra* sp. (Golovin 1941), *S. pastinacina* on *Pastinaca sativa*, and *S. relicta* on *Galium turkestanicum* (Kirgizbaeva 1997) in the same area, we did not find these species in the study area during our three years of the survey. We also identified *Septoria* sp. on the *Heracleum lemannianum* Bunge from the Jizzakh region. According to our microscopic examination, this species could be *Septoria heraclei* Desm. This species is a new species for the mycobiota of Uzbekistan. According to Index fungorum, *Septoria heraclei* was changed to *Phloeospora heraclei* (Lib.) Petr.. This species is a new record for the mycobiota of Uzbekistan. According to Index fungorum, *Septoria heraclei* was changed to *Phloeospora heraclei* (Verkley et al. 2013). This requires that we re-conduct extensive molecular studies on this species of *Septoria*.

Our results confirm that most species of *Septoria* have narrow host ranges, being limited to a single genus or a few genera of the same plant family. For example, *Septoria astragali* is found only on the genus *Astragalus* (Fabaceae), *S. bromine* on the genus *Bromus* (Poaceae), and *S. convolvuli* on the genus *Convolvulus* (Convolvulaceae). However, there were a few notable exceptions. Verkeley et al. (2013) demonstrated that the supposed single-family host ranges of *Septoria paridis* (Liliaceae) and *S. urticae* (Urticaceae) each included one additional family (Violaceae and Lamiaceae, respectively). Previously *Septoria protearum* was only associated with Proteaceae (Protea), was now found to be also associated with Araceae (*Zantedeschia*), Aspleniaceae (*Asplenium*), Rutaceae (*Boronia*), Boraginaceae (*Myosotis*), Oleandraceae (*Nephrolepis*), and Rosaceae (*Geum*) (Crous & Braun 2003).

Septoria species in Uzbekistan were found on 163 host plant species of 104 genera, and 40 families. The largest number of *Septoria* species was recorded in seven families: Poaceae, Lamiaceae, Fabaceae, Rubiaceae, Asteraceae, Apiaceae and Rosaceae. It is most common among the members of the family Poaceae. This may be due to the fact that species in these families are widespread in Uzbekistan. *Septoria* species are also common in members of the Poaceae family, similar to other countries (Seifbarghi et al. 2009; Assylbek et al. 2021).

Data on Mycosphaerellales fungi in Uzbekistan are still scarce. Molecular and morphological studies are very important to revise and reevaluate existing *Septoria* species and also to determine

their taxonomic position. The knowledge generated by the work is of immense importance as it is a key to revealing the diversity and ecology of the genus *Septoria* from Uzbekistan.

Acknowledgements

This work was supported by the Ministry of innovative development of the Republic of Uzbekistan, project No. P3-20170921183 and "Pathogenic fungi of economically important plants exporting fruits, vegetables and melons: diversity, monitoring, and creation of an electronic database (on the example of Namangan and Bukhara regions)" state program. We thank Dr. Yusufjon Gafforov (Institute of Botany, Academy of Sciences of the Republic of Uzbekistan) and Dr. Bakhtiyor Sheraliev (Southwest University) for reviewing, and their valuable comments on the manuscript.
