Aarostckum crinitum seems to be i plant of very rare occurrence; the only station, hitherto given, being the Island of **Martinique**, when indeed the fructification does not npesu to liave been discovered. Our friend Mr. Guiklin¹ has sent us truly magnificent specimens from the Island of St. Vincent, in various states; and from these our figures have been made.

Acrostichum aureum folium.

TAB. 11.

ACROSTICHUM SUCCISIFOLIUM.

FILICES.—GYRATJE. *Br.* PoxYPODiACEai. *Kaulf.* FILICES verse. *Willd.*

GEN. CHAR. *ACROSTICHUM*, Linn. *Sorte amorphi*, seu *Capsula* per totam paginam inferiorem frondis (interdum diversae) vel ad ejus partem sparsae. *Indusium* nullum (nisi squamulae, v. sets in quibusdum capsulis inferstinctae). *Br.*

ACROSTICHUM succisafolium; fronde simplici oblonga coriacea obtusissima stipiteque ferrugineo-squamosis, squamis lanceolatis spinuloso-serratis.

HAS. In sylva insulse Tristan d'Acunha. Aubert du Petit Thouars. Carmichael. Insulae Mauritii. Aubert du Petit Thouars.

Caudex repens, hie illic fibrosus, paleis squamosis, subulatis, intense fuscis ubique obsitus.

Stipes 6-pollicaris et ultra, erectus, crassiusculus, undique ferrugineo-paleaceus.

Frons digitalis, coriacea, oblonga, costa medio instructa, basi apiceque valde obtusa, utrinque paleaceo-squamosa, squamis lanceolatis, acuminatis, spinuloso-ciliatis, membranaceis, reticulatis, non raro subpeltatis:—^erf;7& magis angusta basi apiceque obtusissima.

Capsule numerosissimae, totem inferiorem partem frondis tegentes, costa excepta, intense fuscæ, pedicellatæ; *anmdo* fere complete

Semina subsphaerica, reticulata, marginata.

Fig. 1. Squamae, f. 2. 2. 2. Capsuls. f. 3. Sennnm—magn. auct.

This very distinct species of *Acrostichum* seems to have been found by M. du Petit Thouars in the Isle of France, as well as in Tristan d'Acunha. Our specimens are from the latter island, where they were gathered by Captain Carmichael.

Poiret has given this plant upon the authority of Jussieu's Herbarium as the *A. succxsafolium* of that author; but he probably only adopted the name of Du Petit Thouars.

Acoristichum glandulosum.

TA13. III.

ACROSTICHUM GLANDULOSUM.

FILICES.—GYRATE. *Br.* POLYPODIACEJS. *Kaulf.* FIUCES verse. *Willd.*

GEN. CHAR. *ACROSTICRUM*, Linn. *Sorte amorphi*, seu *Capsula* per totam paginam inferiorem frondis (interdum diversae) vel ad ejus partem sparsae. *Indusium* nullum (nisi squamulae v. sete in quibusdam capsulis inter stictae). *Br.*

ACROSTICHUM glandulosm; fronde simpli-ci oblonga coriacea basi apiceque acutiuscula subnervosa nudiuscula glabra glancjuloso-punctata, stipite subsquamoso, caudice dense paleaceo.

Acrostichum glandulosum. *Carmichael MSS.*

Acrostichum oblongum? *Desv. Journ. de Bot. 1813. p. 271.*

HAB. In promontorio Bonae Spei. *Carmichael.*

Caudex repens, crassus, lignosus, *squamis ferrugineis*, membranaceis, ciliato-dentatis, densissime obsitus.

Stipes 2—5 uncias longus, hinc sulcatus, basi praeципue subsquamosus.

Frondes S—5-pollicares, oblongae, coriaceae, margine parum revoluta*bi* medio costate[^] nervis obscuris parallelis, punctis glandulosis peUucidis adspersae, caetero glabrae, nitidae, costa subtus paululum paleacea, basi apiceque acutiusculas; ^?r;*%£ fronde minore aDgustiore, sed stipite longiore.

Capsule totam frondem tegentes, fusc&, numerosissimae; longe pedicellata, annulo magno.

Semina sphaerica, marginata, margine tuberculata.

Fig. 1. Capsulae. f. 2. Capsula magis aucta. £ 3. Semin* :—magn. and.

This is very nearly allied to *A. conorme* of Swartz: but our specimens of that plant are perfectly destitute of glandular dots. Still more closely does it approach the *A. oblongum* of Desvaux, which Kaulfuss unites with the *A. coniforme*.

Acorstichum Riddianum

TAB. IV.

ACROSTICHUM RADDIANUM.

FILICES.—GYRATJE. *Br.* POLYPODIACE[^]. *Kaulf.* FILICES verse. *Willd.*

GEN. CHAR. *ACROSTICHUM*, Linn. . Sort amorphi, seu *Capsulm* per totam paginam inferiorem frondis (interdum diversae) vel ad ejus partem sparsae. *Indusium* nullum (nisi squamulae v. setae in quibusdam capsulis interstinctae). *Br.*

ACROSTICHUM Raddianum; frondibus stipiteque villosissimis, sterilibus lineari-lanceolatis, fertilibus ellipticis integris.

Acrostichum sj>athulinum. *Raddi, Fil. Brasili p. 3.1.15./. 2.*

HAB. In udis rupibus torrentium super Montes Estrellenses, Brasilia. *Raddi.*
Radix dense caespitosa, fibris valde ramosis subpinnatis.

Stipites plurimi ex eadem radice, 2—5 uncias longi, erecti, densissime pilosi, pilis patentibus rufescensibus.
Frondes steriles 3—4 uncias longae, lineari-lanceolate, obtusae, basi sensim in petiolum attenuate, utrinque marginaque ferrugineo-pilosae. Hi pili sub lente serrulati sunt, basidilatati, concavi, reticulati, membranacei:—
fertiles sterilibus multo breviores, ellipticae, acutiusculae, dorso marginaque solummodo pilosas.

Capsules totam frondem dorso tegentes, longe pedicellate, sphericae, late annulate, annulo incompleto.

Semina parva, sphacrica.

Fig. 1. Filus vel squama. £ 2. Capsuls. f. 3. Semina i—magn, auct*

We have changed the name which Professor Raddi applied to this Fern, because of its similarity with that of *spathulatum*, given by Bory de'St. Vincent to a species of the Isle of France, and which, as far as we can judge from the figure in the Voyage aux Quatres Isles des Mers d'Afrique, we agree with Raddi in considering very nearly indeed allied to the present; differing almost solely in the very obtuse and emarginate extremity of the fertile fronds.

TAB. V.

CETERACH PEDUNCULATA.

FILICES.—GYRAT/E. *Br.* POLYPODIACEJE. *Kaulf.* FILICES verae. *Willd.*

GEN. CHAR. *CETERACH*. *Sor̄t* lineares transversales. *Indusia* nulla. *Willd.*

CETERACH pedunculate; fronde simplici lato-Janceolata sinuato-crenata reticulata basi attenuata, fertili longe stipitata, soris' e costa ad marginem frondis attingentibus.

HAB. Sylhet Ind. Orientalis, ubi legit JO. Smith. Misit clariss. Wattich.

Caudex repens, lignosus, tortuosus, pennae passerines crassitie, subtus radiculosus, radiculis e fibris ramosis descendibus, quorum majoribus hirsutis.

Frondes steriles et fertiles ex eadem caudice, utraque stipitata.

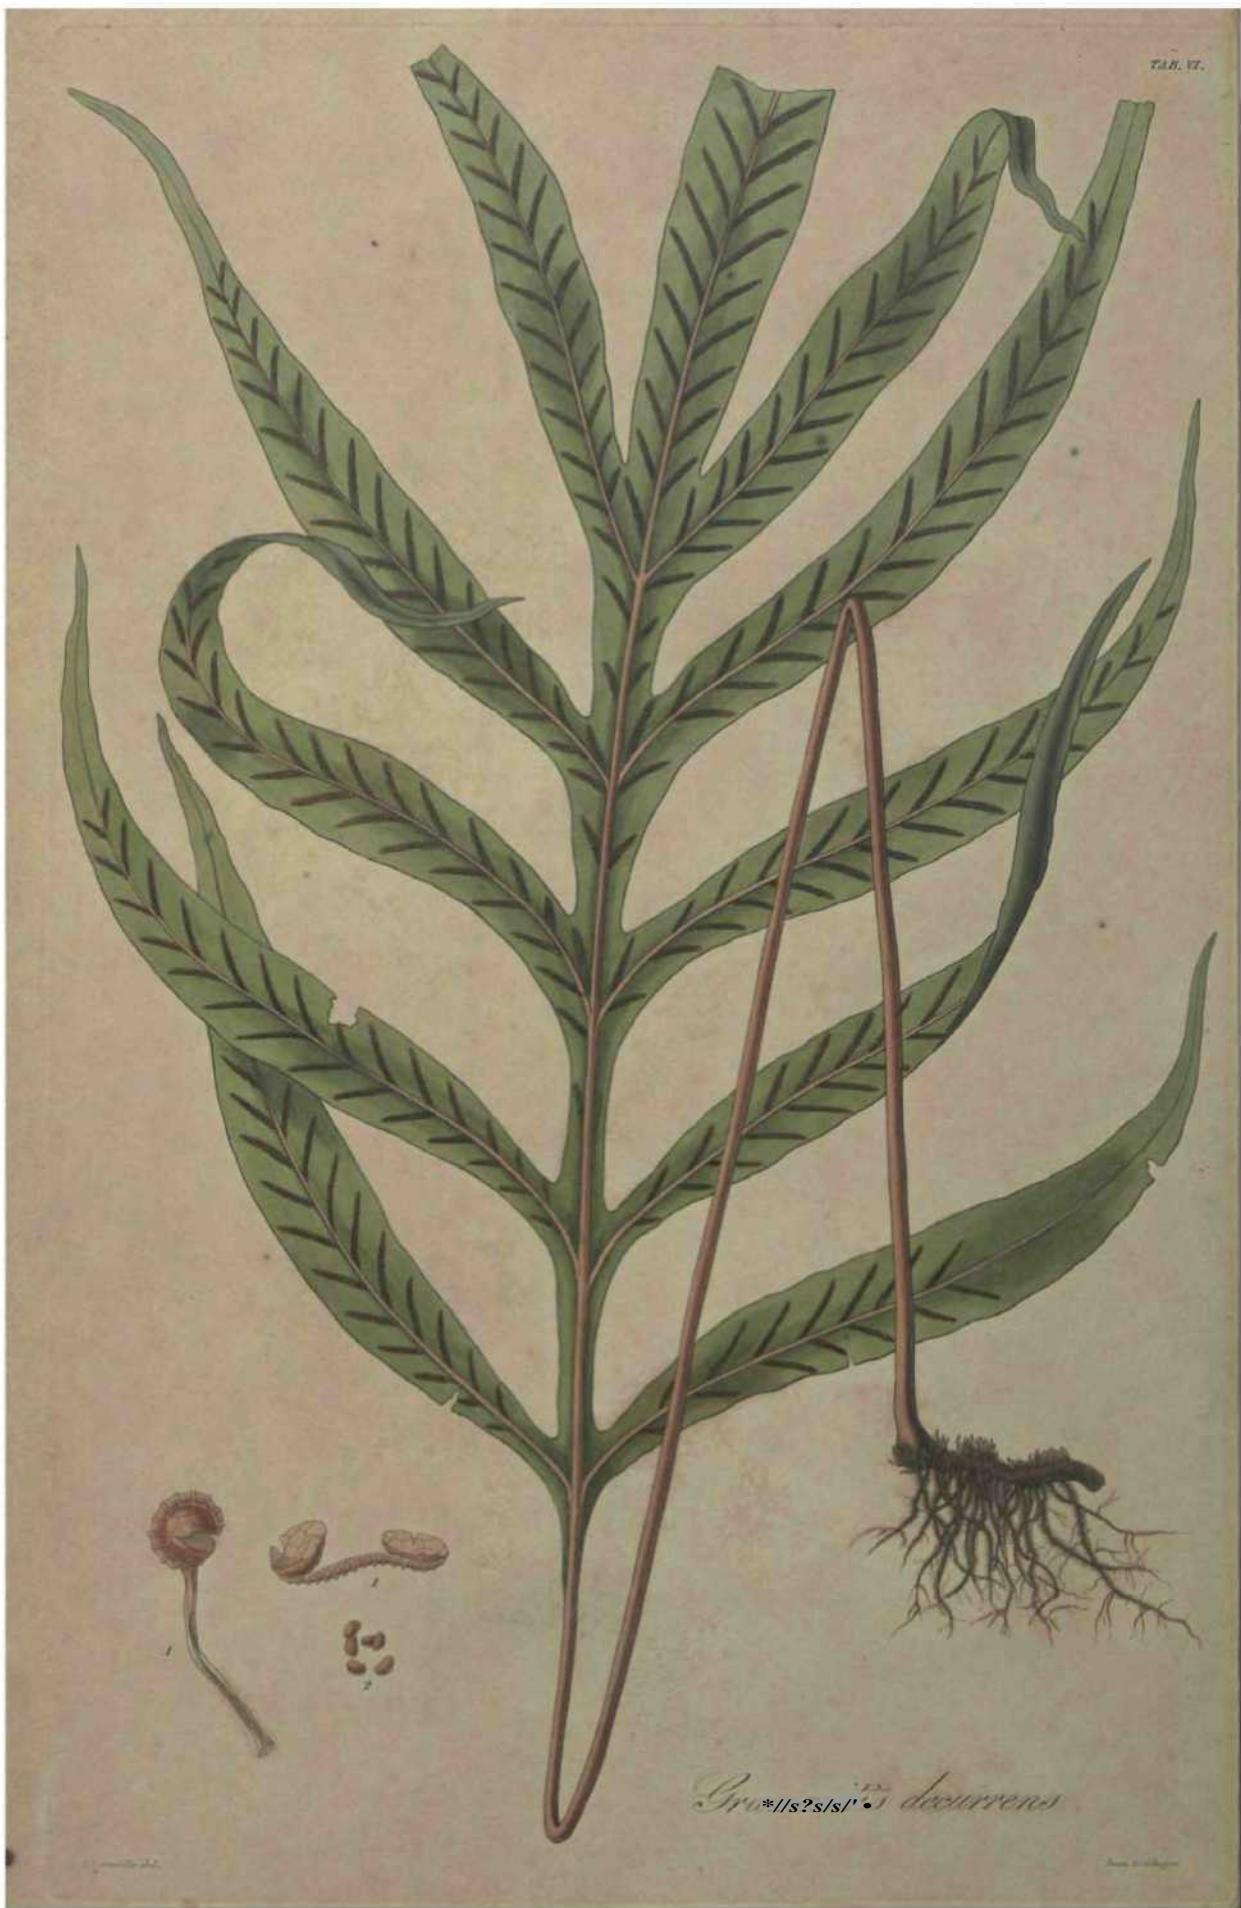

Sterilis.- *Stipes* erectus, glaber, gracilis, nitidus, pallide fuscus hinc sulcatus, 3—4-pollicaris. *Frons* 4—6 pollicaris, lato-lanceolata, membranacea, fusco-viridis, apice acuminata, basi attenuata, decurrente, margine sinuato-crenata, costa instructa venisque horizontali-patentibus, venulis anastomosantibus.

Fertilis: *Stipes* ut in sterili, sed triplo longior. *Frons* ut in sterili, sed magis angusta, crenata, substantiaque firmiore. *Indusium* nullum. *Sor̄t* lineares, intense fusi, in venis parallelis et cum iis alternantibus et totam latitudinem e costa ad marginem occupantes. *CapsuUe* spherics*, sublonge pedicellate, reticulate, annulo fere complete. *Semina* minuta, oblonga, vix angulata, fusca.

Fig. 1. Capsule. & 2. Semina:—magn. auct.

How far the genus *Ceterach* merits to be distinguished from *Grammitis* must be left to be determined by future observation. Kaulfuss makes one of the characters to depend on the chaffy scales with which the fructification is covered, as in *Ceterach Officinarum*. These scales are totally wanting in our plant; but the *sor̄t* are *transverse*, upon which appears to rest the main character of the genus as distinguishable from *Grammitis*.

Grammitis again, according to Mr. Brown, has the *Sor̄t* "venulâ unicâ insidentes." In *Ceterach pedunculata* they occupy each a number of veinlets or reticulations exactly intermediate between the straight lateral veins.

TAB. VI.

GRAMMITIS DECURRENS.

FILICES.-T-GYRATJE. *Br.* PoLYPODiACEiE. *Kaulf.* FILICES verse. *Willd.*

GEN. CHAR. *GRAMMITIS*. *Sort' oblongi*, lineares, recti, sparsi. *Indusia nulla*. *Willd.*

GRAMMITIS decurrens; fronde pinnatifida, segmentis remotis lanceolatis acuminatis integerrimis,
stipite rachique glabris.

Grammitis decurrens. *Wall. MSS.*

HAB. In India Orientali (Nepal ?). *Wallich.*

Caudex repens, crassus, valde fibrosus, fibris ramosis non raro hirsutis.

Stipes syedatis et ultra, pennae corvinæ crassitie, erectus, glaber, nitidus, fuscus, teres, Line sfulcatus.

Frons, circumscriptione late ovata, profunde pinnatifida, segmentis 6—8-pollicaribus, patentibus[^] lanceolatis, acuminatis, coriaceo-membranaceis, apice acuminatis, marginibus integerrimis; rachi laevi supeme late, inferne anguste alata.

Sort' in medio'frondis ut et in segmentis, lineares, obliqui, venulis suppositi, prope costam, sed non ad marginem attingentes.

Capsu' e sphsericæ, longe pedicellate, reticulate, annulo incomplete.

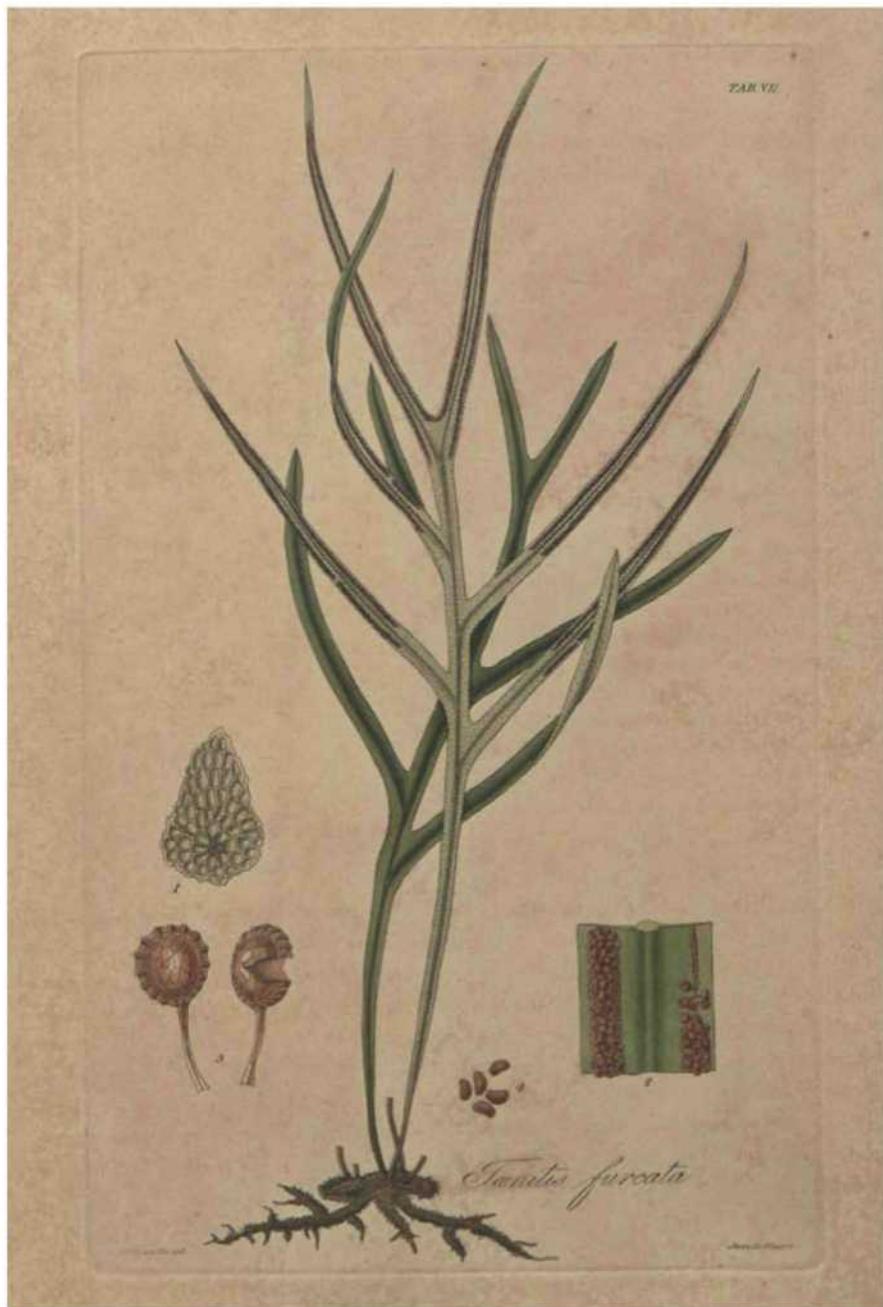

Semina parva, oblongo-subreniformia.

Fig. 1. 1. Capsuls. f. 2. Semina:—*magn. auct.*

In the *Grammitis decurrens* of Dr. Wallich we have a species quite unlike any other described plant of the genus, and very similar in habit to many species of *Polypodium*.

We have received specimens from Dr. Wallich in 1820, and again in 1826 from the Honourable the East India Company; but the exact place where the plants were gathered is not mentioned.

PL. VII.

TAB. VII.

T.ENITIS FURCATA.

FILICES.—GYRATJE. *Br.* POLYPODIACE;E. *Kaulf.* FILICES verae. *Wittd.*

(SEN. CHAR. *TJENITIS*. *Sorus linearis, continuus, quandoque interruptus, longitudinalis, inter costam et marginem exteriorem frondis situs. Indusium nullum. Wittd.*

Tmmris furcata; frondibus dichotomo-partitis pinnatifidisve, laciniis lineari-lanceolatis acutissimis, subtus squamuloso-punctatis.

Taenitis furcata. *WiUd. Sp. PL v. b.p. 136. Smith in Bees Oycl.*

Pteris furcata. *Linn. Sp. PI. p. 1531. Swartz. Syn. Fil. p. 95.*

Lingua cervina furcata. *Plum. Ml. p. 122 et 141.*

HAB. In sylvis Hispaniolae. *Plumier.* Insula Sancti Vincentii. *Rev. L. Guilding.* Insula Trinitatis. *D. Lockhart.*

Caudex repens, ramosus, densissime sqnamoso-tomentosus, intense fuscus.

Stipes fere nullus.

From spithamea ad pedalem, erecta, infeme indivisa, linearis, basi attenuate, superne vel dichotomo-partita vel pinnati6da; laciniis ultimis et nonnunquam lateralibus furcatis; omnibus lineari-lanceolatis vel linearibus, 8—6 vel ad 8 undas longis, 6 linens (in spechnine Plumieri unciam) lads, coriaceo-membranaceis, integerrimis, acutissimis, costatis et obscure venosis, facie superaa viridibus, subnitidis fere nudis, subtus pauidioribus punctato-squamulosis, squamulis minutis, ovatis, reticulatis, pellatis.

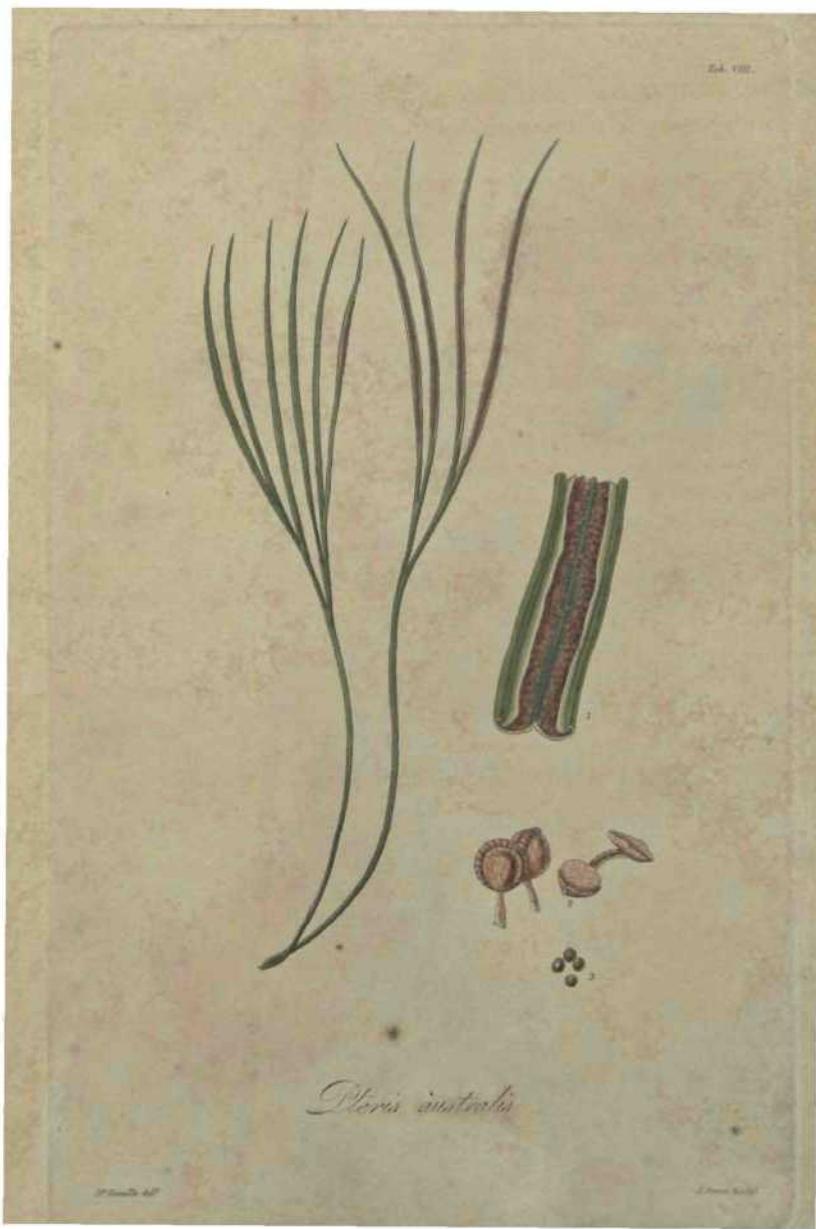

Son in duas lineas longitudinales prope marginem frondis, et totam fere longitudinem laciniarum plerumque occupantes. *Indusium* omnino nullum.

*Capsu*Ue pedicellate, annulo complete.

Semina oblonga vel subreniformia.

Fig. 1. Squamula. f. 2. Portio frondis cum soris. f. S. Capsulss. f. 4. Semiu:a:—*magn. auct.*

If we are right in referring this undoubted species of *Tasnitis* to the *T. furcata* of Swartz and the *Lingua cervina furcata* of Plumier, it would seem to be a species of very rare occurrence, and only hitherto known to Plumier. The figure in our plate indeed differs from that of Plumier in its much narrower fronds, and in the divisions being rather such as to give the character of pinnatifid than regularly dichotomous: but since the annexed engraving was finished, we have received specimens from His Excellency Sir Ralph Woodford of Trinidad, gathered by Mr. Lockhart, which have the fronds considerably broader, still narrower than Plumier's plant, and with some of the individuals (evidently the younger ones) simply dichotomously divided. The more perfect state of the plant is perhaps constantly pinnatifid with few segments, and the breadth of tho. frond is liable to much variation.

TAB. VIII.

PTERIS AUSTRALIA

FILICES.—GYRATE. *Br.* POLYPODIACE[^]. *Kaulf.* FILICES verae. *Willd.*

GEN. CHAR. *PTERIS*, Linn. *Sori* lineares, marginales, continui; *capsulis* sinu involuci insertis.
Involucrum marginale, continuum, scariosum, intus liberum. *Br.*

PTERIS australis; fronde dichotome radiata, laciniis linearibus acutis subfalcato-secundis, stipite
frondem subaequante.

Asplenium australe. *Swart**. *Syn. Fd. p. 74 et 258. l. 3. / 1.* *Wilt. Sp. PL v. 5. p. 308.*

Acrostichum australe. *Linn. SuppL p. 444. (non Pahl.)*

HAB. Insulis Mauritii et Borboniae.

"*Stipites* plures e csespite squamis lineari-subulatis, membranaceis, ferrugineis, nitentibus congestis radiculas sim-
plices villosiusculas fuscas inferne emitte," erecti, flexuosi, 4—5-pollicares, filiformes, hinc sulcati.

Frondes lineari-filiformes radiatim dichotomae, laciniis 3—4-pollicaribus, acutis, subfalcato-secundis, glabris nitidis,
ubique dorso sulcatis, marginibusque introflexis.

Indusia e margine introflexo frondis continua, membranacea, initio fere ad costam attingentia.

Capsule numerosee, fuscse.

Semina spheerica, minuta.

Fig. 1. Portio frondis horizontaliter secta, cum indusiis capsulisque. £ 2. Capsulae. f. S. Semina:—*magn. auct.*

If our figure of the structure of the frond of this plant, and especially of the indusia, be correct,—and we have examined it with considerable care,—we trust we shall be considered to have done right in removing it from *Asplenium* to *Pteris*.

Our specimens were gathered by Captain Carmichad in the Mauritius.

TAB. IX.

" iJai.r fuscafibrosa, fibris crassis." *Willd.*

Stipes loDgitudine variat 2—3 lincias ad 6—8-pollicares, filiformis, gracilis.

Frondes, circumscriptione ovatae, vel ovato-deltoideae, pinnate, pinnis nunc 3—4-, nunc 16-jugis, cum impari, alternis, patentibus, lanceolatis, 3—6-pollicaribus, spinuloso-serratis, obtusiusculis, basi superiore truncate, inferiore subdecurrente, costatis, venis furcatis vasis transversalibus rete tenerrimum includentibus connexis (f. 2.):—summis confluentibus; terminali elongata;—in fronde sterili, loco pinnae terminalis, *rachis* apice nuda, elongata, radicans.

Sort marginales, numerosissimi, serraturas terminantes.

Indusia cyathiformia, exserta, compressa, ore sub-bilabiato.

Receptaculum indusio duplo triplove longius.

CapsuUs ad basin receptaculi, rotundato-compresss sessiles, annulo completo transversali cinctse.

Semina minuta subsphaerica.

Fig. 1. Apex pinnae fertilis. f. 2. Portio pinnae, f. 3. Indusium, cum ejus receptaculo. f. 4. Receptaculi basis, cum capsulis tribus. f. 5. Capsula. f. 6. Semina:—*magn. auct.*

A beautiful and we believe very rare species of *Trichomanes*, remarkable for its numerous marginal fructifications, and, as Kaulfuss' well observes, for the nature of its *venation*. The lateral parallel veins resemble those of many monocotyledonous plants; and from the extreme delicacy of the parenchyme between these veins, the pinnae are frequently torn in the direction of them, as we see to be the case in the different species of *Musa*.

The late Baron de Schach favoured us with the specimens here figured, from the shores of the" Asphaltum lake in Trinidad.

Trichomanes lucens.

f. 4. *Capsula.* f. 5. *Semina:*—*magru aucU*

ExeDent, in almost every respect, as is the description that Dr. Swartz has given us of this plant, yet, probably in consequence of the indifferent figure referred to in Plumier, it has had the misfortune of being little understood; the *Trichomanes lucens* having generally been sent to us 'hv i_u* name of *alatum*,—a larger and much finer plant, as will be seen by our figure.

This must not be confounded with the *Trichomanes alatum* * of Hook, in 17. *Lond.* (the *Hymenophyllum alatum* of Engl. Bot.) On referring that species to its prper genus, the old specific name was retained, without recollecting that it was preoccupied. It should now be called, after Smith in Rees's Cyclopaedia, *T. europaum*.

Our finest specimens of tin* trno *T. alatum* are from the Rev. Lansdown Guilding.

* The two specie9»are nevertheless verv nearly allied. The European plant is much more divided, so as to be 3—4 pinnatifid, the ultimate segments never serrat*

Radix fibrosa, nigra.

Stipes 3—6.uncias longus, erectus, hirsutus, hinc subcanaliculatus.

Frons 6-uncialis usque ad sesquipedalem, oblongo-lanceolata, acutiuscula, pinnatifida, inferne pinnata. *Pinna* sesquiplicares, horizontales, parallels, approximate, pellucids, crispatiilae, oblodgas, obtusae, nervis dichotomis margineque subhirsutae, brevissime et obscure denticulatae, reticulatae, areolis,minutis.

Sori ad apicem, solummodo, pinnarum, venas terminantes.

Indusia fere omnino immersa, cylindracea, ore aperto, subdilatato undulato.

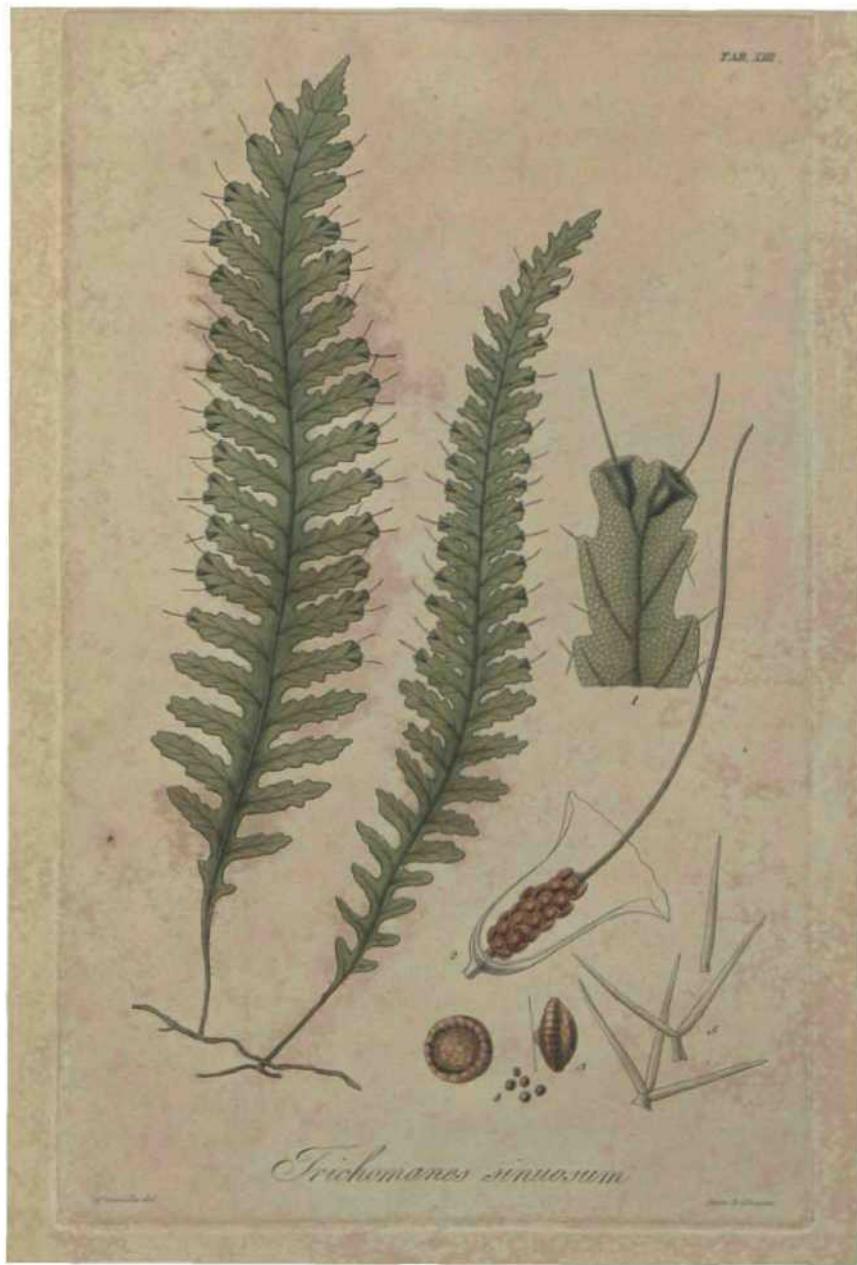

Receptaculum indusio triplo quadruplo longius.

Capsules ut in reliquis hujus familie.

Semina parva, subspharistica.

Fig. 1. Apex pinna* cum soris. & 2. Ejusdem portio magis aucta. & 3. Indusium verticaliter sectum. & 4. Capsule. & 5. Semina:—magn. auct.

This, like the *Trichomanes lucens*, is liable to vary much in size. Our largest specimens are from Guadeloupe, gathered by Mr. Parker. Those here figured are from St. Vincent, and are intermediate between the largest and the smallest size. We possess some small and apparently young specimens which are thickly clothed with ferruginous hair, but do not seem otherwise to differ from the more common state of the plant.

magn. aucU

A very delicate species, but, except in this greater degree of delicacy, smaller size and more obtuse segments, very nearly allied to *T. lucens*. Smaller specimens than those here figured are scarcely more than situated at the margin, and bear a single indusium upon each lobe; whilst larger specimens seem almost to have the character of the younger plants of *T. lucens*.

Fig. 1. Portio frondis a parte inferiore visa. f. 2. Ejusdem portio cum soris. f. 3. 3. 3. Capsule. f. 4. Semina: —magn. auct.

This is perhaps the species of this curious genus which is the most generally dispersed, being found in the West as well as the East Indies, in Japan, in the Society and Sandwich Isles, and in New Holland. All these countries, however, are intratropical, except Japan and Nepal. The plant is liable to considerable variation. The specimen figured in the *Flora Japonica*, and those which we have received from M. Bojer at the Mauritius, as well as our New Holland individuals, have the lowermost segments of the fronds pinnatifid, so as to appear like those of the original *Gleichenia*, with which we think Mr. Brown has justly united the *Mertensiae*.

From the Prince of Wales Island we have a species which scarcely differs from this but in having the segments of the frond much longer and equally linear, so that each frond has almost exactly the appearance of that of *Polypodium pectinatum*. Probably the *Mertensia emarginata* of Raddi, from Brazil, is not really distinct from our plant. It has the lower segments of the frond shorter, the whole frond somewhat narrower: the emarginate apices are common to both. To this Raddi refers the *M. glaucescens* of Humboldt and Willdenow.

Gleichenia imversa.

Stipes lepetitum dichotomus, primum pubescens, demum glaber, nitidus, fus^{us}, ex axiis proliferus, ramis ultimis (et antepenultimis, hinc) frondosis.

Frondes geminato-furcatae, lanceolatse, basi apiceque subattenuatae, 6-unciales ad sesquipedalem longce, supra glabre, subtus ferrugineo-tomentosse, profunde fere ad basin pinnatifidae, segmentis linearibus horizontali-subfalcatis, marginibus omnino integerrimis. *Rachis* demum glabriuscula. *Costa* pubescens.

*Sor*t tomento ferrugineo immersi, e capsulis quatuor radiatim dispositis, sphaericis, fere omnino sessilibus, oblique subverticaliter lato annulatis demum e vertice dehiscentibus.

Semina oblongo-reniformia, parva.

Fig. 1. Portio frondis ab inferiore parte visa. f. 2. Ejusdem portio, *cum* sonis. f. 3. Portio segmenti, tomento ~~abrisco~~, cum soro capsulis duabus. f. 4. Capsulae. f. 5. Semina :—*magn. auct.*

This seems to agree so well with the *Mertensia immersa* of Kaulfuss, that we can have little doubt of the two plants being the same. It is possible that it may be the *M. pubesvens* of Humboldt and Willdenow; though that is said to be clothed beneath with white down. Again, the *M. bifida* of the same author has many points in common with this; but according to the figure in *Act. Holm*, the branch immediately below the ultimate one is pinnatifid on each side. May not this be the *M. decurrentis* of Baddi?

Mr. Brown, in his admirable *Prodromus Flora Nova Hollandia*, mentions that this plant is liable to great variation both in regard to the number of pinnae, of which the fructifying appendage is composed, and to the roughness of the frond. Sir James Smith, too, mentions an Otaheitan variety, or, as he is inclined to think, a distinct species, which he would call *S. fastigiata*, having "the segments of its fertile fronds level-topped and exceedingly numerous, the appendages uniformly four pair, as nearly as possible, in each spike, all of them erect and parallel, not divaricated, nor are the spikes recurved." We have received what we consider to be the same plant, from the East India Company, named by Dr. Wallich *S. dichotoma*: but here the appendages are not one-fourth the size of those we have figured.

The specimens here represented were sent to us from the Mauritius by M. Bojer.

We are not aware that any attempt has yet been made to cultivate this handsome and curious species of Fern: but now that we have been so successful with many other individuals of this graceful tribe of plants, we do not yet despair of seeing it flourish in our stoves.

It is probably a native of several of the West India islands, having been found in Martinique by *Plumier* in Jamaica by *Swartz*, and in the fertile island of St. Vincent by our friend the Rev. *Lansdown Guilding*, whose inestimable botanical communications from that country, particularly of Ferns, have been one of the principal inducements for us to undertake the present publication.

The genus *Danaea* is a very distinctly marked one, having the under side of the pinnae almost wholly covered with closely placed, parallel, immersed sori, formed of a double row (the rows joined by the lateral nerve upon which the sorus is inserted) of closely united capsules, each opening by a pore at the extremity. Upon removing a sorus, a deep cell or cavity remains; as at fig. 2.

Spica pedunculata, nunc basin versus, prope medium, vel infra apicem, frondis sita, digitum ad pedem longa, pendula, linearis, compressa, marginibus utrinque capsulifera. Hae capsules arete connatae, sphricse, transversim dehiscentes.

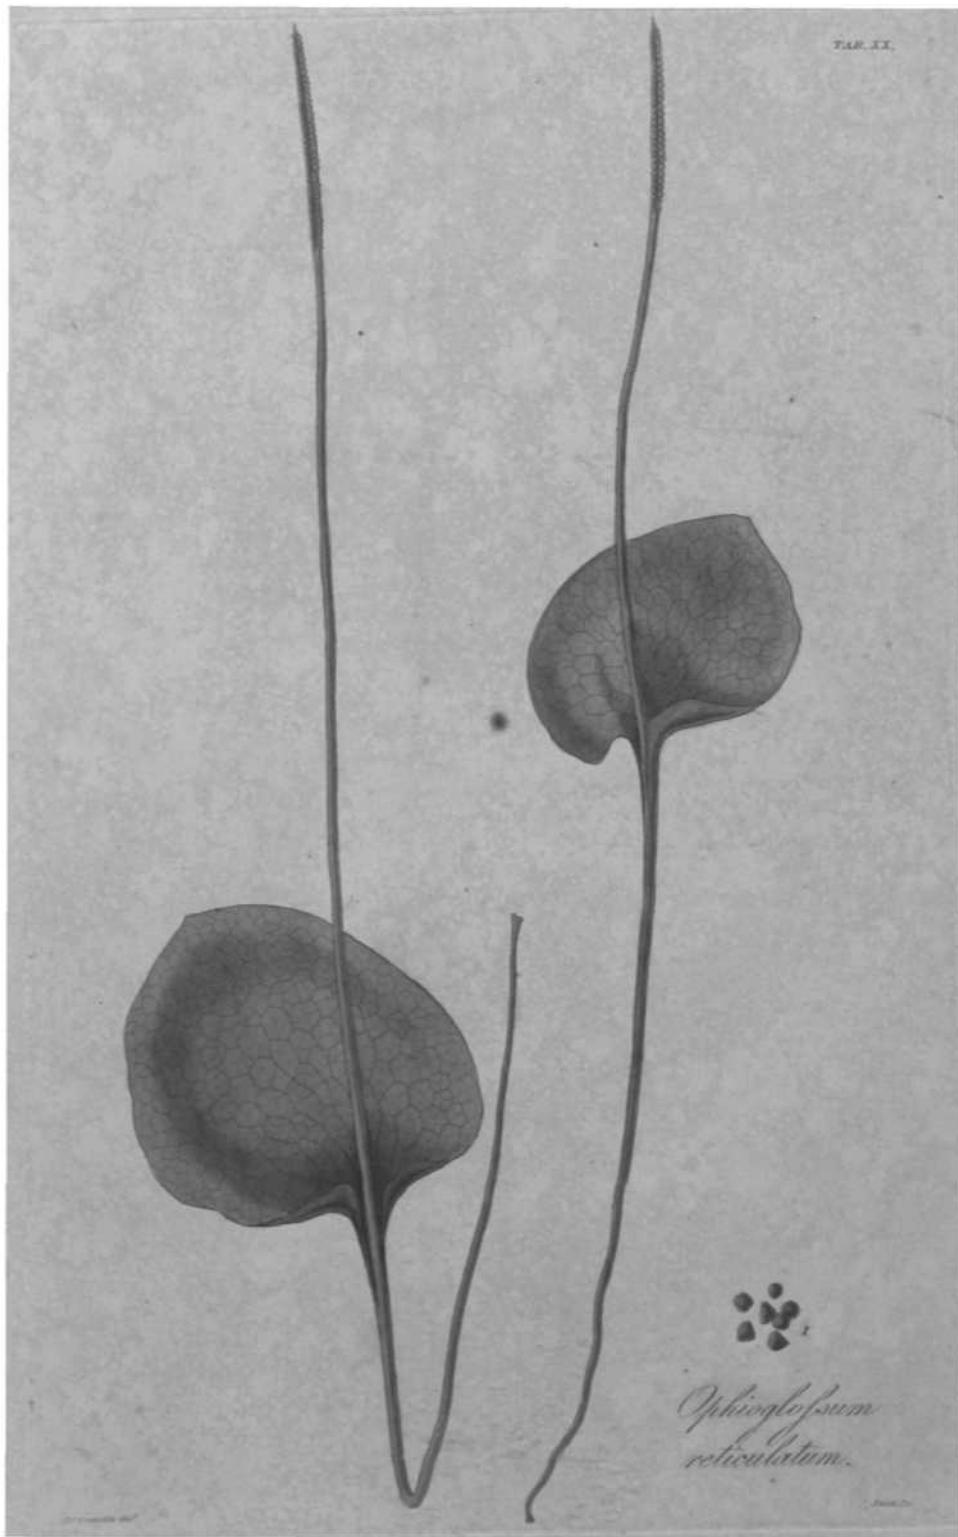

Pedunculus duas uncias longus, teres.

Semina parva sphaerica fuso-lutea.

Fig. 1. Capsula dehiscens. f. 2. Semina:—magn. auct.

This noble species of *Ophioglossum*, only perhaps exceeded in size by the South American *Ophioglossum palmatum*, has been sent to us from the Mauritius by Captain Carmichael (from whose specimens the accompanying figure has been drawn) and by Dr. Sieber. It is probably not uncommon there. In Amboyna, Rumphius says, it is exceedingly rare. In the Banksian Herbarium, Sir James Smith tells us, very fine specimens are preserved, gathered by Mr. David Nelson upon the high mountains of Owhyhee.

Leman, in the *Dictionnaire des Sciences Naturelles*, suggests that on more minute examination of the fructification, this species will be found distinct from the genus *Ophioglossum*: but we see no reason for entertaining such an opinion.

Fig. 1. Semina:—*magn. and.*

It is the case with this, as with many other tropical Ferns, that it is found equally in the New as in the Old World. Our specimens are all from the Mauritius; but judging from the figures of Plumier above quoted, and the testimony of other writers, there appears to be no difference between them and those that axe natives of the West Indies.

The drawing was made from specimens gathered by Captain Carmichael in the Mauritius.

PROSPECTUS.

The Tribe of FERNS, universally celebrated as amongst the most elegant and vegetable productions, and which a celebrated French author has lately elevated to the rank of a distinct *Class* among Plants, does not appear hitherto to have been illustrated in the degree that it deserves. Besides the beauty of external appearance of the Ferns, which must strike even the most casual observer, the power and wisdom of the Creator is nowhere more evident than in the curious and varied forms of their fructification. They seem to hold a middle rank between the *Cotyledonous* and *Acotyledonous* plants, with somewhat the habit of the former, though possessing the simpler organization for the production of their seeds which characterizes the latter. The largest of them emulate the *Pottia* in their size and mode of growth, the smallest are hardly discernible at first view from some of the *Hepaticæ*, especially from the genera *Marchantia* and *Jungermannia*.

The Ferns are not without their obvious use in the arts and in domestic economy. In the East Indies and New Zealand several species are employed as food by the natives. In our own country, and in the North of Europe, potash is procured from them after combustion; and this substance is so combined in the *Pteris aquilina*, or common Brake, with resinous extractive matter, as to allow of its being used as a substitute for soap. Tannin, again, is another product of Ferns, and Gallic acid of the *Scolopendrum officinale* and *Polypodium vulgare*. Many of the most abundant species are employed medicinally; and one already mentioned, the *Pteris aquilina*, affords in its stalks an excellent covering for the roofs of houses, and as such is very commonly used in the countries where it grows.

For a long time the Exotic Kinds of Fern were almost wholly excluded from our stoves and green-houses, in consequence of an erroneous opinion that their culture was attended with such difficulty as to be nearly impracticable. The reverse is now found to be the case; and the Messrs. Shepherd of the Liverpool Botanic Garden were the first to prove that these plants might easily be raised from seed, even after that seed had for many years been attached to specimens in the herbarium. It was thus that Willdenow enriched the Berlin Garden with numerous species that existed in the Hortus Siccus of the German Botanist; and, to confine ourselves to instances in our own country, we need only mention the Liverpool Garden, the Royal Garden at Kew, that of Messrs. Loddiges at Hackney, those of Edinburgh and Glasgow, and of the late Mr. Hussey at Ipswich (now that of W. Rodwell, Esq.), as proving how readily the Ferns may be now cultivated, and what a valuable addition they make to our collections. In the herbarium, too, no plant* retains their form and colour so well.

Few indeed are the works which have, by means of faithful representation, aided the study of this tribe of Plants. Professor Radii of Florence has lately published a work with numerous plates, entirely confined to the Ferns of Brazil; and Schkuhr's "Filices" contain sufficiently accurate representations of many, and especially the more common kinds.

To compensate in some measure for what is wanting in these and other similar publications of less note, Dr. Hooker and Dr. Greville have undertaken the editing of a work on the new or rare and little known species of the family.

The herbaria of the authors are enriched by the contributions of their correspondents in various parts of the world, and they have received the promise of still further assistance from their friends both at home and abroad.

The work will be included in 12 Fasciculi, each consisting of 20 plates, accompanied with as many leaves of description, to appear quarterly. The Descriptions will be written entirely in Latin, and a few remarks added in English; the Plates will be executed with the greatest attention to accuracy, and in the best style of the art, especially in the dissections of the fructification, from drawings made by the authors. The engravings which adorn Humboldt's and Bonpland's *Nova Genera* and De Lessert's *Icones* may be considered as the models for those which will illustrate the present work.

The price of the work will be Twenty-five Shillings each part. A set. Copies will be coloured in a superior style, price Two Guineas each.

A List of Subscribers will be given in the last Number.
