CARING FOR
OUR COUNTRY

What is Bush Blitz?

Bush Blitz is a four-year, multi-million dollar partnership between the Australian Government, BHP Billiton, and Earthwatch Australia to document plants and animals in selected properties across Australia's National Reserve System.

This innovative partnership harnesses the expertise of many of Australia's top scientists from museums, herbaria, universities, and other institutions and organisations across the country.

Summary

Bush Blitz fieldwork was conducted at four National Reserve System properties in the Western Australian Avon Wheatbelt and Yalgoo Bioregions during 2009. This included a pilot study at Charles Darwin Reserve and a longer study of Charles Darwin, Kadji Kadji, Lochada and Karara reserves. Results include 651 species added to those known across the reserves and the discovery of 35 putative species new to science. The majority of these new species occur within the heteroptera (plant bugs) and lepidoptera (butterflies and moths) taxonomic groups.

Malleefowl (*Leipoa ocellata*), listed as vulnerable under the federal *Environmental Protection and Biodiversity Conservation Act 1999* (EPBC Act), were observed on Charles Darwin Reserve. One plant species listed as vulnerable under the EPBC Act and as a declared rare flora under the *Western Australian Wildlife Conservation Act 1950* (WC Act), *Eucalyptus synandra*, was found on Karara and Kadji Kadji reserves. A second species also listed in Western Australia, *Acacia woodmaniorum* was located on Karara reserve. Vertebrate pests including feral cats, foxes, goats, mice and rabbits were identified on all four reserves. The European Honey Bee (*Apis mellifera*) was found on Lochada reserve. Weeds were prominent in disturbed areas.

Introduction

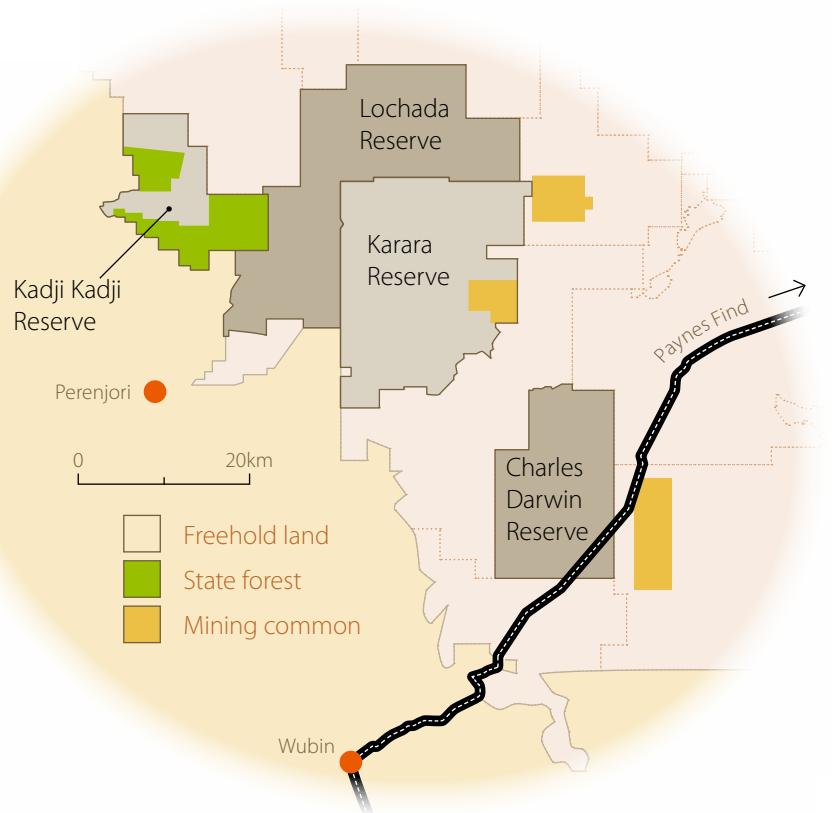

Bush Blitz is Australia's largest nature discovery project, conducting surveys in areas recently added to the National Reserve System in order to document biodiversity and discover species new to science. Bush Blitz is an initiative of the Australian Government, through the Australian Biological Resources Study in partnership with BHP Billiton and Earthwatch Australia. The Bush Blitz objectives are:

- + to promote, publicise and demonstrate the importance of taxonomy through the vehicle of species discovery;
- + to undertake a national species discovery program targeted at recently acquired properties of the National Reserve System of Australia;
- + to support the science of taxonomy in Australia through training students and early career researchers, provision of grants for species description and resolution of taxonomically problematic, nationally important groups;
- + to promote partnerships between science, governments, industry and non-government organisations; and
- + to inform the National Reserve System, Reserve Managers and other stakeholders of the results of the Bush Blitz Project.

Four Western Australian reserves were surveyed during this Bush Blitz. All occur approximately 350 km north of Perth, at the northern end of the Avon Wheatbelt Bioregion and southern edge of the Yalgoo Bioregion. The reserves occur just to the north of an intensive agricultural zone, but fall within a largely

intact landscape that has a comparatively high level of integrity. The region has been subject to extensive prospecting for mining and exploration has occurred on or adjacent to several of the properties.

A preliminary trial of Bush Blitz was carried out on Charles Darwin Reserve from 3–9 May 2009, with the aim to test survey logistics. BHP Billiton participants assisted scientists on the initial trip to Charles Darwin Reserve in May. A full survey was then undertaken from 14–25 September 2009 across Charles Darwin, Kadji Kadji, Lochada and Karara reserves. Four days were spent on Charles Darwin Reserve and seven days on the three interconnecting reserves to the north-west (Kadji Kadji, Lochada and Karara). A supplementary trip targeting reptiles and frogs was conducted from 7–18 December 2009 across the four reserves.

Reserves Overview

Charles Darwin

Bush Heritage Australia

Date of purchase

10 January 2003

Area

68,600 ha

Description

Charles Darwin Reserve consists of a mosaic of plant communities that inhabit extensive plains of yellow sand, red sandy clay or loam, granite rocks, lateritic breakaways, greenstone ridges or hills, and wetlands such as salt lakes, claypans and ephemeral swamps. The vegetation includes extensive areas of species-rich shrubland of several variants. These are representative of flora considered characteristic of the wheatbelt and of the arid zone rangelands: acacia-dominated shrubland on red soil plains, eucalyptus woodlands on heavier clay-containing soils and chenopod shrublands on saline sites. The eucalyptus woodlands are of three different kinds: York Gum (*Eucalyptus loxophleba*) woodland, Salmon Gum (*E. salmonophloia*) woodland, and Gimlet (*E. salubris*) woodland.

National Reserve System conservation values

The nationally vulnerable *Environment Protection Biodiversity Conservation Act 1995* (EPBC Act) listed species Malleefowl (*Leipoa ocellata*), has been recorded on the property, as has Australian Bustard (*Ardeotis australis*) which is listed as near-threatened in *The action plan for Australian birds*. In addition, Charles Darwin Reserve provides habitat for a significant guild of woodland birds which are in serious decline across their range, including Major Mitchell Cockatoo (*Lophochroa leadbeateri*) which is specially protected in Western Australia, and Red-tailed Black Cockatoo (*Calyptorhynchus banksii*). The reserve also supports five plants that are listed as priority species for conservation under the *Western Australian Wildlife Conservation Act 1950* (WC ACT): *Philoteca nutans*, *Persoonia pentasticha*, *Comesperma griffinii* ms, *Acacia formidabilis* and *Verticordia venusta*.

Kadji Kadji

WA Department of Environment and Conservation

Date of purchase

4 September 2003

Area

47,377 ha

Description

Kadji Kadji lies on the boundary between the Avon Wheatbelt and the Yalgoo IBRA Regions, an interzone between the South-west and Eremaean Botanical Provinces. The vegetation associations present on the reserve include nine shrublands, one medium woodland, one succulent steppe with thicket, one hummock grassland and one succulent steppe with woodland and thickets. The northern and eastern boundaries of the reserve adjoin Lochada.

National Reserve System conservation values

Located on an environmental gradient between two botanical provinces, Kadji Kadji has a high diversity of vegetation. The property supports 13 vegetation associations, eight of which are inadequately represented in the existing and proposed reserve system. Two of these have less than 2% of their original area in conservation reserves. The Avon Wheatbelt and the Yalgoo IBRA regions are poorly conserved at present and have been rated as a very high priority and moderate priority respectively for land acquisition.

Kadji Kadji Reserve, A Wheeler & B Glasser

Karara

WA Department of Environment and Conservation

Date of purchase

10 January 2002

Area

109,291 ha

Description

Karara Pastoral Lease adjoins Lochada, lying to the south-east of that property. Twelve vegetation types are found on the property, which was grazed until its purchase, after which it was progressively de-stocked.

National Reserve System conservation values

The purchase of Karara improved the comprehensiveness and consolidation of the National Reserve System within the Avon Wheatbelt and Yalgoo IBRA regions and was important for the implementation of the Gascoyne Murchison Strategy. Two state-listed rare flora species occur on the lease, *Grevillea scabrida* and Jingymia Mallee (*Eucalyptus synandra*), which is also listed as vulnerable under the EPBC Act. Nine of the vegetation types found on Karara were inadequately represented in the national reserve system before its purchase.

Lochada

WA Department of Environment and Conservation

Date of purchase

26 May 2000

Area

115,000 ha

Description

Lochada lies to the east of Kadji Kadji and contains vegetation types similar to the Kadji Kadji reserve. Fourteen vegetation types are present, as well as a salt lake ecosystem. Five of these vegetation types are not represented in any other reserve and seven are poorly represented throughout the reserve system.

National Reserve System conservation values

Fifty per cent of the Lochada lease contains shrublands of Bowgada (*Acacia ramulosa*), Jam Tree (*A. aff. acuminata*) and *Melaleuca uncinata*, which provide habitat for Malleefowl (*Leipoa ocellata*). Malleefowl are listed as vulnerable under the EPBC Act.

Methods

Collection and observation sites were selected based on land classes, supplemented by identification of suitable microhabitat during the field visit. A number of taxonomic groups were identified as targets for study. Table 1 provides the groups surveyed and the specialists who undertook the field work.

Checking traps at Charles Darwin Reserve © A Cowley

As Charles Darwin Reserve already had substantial survey work conducted on small mammals and birds, these groups were not targeted, however, opportunistic observations were recorded.

Arachnida (spiders) and myriapoda (millipedes and centipedes) were only surveyed at Charles Darwin and Lochada reserves. Incidental collections were also made of cockroaches, fungi, lichens, water bugs, termites and dragonflies.

A standard suite of survey techniques was used:

- + Bees were collected using a hand net or by sweeping flowers. Malaise traps and blue and yellow pan traps were also used.
- + Flies and beetles were collected using Malaise traps, baited pitfalls, hand collecting, bark spraying and sweep netting.
- + Butterflies were collected opportunistically using hand-held butterfly nets.
- + Moths were captured using light traps deployed every night. Beat-sampling of vegetation was used to collect larvae which were then reared to the adult stage on the host plant.
- + True bugs were collected by beat-sampling vegetation, with a few collected on and under bark and leaf litter. Some of the light traps and malaise traps used for other invertebrate species also collected true bugs.
- + Snails were surveyed in two stages. The first stage involved visiting as many sites as possible for a rapid survey to assess broad patterns in shell abundance. The second stage involved revisiting those sites that had yielded high diversity to conduct more thorough hand searches.
- + Spiders, scorpions, centipedes and millipedes were found by hand-searching under rocks and logs, in leaf litter and under bark of trees. Specimens were also removed from traps used to sample reptiles.
- + Reptiles and frogs were collected by active foraging as well as using pitfall trap lines with a drift fence and funnel traps at each end.
- + Vascular flora were collected by hand, pressed and dried.

Conditions for collecting were suboptimal for fauna on both trips. The May trip was suboptimal for all taxa due to cool conditions and low rainfall. Conditions were warm in September, with good rain received during the winter months. However, low cloud cover and seasonal rain did affect some fauna groups, notably bees and flies whose flight is interrupted by rain.

Flora specimens were lodged with the Western Australian Herbarium and fauna specimens were lodged with the Western Australian Museum. Final species lists were compiled using data supplied by the Australian Natural Heritage Assessment Tool, the Western Australian Department of Environment and Conservation, Bush Heritage Australia and the results of this Bush Blitz.

Lasiacantha n. sp. 001 (Tingidae)

Results

The locational data are available to reserve managers.

Species Lists

Appendix A provides full, updated species lists for each reserve. Names in **bold brown text** are putative new species. Species marked with an asterisk (*) have not been previously recorded for that reserve. Species without an asterisk have been recorded previously and found again during this survey. Species with **blue squares** were not recorded on this survey, but are known from previous records for the reserve. Table 2 provides a summary of the number of new flora and fauna records and putative new species for each reserve. Table 3 provides a summary of the number of new records for each reserve by taxonomic group.

Rare and Threatened Species

Appendix B includes the listed species known from the reserves. Those marked with an asterisk (*) have not been recorded previously.

Exotic and Pest Species

Appendix C lists exotic pest species known from the reserves. Those marked with an asterisk (*) have not been recorded previously. The seasonal conditions during the initial May trial made the detection of annual weeds problematic. A summary of exotic and pest species recorded for each reserve is provided in Table 4.

Table 4: Total number of exotic and pest species encountered in each reserve

Reserve	Flora Species	Fauna Species
Charles Darwin	9	4
Kadji Kadji	14	1
Lochada	13	3
Karara	27	2

Discussion

A total of 651 species were added to those previously known across the reserves and approximately 35 fauna and four flora putative species new to science were discovered — these await description and publication. A breakdown of the taxonomic groups in which new species occur is given in Table 5.

Table 5: Putative new species by group

Rare and Threatened Species

Mason's Darwinia (*Darwinia masonii*) is listed under the EPBC Act and the WC Act as vulnerable. Both the WA herbarium and ANHAT had records of this plant occurring on Charles Darwin Reserve, but it was not located during this fieldwork. Also listed under the EPBC Act and the WC Act as vulnerable, Jingymia Mallee (*Eucalyptus synandra*) was recorded on Karara and Kadji Kadji. Karara also contains specimens of *Grevillea scabrida*, which is under consideration for declaration as a rare flora in WA. Silky Eremophila (*Eremophila nivea*), listed under the EPBC Act as endangered and declared as critically endangered in WA, was thought to occur at Kadji Kadji but the record was based on old reports and no specimens. It may be present,

but was not found on this trip (T. Macfarlane, pers. comm.). Karara has also been recorded as containing *Acacia woodmaniorum*, another species declared as vulnerable in WA.

The presence of Malleefowl (*Leipoa ocellata*), listed under the EPBC Act as vulnerable, was identified as a key factor influencing lease purchase for Lochada. A number of observations of Malleefowl were made over the course of the surveys on Charles Darwin Reserve, demonstrating the presence of the species in the region. No self-sustaining population of Malleefowl exists on any of the four properties, which is a reflection of the area required to support a minimum viable population of this species.

Pseudomys sp., P Taylor

Ptilotus macrocephalus, A Wheeler

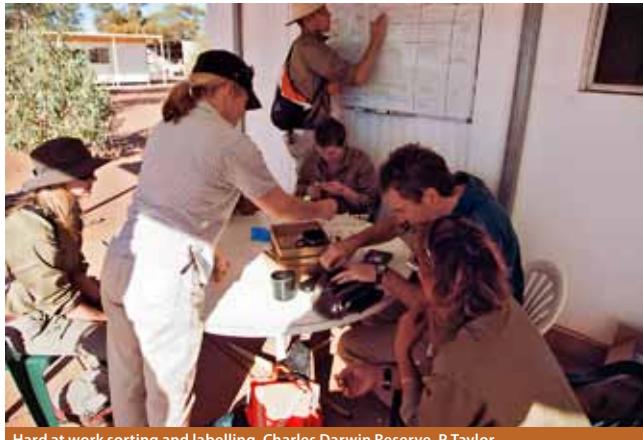

Exotic and Pest Species

The properties showed indirect evidence of goats, which are a recognised management issue in the district. Sheep were observed on Karara, feral cats on Lochada, and foxes, cats, goats and rabbits on Charles Darwin Reserve. The impact of feral species in these reserves is low compared to most of the semi-arid zone of southern Australia. This Bush Blitz constitutes the first snapshot of the invertebrate fauna of these reserves and only one exotic invertebrate pest was identified during the course of the fieldwork. *Apis mellifera*, the European Honey Bee, was found at Lochada. This species may potentially out-compete native birds for nectar or nesting sites such as tree hollows. It may also compete for pollen and nectar with native bees in periods of low flower abundance.

Twenty-six new weed species were identified as present across the four reserves. Given the developing species lists for all the reserves, it is difficult to judge whether these records can be considered as evidence of weedy expansion or a reflection of better knowledge of the reserves. For the most part, observations on weeds were made during a dry season, making it more difficult to detect their presence. Weeds seem to be present in many natural vegetation areas, usually as low-impact scattered annuals. There are dense populations of weeds in disturbed areas (around

the old pastoral facilities such as sheds, yards and bores). There are more weed species on the Karara, Lochada and Kadji Kadji pastoral leases than there are on Charles Darwin Reserve. Examples of typical minor weeds found in these disturbed areas are the small annual Common Mediterranean Grass (*Schismus barbatus*) and the annual Brome Grass (*Bromus rubens*). The introduced herbaceous annual Crane's or Stork's Bills (*Erodium* species), Capeweed (*Arcotheca calendula*) and Paterson's Curse (*Echium plantagineum*) are common to abundant in such sites (T. Macfarlane, pers. comm.).

In more natural sites, such as stream courses and the base of granite outcrops where there is seasonal runoff and sometimes more fertile soil some weed species are abundant. These include the common, but still fairly scattered herbaceous plants Stinking Roger (*Monoculus monstrosus*), Common Bartsia (*Parentucellia latifolia*), Hairy Pink (*Petrorhagia dubia*) and *Silene* spp., and the more densely occurring plants that can be abundant to dominant (along with various native species) in richer sites like granite rock aprons: small *Juncus* spp., the small annual grasses *Vulpia* spp., Golden Top (*Lamarckia aurea*), False Hairgrass (*Pentaschistis airoides*), Flatweed (*Hypochaeris glabra*) and the Spiny-fruited Caltrop (*Tribulus terrestris*). Some of these sites may be quite weedy but still have good native plant values. The weeds therefore may not increase much further unless fires

Hard at work sorting and labelling, Charles Darwin Reserve, P Taylor

provide an opening, though they may encourage and maintain rabbit grazing (T. Macfarlane, pers. comm.).

Saline areas often have weeds over fairly extensive areas. Some of these have been very heavily grazed in the past and have hard compacted or eroded soils where weedy grasses and plants such as the perennial Sea Lavender (*Limonium lobatum*) occur, although not to the exclusion of other plants. In salt marsh habitats there are a few weed species that are well-established, such as the succulents Ice Plant (*Cleterum papulosum*) and small Ice Plant (*Mesembryanthemum nodiflorum*), although their impact is unclear. There are also quite dense populations of small annuals such as the grasses *Vulpia* spp. in these habitats. While these are unlikely to significantly affect the perennial saltbushes and samphires, being quite ephemeral in the good season, they may in places exclude small native annuals. Nuisance weeds occurring on the reserve include Spiny Emex (*Emex australis*), whose spiny fruits and dense growth habit can be a problem to humans and animals. Other nuisance weeds are Caltrop (*Tribulus terrestris*) and the Afghan Melon (*Citrullus colocynthis*) (T. Macfarlane, pers. comm.).

Other Points of Interest

Three of the plant species believed new to science were discovered on Lochada. The plants belong to the genera *Abutilon*, *Thysanotus* and *Lomandra*.

The heteropteran (true bug) subfamily Orthotylinae produced the majority of mirid bug species (plant bugs) across the reserves. Many of these species were associated with particular species of myrtaceous shrubs with a high degree of host specificity observed. One of the new species of Orthotylinae, *Harveycapsus dimorpha* (Cassis, in prep.), is a remarkable find, in that it is one of only a handful known from anywhere in the world that is ground-dwelling. In fact, these were collected under rocks on Mungada Ridge in Karara Reserve, a previously unheard-of microhabitat for plant bugs.

The general rule, that in dry to semi-arid environments the highest diversity of snails is found in rocky habitats, applied across the reserves. Rocky outcrops and ridges act as major refuges harbouring source populations for the majority of terrestrial snails. In particular, Bioada Hill, Forrests Hill, Mungada Ridge and Greenstone Ridge are examples of environments that should be prioritised when considering snail conservation within the region.

An abundance of flowering, due to the very good conditions at the time of the survey, meant that bees were widely dispersed and difficult to sample. As a result, the bee data presented here is likely to be an extreme underestimation of the true bee biodiversity found on the reserves.

The highly restricted species of skipper butterfly, Laterite Ochre (*Trapezites waterhousei*), was recorded for the first time in Charles Darwin Reserve.

<i>Cyanicula fragrans</i>	P3	✗ *			
<i>Darwinia masonii</i>	EPBC — Vulnerable WCA — Vulnerable	■			
<i>Drummondita fulva</i>	P3			✗	✗

EPBC = Refers to the *Environment Protection and Biodiversity Conservation Act 1999* (Commonwealth)

WCA = Refers to the *Wildlife Conservation Act 1950* (Western Australia)

P1-P4 Are priority taxa within WA.

P1-P3 Are poorly known, do not meet adequacy of survey requirements for listing as threatened taxa, but appear under threat, or could be affected by known threatening processes.

P4 Are well surveyed and not threatened but rare.

For more information see: <http://florabase.dec.wa.gov.au/conservationtaxa>

Contributors

Bush Blitz is coordinated by the Australian Biological Resources Study (ABRS), which is part of the Australian Government Department of Sustainability, Environment, Water, Population and Communities. The program is a partnership between the Australian Government, BHP Billiton and Earthwatch Australia.

Research agencies involved in the Charles Darwin, Kadji Kadji, Karara and Lochada Bush Blitz were the Australian Museum, Museum Victoria, Queensland Museum, South Australian Museum, Tasmanian Museum and Art Gallery, University of New South Wales, Western Australian Museum and the Western Australian Herbarium.
