

Plant Health for Plant Nurseries

Sarah Green and Debbie Frederickson Matika (Forest Research)

Matt Elliot (RBGE)

Alistair Yeomans (Plant Healthy)

Royal Botanic Garden Edinburgh

Agenda morning session

- 10.00: Welcome and Slido
- 10.10: Plant Health Management Standard
- 10.25: Link between emerging diseases and trade, research evidence
- 10.45: Recognising and acting on symptoms of ill health
- 11.05: Diagnostics demo/discussion/refreshments
- 11.30: Water management
- 11.50: Waste management
- 12.05: Research evidence on peat free growing media
- 12.20: Wrap up discussion for indoor session

Agenda afternoon session

- 12.30: Lunch
- 13.00: Walk to RBGE nursery
- 13.20: Nursery walk and talk covering morning themes
- 15.00: Walk back to auditorium area for refreshments
- 15.45: Round up/ final Slido/ depart

Why worry about plant health?

- Overall value to UK of plants and trees is ~£15.7 billion pa
- Value of agricultural and horticultural crops is ~£4.1 bn pa
- Forest industries are worth £0.7 bn
- Plants have ecosystem and societal value
- Your reputation has a value!

$\underline{\sf Home} > \underline{\sf Environment} > \underline{\sf Rural}$ and $\underline{\sf countryside} > \underline{\sf Forests}$ and $\underline{\sf woodland} > \underline{\sf Plant}$ biosecurity strategy for Great Britain (2023 to 2028)		
Department for Environment Food & Rural Affairs	Forestry Commission	<u>Scottish</u> <u>Government</u>
<u>Welsh</u> Government		

Policy paper **Plant biosecurity strategy for Great Britain (2023 to 2028)**

Published 9 January 2023

Applies to England, Scotland and Wales

Four desirable outcomes of the new GB Plant Biosecurity Strategy:

- A world class biosecurity scheme
- A society that values healthy plants
- An enhanced technical capability
- A biosecure plant supply chain Plant Healthy/ raise biosecurity standards and showcase best practice

Link between emerging diseases and the plant trade

A few Phytophthora facts

- Phytophthora means 'plant destroyer'
- > 190 species described worldwide on broad range of hosts
- Oomycetes 'water molds' spread via free swimming zoospores
- Mainly infect plants through roots but some species also infect stems and foliage
- Borne in water and soil can persist in soil
- These pathogens love plant nurseries!

Forest Research

Strong link between outbreaks and trade

Crown copyright

A little bit about our research projects

• Sampled 17 UK nurseries 2016-2022

orest Research

- Identify Phytophthora pathogens using DNA and baiting
- Linked findings to management practices

Nursery sampling

- 2-5 visits per nursery over 2-3 yrs
- Sampled water and roots
- >3000 samples collected from ~150 host plant species
- 50% Phytophthora positive

Water baiting for Phytophthora

We found lots of Phytophthora!

- Phytophthora abundant in UK
 nurseries
- Over 65 Phytophthora species
- All 17 nurseries had *Phytophthora* – more some than others!
- Damaging pathogens, quarantine pathogens, rare pathogens and new UK records

Nurseries with higher levels of biosecurity which;

- Do not import live plants
- Have quarantine holding areas
- Use disinfestation mats
- Have significantly fewer;
- Common Phytophthora species
- Invasive species
- Species rare in the wider UK environment

Higher risk nurseries

Of highest risk:

- Smaller, lower turnover ornamental nurseries that;
- Use open/untreated water supplies
- Import live plants

These nurseries had more;

- Diverse Phytophthora communities
- Recent invasive species (ie P. austrocedri)
- Rare species not yet widespread in the UK environment

High risk hosts for Phytophthora

18/10/2023

Good practice works!

 Management practice is effective in limiting or even eliminating pests and pathogens

Four priority nursery practices that can be improved:

- Not seeing signs/symptoms of ill health in plants
- Irrigating plants with pathogens and allowing water to spread pathogens around plant stock
- Pathogens proliferating in waste piles
- Putting plants into contaminated growing media

Recognising and acting on symptoms of ill health

(Sarah Green, Forest Research)

Common indicators of infection

Pale or chlorotic foliage

Brown patches

Desiccation

Locating bark infections

Bacterial wilt and gummosis

Crown copyright

Signs to look for with insect pests

- Galls
- Exit holes
- Frass
- Leaves with holes!

Poor root health

- Phytophthora root infections in newly arrived imports from continental Europe
- Waterlogging leads to infection
- Raise plants off the ground

Poor root health

Monitor your landscaping trees

Crown copyright

- Be observant and monitor stock regularly
- Know what a healthy plant should look like!
- Remove any sick plants from main stock
- Waste should be located on hard standing away from growing stock, hedgerows, woodlands or water courses
- Know your supplier
- Check newly arrived stock thoroughly, quarantine holding area
- Talk to all staff about plant health and biosecurity

How to get a diagnosis

Quarantine concerns

SASA is the competent Plant Health Authority for Scotland

Non-quarantine concerns

- For trees in forest and horticultural nurseries Forest Research <u>https://treealert.forestresearch.gov.uk/</u>
- <u>Water Bait Test (Phytophthora and Pythium) (fera.co.uk)</u>
- RHS offers diagnostic services to members

Water management

(Debbie Frederickson-Matika, Forest Research)

Use clean water!

- Watch out for sources of contamination!
- Mains or borehole water = low risk
- Open reservoir, river or recycled water all contained multiple Phytophthora pathogens
- Water treatment required

River sample used to irrigate stock had 8 Phytophthora species:

Phytophthora chlamydospora Phytophthora gallica Phytophthora gonapodyides Phytophthora lacustris Phytophthora pseudosyringae Phytophthora riparia Phytophthora rubi Phytophthora syringae

Partner nursery example

- Sourced water from small
 reservoir fed by stream
- Irrigation water contained 11
 different Phytophthora species
- Installed borehole following project engagement

Forest Research Forest Research recycled and rain water

45 18/10/2023

Sodium hypochlorite treatment

46 18/10/2023

- Do not overwaterstop run-off!
- Place containerised plants on free-draining surface, ideally raised above the ground
- Improve drainage to prevent puddles forming

Puddles spread pathogens!

A single puddle sample had 12 Phytophthora species:

Phytophthora austrocedri Phytophthora bilorbang Phytophthora chlamydospora Phytophthora cryptogea Phytophthora gallica Phytophthora gonapodyides Phytophthora hibernalis Phytophthora inundata Phytophthora megasperma Phytophthora plurivora Phytophthora pseudosyringae Phytophthora syringae

Promote general cleanliness

- Cover your clean water!
- Hang hoses/nozzles above ground
- Keep your irrigation system clean

Promote general cleanliness

- Clean and disinfect pots, trays and tools
- Clean and disinfect Mypex
 surfaces between batches
- Reduces potential for water contamination

Waste management

(Sarah Green, Forest Research)

Waste management: the bad and ugly

Crown copyright

18 different *Phytophthora* species detected in waste piles

orest Research

- 8 species baited into live culture including P. ramorum from 2/3 nurseries tested
- These sampled piles are located next to hedgerow trees <u>and</u> streams
- Dumping presents <u>very high risk of</u> disease spread into wider landscapes

Waste management: the good

- One nursery had NO Phytophthora in their waste piles
- Operates to very high biosecurity standard
- Low risk of infected waste plants
- Has an effective on-site
 composting system for waste

Waste management: the options

- Minimise waste and risk of infected waste material by growing healthy plants
- If a notifiable pest/pathogen seek advice from SASA
- If non-notifiable waste then there are four main options:
- On site composting
- Incineration
- Disposal to landfill
- Removal to commercial composting facility

On site composting

- For legislation around on-site composting contact SEPA
- Unless the composting system is accredited (UK Compost Certification Scheme) to PAS100 level it remains a 'waste'
- 'Waste' can only be used again on the same premises
- EPPO recommend at least 40% water content and continuous 55C for 2 wks with minimum number of turns

Incineration with licence

- Good for small quantities of relatively dry diseased material
- Contact SEPA for exemptions

Disposal to landfill

• Expensive and may be banned in future

Removal to commercial certified (BSI PAS100) composting system

- Effective and environmentally sustainable
- Subject to gate fees (£30-£60 per tonne) plus haulage costs

Our research into some plant health risks from peat-free growing media and recommendations

(Debbie Frederickson-Matika, Forest Research)

Peat-free alternatives

Crown copyright

Analyses of peat-free growing media

 Peat-based growing media being phased out

rest Research

- 'Rush' for alternatives to peat
- Tested 36 samples of peat free growing media for Phytophthora
- Included commercial products and key individual constituents (chopped bark, coir, recycled coir, composted green waste, industry mixes)

- No living Phytophthora was isolated by baiting, but DNA from 11 species detected in samples of peat-free growing media
- Included Phytophthora bisheria in recycled coir from NL
- Seven species of Pythium, Phytopythium and Elongisporangium, including four species not previously reported in the UK, were baited into live culture

Management of growing media

- Ask your supplier what's in it? and how is it processed?
- Can they guarantee it is pest and pathogen free?
- Avoid any product containing recycled material
- Store growing media in a clean, dry, covered space
