Uredinales of the Southern Ryukyu Islands¹⁾

By

Naohide HIRATSUKA* and Shun-ichi SHIMABUKURO**

The Southern Ryukyu Islands designated in the present paper include the two island-groups; Miyako and Yaeyama. Miyako island group consists of the following islands: Miyako, Ikema, Kurima, Irabu, Shimochi, Tarama, Minna and Ogami, of which the island of Miyako is the largest. Miyako lies to the southwest of Okinawa being separated about 250 km. from the latter by open sea which attains a depth of more than 1,000 meters. Yaeyama island group consists of the islands: Ishigaki, Taketomi, Kohama, Kuroshima, Aragusuku (Kamiji and Shimoji), Hateruma, Iriomote, Hatoma and Yonaguni. Besides these islands, there are a few uninhabited islets, namely Senkaku-Retto, Kayama-jima, Nakami-ugan, and others. The principal islands of Yaeyama island group are Ishigaki and Iriomote. The former is located on the eastern side of the Yaeyama group, at a distance of 436 km. from Naha port on Okinawa and 144 km. from the island of Miyako. Iriomote Island lies nearly the center of the Yaeyama group.

The first account of rust fungi from the Southern Ryukyu Islands was presented by the senior author (1) in 1936. He recorded *Phakopsora Ehretiae* Hiratsuka on *Ehretia Dicksonii* Hance. var. *japonica* Nakai, based upon a specimen collected by Tetsuo Miyagi on Ishigaki Island. In 1954, the present authors (2) reported 8 genera and 17 species of rust fungi from the Southern Ryukyu Islands in a paper, entitled, "Uredinales of the Ryukyu Islands."

Since August 1953, the junior author has made two trips to the islands of Miyako and Ishigaki and one to Iriomote for the purpose of collecting rust fungi. Furthermore, Masao Tamori spent about a month on Ishigaki in the summer of 1954 for the same purpose, under the direction of the junior author. The whole number of specimens collected by the junior author and Tamori is some 300.

As shown in the table, there are 14 genera and 69 species including 12 species of the two form-genera, *Aecidium* and *Uredo* which are now known from the Southern Ryukyus. Among them, the following six species are considered new additions to the rust-flora of the Japanese Archipelago. They are: 1) *Hapalophragmium Derridis* Sydow, 2) *Uromyces orientalis* Sydow, 3) *Puccinia Curculigonis* Raciborski, 4) *Endophyllum Griffithiae* (P. Henn.) Raciborski, 5) *Aecidium hornotinum* Cummins and 6) *Uredo sinensis* Trotter.

The specimens studied are all kept in the Hiratsuka Herbarium, Tokyo, Japan, with duplicates deposited in the Herbarium of University of the Ryukyus.

The authors are indebted to Mr. Masao Tamori for collecting some valuable specimens. The expenses of the present work have been defrayed from a Grant in Aid for Developmental Scientific Research of the Department of Education (Tokyo, Japan), and from a Grant in Aid for Scientific Research by the University of the Ryukyus.
