PREFACE

This publication was written for the purpose of taking stock of what has been published so far on European polypores. Considerable time was spent in surveying the literature. Once I realized that a really exhaustive survey would take too much of my time I halted it rather abruptly; during the last few years I limited myself as far as this project was concerned to editing the collected data and implementing the manuscript with such additions and corrections as had been encountered in the daily routine.

I wish to make it quite clear that from the start I never had any intention of going beyond the very first steps necessary for the preparation of a monograph. No taxonomic revision at either the specific or any other level was aimed at. The taxonomic basis presented in the main section of this publication is not a critical one; it simply reflects what judging from the experience gained during many years of intermittent attention to polypores in general I thought to be reasonably up-to-date. Many innovations, or at any rate alterations, could have been worked into the arrangement of the species but I deliberately restricted myself to an arrangement that I regard as a somewhat conservative presentation of what had previously been accomplished in this field—in Europe. “In Europe” is added to emphasize one of the principal weaknesses of the taxonomic arrangement I adopted. This arrangement has been built up by authors who for the most part have only a negligible critical knowledge of the polypores growing outside Europe, a continent relatively poor in species of this group. It is about time that European taxonomists ceased thinking that the taxonomy of the polypores can be worked out completely with knowledge of only a small percentage of species of the group as a whole. This is not to say that the ‘European’ scheme of classification will be of no use at all in accommodating extra-European species; even though it is inadequate, at the same time it appears to be a useful frame both for reference and for correction and additions. Except for notable exceptions in connection with cultural characters, mainly of species from temperate North America, it must be admitted in all fairness that mycologists outside Europe have scarcely even begun to take a share in advancing the classification of the polypores.

In several instances I could have entered fresh results, but this again did not agree with the primary intention. What was more important was to deliver a basis for future work by consulting and checking the literature, and also to reassess the various components that make up the more complex protogues of revalidated names. During these activities I encountered a complaint dating from as long as 150 years ago that revealed that a failing common to many a modern author is of long standing:

"The practice of accurately examining the synonyms, instead of copying them from other authors, has been too long neglected" (Purton, App. Midl. Fl. 335. 1821). This failing has culminated in a number of errors and puzzles in references in some of the much used European publications that is really stupendous.

The group of fungi indicated in the title of this book as the 'polypores' coincides almost completely with what remains of the Friesian conception of the "Polyporei" after the exclusion of the Boleti and the meruloid and cyphelloid elements and after the addition of a sprinkling of species taken from such genera as *Irpea*, *Lenzites*, and *Sistotrema*. Nowadays almost without exception specialists agree that the polypores, even with the foregoing restrictions, are still a strongly mixed group of similar life forms based on a few features only, the principal ones being the presence of holobasidia and a more or less tubulose hymenophore with sterile edges of the tube-dissepiments.

At present I am prepared to distribute the polypores over seven families, of which one, the Polyporaceae sensu stricto, contains the large majority of the genera.¹ The restricted family of Polyporaceae is still a thoroughly heterogeneous assemblage and includes a number of artificial genera (at any rate as delimited on this Check list) that have not as yet been broken up satisfactorily: *Albatrellus*, *Fomitopsis*, *Poria*, *Trametes*, and *Tyromyces*. Some of the genera of the Hymenochaetaceae (like *Inonotus* and *Phellinus*) also represent groups that are too broadly conceived.

As to the composition of the Check list proper, it will be seen that in the separate entries of the taxa the purely nomenclative are kept apart from the rest, which aims at providing a key to the current conception and further knowledge about each of the taxa. Only generic and specific names are taken into consideration (save for indispensable exceptions). The generic names are mostly treated more summarily, partly in anticipation of a review of the genera that is in preparation. Most of the pertinent nomenclative information has already been dealt with in a series of previously published papers primarily concerned with this kind of information (in particular, Donk, 1960, 1962).

The appended "Notes" differ in tenor from those that preceded them in a series of separately published papers (Donk, 1966a, 1966b, 1967, 1969a-c, 1971a-c, e, 1972a-c). While the earlier notes attempted to clarify some of the conclusions that entered into the shaping of the Check list, the notes that are offered in the present publication for the most part draw attention to various problems requiring further study.

The "List of omitted names" has expanded to unexpected length. It contains mainly nomina dubia and not validly published names but also such names as have been reduced to the synonymy of the 'admitted'

¹ Compare also M. A. Donk (1964), A conspectus of the families of Aphyllophorales, in Persoonia 3: 199-324.

names on the Check list proper but that for one reason or another had to drop out. The "Index" makes it possible to trace presumed or now rejected connections of the 'omitted' names with those 'admitted'.

Fossils have not been taken into consideration. A few papers dealing with them are listed in the bibliography (Bondarcev, 1960; Kirchheimer, 1942).

This registration of names is not intended to assign to them any status under the "Code" other than the one they had before this publication appeared.

ACKNOWLEDGEMENTS.—Since much of the composition of this book consisted of checking literature, a special word of thanks is extended to Librarians. Of these Mr. L. Vogelenzang and his staff of the Rijksherbarium, Leiden, deserve first mention. Other libraries consulted were those of the British Museum (Natural History), London; of the Herbarium, Royal Botanic Gardens, Kew; of the New York Botanical Garden; of the National Fungus Collections, Beltsville. During my stay in the U.S.A., while enjoying a National Science Foundation Senior Scientist Fellowship at the Department of Botany, University of Tennessee, I received extensive help from the Librarians of that Department. To all of them and to the institutes I express my gratitude.

It is not feasible to mention here all of the many mycologists and herbaria from which I received specimens or information. In many cases they have been mentioned individually in the appropriate places in this and former publications. However, it would be negligent were I not to make particular mention of Dr. J. L. Lowe, Syracuse, U.S.A. and Dr. H. Jahn, Heiligenkirchen, Germany.

I am indebted, as usual, to the constant help received from Dr. Elizabeth Helmer van Maanen for improving the English text of the introductory chapters, the "Notes", and the "List of omitted names".

Note—Long after the manuscript of this work had been accepted for publication, it became apparent that some of the technicalities proposed by the late author could not be realized. The undersigned takes responsibility for possible ambiguity resulting from economy in printing.

Dr. Donk left no instructions as to what should be included in the index of his work. Here again the necessity to economize dictated the adoption of an arrangement as explained on p. 452.

R. A. Maas Geesteranus

METHOD OF PRESENTATION

EUROPE

'Europe' is accepted in the traditional sense, without Greenland, but including Caucasia.

GENERIC NAMES

Generic names published before 1962 are listed without the usual references. Variant spellings are not mentioned. For these and other nomenclative details the series "The generic names proposed for Hymenomycetes"² should be consulted, particularly "The generic names proposed for Polyporaceae" (Donk, 1960, 1962). Instead of the usual bibliographic citations references to the treatment of the generic names in this series are added between square brackets.

EXAMPLE.—"PIPTOPORUS P. Karst. / 1881 [1960 (Pe 1): 257]. — Lectotype: *Polyporus betulinus* (Bull.) per Fr." is an abbreviated form of

PIPTOPORUS P. Karst. 1881 (for place of publication and other nomenclative details, see Donk in Persoonia 1: 257. 1960). — Lectotype (selection discussed by Donk, l.c.): *Polyporus betulinus* (Bull.) per Fr.

SPECIFIC NAMES

This Check list distinguishes between four kinds of specific names: (i) the *basionym* and (ii) the *recombinations* of its epithet, as well as (iii) the corresponding *new name(s)*, viz. substitute name(s) (name changes) replacing the basionym, including its epithet. These recombinations and substitute names form the *isonyms* of the (ultimate) basionym.

The last category is (iv) the *non-isonymous synonyms* of a correct name, viz. names that when published were not (or not primarily) intended to replace a previously published name. Some of these may later prove to have based on the same type as another name, in which case they become obligate synonyms (typonyms).

Of a *correct* name the specific epithet is printed in bold face type, followed by the author's citation and the date of publication. Then, separated by a dash, come the basionym and/or the recombinations, as well as substitute names (preceded by the symbol ≡), in so far as they are devalidated names or have been validly published (provided no

² Parts I-IX, XII, XIII were brought together in a facsimile edition to which an "Index" was added (Verlag J. Cramer, 1966). "The generic names proposed for Agaricaceae" (*in* Beih. Nova Hedw. 5. 1962) makes up Part XI of the series. "The generic names proposed for Polyporaceae" is Part X (1960) and Part XIV (1962); of the former there was a facsimile edition (Verlag J. Cramer).

qualification to the contrary is added); each is likewise followed by the author's citation and the date of publication.

Non-isonymous synonyms form separate entries. These entries are arranged in chronological order according to the date of the first-published specific combination—validly published or devalidated. Where nomina anamorphosium are listed these come after the names based on the perfect states.

Then, preceded by the indication "M.", there follows a selection of misapplications in such cases as these were thought to be worth mentioning at all.

REFERENCES

There are various kinds of references. Besides an occasional reference of a more customary type, one of these kinds consists of references comprising only a date not printed in italics. These references are not further elucidated or taken into consideration in the following explanation.

The dates are presumed to be the correct ones. Sometimes, where additional information has shown that a correction was necessary, they replace the dates in the publications themselves. In the reference '1959 (Ll 21): 105' the date in the publication referred to ["1958"] is not mentioned.

(i) REFERENCES CONSISTING OF A DATE NOT PRINTED IN ITALICS AND FOLLOWED BY ADDITIONAL INFORMATION.—In connection with this category a distinction is made between 'individually cited publications' (a) and 'serials' (b). The former are cited by date or by a date and a strongly reduced title, and where necessary the number of the volume, fascicle, &c., followed by the indication of such items as page, plate, figure, or, in the cases of exsiccati of series with 'printed' labels, of number ("No."). Titles of 'serials', including periodicals and journals, are abbreviated to no more than three letters and are usually followed by the number of the series (except for the first series) and the volume, all between brackets. In other respects the same pattern as in (a) is adhered to. Where alternative pages are mentioned, the second is that of the reprint.

The abbreviated titles are listed and elucidated by their more usual, less strongly abbreviated form in the Chapter "Strongly reduced bibliographic references".

EXAMPLES.—

(ia): Bull. 1786: pl. 312 = Bull., Herb. Fr. pl. 312. 1786.

(ia): Bull. 1791 H.: 348 = Bull., Hist. Champ. Fr. 348. 1791.

(ib): Bres. 1897 (AAR III 3): 78 = Bres. *in Atti I.R. Acad. Agiati [Rovereto]* III 3: 78. 1897.

(ii) REFERENCES TO TITLES LISTED IN THE "BIBLIOGRAPHY OF SPECIAL LITERATURE."—These are in the form of *dates printed in italics*.

Authors cited in combination with references in the form of year-dates

in italics are not always entered on the list of abbreviations of authors' names. Their initials can be traced from the "Bibliography of special literature".

I wish to emphasize that every reference not followed by '(n.v.)' has been checked. This also applies to those references that consist of a date only ('1846'), i.e. without any further indication of place of publication.

COMPOSITION OF ENTRIES

To each entry of a correct specific name or of a non-isonymous specific synonym at least one reference to a description is added. If there is not more than one such reference this indicates that I know of no improved description or illustration. Usually this one reference is to the original description or the protologue of the name. If for some reason the original account was thought somehow to be useful a reference to it is given separately, following the nomenclative information.

The one or more references following the nomenclative information about an entry and separated from it by a dash (—), are such as I consider to be of a certain importance to the knowledge of the taxon or to its recognition. These are arranged in chronological order and usually refer to the more representative descriptions and illustrations of the taxon, and occasionally also to notes on other subjects, such as nomenclature, distribution, and cytology. The descriptions and notes referred to are not necessarily reliable. They may for instance have been drawn up for a too-inclusively conceived taxon. They may even represent misconceptions that have so far not been recognized as such. Sometimes they contain only a minor addition to previous knowledge of the taxon, but in that case very little is known about the latter and the information may conceivably be of some use to future workers.

These references are nearly always followed by a generic or specific name between brackets. This was added to indicate the specific or infra-specific name under which the matter referred to was published, usually without repetition of the corresponding epithet. In cases where the same name would have followed two or more consecutive references it has been placed only after the last of the series, and where it is the same for all references as the name given at the beginning of the entry it has been deleted. In the case of homonyms the swung dash (~) avoids repetition in full of the preceding name minus the author's citation.

EXAMPLE of an entry of a correct name.—

"*grisea* (Peck) Bond. & S. 1951 (17-19). — *Polyporus* Peck 1873, 1874 (U.S.A., New York), not ~ Bres. 1912, not ~ (Wint.) Pilát (n.v.p.); *Scutiger* Murrill 1903. — Lloyd 1911 (LMW 3, 0.): 78 /s. 499, 500; Lowe 1942: 35; Overh. 1953: 228 pl. 168, pl. 130 fig. (*Polyporus*); Malenç. 1956 (BmF 71): 272 (*Boletopsis*)" is to be read as follows:

Boletopsis grisea (Peck) Bond. & S. 1941 (see notes 17-19). — Synonyms: *Polyporus*

griseus Peck 1873, 1874 (basionym; type locality, U.S.A., New York State), not *Polyporus griseus* Bres. 1912, not *Polyporus griseus* (Wint.) Pilát (not validly published); *Scutiger griseus* (Peck) Murrill 1903. — Description, illustrations, &c.: Lloyd, Mycol. Writ. 3 (Syn. Sect. Ovinus Polyp.): 78 *fs.* 499, 500. 1911 (as *Polyporus griseus*); Overh., Polyporac. U.S., Alaska & Canada 228 *pl.* 168, *pl.* 130 unnumbered figure (as *Polyporus griseus*); Malenç. in Bull. Soc. mycol. Fr. 71: 272 (as *Boletopsis griseus*).

A reference will often be found at the end of the first member of an entry. This is to the author who reduced the name to synonymy. He may not have been the first to do so. There are various reasons why the citation of a later author may be preferable; he may have seen the type or have recently studied it microscopically. If such a reference fails to mention the taxon to which a name is reduced this indicates that the name had already been reduced to the name considered to be correct (in one of its manifestations: basionym or one of its isonyms). In other cases the name of the taxon is mentioned specifically.

EXAMPLES of entries of non-isonymous synonyms:—

[*Chaetoporus collabens* . . .]

"*Polyporus emollitus* (Fr.) Cooke 1878; fide Bres. 1897 (AAR III 3): 82 = *Poria blyttii* [sensu Bres.]." is to be read as follows:

Polyporus emollitus (Fr.) Cooke 1878; fide Bres. in Atti I.R. Accad. Agiati, Rovereto III 3: 82. 1897 = *Poria blyttii* in Bresadola's conception in the cited work.

[*Coriolus hirsutus* . . .]

"*Polyporus cinereus* Lév. 1846 . . ., not ~ Schw. 1832; fide Bres. 1916 (Am 14): 223." should be read as follows:

Polyporus cinereus Lév. 1846 . . ., not *Polyporus cinereus* Schw. 1832; fide Bres. in Annls mycol. 14: 223. 1916 = *Polyporus hirsutus*.

NOTES

Numbers in bold-face type between brackets refer to the remarks assembled in the section "Notes".

SPECIAL LITERATURE

The references listed under this caption and following the generic name (and its synonymy) are to the titles in the Section "Bibliography of special literature". With a few exceptions these items deal *exclusively* with the subject, or part of the subject, for which they are cited.

ABBREVIATIONS AND MISCELLANEOUS

The following list does not mention the abbreviations of authors' names and titles of publications. These will be found in the Sections "Strongly reduced bibliographic references" and "Abbreviations of authors' names". The abbreviations below do not, however, include many of those that are in common use.

c.	<i>circa</i>
d.n.	devalidated name
descr.	description
<i>f., fs., fig.</i>	figure(s); <i>fig.</i> , unnumbered figure
Ind.	Index
M.	misapplication
No.	number, numéro, &c., especially used in connection with exsiccati series.
nom. altern.	nomen alternativum
nom. anam.	nomen anamorphosis
nom. conf.	nomen confusum
nom. monstr.	nomen monstrositatis
nom. nud.	nomen nudum
nom. prov.	nomen provisorium
<i>n.v.</i>	<i>non vidi</i> (not seen)
n.v.p.	not validly published
<i>pl., pls., plate</i>	plate(s); <i>plate</i> , unnumbered plate
ref.	reference
repr.	description reproduced in/by . . .
sp., spp.	species (singular, plural)
<i>tpl., tpls.</i>	text-plate(s)
→	= & see . . .
(0)	refers to the "List of omitted names".

Plates or figures not simultaneously published with the corresponding name are placed between square brackets.

In an attempt to correlate other authors' nomenclature with the nomenclature adopted in this publication, additions between square brackets are used freely. This avoids a search for the correct name via the "Index". It should be emphasized, however, that the use of the square bracket implies that the additions reflect my personal view and are not necessarily correct.

EXAMPLES.—"*Merulius [Phlebia] rufus*" means that the species called *Merulius rufus* by the author mentioned in connection with it I regard as belonging to *Phlebia*. — "*Polyporus subsquamulosus* [sensu Bres. = *Boletopsis griseus*]" means that in my opinion the taxon Bresadola called *Polyporus subsquamulosus* belongs to *Boletopsis grisea*.

The qualification of 'extra-European' often implies that the species involved has not been otherwise dealt with elsewhere in this publication.

CHECK LIST OF EUROPEAN POLYPORES

ABORTIPORUS Murrill

1904 [1960 (Pe 1): 175]. — Holotype: *Boletus distortus* Schw. — Cf. Donk 1971 (PNA 74): 1.

Irpicium Bref. 1912 [1960 (Pe 1): 231]. — Monotype: *Irpicium ulmicola* Bref. *Heteroporus* Lázaro 1916 [1960 (Pe 1: 223)]. — Lectotype: *Daedalea biennis* (Bull.) per Fr.

M.—*Daedalea* Pers. sensu Quél. 1886: 184 ("Pers.") emend. Pat. 1900: 95 → *Daedalea* Quél.

SPECIAL LITERATURE.—Boudier, 1888; O. Fidalgo, 1959b, 1964, 1969; Graff, 1939; Schulzer von Müggenburg, 1874, 1880a; de Seynes, 1888a, 1888b.

biennis (Bull. per Fr.) Sing. 1944 (1, 2). — *Boletus* Bull. 1789 (France) (d.n.); *Sistotrema* Pers. 1801 (d.n.); *Hydnnum* DC. 1805 (d.n.); *Daedalea* (Bull.) per Fr. 1821; *Hydnnum* Mérat 1821; *Sistotrema* S. F. Gray 1821; *Boletus* Purt. 1821; *Polyporus* Fr. 1838; *Heteroporus* Lázaro 1916; *Phaeolus* Pilát 1935. — Bull. 1789: pl. 449 f. 1; 1791 H.: 333; Sow. 1799: pl. 191 [referred to *Polyporus rufescens* by Fr. 1838: 433] (*Boletus*); Berk. 1836: 130; Gillet 1874–90 P.: pl. 265/476 (*Daedalea*); Seyn. 1888 P.: 55 pl. 5 fs. 4–16, pl. 6 (*Polyporus*); Bourd. & G. 1928: 526; Konr. & M. 1932 I. 5: pl. 447 (*Daedalea*); Donk 1933: 177; Pilát 1936–7 (ACE 3): 115 pls. 48–52; D. Reid 1958 (TBS 41): 434 f. 15, pl. 23 f. 2: Fid. 1969 (Ri 4): 127 fs. 1–17, 50, in part: var. *biennis* (*Heteroporus*). — Sensu Sow. → *Daedalea sowerbeii* Fr. (O), a not validly published syn. of the present sp.

Sistotrema rufescens Pers. 1801 (Germany) (d.n.). — *Hydnnum* Poir. 1808 (d.n.), not ~ Schaeff. 1774 (d.n.); *Polyporus* (Pers.) per Fr. 1821; *Sistotrema* Pers. 1825; *Daedalea* Seer. 1833, not ~ (Lázaro) Sacc. & Trott. apud Trott. 1925; *Trametes* Fr. 1849 (n.v.p.³), Otth 1860; *Polystictus* P. Karst. 1882; *Spongiosus* Torrend 1924. — Pers. 1803 I.p.: 14 pl. 6 (*Sistotrema*); Berk. 1860: 238; Fr. 1874: 529 (*Polyporus*); Bres. 1931 (BIm 20): pl. 958 (*Polyporus biennis* var.). — Sensu Rostk. 1828 (StP 4): 17 pl. 7 = *Onnia*

³ When Fries (1849: 322) published the new combination *Trametes rufescens* he gave no description and only one reference, "B. n. 130." This is apparently an error to be corrected into 'B. 130' = 'Berk. 1836: 130' where *Daedalea biennis* is described but without any direct or indirect reference to *Polyporus rufescens* (Pers.) ex Fr. In my opinion this makes the name *Trametes rufescens* of Fries a nomen nudum, with a reference to a taxonomic synonym rather than to the 'basionym'.

sp., fide Fr. 1832^{Ind.}: 148 = *Polyporus [Onnia] tomentosus*; sensu Buller 1922 = *Abortiporus distortus* (extra-European) (0).

Poria terrestris Pers. 1805 (France?) (d.n.); fide Bourd. & G. 1925 (BmF 41): 153 (forma). — *Boletus* DC. 1815 (d.n.), misapplied; *Polyporus* (Pers.) per Fr. 1821, in part; *Physisporus* Chev. 1826; *Boletus* Spreng. 1827; *Poria* Cooke 1886, Quél. 1886, misapplied, not ~ Bourd. & G. 1925. — Pers. 1805 I.p.: 35 pl. 16 f. 1 (*Poria*); sensu Bourd. & G. 1925 (BmF 41): 153 & 1928: 577 (*Daedalea biennis* f.); & cf. Polyporus megaloma Lév. 1846 (ASn III 5): 128 (U.S.A., New York)

⁶ Kotl. & P. 1971 (ČM 25): 88, 99 thought that the possibly oldest name given to *Ganoderma adpersum* could be *Polyporus stevenii*. I am convinced that this is not the case. The colour of the cap as rendered on the plate is a diluted café-au-lait and comes near to that of the form of *G. appplanatum* that has been called *Polyporus leucophaeus* Mont.

(39); fide Atk. 1908 (Am 6): 189 = *Ganoderma lipsiense*; fide Bres. 1912 (H 53): 54 (*Ganoderma leucophaeum* cited as a syn.); fide Overh. 1953: 99. — *Fomes* Cooke 1885; *Scindalma* O.K. 1898; *Elvingia* Murrill 1903; *Ganoderma* Bres. 1912. — Murrill 1903 (BTC 30): 300 (*Fomes*).

NOTES

Abortiporus

(1). The European species *Abortiporus biennis*, which is perhaps not specifically different from its North American counterpart *A. distortus* (2), in more than one respect shows an astonishing range in variation. The configuration of the hymenophore is so variable that the species was repeatedly described as new during the period that highly artificial definitions of the genera of Hymenomycetes were still accepted; the so-called novelties were accommodated in *Polyporus*, *Daedalea*, *Sistotrema*, *Irpea*, and *Hydnus*.

Above all, the range of variation of the shape of the fruitbody is perhaps unmatched among the polypores. As remarked by Bourdot & Galzin (1928: 576): “*D[aedalea] biennis* est si variable qu'il n'y a pas de forme qui lui soit propre: stipité infundibuliforme, à chapeaux libres ou connés, spathuliforme ou sessile flabellé, dimidié, imbriqué. Nous [avons trouvé des] formes plus ou moins résupinés, à hyménium supère, dans lesquelles l'espèce est plus difficile à reconnaître.” They described the most reduced form (*Poria terrestris* Pers.) as “étalé interrompu, mince, formé de pores oblongs, tendres et fugaces . . .”!

Moreover the species produces secondary spores. In north-western Europe these are sometimes almost (but perhaps never completely) absent in the ‘normal’ hymenium of well-developed stalked fruitbodies. The opposite extreme is that they are formed profusely in fruitbodies of their own. These are quite different from typical basidiferous ones and have been placed in the genera for imperfect states *Ceriomyces* (0) or *Ptychogaster*. In this case, too, all gradations between the extremes may be met with. Somewhere in between perfectly ‘mixed’ fruitbodies result. Since it would seem forced to consider the production of the secondary spores as an ‘abnormal’ condition in the basidiferous fruitbody I have abstained from drawing a line between ‘normal’ basidiferous fruitbodies and those in which a more advanced production of secondary spores is to be found.

(2). It is now common practice to include *Abortiporus distortus*, described from North America, in *A. biennis*, whether or not as a distinct variety with its own geographical distribution. It seems to differ in the somewhat smaller pores; perhaps also in the less wide range of variation of the shape of the fruitbody; and in not producing typical (imperfect) *Ptychogaster* states in nature. Overholts (1953: 224–226) merely stated “chlamydospores often present in distorted forms”. His remark that “a ptychogastric form is known in Europe under the name *Ceriomyces terrestris* Schulzer” strongly suggests that such a form was not known to

him from North America. Fidalgo (1969: 162) made a similar remark; he regards *A. distortus* as a variety and calls it *Heteroporus biennis* var. *flabelliformis* ("Mont.") Fid. As pointed out by Donk (1971a: 2), this is a misapplied name. Fidalgo stated that in this taxon "abnormal forms corresponding to those of the extra-American variety [= *Abortiporus biennis*] were not found, neither have imperfect forms ever been recorded." On the other hand in North America monstrous fruitbodies may reach considerable dimensions in the form of more or less spherical balls (Buller, 1922a). These are apparently not a chlamydosporous imperfect state; at any rate so far nothing to suggest the contrary has been written. Such fruitbodies are the basis of *Polyporus abortivus* var. *subglobosus* Peck. Although at the moment I have no overriding reason for doubting the specific identity of the two I have not entered either *A. distortus* or the synonyms based on material from the two Americas referred to it under *A. biennis*. These will be found in the "List of omitted names".

In addition to the synonymy related to *Abortiporus distortus* it will be noticed that names based on all other extra-European collections are also omitted from the synonymy of *A. biennis*. This is because our knowledge of *Abortiporus* in the palaeotropics and the regions south of them is still poor. Careful microscopical examination is needed to avoid confusion with *Diacanthodes novo-guineensis* (P. Henn. apud Schum. & Hollr.) Fid. For this reason the names *Polyporus platyporus* Berk. (O), *P. anthelminthicus* (O), *P. proteiporus* (O), and *Ptychogaster rufescens* (O) are omitted.

Albatrellus

(3). Niemelä (1970) recorded *A. syringae* not only from its type locality in Estonia but also from Finland and Sweden. The several habitats he mentioned suggest that the relation with *Syringa* is merely incidental. After careful comparison with the North American counterpart, *A. peckianus*, he concluded that the two should be kept apart as distinct species, although the differences appear rather trivial and may prove to be of questionable importance. He overlooked a paper by Malençon (1966).

Malençon described a fungus from Tirol that he considered probably identical with *Polyporus [Albatrellus] peckianus*. Comparison of the description and figures with the specimens of the same collection of *A. peckianus* studied by Niemelä (Canada, Quebec, leg. J. H. Ginns 1336) seems to indicate a remarkable degree of likeness. A few items (like spore size and colour of cap) however suggest instead that the Tirolean collection should also be referred to *A. syringae*.

Antrodia

(4). *Antrodia* is the same genus as *Coriolellus* as defined by workers primarily interested in cultural characters (Sarkar, 1959b). As Sarkar

defines it the group would appear to be homogeneous, but recently doubt has been raised as to the constancy of some of the characters she emphasized. One of the main features of the genus is the presence, among other things, of a certain type of thick-walled hyphae that are differentiated to form nodose-septate hyphae with irregularly thickened walls or with scattered thick-walled, refractive areas on walls (code symbol 9 of Nobles, 1945: 1107). This type of hyphae is most readily observed in cultures and often not easily demonstrated in dried fruitbodies (5). Sarkar described both the irregularly thickened walls and the refractive projections on them for *Coriolellus* [*Antrodia*] *malicola* as well. Domański (1966c: 608) was unable to observe them in any of his strains, including two used by Sarkar. This species and *A. ramentacea* have been found to be homothallic, in contradistinction to the other species more closely investigated in cultures; those appeared to be heterothallic and bipolar (Sarkar, 1959b and Domański, 1966c for *A. malicola*; Domański, 1969a for *A. ramentacea*). It should be remarked however that in a later publication, when contrasting *Antrodia* with *Diplomitoporus*, Domański (1970b: 206) categorically attributes to *Antrodia* "the bipolar type of interfertility".

Aoshima (1967) transferred all of the species of *Coriolellus* studied more extensively except one to *Daedalea* sensu stricto by emphasizing the thickened generative hyphae with clamps and irregular thickening of the walls (5). In my opinion this implies an underrating of certain characters of the fruitbody. I am not prepared to follow him in this respect. The exception alluded to is *Poria* [*Antrodia*] *sinuosa* (10), which Sarkar has found to be a species sharing all the characters deemed essential for the genus *Coriolellus* except that its small, allantoid spores are a unique feature within the genus.

In *Antrodia serialis* the hyphal construction of the fruitbody is described by Sarkar (1959b: 1259 f. 29d) as somewhat more complex than in the other species; she reports that in the trama of the dissepiments of the tubes the skeletals "are frequently branched and contorted". These look like 'binding hyphae' and would make the context trimitic, but in my opinion this is an insufficient reason for the introduction of a distinct genus.

(5). The occurrence of clamped and irregularly thick-walled generative hyphae mentioned under (4) is not restricted to *Daedalea quercina* and *Antrodia*. This feature is best observed in cultural mats. It has been found to be widely distributed among polypores and at present there is no strong evidence that it is *per se* indicative of close relationship. In her latest paper Nobles (1971: 180, 182, 183) listed the character (her code symbol 9) for both 'oxidase-negative' and 'oxidase-positive' species. In the former category she listed under her Key Code 1.3.8.9 *Fomes* [*Fomitopsis*] *Cajanderi*, *Daedalea quercina*, six species of *Coriolellus* [= *Antrodia*] inclusive of *C. [A.] malicola* (4), *Poria placenta*, *P. xantha*, and *P. alpina* (perhaps not correctly identified), as well as two extra-

European species, "*Polyporus*" *durus* Jungh. and "*P.*" *lilacino-gilva* Berk.; and under her Key Code 1.3.9 (hyphae differentiated to form 'fiber hyphae' lacking), *Osteina obducta*, *Poria oleracea*, *P. placenta*, *P. sericeomollis*, *Tyromyces* [*Poria*] *albo-brunneus*, *T. stipticus*, *T. tephroleucus* [= ?], and *T. undosus*.

In the other category ('oxidase-positive') she listed *Skeletocutis amorphus*, *Polyporus* [*Tyromyces*] *albellus* [= *T. chioneus*], *Climacocystis borealis*, three species of *Poria* referable to *Incrustoporia* (*P. stellae*, *P. subincarnata*, *P. tschulymica*), as well as *Leptotrimitus* [*Incrustoporia*] *semipileatus* and the extra-European *Poria odora* (Peck) Sacc.

This kind of hyphae is very much in evidence in the fruitbodies of *Osteina obducta* and "*Tyromyces*" *undosus*. The introduction of the genus *Cartilosoma* (based on "*Trametes*" *subsinuosa*) was largely but indirectly induced by this kind of hyphae in the fruitbody; its type species appears on this Check list as *Antrodia ramentacea*.

These observations tend to stress the necessity for caution. When hyphae of this kind are used by the taxonomist to aid in the delimitation of generic taxa they should be strongly supported by other characters as well. In this connection see also some remarks on *Incrustoporia* (Donk, 1971b: 37).

(6). The core of *Antrodia* is a complex whose exact limits and the probable ranks of whose constituent taxa are as yet insufficiently understood. It consists of *Antrodia serpens*, *A. albida*, and *A. heteromorpha*, all three described by Fries from Sweden, and of *Trametes sepium*, described from North America. In his last comprehensive work Fries (1874) placed both his cap-producing species in *Lenzites* (which implies that well-developed fruitbodies tend to form a lamellate hymenophore); one (*A. albida*) was thought to grow on frondose wood, the other (*A. heteromorpha*) on coniferous wood. The third of Fries's species (*A. serpens*), with resupinate fruitbody and growing on frondose wood, was referred to *Trametes*.

Scandinavian authors like Jørstad [1937 (KnS 1936¹⁰): 31 fs. 7-9] and Lundell [1941 (LNF 21-22): 6 No. 1011a] thought that *A. heteromorpha* also occurred on frondose wood and suggested that the true *A. albida* might be no more than a form of *A. heteromorpha*. In this connection, however, it may be recalled that Bourdot [1932 (BmF 48): 227] did not identify true *A. heteromorpha* from Sweden with what he had previously called *Trametes albida*, of which he had studied numerous collections from France. This could be taken as an indication that *Trametes albida* sensu Bourd. is not the same species Jørstad and Lundell had in mind. Other authors think that *A. serpens* and *A. albida* are not specifically different and maintain the two as infraspecific taxa (7). As to *Trametes sepium*, it has been either maintained as a good species or reduced to the synonymy of *A. albida*. Finally, *Trametes salicina* Bres., with resu-

pinate fruitbody on frondose wood and relatively small pores, has also been included in this complex by some authors but Domański (1966c: 607) compared it with *Coriolellus [Antrodia] malicola*.

If all, or some, of the above-mentioned taxa are really to be treated as good species it is fundamental to work out 'new' characters that are more reliable than the 'old' ones. This will be by no means an easy task. To give an example of the difficulties ahead Sarkar (1959b: 1258) differentiated *Coriolellus [Antrodia] sepium* (8) by "Cystidioles present: basidia usually with four, but occasionally with two sterigmata with definite thickening of the walls at the base of some basidia and cystidioles . . ." from *Coriolellus [Antrodia] heteromorphus*, "Cystidioles absent; basidia consistently thin-walled with four sterigmata . . ." Yet Domański (1965b: 183 f. 63) depicts not only cystidioles for *C. heteromorphus* but also somewhat thick-walled basidia and cystidioles.

While awaiting renewed studies in this group I have retained all the above-mentioned taxa as distinct species. *Trametes sepium* is treated as a doubtful European species for which descriptions based mainly on North American material are cited. It seems to be close to *A. albida* sensu Bourd. & G. from southern Europe.

In connection with *Antrodia albida* all references to descriptions based on Eastern Asian material have been left out [Imaz. 1939 (JJB 15): 302 /s. 1, 2; S. Ito 1955: 227 f. 175; &c. (*Trametes*)] and also possible synonyms based on material from Japan: compare *Coriolellus kusanoi* (0), *Irpiciporus tanakae* (0), *Lenzites yoshinagae* (0), and *Daedalea kusanoi* Murrill sensu Lloyd (0).

(7). Should *Antrodia albida* and *A. serpens* be considered conspecific it would appear that the correct name (or its basionym) is *Trametes [Antrodia] serpens*. As far as I am aware, of the two specific names involved and simultaneously validly published the one first reduced to a synonym of the other is *T. albida*; Bourdot & Galzin (1925: 167) made *T. albida* a subspecies of *T. serpens*.

(8). European mycologists often consider *Trametes sepium* to be merely a synonym of *Antrodia albida* but the correct interpretation of the latter species is still rather doubtful (6, 7). It is not unlikely that *A. albida* itself (exclusive of *Trametes serpens*, *T. salicina*) is not interpreted consistently in Europe and that (i) apart from a taxon related to *A. serpens* (ii) specimens of *A. heteromorpha* have also been referred to it. In that case it might turn out that *Trametes sepium* will have to be identified with taxon (i) but in my opinion this still needs further study. For this reason *T. sepium* is included separately on the Check list, but with a question mark; the accompanying references are all to descriptions and illustrations based on North American material except for the one to Bakshi & al. (1958) that deals with specimens from India.

It was Bresadola [1903 (Am 1): 81, as *Trametes*] who recorded *T. sepium* from Europe, although he mentioned some differences with North American material. Later in life [Bresadola, 1932 (BIM 21): text to pl. 1024 f. 2 (*Trametes sepium*) & op. cit., text to pl. 1022 f. 1 (*T. albida*)] he thought that *T. sepium* was probably merely a straw-coloured form of *T. [Antrodia] albida*.

Should it prove necessary to regard *T. sepium* as a species different from *Antrodia albida* the correct name to be used for it will have to be examined anew. Overholts [1923 (M 15): 214, 221] concluded that *Polyporus favescens* Schw. (1832) and *Polyporus rhododendri* Schw.⁷ (1832) are the same species as *T. sepium*; both names are of an earlier date; both were described as 'resupinates'. In later work Overholts (1953) seems to have forgotten these names. Lowe (1966) does not mention them either.

(9). Fries used the name *Trametes serpens* in three different senses.

(i) *Trametes serpens* Fr. 1849: 324, for a species collected by Lindblad. This was reduced to the synonymy of *Daedalea mollis* "Wormsk." (Fries, 1863 M. 2: 256). 'Wormsk.' is apparently an error for 'Sommerf.', resulting from a previous reference by Fries of a collection by Wormskjold from Kamčatka to *Daedalea mollis* Sommerf. (as " β . *D. membranacea*" Fries, 1828 E. 1: 72, a subspecific designation that he later dropped, cf. Fries, 1874: 585 under *Trametes mollis*). This is *Datronia mollis*.

(ii) *Trametes serpens* Fr. 1863 M. 2: 255, 349, 355. In the index of the same work (pp. 349, 355) this was stated to be a *lapsus calami* for *T. serialis*.

(iii) *Trametes serpens* (Fr. per Fr.) Fr. 1874: 586 is a recombination of *Daedalea* [*Antrodia*] *serpens* Fr. per Fr.

(10). The current interpretation of *Polyporus sinuosus* was founded by Bresadola [1903 (Am 1): 78], who referred to it a specimen that in his opinion agreed completely with Fries's figure (1884 I. 2: 88 pl. 190 f. 1) drawn from "exempl. original. sicca". Bourdot & Galzin (1928: 672) gave a full description of it in this sense.

Romell (1926: 17) was not satisfied that the above conception was correct and thought that "perhaps the true *Pol. sinuosus* is rather the resupinate state of *Trametes subsinuosa* or of *Lenzites heteromorpha*, both of which are rare in Sweden," since it was "raro" according to Fries (1821: 382 & 1874: 576) and *Poria sinuosa* sensu Bres. is very frequent in Sweden. Moreover, Romell thought that Fries's figure contradicted Bresadola's interpretation. On the other hand there is "an authentic specimen in Fries' herbarium [that] seems to confirm the general inter-

⁷ Von Schweinitz (1832: 158) compared his species with '*Polyporus contiguus*'. It may be recalled in this connection that *Boletus contiguus* var. *dimidiatus* A. & S. 1805 (d.n.) is rather *Antrodia serialis* than *Phellinus contiguus* (cf. Donk, 1971b: 27).

pretation'', and stability in nomenclature will best be served by accepting Bresadola's interpretation.

The taxonomic position at the generic level is still under discussion (4).

(11). When Persoon (1825: 107) accepted *Polyporus sinuosus* Fr. he made a clerical error: instead of copying Fries's phrase and description he associated the name with an adaptation of the phrase and description of *Polyporus callosus* Fr. described by Fries on the same page and preceding *P. sinuosus*. This did not escape Fries (1828 E. 1: 120): "*P. sinuosum* l.c. p. 107. evidentem nostram sistere *P. callosi*, descriptionem, verbotenus transcriptam". This error could be interpreted as the introduction of a typonym of *Polyporus callosus*, viz. *Polyporus sinuosus* Pers., not *P. sinuosus* Fr., but I prefer to look on it for what it actually is, 'an unintentional error'.

Bjerkandera

(12). Some years ago Pouzar (1966c: 370) denied *Bjerkandera* generic status and reduced it to a subdivision of *Tyromyces*. The monomitic context with clamps apparently turned the scale. It is also evident that Kotlaba & Pouzar (1966b: 103) were on the verge of doing the same with *Hapalopilus*, of which they stated that it differed from *Tyromyces* practically only by the presence of the extracellular pigment which produces such a spectacular change of colour in KOH solution. It seems to me that they attach so much weight to the term monomitic that it is detrimental to the correct appraisal of other features.

The present genus *Bjerkandera* owes its scope to Murrill, who (in addition to the anoderm cap and other features) emphasized the more or less smoke-coloured hymenium at maturity. This is not a very impressive character. It was Ames (1913: 236, 239) who provided a much better one: "Hymenophore arising from a distinct layer." This layer is thin but quite typical. It always precedes the formation of the tubes and on section is much darker coloured than the context of the cap. The species of *Bjerkandera* have a strong tendency to develop sterile portions devoid of hymenophore; nevertheless in such places the layer is formed and is easily noticeable because of its colour and its polished to shiny surface. The presence of this layer, in combination with other features, induced Donk (1933: 160) to introduce Murrill's conception of *Bjerkandera* in European mycology. I still believe the genus as thus defined to be a usable generic taxon.

Pilát [1937 (ACE 3): 149] combined *Bjerkandera* with *Gloeoporus*, which I prefer to keep apart, even though Domański (1966b) thought that *Gloeoporus* is not meruliod but has sterile edges along the dissepiments (at least as far as the European species are concerned). Its hyphal make-up and consistency show important differences; it also lacks the dark layer found in *Bjerkandera*.

(13). European and North American mycologists now admit only two species. These are easily distinguishable by the colour of the context of the dissepiments, best seen in sections transferred to a drop of KOH solution; it is the same colour as the dark layer (12) in *Bjerkandera adusta* and the same colour as the context of the cap (hence, paler than the dark layer) in *B. fumosa*. These two species are far fewer in number than those accepted before Bresadola; Bourdot & Galzin reduced the chaos to some degree of order. I have long been fascinated by the question as to how Fries came to admit about a dozen species instead of the two currently accepted. In the following notes (14, 15) I have tried to sketch what happened. Species varying greatly in the shape of the fruitbody were often stumbling-blocks to Fries, especially where this feature is coupled with considerable variation in the shape of the pores, the sets of main characters on which his groups of polypores were based. He put too much faith in his own scheme of classification.

The dark layer between the context of the cap and the hymenophore escaped his notice almost completely. This is not surprising with *Bjerkandera adusta*, where it is the same colour as the hymenophore. In *B. fumosa*, where it is much easier to observe, however, he noticed it only once (15).

(14). Very much the same as with *Bjerkandera fumosa* (15) also happened with *B. adusta*. In this case Fries distinguished among at least five species (and subspecies).

Tribus *Merisma* sect. *Lenti*.—*Polyporus candidus*?

Tribus *Apus* A. *Anodermei* sect. *Lenti*.—*Polyporus scanicus*, *P. adustus*, *P. carpineus*, *P. crispus*.

Of these, *Polyporus crispus* survived the longest as a taxon distinct from *P. adustus*, especially in the U.S.A., where Overholts kept it alive for a long time, suppressing it only in his latest work (1953: 365). This form was maintained mainly because of the crisped margin of the cap and the somewhat larger and unequal pores, which tend to become labyrinth-like. *Polyporus carpineus* is another form that is often easily recognizable.

(15). The species that Fries (1874) accepted as distinct and that are listed on the Check list as belonging to *Bjerkandera fumosa* are the following:

Tribus *Merisma*.

Sect. *Caseosi*.—*Polyporus alligatus* (cf. Donk, 1971b: 27).

Sect. *Suberosi*.—*Polyporus imberbis*, *P. salignus*, *P. holmiensis*.

Tribus *Apus* A. *Anodermei*.

Sect. *Carnosi*.—*Polyporus pallescens*? (16).

Sect. *Lenti*.—*Polyporus albus* (*Boletus salicinus* Bull.), *P. fumosus*.

Of some of these taxa it is not altogether certain that they really belong to the *B. fumosa* complex, but I doubt whether many errors have crept in. From their distribution over the genus it may be concluded that Fries over-emphasized the variations in the 'shape' and consistency of the context. It is not surprising that Fries's later determinations were not always consistent and perhaps even erratic. The 'species' that went into *Polyporus* tribus *Merisma* Fr. owe their position to the fact that *B. fumosa* often forms a common 'stroma' from which the caps arise. What is especially remarkable is that Fries noticed the dark line seen in sections between the tube-layer and the context of the cap in only one of his taxa, viz. *P. salignus* [subsp.] **P. holmiensis*! Its description contains: "pileis . . . linea fusca ab hymenophoro limitatis" (italics as in the original). In several of the above mentioned 'species' Fries did not even indicate the usually characteristic darkening of the pores but merely called them whitish or white.

I do not wish to go so far as to state that *B. fumosa* is a thoroughly homogeneous, though variable, species; it may well be that the current circumscription has been drawn up too widely and that in the future it will be possible to distinguish between a few taxa at a level perhaps even higher than 'subspecies'. Especially on *Salix* some forms occur that are worthy of further study. In this connection attention is drawn to the fungus depicted by Bulliard as *Boletus salicinus* (*pl. 433 f. 1*) and diversely interpreted.

(16). When publishing *Polyporus pallescens*, Fries cited *Boletus pelloporus* Bull. sensu Sow. 1799: *pl. 230* ["250"] as "optime". This plate is difficult to place but I suggest that it might represent sessile fruitbodies of *Abortiporus biennis*. Romell (1911: 19–20) concluded that Fries's species "seems to be identical with *Pol. fumosus* . . . as far as authentic specimens in the Kew herbarium are concerned." The original description does not seem to contradict this.

Polyporus pallescens as published by Kalchbrenner [1868 (MtK 5): 262] has occasionally been treated as a species distinct from *P. pallescens* Fr. This is not correct; it represents an application of *P. pallescens* Fr. and the accompanying Latin description strongly suggests that the collection was also *Bjerkandera fumosa*.

For *Polyporus pallescens* Romell ("Karst."), see (119).

Boletopsis

(17). I have found it difficult to make up my mind about the number of species to be recognized within this genus. I have seen few specimens in fresh condition and these were typical *Boletopsis leucomelaena*. Most authors now recognize two taxa which are taken either to be good species or else colour forms of a single species. Murrill [1903 (BTC 30): 431]

conceived them as species with different geographical distribution, one (*Polyporus griseus*) North American, one (*P. leucomelas*) European; he maintained that "the two are certainly distinct." Lloyd (1911: 77-79) claimed that the taxon with pale caps occurred in North America and Europe (called *Boletopsis griseus* below) while that with a much darker cap (*B. leucomelaena*) is a rare plant occurring in Europe only.⁸ This would rather point to two different species. It has proved however that Lloyd's assertion does not hold true. The dark-coloured taxon does occur in North America. During a trip in northern Idaho I saw a few fresh (and some very young) fruitbodies; if these had been found in Europe I would unhesitatingly have referred them to *B. leucomelaena*. Dr. K. A. Harrison (personal communication) also insists that he found this dark taxon in the U.S.A. This shows that Overholts's description, excerpts from which will be quoted below, was drawn up without knowledge of this dark form.

The two species are not always easy to separate from one another, at least when their identity is to be judged from published descriptions and illustrations, not only because these are often poor, but also because the pale form becomes darker when old. According to Overholts (1953: 228) the colour of the cap of North American material of *B. griseus* is "ivory-white or with a darker center when young and growing, but soon becoming gray and then smoky umber and darkening even more on drying (especially in old sporophores) . . ." For *B. leucomelaena* the colour of the cap is described by Boudier (1911: 71) as "gris fuligineux plus ou moins foncé" and by Bourdot & Galzin (1928: 519) as "isabelle foncé gris bistré, brunissant au toucher, . . . à la fin entièrement bistré". These indications suggest some overlapping in colour. Moreover, other descriptions indicate that the colours of both may also vary in other respects.

Boletopsis appears to be rather common in southern Bavaria; this resulted in its occurrence under at least four different names in Britzelmayr's work; three of these names were given to 'new' species. Of two other species that have sometimes been referred to here no spores were mentioned and Britzelmayr's brief descriptions and sketchy drawings are in my opinion insufficient for their acceptance as surely belonging to this group; these were named *Polyporus subsquamulosus* "Linn." ("nicht als Speisepilz bekannt") and *P. dapsilis* Britz. (O). The descriptions of

⁸ *Polyporus leucomelas* is the name that for some time was used in the U.S.A. to indicate *P. griseus*; it is usually accompanied by descriptive matter taken at least partly from descriptions by European authors. For instance the description of the spores ("cylindric-fusoid, pale brown, 10-12 × 4-5 µ") was copied from Massee (1892 B.F. 1: 229) and is patently wrong; compare McIlvaine (1900: 480) and Hard (1908: 391). "*Polyporus violaceus* apud Hard", as mentioned in a note by Saccardo & Trotter [1912 (SF 21): 255], is an error for '*Polyporus leucomelas*' (Hard, l.c.).

the other species taken together pretty well cover the whole colour gamut of *Boletopsis*. In the following recapitulation of Britzelmayr's species now referred to *Boletopsis* I have copied not only the colours but also the taste and smell (18) as mentioned in his descriptions:—

Polyporus involutus Britz.: Hut weisslich bis isabellfarben, auch mit gelbbräunlichen Flecken. Stiel weiss, gelblich. Fleisch weiss. Sporenstaub weiss. Sporen gelblich. Geschmack nicht unangenehm.

Polyporus conspicabilis Britz.: Hut grau, graublauish. Stiel schmutzig grau. Fleisch blass grauviolet. Poreschicht weisslich. Sporen gelblich. Geruch angenehm.

Polyporus formatus Britz.: Hut braunrot, braungrau und ins Weissliche verblassend. Stiel oben weisslich, nach unten bräunlich, rotbraun, am Grunde dunkler. Fleisch weiss, sehr blass violettbläulich, unten im Stiel grauschwärzlich. Poreschicht weiss, weisslich, später schmutzig isabellfarben. Sporen farblos. Geruch und Geschmack nicht unangenehm.

Polyporus leucomelas Pers.: [Colours of cap and stalk not mentioned in the text, but dark.] Fleisch weisslich, angebrochen sich rötlich färbend. Poreschicht weiss, rötlich grauweiss. Sporen gelblich, blass goldgelb. Geschmack nicht gerade unangenehm, aber etwas zusammenziehend, herb.

Of these forms the first would be *Boletopsis griseus* in the young stage before the colours had turned darker; the last two would be good *B. leucomelaena*; while the second would appear almost intermediate between the two usually accepted taxa, but perhaps it could still be referred to *B. leucomelaena* in a state before the colours had turned darker. Bresinsky & Stangl (1968: 77), who live in the same region as Britzelmayr, reduce all the above forms (and also *P. dapsilis*) to a single species, which they call *Boletopsis subsquamulosus*.

Bresadola [1931 (BIM 19): *pls. 947, 949*] recognized two species, a conclusion based on personal collections in Italy: "*Polyporus subsquamulosus*: affinis *Polyporo leucomelano* Pers. sed pileo nunquam atro et stipite breviore satis distinctus." There are indications that typical *Boletopsis griseus* (*Polyporus subsquamulosus* in the sense of Bresadola) is rare in Sweden, if it occurs there at all. Lundell [1946 (LNF 27–28): 4 No. 1309] does not include *Polyporus subsquamulosus* in the then current sense of European authors in the synonymy of *Polyporus leucomelas*. He knew only the dark form and admitted that he had never seen such pale and giant specimens as those illustrated by Fries (1863 S.S.: *pl. 53*) under the name *Polyporus subsquamulosus*. This also implies that he never saw such almost pure white fruitbodies as Overholts mentioned for *Boletopsis griseus* and as Britzelmayr depicted as *Polyporus involutus*. On the other hand in the text accompanying the plate just-mentioned Fries remarked that *P. subsquamulosus* was often also more whitish (translated from the Swedish).

Because of insufficient experience in the field I have no personal opinion to offer. That mycologists of repute (like Bresadola) maintained two taxa, however, and that certain other authors who came across typical *B. leucomelaena* do not know the whitish form has induced me to list

two species of *Boletopsis*. This is also done to encourage critical examination of this point of view.

(18). *Boletopsis griseus* (usually under the name *Polyporus subsquamosus*) is often supposed to be an edible species. The odour seems to vary; there are indications that it may be pleasant in young and vigorous fruitbodies and less so in old ones. The taste, as given by Malençon [1956 (BmF 71): 274] for *B. griseus* from Morocco, is "douce puis amarescente" and "très amère et immangeable après cuisson", after Maire *in litt.* As to *B. leucomelaena*, this was annotated by Konrad & Maublanc (1935 I. 5: pl. 422) as "Comestible. — Pas fameux, goût amer, ne vaut pas la cuisson. Nous l'avons essayé." B. Hennig (1927: no. 289) wrote: "nicht gerade wohlschmeckend". As to North America I have not come across any detailed not-copied statements about the taste and edibility of *B. griseus*.

Malençon raises doubts about the specific identity of the species he described from North Africa as *Boletopsis griseus* and the European species that has been called *Polyporus subsquamosus*: "Sans doute existe-t-il en Europe une forme de [*Boletopsis*] . . . comestible . . ." This assumption is not well tenable: the reputation of *P. [Boletopsis] subsquamosus* sensu auett. or *Boletopsis grisea* as an edible species is due to the fact that Fries placed *P. subsquamosus* sensu Wulf. (= *Polyporus carinthiacus* Pers.) by error in the synonymy of *P. subsquamosus*. The species described by von Wulfen is not a species of *Boletopsis* but like *Polyporus subsquamosus* itself (cf. Donk 1969a: 255) it is *Albatrellus ovinus*, which is rated high as an edible species.

(19). As to the correct name for the taxon with a whitish cap while young I have stated my reasons for rejecting both the names *Polyporus subsquamosus* and *P. carinthiacus* (Donk, 1969a: 255). The use of the earliest name available as basionym (*viz.* *P. griseus*) is accepted here on the tentative assumption that the North American fungus which received this name is identical with the European fungus that has often erroneously been called *P. subsquamosus*; the two were identified by Bresadola.

(20). When Fries in 1821 revalidated *Polyporus subsquamosus* (= *Albatrellus ovinus*) he associated it with two varieties which both represent forms of *Boletopsis*. Variety α ("pileo . . . fuligineo-nigricantibus") is simply the true *Boletopsis leucomelas* itself.

The other variety, " β . *P[olyporus] repandus*", "pileo cinereo", shows that Fries himself had seen specimens of a species of a pale *Boletopsis* ("v.v."). He first thought that this was the same as a species of Micheli (pl. 70 f. 2, now identified with *B. leucomelaena*) but later he was not sure about this, as can be concluded from a remark under *Polyporus leucomelas*

in 1838 (p. 429). Variety β was raised to the rank of a species in 1879 by Karsten as *Polyporus repandus*. Does this taxon belong to *Polyporus [Boletopsis] griseus* Peck (1872) or is it a rather pale state of *Boletopsis leucomelaena*? Compare also (17).

Ceriporia

(21). *Ceriporia bresadolae* has also been recorded from North America (Arizona) by Gilbertson & Lowe [1962 (PMi 47): 168 pl. 1 f. 3, pl. 2 fs. 5C, D]. Besides resupinate fruitbodies their material also includes effuso-reflexed and sessile ones. Although these authors compared their material with "isotype" material of *C. bresadolae* (which Lowe 1966: 34 later reduced to *Poria [Ceriporia] purpurea*) I hesitate to enter a reference to their description on the Check list. The French authors of the species appear to have seen many collections ("toujours récolté dans un rayon très limité, au-dessus de Carbassas, Causse Noir"); nevertheless no mention was made of any other condition of the fruitbody except the resupinate.

The North American record is in any case very interesting since it demonstrates that *Ceriporia* need not always be completely 'resupinate' (effused).

(22). *Polyporus rhodellus* is a highly controversial species. One interpretation was founded by Bresadola [1897 (AAR III 3): 80] and propagated by Bourdot & Galzin (1928: 662), who provided a good description. Lundell [1946 (LNF 27-28): 14 No. 1328] did not accept this interpretation as correctly named but introduced the name *Poria excelsa* for it. To him *Polyporus rhodellus* was a dubious species. This thesis he defended as follows:—

"It has always been a mystery what Fries meant by his *Polyporus rhodellus* and there is no Swedish tradition about this species (comp. e.g. Romell, Sv. Bot. Tidskr. 20 p. 17): There is no material left in Hb. Fries, and the figure cited by Fries (Bulliard tab. 442 D) gives no clue, as it is too vague. The illustration in Fries, Icon. sel. tab. 189: 2, shows without any doubt *Poria purpurea* (Fr.) Cke, and it is rather possible that the original description of *Polyporus rhodellus* is based on young specimens of that species. It has thus been necessary to give a new name to the species that Bresadola interpreted as Fries's species."

Romell (1926: 10, 17) thought that *Polyporus rhodellus* might have been *Poria eupora* (= *Chaetoporus nitidus*). The basis for this was Fries's reference of an unpublished picture of this species by H. A. von Post to *P. rhodellus*. In view of Fries's description (1821: 380), which contains, *inter alia*, "... digito tritus evanescens ..." this is unacceptable. Romell, however, referred to Fries's own figure (1884 I. 2: 88 pl. 189 f. 2) as probably representing *Poria purpurea*. This shows that Bresadola [1897 (AAR III 3): 81], Romell, and Lundell were in agreement about this figure published after Fries's death.

A new development was started by Lowe [1959 (Ll 21): 106; 1962

(PMi 47): 185; 1966: 30] when he took *Poria viridans* in a still more inclusive sense than had been done before (for instance by Bourdot & Galzin, 1928: 661) by including *Poria excelsa* (to mention only one of the European synonyms he added recently). For this emendation he simultaneously adopted the name *Poria rhodella* "in the sense of Bresadola". Therefore it may be concluded that if he had decided to keep *Poria viridans* (in the circumscription of Bourdot & Galzin) and *P. excelsa* (= *P. rhodella* in the sense of Bresadola) apart he would not have dropped the name *Poria viridans*. No arguments were advanced either to defend the inclusion of *Poria excelsa* or to disprove Lundell's conclusion that *P. rhodella* was a nomen dubium.

(23). Since no reliable authentic material remains my effort to form my own opinion about the original *Polyporus rhodellus* leaves little alternative but to reproduce Fries's first published and at the same time most extensive description:—

"... *Polyporus rhodellus*, effuso-elongatus membranaceus subfugax roseus, margine tenui subpubescente, poris subrotundis obtusis. / In ligno fagineo Aug. / Obs. Membrana 2-4 unc. longa, laevigata, tota albido-rosea, tacta obscurior subincarnata, arete adnata tenuis, ut digito trita evanescat, margine tenui irregulari pubescente; sed non byssino. Tubuli haud lin. longi subrecti. Pori mediocres. Diversi sunt et *Polyp. sanguin.* et *P. incarnatus*, mox describendus".—Fries (1818 O. 2: 261).

To my surprise this for its time rather full account calls to mind the most common species of *Ceriporia* in Europe, viz. *C. viridans*. The observation "... ut digito trita evanescat ..." rules out such species as *Poria placenta* (Fr.) Cooke, *P. gilvescens* Bres., and *P. [Rigidoporus] sanguinolenta*, the last two often also becoming reddish when bruised but with a much firmer consistency. The substratum ("in ligno fagineo") and the length of the tubes rule out *Poria bresadolae*, another of the species that reddens when touched. The words "... tota albido-rosea, tacta obscurior subincarnata ..." suggest the form of *C. viridans* that received the name *Physisporus inconstans* P. Karst. [1887 (Rm 9): 10; "... albus, fractus dilute violascens ..."]. I cannot wholeheartedly share Lundell's conclusion that the name *Polyporus rhodellus* is a nomen dubium. If it is concluded that *Polyporus rhodellus* is the correct basionym for *C. viridans* in the broad sense of Bourdot & Galzin, whether with the inclusion of *C. excelsa* (*Poria rhodella* sensu Bres.) or not, it might still be advisable to rule out this earlier name as a nomen ambiguum. In any case a more careful consideration of the question as well as a renewed and detailed taxonomic investigation of the whole of the complex to which *C. viridans* belongs is needed before the name *Polyporus rhodellus* is again brought into circulation for a species that does not include *C. excelsa*.

The original publication of *C. viridans* mentions the colour thus: "... primum album, exsiccatus pallide viridans ..." and "... perfectly white at first, but in drying assuming a delicate pale green, with a honey-

like tinge in parts . . ." The present conception in Europe includes many colour forms.

Coltricia

(24). *Coltricia focicola* was described from North America. As re-described by Coker "it is usually if not always confined to burnt-over woods or ash piles. While found as far north as New York, it is much more common in the southern states." Moreover he remarked that in America *C. perennis* does not have the habit of growing on charcoal heaps, while *C. focicola* does. His description and illustrations also show that *C. focicola* has much larger pores than *C. perennis*. Overholts added that it is a short-stalked species the cap of which soon weathers to gray or ash colour and that it is both zonate and radiate-striate. He also stated that it has longer spores that are much narrower in proportion to their length than in either *C. perennis* or *C. cinnamomea*. In contradistinction to Coker, Overholts, like other American authors, found *C. perennis* "often where fires have been kindled"!

Like Overholts, many European authors report *C. perennis* as common on burnt-over places, and I have seen quite a number of collections from such spots; in general habit they suggested *C. focicola* but had the smaller spores of *C. perennis*. In agreement with other European mycologists I refer such forms (not without some hesitation) to *C. perennis*. This leaves the question open as to whether or not *C. focicola* has also been found in Europe. If it has it must be rare. Its inclusion on the present Check list is based on the report of it from "Carpatorossia" (Hungary) by Pilát as *Polystictus perennis* f. *focicola* (B. & C.) Pilát [1942 (ACE 3): 581]. He did not describe the spores.

(25). It is rather obvious that there is great similarity between *Coltricia montagnei* and *Cycloporus greenei*, especially when the hymenophore is left out of consideration; it is 'polyporoid' in the former and 'cyclomycetoid' in the latter. Gilbertson (1954) has combined the two taxa into a single species by reducing *Cyclomyces greenei* to the rank of a variety. This solution appears acceptable provided it is realized that the variety is geographically limited to the extra-European territory of the species; in Europe the clearly cyclomycetoid state of the hymenophore is unknown, in contrast to the U.S.A. and Japan, where both forms have been reported.

Lloyd also referred two other cyclomycetoid taxa to *Cyclomyces greenei*, viz. *Cyclomyces turbinatus* Berk. (India) (0) and *Xanthochrous javanicus* Pat. (Indonesia) (0). There is little doubt but that they are closely related to *Coltricia montagnei*, but a more careful study of this question is still needed.

(26). I refer *Polyporus casimiri* Velen. and *P. baudyšii* Velen. to *Coltricia cinnamomea*, although with a good measure of hesitation. This

reference is based not only on the original descriptions and on drawings of the spores and their measurements but also on the assumption that it is not very likely that two species with smooth spores other than those admitted on the Check list might also occur in Europe.

Pilát [1942 (ACE 3): 580] referred *P. baudyšii*, with doubts and without comment, to *Polystictus* [*Coltricia*] *perennis*. He reduced *Polyporus casimiri* to the rank of a form of *Polystictus perennis* (*op. cit.*, p. 581). His conception of the latter species was so inclusive that it covers the whole of the genus *Coltricia* of this Check list. I am convinced that this is untenable and that several good species are involved. A renewed study of the two species published by Velenovský is suggested.

Coriolus

(27). *Coriolus zonatus* has been a source of much confusion; mis-determinations in the herbaria are numerous. Although it does not always seem to be easily separable from *C. versicolor*, little exact evidence for fusing the two species has been offered. On the contrary Jahn (1963: 79) has pointed out that the distribution areas do not overlap completely; in Europe *C. zonatus* has a more pronounced northern limit than *C. versicolor*. Moreover *C. zonatus* is more selective in its hosts, *Betula* and *Populus* being its favourites. British authors have understood the species only poorly.

It would seem as though North American authors have neither a consistent nor a correct idea of *Polyporus zonatus*. (i) Thus Overholts (1953: 344) stated that *Polyporus zonatus* "in my earlier papers" is a form of *Polyporus* [*Coriolus*] *versicolor*. (ii) Later he (Overholts, 1953: 348) believed that the conception held by Romell, Karsten, and Bresadola covers a form intermediate between *Polyporus pubescens* and its variety *grayi*. (iii) At the same time he also thought that his interpretation of *P. velutinus* "might better be referred to *Polyporus zonatus* Fries, but not in the sense of Romell and Karsten" (Overholts, 1953: 355). His final description and his figures of what he called *P. velutinus* do suggest certain forms of *Coriolus zonatus*. According to Lowe & Gilbertson [1962 (M 53): 489] the "zonatus Fries of American authors" is *Polyporus* [*Coriolus*] *velutinus*, which they distinguish from *P. pubescens*. They do not include *P. zonatus* in their synopsis of the Polyporaceae of the western U.S. and Canada. I believe that there is little reason to ascribe an erroneous interpretation to Romell and Karsten, as Overholts did.

It also seems doubtful whether Cunningham (1965: 167) correctly interpreted the material from New Zealand and Australia that he described and listed as *Trametes zonata*. I have deleted all references not only to his treatment under that name but also to the synonyms he referred to it. These are briefly mentioned in the "List of omitted names" as *Polyporus bireflexus* B. & Br. ex Cooke (0), *P. orbiculatus* Colenso (0), and *P. rufogulosus* Lloyd (0).

(28). *Boletus [Coriolus] ochraceus* Pers. is recognizable from its first description as belonging to *Coriolus zonatus*; this was somewhat amplified in 1801. Fries (1874: 568) made it a direct synonym of *Polyporus [Coriolus] zonatus*, which explains why various authors have treated *Boletus ochraceus* as a variety of *P. zonatus*. Persoon himself was not sure whether it was really distinct from *Coriolus versicolor* and in later work (1825: 72) he reduced it to the rank of a variety of that species. This uncertainty about the specific distinction between the two species is still shared by some contemporary mycologists. The inclusion by Maire [*apud* Maire & Pol. 1940 (AAT 1): 78] of *Boletus ochraceus* in *Coriolus hirsutus* as a variety is surprising: it was perhaps induced by Bresadola's conception. Donk reported that specimens which the latter author had referred to the Persoonian species agreed with what he called *Coriolus versicolor* f. *sub-hirsutus* Donk (1933: 181). The form of *Polyporus versicolor*, which Overholts (1953: 344) referred to as *Polystictus ochraceus*, as well as *Polystictus ochraceus* sensu Lloyd [1920 (LMW 6): 979], perhaps coincide with it.

Daedalea (4)

(29). The precise identity of the remarkable kind of mycelial growth called *Xylostroma giganteum* is still something of a puzzle. I cannot improve on the following quotation from Sowerby (1802: text to pl. 358):—

"It should seem that this fungus may have given rise to the use of *Agaricus Chirurgorum*, Pharmac. Edin. and *Agaricus querneus*, Pharmac. Gener. As Ray says it was used by the country people of Ireland to cure wounds; and thus I think the true styptic Agaric should be the *Agaricus querneus*, Linn. tab. 181 [= Sow. pl. 181 as *Agaricus quercinus* L. = *Daedalea quercina*] and not *Boletus [Phellinus] igniarius*, tab. 132, which I believe never has been found growing on the oak, although *Boletus [Fomes] fomentarius*, [Sow.] tab. 133, which nearly resembles it, sometimes does . . . *Agaricus quercinus* nearest resembles the Oak Leather in delicate fibrous texture, and may be readily cut into slices and freed from impurities. The other two are of a less delicate colour, and require more preparation." — And compare Ray 1686 H. 1: 110 (*Fungus coriaceus Quercinus haematodes* Breyne) and 1724: 25 (" . . . Oak-Leather Hibernis").

This and some other suggestions made in early literature led me to assimilate *Xylostroma giganteum* with a sterile mycelial state known for *Daedalea quercina*. This state answers well to Tode's original description, which does not mention the host species. However he cited as synonyms *Fungus amplissimus* Scop. (O) and "Oak-Leather Raj . . ." The second citation specifically introduced oak as substratum.

Another suggestion of relationship is to *Fomes fomentarius*. I have found large mycelial sheets formed by this species in the stem of an old beech in Scotland. Such pieces may well have been the basis for "*Agaricus coriaceus faginus haematoidis* Gagnebin" Haller (1768 H. 3: 143 no. 2290).

Dana (1771) described still another xylostromatoid mycelium from *Larix* as *Agaricus, seu Boletus pelliceus* \equiv *Agaricum pelliculum* Latourr. (O). I am unaware of any identification of this mycelial growth.

Another mycelial production in the form of very extensive leathery sheets was found by Dr. H. H. Burdsall in northern Michigan. I saw them in fresh condition and could identify them as being a product of *Stromatoscypha fimbriatum* (O), a species usually referred to the 'Cyphellaceae'.

Fuckel [1873 (Jna 27-28): 86] thought that *Xylostroma corium* "Rbh." [\equiv *X. giganteum*] was a state of *Polyporus xylostromatis* Fuck., a species that has been identified with *Perenniporia medulla-panis*.

Daedaleopsis

(30). There is a pronounced tendency to refer all names based on European specimens of this genus to a single species. This variable species is represented three times in Fries's "Systema", viz. as *Daedalea confragosa*, *D. rubescens*, and *D. suaveolens*. Of these simultaneously published names *D. rubescens* and *D. suaveolens* were reduced to the synonymy of *D. confragosa* before similar but reverse reductions were made; this makes *Daedalea confragosa* the basionym of the correct name.

Some authors still prefer to distinguish between two European species, *Daedaleopsis confragosa* and *D. tricolor*, and I have followed this trend. One reason is that typical *D. tricolor* seems to have a distribution area of its own and a different preference for hosts. Another reason is to keep the attention of mycologists who regularly come across the two taxa focused on the problem.

(31). The enormous variation of the hymenophore of *Daedaleopsis confragosa*—from typically lamellar to strictly poroid—has been the main reason for the many names proposed for this species and the various genera to which the forms were assigned. This variation is not always displayed by fruitbodies from different mycelia; it may even occur in the hymenophore of a single fruitbody or in fruitbodies growing closely together. Other variations also exist. It seems legitimate to ask whether or not all the forms found in Europe (apart from *D. tricolor*) really belong to a single species. I have decided on the single species but am not prepared to go further and reduce unconditionally a long series of species described from outside Europe to this species, as is done at present. What is needed are extensive studies on a world wide scale. Modern Japanese authors distinguish between several species in this complex in their country. (It would seem as though they are misapplying the name *D. confragosa*.) In the "List of omitted names" no less than nearly a score of names based on extra-European material are mentioned as having been placed in the synonymy of *D. confragosa*.

(32). Some authors who admit *Lenzites [Daedaleopsis] tricolor* as a distinct species (following Bresadola) also refer to it forms with trametoid hymenophore. Therefore it is not surprising that several synonyms have been attributed to this species. Those based on extra-European material are mentioned only on the "List of omitted names".

Fomitopsis

(33). As it appears on the Check list *Fomitopsis* is much reduced but it is still heterogeneous. There are only a few true species and these are held together by the whitish to so-called bright but not brown coloured, dimitic (by skeletals) to incipiently trimitic context of the cap; the colourless, acyanophilous, smooth spores; the tendency of the hymenophore to become layered; the presence of a 'crust' covering the cap; and the lack of an imperfect state referable to *Oedocephalum*; they are brown-rot fungi ('oxidase-negative') in contradistinction to the typical species of *Trametes*, which are white-rot fungi.

Fomitopsis cytisina is a strongly deviating element that does not fit well in any of the existing European genera. It seems to deserve a distinct genus to be shared with some tropical species.

Other elements that have been included in *Fomitopsis* are species with a more or less pinkish to pinkish-vinaceous context; the European representatives are *Fomitopsis cajanderi* and *F. rosea*. They have been thought to be closely related to each other or even barely distinguishable on the specific level. Recent studies however indicate that possibly they should not even be included in the same genus. While (according to data furnished by Nobles, 1971: 179) *F. rosea* would appear to be closely related to the type species of *Fomitopsis*, recent studies by Nobles (1971: 180) and Van der Westhuizen [1971 (Bo 10): 208 f. 18] show that *F. cajanderi* shares important characters with *Daedalea* sensu stricto, such as, for instance, Nobles's code symbol 9 (4). Removal of this second species from *Fomitopsis* seems unavoidable but whether it should be included in *Daedalea* or in a closely related group (well represented in the tropics), characterized *inter alia* by the pinkish colour of the context and pores, must still be worked out. In my card index this group is filed as 'Rhodoporus'; this is not a 'name' but merely a convenient indication of a group whose status is still undecided.

(34). Donk (1973: 223) concludes that Fries introduced a *Polyporus marginatus* (1838) of his own, distinct from *P. marginatus* (Pers.) per Fr. (1821); after some initial hesitation he has also concluded that the two are not specifically different and that both are to be included in *Fomitopsis pinicola*. Given the often very incomplete references to basionyms by older authors it is not always easy (and sometimes impossible) to decide unequivocally on the basionyms, whether 'marginatus Fr. 1838' was

intended or 'marginatus (Pers.) Fr. 1821'. On the Check list I have tried to register the complete set for 'marginatus Fr. 1838' at the generic level but have not tried to work out the 'parallel' set for 'marginatus (Pers.) per Fries 1821'. The recombinations of the latter set apparently all date from later than the corresponding recombinations of the former set.

Funalia

(35). *Funalia* is accepted in this publication because it is convenient and is appealing as acceptable for the European species. However the main distribution is presumably in the tropics, where the type species was collected (Guinea) as well. If one also takes into consideration the mixed lot of extra-European species that is now occasionally assembled under the name *Coriolopsis* it would appear that the limits between the two are far from settled.

Recently Domański (1968) rejected the name *Funalia* because "he had no herbarium material or culture at his disposal, and not even a satisfactory description of *P[oly]porus funalis*", the tropical type species of the generic name. For this reason he preferred to revive *Trametella*, based on *Trametes hispida* [= *Funalia gallica*]. Not until it is shown that *Polyporus funalis* is a nomen dubium or that this species is not congeneric with *Funalia gallica* in the sense accepted here will I abandon the earlier name *Funalia*, which is now currently applied to two European species.

(36). I accept two species for Europe, both taken from *Trametes*: *Funalia gallica* (often called *Trametes hispida*) (37) and *F. trogii*. The former in particular is extremely plastic; there is considerable variation, especially as regards the size and shape of the pores, and to a lesser degree the colour of the flesh and the hirsuteness of the cap, so that the question arises whether or not it is homogeneous in its present European conception. For some time the two species just mentioned were considered to be varieties of a single taxon.

In view of certain discrepancies between European and North American descriptions and material and considering the uncertainty of the exact delimitations of the two species, on the Check list proper I have refrained from listing synonyms attributed to them based on material collected outside Europe and adjacent North Africa. Those names will be found included in the "List of omitted names"; they are *Trametes fergussonii* (Berk.) ex Corda, *Irpegrossus* Kalchbr., ? *Trametes lindheimeri* B. & C. apud Berk., *T. peckii* Kalchbr. apud Peck, ? *Polyporus proteus* Berk., *Polyporus pulcher* Speg. ((= *Polystictus celottianus* Sacc. & Manc. apud Sacc.), *Polyporus sciurinus* Kalchbr. apud Thüm., *Trametes stuprea* Berk., *Daedalea trametes* Speg. (= *Trametes daedalea* Speg.), and *Trametes tucumanensis* Speg.

(37). The use of the name *Polyporus gallicus*, introduced for *Boletus favus* L. sensu Bull. from France, needs some explanation. Bulliard's plate shows a fruitbody with big and rather regular hexagonal pores not exactly matched by any specimen I have come across. Lloyd [1912 (LMW 4): 520 f. 517] published a photograph of a fruitbody with big but more irregular pores from France itself; this comes close to Bulliard's picture. Considering that the pores in the present European conception are extremely variable in shape and size; that no other European species could be compared with any confidence with Bulliard's plate; and that some of Bulliard's objects have been found to be unsatisfactorily rendered on his plates, I am strongly inclined to follow Bresadola [1897 (AAR III 3): 90]: "... valde probabiliter ... *Boletus favus* Bull. tab. 421 (certe nimis artificiose depicta), species a nemine intellecta et Mycologicas gallicis quoque ignota, huc pertinet . . ."; [1908 (Am 6): 39] "*Boletus favus* Bull. tab. 421 absque dubio ad hanc speciem [*Trametes favus* sensu Bres.] pertinet; icon sat bona, tantum pori solito latiores delineantur."

Ganoderma

(38). Most species of this genus are easily recognizable as such through their highly characteristic type of spores (Coleman, 1927; Furtado, 1962; Heim, 1963). *Amauroderma* Murrill is very closely related but it is not found in Europe; it lacks the truncate-depressed apex of the dried up *Ganoderma* spore. The number of European species is low in comparison with those of North America and the tropics but the confusion has been impressive. The following notes indicate a considerable number of gaps in our knowledge together with controversial problems; these need further detailed attention. Compare also Donk (1969b).

It has appeared more and more unsatisfactory to separate *Elvingia* (type, *Ganoderma applanatum*) from *Ganoderma* sensu stricto (type, *G. lucidum*), so that the two genera have now been re-united.

(39). The present restricted interpretation of *Ganoderma applanatum* in Europe still covers a variable species. For instance the initial colour of the surface of the cap (before it becomes heavily dusted with spores, as it often does) and the thickness and hardness of the crust show considerable variation. At one extreme stands a form with a whitish-grey and comparatively thick and hard crust; at the other extreme a form with a brown crust, thin enough to be indented with the thumb-nail. The former has been called *Ganoderma leucophaeum* and also *G. megaloma*. Both these names were based on North American types. If this form deserves a specific name at all it should perhaps be derived from one published earlier, viz. *Polyporus stevenii* Lév. (Crimea), as basionym, but Kotlaba & Pouzar (1971: 99) consider this as possibly the oldest name from Europe for *Ganoderma adpersum*, a suggestion I cannot accept.

Patouillard (1889a: 73) reported *G. leucophaeum* for Europe (France and Switzerland); he described the spores as "lisses, . . . 8–9 × 5 μ" and considered it "bien distinct de *G. appplanatum* [sensu Patouillard] par sa couleur blanche et ses spores lisses". He was followed by Bresadola [1897 (AAR III 3): 73–74] who listed it from 'Hungary' (Czechoslovakia) and who emphasized the following differences: "A *Ganoderma[te] appplanato* Pers. [sensu originario!] distinguitur crusta albida, initio lactea et contextu brunneo." Under *G. appplanatum*, which Bresadola then called *G. rubiginosum*, he remarked, "A *Ganodermate leucophaeo* Mont. distinguitur cute rubiginosa initio [pulvere] copioso concolore obtecta et substantia cinnamomea." Although the spores of the second species were given as 8–10 × 5.5–6 μ (slightly too big) these characterizations seem to cover the two forms under discussion. The context of the 'leucophaeum' form ('brunneus') may indeed be of a darker colour than cinnamon. Some other early European records are by Bresadola & Saccardo [1897 (Mal 11): 249] for Italy, by Rolland [1898 (BmF 14): 86] for Corsica and by Torrend [1913 (Bro 11): 63] for Portugal.

Lloyd (1915a: 263, 264) also admitted two species; to him *Fomes leucophaeus* has a hard, pale or white crust and it was considered to be the common form in the United States; his *Fomes appplanatus* has a brown, rather soft crust when fresh and he considered it to be a species frequent in Europe but rare in the United States. (As suggested by Atkinson, 1908b: 183, Lloyd at first "evidently confused *Fomes reniformis* Morgan with *Fomes appplanatus*" but in later work he kept the two apart.) The impression that the 'leucophaeum' form is much more common in North America than in Europe is confirmed by Overholts's description (1953: 98): "Sporophore . . . grayish or grayish black, sometimes brown, covered with a crust which is usually hard and horny but which may at times be thin enough to be indented with the thumb-nail . . ."

Contemporary mycologists, in both Europe and North America, have found it impossible to separate these two forms. They follow Atkinson (1908b), who subjected them to a detailed investigation and concluded that they were conspecific. Atkinson's discussion will need slight adjustment because he was not aware that Bresadola and Patouillard had called two different species *G. appplanatum*. One of these, *G. adspersum*, has indeed the bigger and more distinctly 'echinulate' spores also mentioned by these authors but Atkinson—correctly—denied them for the true *G. appplanatum*.

(40). *Ganoderma appplanatum* has been made a receptacle for quite a number of closely related or more or less similar species from all parts of the world. The resulting mess has not yet been sorted out, although a brave attempt was made by Humphrey & Leus (1931; 1932). The synonyms entered on the Check list proper and on the "List of omitted names" are only those that are based on collections from the northern temperate region.

(41). A flat radiating fungous growth has been found repeatedly on the pore-surface of *Ganoderma applanatum* and some related species occurring in the tropics. Lloyd [1915 (LMW 4): 538 f. 742] first called it *Sebacina dendroidea* (B. & C. apud B. & Br.) Lloyd; consequently when it turned out not to belong to *Sebacina* (Tremellaceae) he adopted the name *Institale bombacina* (Fr.) Fr. for it [Lloyd 1920 (LMW 6): 917]; this is undoubtedly a misnomer of a magnitude characteristic of his methods. He reported it from Venezuela (type of *Hymenochaete dendroidea* B. & C.), Ceylon, Madagascar, and the U.S.A. What might be considered a similar growth was described from Yugoslavia as *Septocylindrium lindtneri* W. Kirschstein (1936).⁹ The true nature of this fungous growth is still open to discussion.

Petch [1912 (APe 5): 280, 281] reported that the collection described from Ceylon as *Hymenochaete dendroidea* [Berkeley & Broome, 1873 (JLS 14): 69, in the original publication stated to occur "on dead wood"] represented mycelial growth on which the spores of the substratum (*Ganoderma* sp.) had been deposited and which was parasitized by *Hypomyces chrysostomus* B. & Br. He also mentioned that *Reticularia apiospora* B. & Br. [1873 (JLS 14): 82, type from Ceylon] consisted of the thallus of '*Hymenochaete dendroidea*' containing the spores of a species of *Ganoderma* (which he called *Fomes australis*) and the conidia of *Hypomyces chrysostomus*.

According to Lloyd (op. cit., 1920) Bourdot showed that it was not a species of *Sebacina* and "that it has spores directly on the hyphae". Bourdot also suggested that it was an outgrowth of the *Ganoderma* fruitbody, an "expansion mycéiale conidifère." Lloyd doubted this. A similar theory was elaborated by Pilát [1942 (ACE 3): 491] for *Septocylindrium lindtneri*. He took this growth to be a chlamydospore-producing outgrowth of the substratum itself, and called it *G. applanatum* "f[orma] *Septocylindrium Lindtneri*".

Corner (1968: 102) stated that *Thelephora dendroidea* is a mass of germinating spores of *G. applanatum*; he examined the type at Kew.

When Kirschstein described *Septocylindrium lindtneri* he considered it to be an imperfect fungus parasitic on the fruitbody of the ganoderma but apparently living mainly on the fallen spores of the host. He described the conidia for his species as colourless and formed in long chains, of variable length (8–16 × 3 μ), straight and cylindrical, and 1–4 celled.

Apparently Kirschstein came the nearest to the correct evaluation of the problem, at least as far as European material is concerned. A study of excellent material collected in Germany shows that the growth over the pore surface consists of hyaline hyphae without clamp connections at the septa, in my opinion almost certain proof that this mycelium does

⁹ Kirschstein calls the 'host' *Ganoderma lucidum* but Pilát (see below) referred it to *G. applanatum*.

not belong to the host, with its clamped generative hyphae. I also observed the spores described by Kirschstein, although not *in situ*; they occurred in addition to a considerable number of spores of *Ganoderma*.

A renewed study of this question is much needed.

(42). *Ganoderma adspersum* and *G. pfeifferi* might perhaps appear closely related. They can be distinguished easily by their crust: thick, hard, and opaque in the former, thinner and covered by a thin varnish-like film (wrinkling upon drying) in the latter, and also quite distinct in structure. However fruitbodies that have the crust removed are practically indistinguishable. Both are variable species. It is remarkable to find that authors who know these two species well usually come across both of them in their native regions.

(43). As will be shown below it is of importance to decide whether or not the name '*Fomes advena* Quél.' was validly published. Its publication was highly irregular. In "Les Champignons du Jura et des Vosges", as this work appeared in the periodical, Quélét [1872 (MMb II 5): 278, 330] published a personal interpretation of "*P[olyporus] Resinosus*. (Schrad.) F[ries]", which is an application of *Polyporus resinosus* (Schrad.) per Fr. [= *Fomitopsis pinicola*]. On page 330 (in the index) the species is listed as "Polyporus XIX. 2 [= 1]. Resinosus", 'XIX, 1', being a reference to the accompanying figure 1 on plate 19; the explanation of the figure on the plate runs "1. *Fomes Advena*". In the reprint of the work it will be found that in the index (Quélét, 1872: 318) the entry reads "[*Polyporus*] XIX. 1 [!]. Resinosus v. *Advena*".¹⁰ I do not know whether or not the instalment of the periodical and the reprint were issued simultaneously; the odds are that the reprint was published a short time later. Both the plate and the reprint make it clear that in 1872 Quélét managed to publish three names for the same species, viz. *Polyporus resinosus*, *Fomes advena*, and *Polyporus resinosus* var. *advena*. I am as yet not quite certain whether it will prove necessary to treat the first two as alternative names.¹¹ Were the question to be answered in the affirmative this would make *Fomes advena* a validly published name.

According to a later remark by Quélét [1892 (Crf 20²): 469] "le nom de *advena* [était] donné selon l'avis de Fries".

¹⁰ The meaning of 'v.' is not quite evident. For a while I thought that it stood for 'vel', which would result in '*Polyporus resinosus* or *P. advena*'. However, from a remark by Niel [1893 (BRo III 28): 49] who had sent a specimen to Quélét and had confirmed the determination "*Polyporus resinosus* (Schrad.) Fr. var. *advena* (Quélét, Champignons du Jura et des Vosges, p. 262, pl. XIX, fig. 2)", the correct meaning appears to be 'var.'

¹¹ I am also not quite certain that the plates were issued at the same time as the text in the periodical. In the unbound copies that I was able to consult the plates were in a separate wrapper; perhaps such sets of plates were prepared for the smaller-sized reprint.

In case the name '*Fomes advena* Quél. 1872' is to be accepted as validly published the next puzzle to be solved is which species Quélet described in 1872 as *Polyporus resinosus*. Is it *Ganoderma resinaceum* or *G. pfeifferi*? Both names were published at a later date. Quélet gave the colour of the context as "pâle puis chatain" (italics as in the original); 'pâle' points amongst other species to *G. resinaceum*, 'chatain', to *G. pfeifferi*. Later on Quélet (1888: 400, as *Placodes resinosus*) dropped the qualification 'pâle' and called the flesh 'chatain'. He added, 'Spore ovoïde (0^{mm}01–12), grenelée, brune', which supports the placing of his interpretation in *Ganoderma*. Still later Quélet himself [1892 (Crf 20²): 469] identified his interpretation of *Polyporus resinosus* with *G. pfeifferi* but simultaneously he insisted on using "*Placodes resinosus*, Schrad., Spec. (Bol. no. 33). Très bien décrit par Schrader comme un champignon particulier au hêtre", a conclusion I cannot follow.

Through the kindness of Dr. J. A. Nannfeldt I was able to study the material Quélet sent to Fries. A specimen (a piece of a fruitbody broken into several fragments) in Fries's herbarium is annotated in Fries's handwriting "*Polyporus flaviporus* / Gallia. Quélet" (**O**) and also has a label "*Polyporus flaviporus* / Gallia / L. Quélet. / e coll. E. Fries" (presumably written when Fries's herbarium was incorporated in UPS). Lundell determined the specimen as *Ganoderma cupreo-laccatum* (1944) (**O**) and later added a note that the correct name seemed to be *Polyporus (Ganoderma) pfeifferi* Bres. (1954). Both Dr. Nannfeldt and I think that this is correct. The second item in Fries's herbarium is a watercolour drawing annotated as follows, "*Polyporus (Fomes) advena* Quél. / Gallia austr.-orient. / Quélet". It shows a fruitbody with yellowish pore-surface and white uniformly dark-coloured context and tube-layers; I have no hesitation in also referring this figure to *G. pfeifferi*. It resembles Quélet's published picture but it is not a copy. All this reveals that '*Fomes advena* Quél.' belongs to *G. pfeifferi*.

If the name *Fomes advena* were to be accepted as validly published by means of a protologue consisting of Quélet's description of *Polyporus resinosus* and the figure labelled '*Fomes advena*' then the lectotype must be the fruitbody depicted. If valid publication is considered to be effected by the figure only (this in case the plate was not simultaneously published with the text) then the fruitbody depicted on the published plate must be accepted as the holotype.

(44). It will be observed that few references to descriptions and illustrations of *Ganoderma lucidum* based on North American material have been mentioned on the Check list. This is due to the far too inclusive conception of this species imposed over a long period by Overholts (1953: 208). Under the denomination *Fomes lucidus* he admitted a number of taxa that are either not matched by European material or that are referred to other species by contemporary European mycologists. One of these

elements is *G. sessile* Murrill, which corresponds to *G. resinaceum* in Europe. Another is *G. zonatum* Murrill, treated by Overholts as a variety; it occurs on palms and is not found in Europe. It appears to be a good species [cf. Steyaert, 1967 (BBr 37): 473 *fs.* 4A-C, 14, 15].

It looks as though 'typical' *G. lucidum* is rare in North America, at least as far as forms on hardwoods are concerned. Murrill [1908 (NAF 9): 118] did not admit *G. lucidum* at all. Other authors like Atkinson (1908a: 335; using the specific name *G. pseudoboletus*) and Haddow (1931: 33, 39-42) held to the commonly accepted European conception of *G. lucidum* except that they widened it by including *G. tsugae* Murrill. Atkinson was not convinced that the typical European form occurred in North America ("also in N.A.?"'). Haddow cited very few collections from hardwoods from that continent and stated that *G. lucidum* occurs "in America most commonly on Hemlock", thus referring to the *G. tsugae* component.

Even in the restricted sense adopted here for *G. lucidum*, this species shows considerable variation in Europe, where it occurs on a wide range of hosts, mostly hardwoods. One form occurs on *Abies* (*G. pseudoboletus* var. *montanum* Atk.); it should apparently not be confused with *G. valesiacum* (47). This form very likely corresponds to Kreisel's "Boreale Rasse" (1963b: 52). For *G. tsugae*, see also (45).

When Curtis published the (devalidated) name *Boletus lucidus* he cited *Boletus rugosus* Jacq. as synonym. Therefore some authors consider it to be a mere substitute name for the latter (compare Dandy & Stearn apud A. Stevenson 1961: 401). This would make Austria the type locality. It would be more satisfactory to take the specimen depicted by Curtis as lectotype (England, near Peckham).

Some authors have made *G. lucidum* a very inclusive species, with many synonyms based on specimens from all over the world. Such a wide conception is certainly unacceptable. Working out the taxonomy of this group will prove to be a major undertaking. On the Check list proper and on the "List of omitted names" only synonyms based on European specimens are recorded; an exception is made for *G. tsugae*.

(45). It was mentioned in the previous note that those American authors who kept to a stricter conception of *G. lucidum* than that of Overholts felt compelled to merge it with *G. tsugae*. Atkinson kept *G. tsugae* distinct as a variety but Haddow did not wish to make even this distinction. *Ganoderma tsugae* was originally described from *Tsuga*, the usual host in North America, where it is common. Overholts (1953: 211) also recorded it from *Picea* and *Pinus*. Moreover he seemed disposed to completely equate Haddow's conception of *G. lucidum* with his own of *G. tsugae* and also to accept records from hardwoods.

It will be necessary for European mycologists to decide what to do about *G. tsugae*, whether to (i) include it in *G. lucidum*, as Atkinson and Haddow did, (ii) keep it distinct from the latter species or (iii) follow Pilát

and include it in *G. valesiacum* (47). On the Check list I have listed *G. tsugae* as possibly belonging to *G. lucidum*; the references cited have been limited to descriptions based on North American collections.

(46). Although there is a tendency to consider *Ganoderma resinaceum* as not sharply distinguishable from *G. lucidum*, therefore as conspecific with it, I believe that it is preferable to keep the two apart. This opinion is based solely on collections from north-western Europe and does not take into account the various forms that appear to occur in southern Europe. For the latter see Bresadola (*G. resinaceum* var. *martelli* Bres. 1892 F.t. 2: 31 pl. 139) and Bourdot & Galzin (1928: 610).

This conception apparently agrees with that of Haddow (1931); he studied material from both Europe and North America and called the species *G. sessile* Murrill. Evidently he was not aware of the existence of the earlier published name *G. resinaceum*.

Steyaert (1967: 197) circumscribed *G. lucidum* in a broad sense and evidently included *G. resinaceum* but without mentioning the latter name. He is now convinced, however, that the two are different species.

A number of synonyms based on types from the tropics are left off the Check list proper and the "List of omitted names".

(47). *Ganoderma valesiacum* is said to be a species that occurs in Europe only on *Larix*. German authors now identify it with *G. tsugae*, apparently following Pilát [1942 (ACE 3): 483]. In my copy of the reprint of the paper in which *Ganoderma tsugae* was published Bresadola wrote "=*Gan. valesiacum* Boud.?", after the former name. I have no personal opinion about this matter because I have not sufficient knowledge of *G. valesiacum*. The original description in combination with the fact that later Bresadola accepted it as a distinct species suggest that the problem needs renewed and detailed study.

(48). In my opinion the correct identity of *Polyporus roburneus* Fr. (0) is still open to discussion. Fries (1828 E. 1: 106) at first referred his material to *Polyporus [Heterobasidion] annosus* but later (Fries, 1838: 464) he described it as a distinct species, *Polyporus roburneus*. No details about the type collection were mentioned except that it grew on oak in Sweden. For this reason it is difficult to decide whether or not it is still in existence as an 'authentic' specimen. The dark context ("obscure badia l. cochalatae coloris in fungo vegeto"), the presence of a crust on the cap ("superficie glaberrima, quasi laccata, tamen opaca"), the colour of the spore print, emphasized by being printed in italics ("sporidiis purpureo-fuscis"), as well as the remark "Omnium forsitan una cum *P. australi* . . ." (in the description of 1828), all taken together, point to a species of *Ganoderma*. The one species of this genus that comes to mind is *G. adpersum* (compare "superficie . . . tuberculoso-serobiculata, absque zonis distinctis" in the description of *P. annosus*), but several other features refute this

suggestion ("Duritie et pondere fere lapideus"; "interna substantia tota durissima"; "poris . . . umbrino-purpureis"). I have now given up trying to think up another and more likely suggestion. According to Bourdot & Galzin (1928: 619) Lloyd originally thought of "*Ganoderma laccatum*" [= *G. pfeifferii*], but subsequently he rejected this view.

Fries's figures (1884 I. 2: *pl. 184 f. 1*) of *Polyporus roburneus* published posthumously agree well with his original description. Bresadola [1897 (AAR III 3): 74] suggested that they represented *Fomes nigricans* sensu Bres. = black-crusted *Fomes fomentarius*: "Icon Friesii l.c. optima, sed pori fere semper versus lucem micore argenteo-carneo praediti, ideoque, meo sensu, nec *Polyp. roburneus* Fr. specifice differt."

The next interpretation was published by Lloyd [1910 (LMW 3, L. 28): 4] in connection with a specimen sent to him by A. Weidmann, Bohemia: "*Fomes roburneus*, teste Bresadola. It was on birch and has same context color and texture as *igniarius*, but has a smooth *black* crust. It has abundant cystidia." This suggests, first, that the specimen was named by Bresadola and, secondly, that Bresadola had apparently changed his mind, perhaps because of a specimen he had studied that had earlier been named by Fries. A few years later Lloyd (1915a: 246) claimed that he had unearthed the "type" at Kew. It is more likely that 'type' should be revised to 'an authentic specimen'; it is not unlikely that Bresadola had studied it previously. The specimen was said to be a slightly laccate form of *Fomes nigricans* (which is a vague determination); "it is exactly the same, excepting there is a slight resinous exudation on the crust and the setae are quite abundant. The pore mouths are strongly silvery, glancing." Mr. L. Ryvarden informed me that the Kew specimen is a slice and that it is sterile, with short stout setae 12–23 × 6–8 μ ; he believes it to be a young fruitbody of a species of *Phellinus* (cf. *igniarius*). Lloyd also remarked that Fries's "Icones 184 has no resemblance whatever to his specimens, and I believe it represents *Fomes roseus*." Weidmann's specimen mentioned above was said to be "typical". The original *Polyporus roburneus* was recorded from oak ("ad ligna durissima *Quercus*"). Compare also Lloyd 1922 (LMW 7): 1155 & 1923 (LMW 7): *pl. 220 f. 2270*.

There are still other interpretations. "*U[ngulina] roburneus* Fr." of Patouillard (1900: 102) has "Trame pâle, très dense." According to Bourdot & Galzin (1928: 618) "*Pol. roburneus* Fr. était le nom que donnait Quélet dans ses déterminations au *Ph. robustus*."

It will be noticed that most of the interpretations mentioned above passed over the recorded colour of the spores in silence. If this were legitimate (of which I am not at all convinced) it would still be difficult to come to a decision. In view of the many interpretations (belonging to such genera as *Fomes*, *Fomitopsis*, *Phellinus*, and *Ganoderma*) and the uncertainty as to whether the Kew specimen is really the type it seems appropriate for the moment to reject the name *Polyporus roburneus*, as it is a nomen ambiguum et dubium.

Gloeophyllum

(49). The circumscription adopted here includes three genera now often accepted in Europe, viz. *Gloeophyllum* sensu stricto, *Phaeocoriolellus*, and *Osmoporus*. Studies of cultural characters by David (1968) support this emendation.

Gloeophyllum (sensu stricto) is, from a world-wide point of view, the largest element, with two European species, *G. sepiarium* and *G. abietinum*. The hyphal structure of the fruitbody is best known for the former species [cf. Van der Westhuizen 1971 (Bo 10): 175 fs. 5, 6]. It is trimitic; the generative hyphae are differentiated into thin-walled and sclerified hyphae.

Phaeocoriolellus, with one species, *G. trabeum*, has been found to be dimitic. The fruitbody lacks binding hyphae; the binding system, admittedly not well developed, consists of sclerified generative hyphae [Van der Westhuizen 1971 (Bo 10): 180 fs. 7-8]. This genus was introduced because Teston (1953b: 91; as *Trametes*) had reported only generative hyphae and skeletals, in contradistinction to *G. sepiarium* and *G. abietinum* for both of which she also reported binding hyphae. Van der Westhuizen [1971 (Bo 10): 185] believed that "this difference is of fundamental importance in the anatomy of the carpophores [of *Lenzites trabea* and *L. sepiaria*], which therefore cannot be regarded as congeneric."

Osmoporus includes *G. odoratum*, from which *G. protractum* may or may not be specifically distinct. Teston (1953b: 91; as *Trametes*) found only generative and skeletal hyphae in *G. odoratum*; M. E. P. K. Fidalgo (1962; as *Osmoporus*) reported for the same species a dimitic hyphal construction without binding hyphae but with sclerified generative hyphae in older parts of the context of the cap. This led Van der Westhuizen [1971 (Bo 10): 185] to conclude that *G. trabeum* and *Osmoporus* "are thus congeneric and if the genus *Osmoporus* Sing. is accepted as valid, *Lenzites trabea* should be transferred to it."

The above brief analysis shows that there is considerable conformity between the three composing groups, both in cultural characters and in the construction of the fruitbody, the sole difference advanced being the presence of binding hyphae in *Gloeophyllum* sensu stricto in contradistinction to *Phaeocoriolellus* and *Osmoporus*. The same facts from which this single strongly stressed difference is extracted also admit of a contrary interpretation: the system of binding hyphae in *Gloeophyllum* sensu stricto is rather poorly developed while at least in *Phaeocoriolellus* there is sufficiently leeway to speak of a small quantity of incipient binding hyphae. I believe it premature to separate the three groups and await supporting characters before admitting them as distinct genera.

Gloeoporus

(50). This small genus has been combined with *Bjerkandera* by Pilát [1937 (ACE 3): 149] and the type species of *Skeletocutis* by Killermann

(1928: 202). The hyphal construction of these three genera and several other details, however, are so different that there is little reason for keeping them together.

L. Hansen (1956: 253–255) concluded that the tube-layer of *Gloeoporus dichrous* was ‘meruliod’ with the hymenium continuous over the edge of the tubes as in *Poria [Merulius] taxicola* (O). Van der Westhuizen (1971: 170) also concluded that the hymenium is continuous over the edges of the pores. This would remove *Gloeoporus* from the Polyporaceae. Domański (1966b), however, came to the opposite conclusion, viz. that the edges of the tubes were sterile, as in *Poria pannocincta*, a species that Eriksson transferred to *Gloeoporus*.

Although the association of *G. dichrous* and *G. pannocinctus* in a single genus is here tentatively accepted it must be pointed out that according to Nobles the former is oxidase-positive (1965: 1122; 1971: 181) and the latter apparently a brown-rot fungus (typically oxidase-negative; 1971: 179). More recently Van der Westhuizen (1971: 172–173) reviewed the pertinent evidence published in connection with *G. dichrous*; this species appears to behave inconsistently in the production of oxidase reactions but he concluded that it causes a white rot. Much of this kind of research was based on extra-European collections which may not have been conspecific with the typical European taxon (51).

I cannot agree with Lowe (1966: 72) that the type species of *Podoporia* P. Karst. (*P. confluens* P. Karst.) (O) “may be the same plant” as *Poria [Gloeoporus] pannocincta*. I have seen the type but am not prepared to make any other suggestion about its correct identity.

(51). The precise circumscription of *Gloeoporus dichrous* is far from settled. After a few random tests (including tests on North American material referred to *G. dichrous*) I refrain not only from listing any description based on specimens collected outside Europe but also from adding specific synonyms based on extra-European collections. The genus needs very thorough revision. All the species that were or have been referred to *Gloeoporus dichrous* are mentioned on the “List of omitted names”.

Grifola

(52). Pilát’s emendation of this genus has been shrinking rapidly owing to the exclusion of such elements as *Bondarzewia*, *Meripilus*, *Laetiporus*, *Leptoporus castaneae* (= “*Tyromyces*” *spraguei*), and *Osteina*. The principal character indicated for the separation of *Flabellolipus* Kotl. & P. = *Meripilus* P. Karst. was the absence of clamps. This feature needs further study; according to Nobles (1965: 1101; code symbols 5 + 6) the lack of clamps is not absolute, at least as far as cultures are concerned. On the other hand there are a number of other differences between the type species of *Grifola* (*G. frondosa*) and *Meripilus* (*M.*

giganteus). Taking these together the two taxa still appear worthy of recognition as distinct genera. One of the features I have in mind is the strongly pronounced fissility of the flesh in *M. giganteus*; another is the pale ochraceous spore print.

(53). Recently Pouzar (1966c: 360) transferred *Grifola umbellata* to the genus *Polyborus* because of the hyphal system; he considered it to be dimorphic by binding hyphae, which reminded him of *Polyborus squamosus*. I am not always much impressed by the taxonomic importance of binding hyphae as a generic character. Moreover Nobles (1971: 188) concluded that on the evidence of cultural studies *Grifola umbellata* should be excluded from *Polyborus* s. str. My retention of this species in *Grifola* means that at the moment I am not willing to suggest any alternative solution.

Incrustoporia

(53bis). *Incrustoporia percandida* (Mal. & Bert.) Donk, comb. nov.; basionym, *Poria percandida* [J. L.] G. Malençon & R. Bertault in Acta phytotax barcinon. 8: 30, 35 f. 6. 1971. — Al. David (1971: 95) used this new combination but without validly publishing it. Not only is the replaced synonym not clearly indicated but no full and direct reference with page is given to the original publication (Code, Art. 33). The publication of the basionym as "*Poria (Incrustoporia) percandida*" does not constitute valid publication of the combination *Incrustoporia percandida* either.

Recently I made several collections of this species in Morocco.

Inonotus

(54). The circumscription of *Inonotus* used here does not differ much from the genus as emended by Donk (1933: 240) and monographed by Pegler (1964). This should not be taken as evidence that I consider the genus to be homogeneous. That the group will eventually be broken up into a number of smaller genera I do not doubt. Actually for some time I contemplated doing this but it became more and more obvious that a fair knowledge of the European species is definitely not a sufficient basis for effecting this task. As in so many other groups, the European species form only a minority.

When in the future an attempt is made to break up the present genus I have little doubt that two available generic names, now listed as synonyms of *Inonotus*, will have to be restored; they are *Inodermus* Quél. (lectotype, *Inonotus radiatus*) and *Xanthoporia* Murrill (holotype, *I. andersonii*). The former name is discussed below from a nomenclative point of view (55).

On an earlier occasion Donk (1933: 241) divided the Dutch species over three sections. These are:

(i) *Inonotus* sect. *Inonotus* (formerly called *Inonotus* sect. *Euinonotus* Donk). Species: *Inonotus cuticularis*, *I. hispidus*.

(ii) *Inonotus* sect. *Inoderma* (P. Karst.) Donk ("*Inodermus*"). Species: *Inonotus radiatus*, *I. nodulosus* (56), *I. polymorphus* Rostk. sensu Bourd. & L. Maire (57), and presumably also *I. weiri*.

(iii) *Inonotus* sect. *Dryadeus* Donk. Sole species: *Inonotus dryadeus*.

I would now add one more section taken from section *Inonotus* and give it a name:—

(iv) *Inonotus* sect. **Phymatopilus** Donk, *sect. nov.* Basidioma e corpore fibroso-granulato myceliato formatum; superficies anodermatica. Sporae distincte brunneo-coloratae. Setae nullae. Typus: *Inonotus dryophilus* (Berk.) Murrill. — Etymology: φῦμα, a growth or tumor; πῖλος, cap. The European species are mentioned below (59).

(v) With one exception the rest of the European species could be temporarily regarded as forming a group characterized by yellow or sulphur-yellow spore-print. Available names are: *Xanthochrous* sect. *Resupinati* Pat. 1900: 1 (lectotype, *Polyporus andersonii*), *Poria* sect. *Xanthochrous* Bourd. & G. 1925 (BmF 41): 247 (monotype, *Poria obliqua*), and *Xanthoporia* Murrill. Species: *Inonotus andersonii*, *I. glomeratus*, *I. niduspici*, *I. obliquus*.

The exception is the resupinate species

(vi) *Inonotus subiculosus* (61).

(55). If it were to be decided that *Inonotus* sect. *Inoderma* (P. Karst.) Donk must be treated as a distinct genus then the establishment of the correct name for the genus is something of a minor nomenclative puzzle. There are three published names to be considered: *Inoderma* P. Karst. 1879, *Inodermus* Quél. 1886, and *Mensularia* Lázaro 1916, all of which can be taken as based on *Polyporus radiatus* (Sow.) per Fr. If *Inoderma* P. Karst. had not been preoccupied by the earlier homonym *Inoderma* (Ach.) S. F. Gray 1821 (a genus of lichens), *Inodermus* Quél. would have to be treated as merely a superfluous orthographical variant of *Inoderma* P. Karst., differing slightly in termination. Since *Inoderma* P. Karst. is illegitimate however *Inodermus* appears to be available precisely because of the difference in termination; *Inoderma* (Ach.) S. F. Gray and *Inodermus* Quél. are not likely to be confused since they are applicable to unrelated taxa, viz. a genus of lichens and one of Hymenomycetes (cf. Art. 75 of the "Code", the *Peponia-Peponium* Example). The other generic names ending in —a, *Inoderma* Kütz. 1883 (Algae) and *Inoderma* Berk. 1881 (Ascomyctetes) cannot affect the above conclusion, not only because they are generic names given to systematically widely different taxa but also because they drop out as later homonyms, viz. illegitimate names that are permanently unavailable.

In this connection I would mention such generally accepted substitute names as *Melanoleuca* Pat. (for *Melaleuca* Pat.) and *Elmerina* Bres.

(for *Elmeria* Bres.). If the names between brackets had not been pre-occupied by earlier homonyms the substitute names would have to be regarded as mere orthographic variants and as such would not be available.

It is not impossible that an attempt will be made to brand *Inodermus* Quél. as 'superfluous', hence illegitimate (impriorable), because one of its original species [*Inonotus hispidus* (Bull. per Fr.) P. Karst.] is the lectotype of the generic name *Inonotus* P. Karst. published at an earlier date. This selection of the type species of *Inonotus* however was made long after Quélet had introduced *Inodermus*. One interpretation of Art. 63 of the "Code" accepts this as an argument against censuring *Inodermus* Quél. as illegitimate (impriorable). Personally I ignore much of the ruling on 'superfluous' names in its present formulation as a traumatic spot in the "Code" that ought to be cured as soon as possible.

(56). It is with considerable hesitation that I maintain the separation of *I. nodulosus* as a satellite species from *I. radiatus*; I have done so in order to attract attention to this taxonomic problem.

The species received two names in the same year, viz. *Polyporus nodulosus* Fr. and *P. polymorphus* Rostk. (I have not tried to establish the relative dates.) A study of the protologue of the latter name reveals that the fungus grew on *Fagus* and that it formed true caps (not merely nodules); these facts, supported by the rest of the protologue, leave no doubt in my mind about its correct identity. Pilát [1942 (ACE 3): 559] arrived at the same conclusion these many years ago. It is remarkable that *P. polymorphus* could have been so long misapplied to the strictly resupinate species that I now call *Polyporus* [*Inonotus*] *polymorphus* sensu Bourd. & L. Maire for want of a correct name (57).

Moravec [1954 (ČM 8): 93; 1960 (ČM 14): 29] records *Dialonectria cosmariospora* (Ces. & De Not.) Moravec, a parasitic pyrenomycete, as growing on *Inonotus nodulosus* only. The conception of this host species favoured by some Czech authors, like Pilát (l.c.), also includes *I. polymorphus* sensu Bourd. & L. Maire but I have not seen any collection of *Dialonectria cosmariospora* growing on it. Perhaps a more precise knowledge of the preference of this species of *Dialonectria* may help to decide on the status to be ascribed to the taxa of *Inonotus radiatus* complex. The substrata given on labels of works of exsiccati and in other publications are often wrongly named. The determination of the substrata is not always easy because the fruitbodies are often represented in the collections as fragments (usually merely resupinate portions) and old and more or less blackened by rotting. Examples: Rabenhorst (*in* F.e. No. 459, as *Cosmospora coccinea*) gave "In lignis putridis". Roumégère (*in* F.g. No. 2755, as *Nectria cosmariospora*) wrote "Sur le *Polyporus ferruginosus* pourissant." This induced the Tulasne (1865 S.C. 3: 93) to correct this to "crescit in hymenio . . . *Polypori* . . ."; they themselves found the species in beech-wood, which would seem to indicate *Inonotus nodulosus*. However

Saccardo (S.F. 2: 508) merely copied Roumeguère. When Munk [1957 (DbA 17¹): 50] stated "apparently not rare on old fruit bodies of *Polyporus radiatus*" he may have had in mind *Inonotus nodulosus*, which in Denmark is common on *Fagus*.

(57). The fungus that Bourdot & L. Maire first described under the name *Xanthochrous polymorphus* and which Bourdot & Galzin treated as a subspecies of *X. [Inonotus] radiatus* is now often accepted in Europe under the name *Inonotus polymorphus* as a good species (cf. Jahn, 1965c). The use of the epithet 'polymorphus' however is due to a misinterpretation (56) and must be abandoned for the fungus with the conspicuous tramal setae in the dissepiments.

It might appear that a correct basionym exists, viz. *Polyporus dentifer* Velen., but the original description is not completely convincing and the type has as yet not been located for confirmation (Drs. F. Kotlaba & Z. Pouzar *in litt.*, Dec. 14, 1970).

Polyporus salebrosus Lasch (0) has been mentioned in this connection.

(58). *Inonotus radiatus* is usually broadly conceived but there is a growing tendency to admit more than one species in Europe. The most extreme authors admit not only *I. radiatus* but also *I. nodulosus* and *I. polymorphus* sensu Bourd. & L. Maire (57). As pointed out elsewhere the name *Polyporus polymorphus* has been misapplied; in my opinion it is a synonym of *Polyporus nodulosus* (56).

Even when these three taxa are admitted on the specific level a residue remains that still needs further study. This applies perhaps (again as far as Europe is concerned) especially to part of what is now called *I. radiatus* var. *resupinatus* (Bourd. & G.) Pegl. (after the exclusion of resupinate *I. nodulosus* and *I. polymorphus* sensu Bourd. & G.).

The division of *I. radiatus* into three species on this Check list does not mean that I am satisfied that this is correct: it is merely a working hypothesis. Outside Europe there are still some taxa that are now included in *I. radiatus* but perhaps deserve autonomous status; for instance there are *Polyporus cucullatus* and *P. illinoiensis* [= *Inonotus radiatus* var. *cephalanthi* (Overh.) Pegl.], both described from North America.

(59). The *Inonotus rheades* complex is far from well understood in Europe. Lloyd lumped the whole of it in one species under the incorrect name *Polyporus corruscans*, while Bourdot & Galzin admitted four subspecies. I have followed Pegler's modification (1964) of the treatment by the French authors; he admitted three species, each corresponding to one of Bourdot & Galzin's subspecies, except that he combined their *Xanthochrous rheades* (sensu stricto) and *X. vulpinus* (subspecies) into a single species. This combination is accepted by Kotlaba & Pouzar (1969: 169). A nomenclative change of epithet from Bourdot & Galzin's

scheme was also necessary because the correct name for *X. corruscans* is *Inonotus dryophilus*.

Another matter in need of careful study by European mycologists is the host range of these species. The rule of thumb followed in northern Europe is that *I. dryophilus* grows on species of *Quercus* and *I. vulpinus* (= *I. rheades*, in part) on species of *Populus*. Bourdot & Galzin (1928: 635–637) came to a broader range: *Xanthochrous rheades* (sensu stricto) they reported from *Populus*, *Fagus*, and *Betula*, and *I. vulpinus* from species of *Populus* and from *Fagus*. If simple contraction of these two taxa into one species (*I. rheades* sensu Pegl.) is in order then the species now usually referred to as *I. vulpinus* may on the one hand also be expected to occur in northern Europe on hosts other than species of *Populus* alone. On the other hand Kotlaba & Pouzar (1969: 169) stated that "In Czechoslovakia, *Inonotus rheades* is known to occur almost only on dead (only once on living) standing trunks of moderately aged aspen (*Populus tremula*); in one case it was collected on *Populus canescens* (*P. tremula* × *P. alba*) and once in a wound on a branch of living *Salix* cf. *aurita* (quite an exceptional host plant)." They regard the reported occurrence on *Pinus* as surely wrong, while the record of *Rosa* as a host plant was due to an error of determination of the fungus, which turned out to be *I. radiatus*.

The host range of *I. dryophilus* outside Europe is much wider than oak alone.

(60). Bresadola supposed that his *Polyporus friesii* corresponded to the *P. fulvus* of Fries. It should be observed however that his description mentions "Hab. ad trunco praeceps Quercus et Populi in Silva nigra (Dr. Pfeiffer)." There can be little doubt that the type must be selected from Pfeiffer's material; it is also very likely that it represented two species, viz. *Inonotus dryophilus* (the material from *Quercus*) and *I. vulpinus* = *I. rheades* (the material from *Populus*); compare (59). Both species have been recorded from the general region of the Black Forest (= Schwarzwald = Silva nigra). Bresadola recorded the spores as "7–9 × 4–5 μ"; the length suggests *I. dryophilus*, the breadth, *I. vulpinus*. An inspection of Bresadola's specimens is called for to determine their identity one way or the other. I have followed present usage and list the name as a synonym of *I. rheades*, an important reason being that Bresadola himself listed *Polyporus fulvus* Fr. [= *Inonotus vulpinus*] as a synonym.

(61). *Inonotus subiculosus* has been reported from Finland. I have seen several collections from North America and have made an ample collection in Michigan myself; I have also studied a portion of the material on which the European record is based. All the American collections studied had shallow, or rather shallow, tubes with poorly developed

hymenium and they had produced spores that were perhaps not fully mature (viz. thin-walled, colourless). The European collection had much longer tubes and also a fully developed (as well as exhausted) hymenium, with apparently more mature spores. The exhausted hymenium is of the honey-comb type; the just-ripened basidia are broadly club-shaped; and the spores are hardly adaxially flattened, with a hyaline apiculus protruding abruptly from the somewhat thickened wall. These spores may have been faintly tinted but of this I am not quite sure (no spore-print seen). As to the correct genus, this may well be *Inonotus*, as long as this is accepted in the wide sense retained for it on this Check list.

Irpe^x

(62). The *Irpe^x lacteus* of this Check list is broadly conceived, irrespective of possible diversity in certain characters of the generative hyphae. From The Netherlands a clamp-bearing collection was described by Maas Geesteranus [1963 (PNA 66): 452 *fs. 11–13*] ¹²; and Boidin & Lanquetin [1965 (RM 30): 10] reported for this species the tetrapolar type of interfertility and [*fide* David, 1959 (BIL 38): 200] “un comportement normal”, which means that it has uninuclear spores that germinate by producing a mycelium of uninuclear cells, while the “diplonte” is regularly binucleate. Later investigations reported hyphae without clamps for *I. lacteus* (Domański & Orlicz, 1969: 158) while David (*i.e.*) concluded that *I. tulipiferae* was presumably homothallic, without clamps in polyspermous cultures, and “holocénocytique” (mycelium consisting completely of coenocytic cells). This disparity between the results of Boidin and those of David was apparently the reason why instead of *I. lacteus* the name *I. tulipiferae* was used for European collections.

Irpe^x sensu stricto of this Check list is retained as conceived by Domański & Orlicz for a broadly conceived species, presumably characterized by coenocytic generative hyphae without clamps.

For almost none of the type collections, most of which have still to be selected, is information available on the presence or absence of clamps. As to the names *Irpe^x lacteus*, *I. sinuosus*, and *I. canescens*, where Fries left no types, substitutes for them must be selected; this will require separate study. Preferably such a substitute and illustrative specimen (or ‘neotype’) of *I. lacteus* should come from southern Sweden (presumably Femsjö); should answer to the first description and picture published by Fries (1818 O. 2: 266 *pl. 6 f. 1*); and should agree with the only substratum mentioned in its first description, “In ramis dejectis *Fagi*.” The original material of *I. sinuosus* came from two localities,

¹² Dr. R. A. Maas Geesteranus has come to the conclusion that the two collections on which the description was based represent *Steccherinum ochraceum* (Pers. per Fr.) S. F. Gray. The fruitbodies are small, with barely reflexed margins, whitish, and with irpicoid rather than toothed hymenophore.

"Pluries a Ruthenia misit Cel. Weinmann; equidem unico tantum loco, sed per quinque annos reducem habui supra ramos dejectos coacervatus *Quercus* . . . (v.v.)." This second locality is again presumably Femsjö.

Irpex tulipiferae is the name now used for *I. lacteus* sensu lato as it occurs in North America. Even though it is there an extremely common species, so far no specimens with clamps have been reported. Although Bresadola [1897 (AAR III³): 101] at first identified *I. tulipiferae* with *I. lacteus*, later he (Bresadola, 1926: 79) apparently treated it as distinct.

Fries (1838: 522) received the type of *I. pallescens* from von Schweinitz, who collected both this and the type of *I. tulipiferae* on *Liriodendron*. Hence it may well belong to the latter, which is clampless.

Irpicodon

(63). *Irpex pendulum* is a remarkable species of, as yet, doubtful alliance; it seems worthy of being segregated as a distinct genus. This was already Fries's opinion at an early date: "Optima generis species" (1828 E. 1: 143) and ". . . ut facile peculiaris generis typus" (1874: 620). After Reid & Austwick [1963 (GN 18): 314] and Boidin & Lanquetin [1965 (RM 30): 10] had discovered that the spores were amyloid a generic name was provided, viz. *Irpicodon* Pouz.

Ischnoderma

(64). In a recent paper Pouzar (1971) defended the Friesian thesis that the *Ischnoderma benzoinum* of the present Check list is composed of two species. He emphasized that it was the colour of the trama of the dissepiments of the tubes in the hard and final stage of development that constituted the main difference: dark brown in *I. benzoinum* sensu stricto and white, whitish, or at most somewhat dirty yellowish in what he calls *I. resinosum*. Moreover from the specimens at his disposal it appeared that (at least in Europe) *I. benzoinum* is confined to coniferous trees, whereas *I. resinosum* occurs only on deciduous trees, mostly on *Fagus*. It would seem to me that many authors knew only the former taxon (Bourdot & Galzin, 1928: 605, as *Ungulina fuliginosa*; Donk, 1933: 175, as *I. resinosum*).

This revival of the two taxa earlier differentiated by Fries poses a thesis that is warmly recommended for further study. While Pouzar distinguishes two phases in the development of the fruitbody of both taxa (a soft, sappy one and a hard one) it must be pointed out that Fries (1874: 554) emphasized two phases for his *Polyporus resinosus* only, "A. sitaneus, pileo carnosu . . . B. hornotinus pileo suberoso . . .".

Those following Pouzar should reconsider the name to be used for what he prefers to call *I. resinosus*. This was discussed by Donk (1971a: 8); he rejected the name for the whole complex because it was simply a misapplication by Fries that did not exclude the type (Art. 55); the type

is represented by the name *Boletus resinosus* Schrad., which both Pouzar (1971: 18) and Donk (1971a: 8) refer to *Fomitopsis pinicola* as a synonym. Had Fries excluded the type he would have introduced a 'new' name based on a different type (Art. 48). The same argument applies to *Boletus fuscus* Pers. (= *I. resinosum* sensu Pouz.); according to Pouzar, Wahlenberg, in revalidating *Boletus fuscus* Pers., misapplied it to the other taxon (= *I. benzoinum* sensu Pouz.).

The correct names and their synonyms of the two taxa defended by Pouzar would appear to be as follows (with the 'original' substrata added):—

(i) *Ischnoderma benzoinum* (Wahl.: Fr.) P. Karst.—" . . . ad caudices abietinos putridos . . . "

? *Boletus fuliginosus* Scop.—" . . . in Truncis prope radices."

Polyporus morosus Kalchbr.—"In pinetis . . . in trunco *Abietis piceae* reciso . . . "

Polyporus pini-silvestris Allesch.—The name leaves little doubt about the substratum.

(ii) *Ischnoderma fuscum* (Pers. per Wahl.) John Doe (nomen eventuale).—"Passim ad truncos *fagi sylvat.*" (Pers.); " . . . ad radices denudatus *Abietinum* . . ." (Wahl.).

Boletus velutinus Vahl.—" . . . in truncis *fagi* . . . "

Polyporus guttatus Weinm.—"Ad truncos *Alni* etc."

M.—*Boletus resinosus* Schrad. per Fr. sensu Fr. 1821 emend. Fr. 1828.—"Major in arboribus frondosis, minor in pinetis. . . . Ad truncos" (1821), "In trunci *Fagi, Aceris, Alni* etc." (Fries, 1874: 554); ≡ *Ischnoderma resinosum* Donk, not ~ (Fr.) P. Karst.

Laetiporus

(65). *Laetiporus sulphureus* is a common species in Europe and temperate North America, where it shows not only a wide range of variation in shape and colour but also in host. Some authors who received and named polypores from all parts of the world extended their conception of this species by also including taxa described from tropical Asia and South America; of these the best known is *Laetiporus miniatus* (Jungh.) Over. (O) from the eastern Asian tropics; it also appears to have a wide colour range. However, I am not convinced that it should be merged in *L. sulphureus*. (I myself have collected it in West Java, Indonesia.) For this and other reasons names based on taxa from the southern hemisphere and occasionally referred to *L. sulphureus* have not been entered on the Check list; they are mentioned briefly on the "List of omitted names".

Lenzites

(66). In many respects *L. warnieri* strongly resembles *Daedalea*

quercina and several mycologists (among others Bresadola) have even reduced the species to the rank of a mere lenzitoid form of *D. quercina*. On the other hand under the name *L. reichardtii*, Igmandy (1962) and David (1967b) have found that it deviates considerably from *D. quercina*, for instance in cultural characters, and these characters agree much better with *Lenzites betulina*. In contradistinction to *D. quercina* the species is, *inter alia*, 'oxidase positive' and lacks clamped hyphae with irregularly thickened walls (Nobles's code symbol 9). On the other hand the fruitbody shows considerable differences vis-à-vis *L. betulina*, especially in the surface of the cap. However a great deal of information on tropical lenzitoid species is needed before changes in the taxonomic position can be proposed.

Meripilus

(67). Much of the confusion of *Meripilus giganteus* with species of *Grifola* has arisen because the fruitbodies are generally too big to be depicted natural sized, and too intricately built, inducing reduced and schematical rendering on many of the classical plates. A meticulous reading of the accompanying text is necessary to find out the real dimensions; often these will point in the direction of *M. gigantea* in cases where a fruitbody considerably exceeds about one or two feet in diameter. A description of the flesh might also reveal misidentifications, as in the case of *P. frondosus* sensu Rostk.: "Das Fleisch des Hutes ist fest, lederartig, elastisch, weiss, und lässt sich in unendliche sehr feine Fasern zertheilen"; this is certainly *M. gigantea*.

Compare also (52).

Oligoporus

(68). The genus *Oligoporus* is in my opinion still on trial. It was introduced by Brefeld for three *Ptychogaster* states, two of which he knew to be connected with polypores; of the third (*Ptychogaster rubescens*) he knew no perfect state. Brefeld was prejudiced in favour of the co-occurrence of the imperfect states. Had he been followed his genus would have grown into a bigger one at the expense of *Tyromyces* (123) and *Poria* but his view failed to draw support.

The type species of Brefeld's generic name is *Oligoporus farinosus*, which Donk identified with *Polyporus rennyi*. When Pouzar (1967: 206) transferred *Polyporus rennyi* to his new genus *Strangulidium* he emphasized the 'suburniform' (rather, utriform) basidia and the cyanophilous spore-wall, the latter a character strongly emphasized—perhaps with some bias—in the work of Kotlaba and Pouzar. This implied that the other species of polypores known to produce *Ptychogaster* states in nature did not possess these two characters, but this was not stated positively.

The fruitbody of *Oligoporus rennyi*, when not associated with its imper-

fect state, is effused, but on vertical substrata fruitbodies associated with the *Ptychogaster* state this state may produce raised edges with tubes formed on the underside. If the genus is not accepted the perfect state could be placed in an inclusive genus *Poria* or in *Strangulidium*, which is based on *Poria sericeo-mollis*. Pending further research I prefer to maintain *Oligoporus* for a single species.

Onnia

(69). The generic status of the *Polyporus tomentosus* complex and its precise circumscription is still open to discussion. I have restricted *Onnia* to this complex only. It has been included in *Coltricia* but the differences are that its fruitbody (which may vary from stalked to sessile or even pulvinate) is less definitely stalked; the duplex context of the cap is more or less pronounced (the lower layer becomes firm to hard and even almost woody and the soft upper layer varies in its degree of development from a mere tomentum to a thick layer); big haplosetae (hymenial) are present; the spores are smaller and paler (colourless); and through mycorrhizal association or parasitically the species are related to conifers.

Other genera that should be taken into consideration before autonomous generic status is assigned to *Onnia* are *Phaeolus* and *Inonotus*; here these are not discussed further. Authors who favour an inclusive genus *Inonotus* will perhaps find it not too easy to define clear cut characters for these three genera and they may be inclined to combine them into one.

In some recent European publications the genus *Onnia* is called *Mucronoporus* on the assumption that *Polyporus circinatus* is the type species of this generic name. It was recently pointed out by Donk (1971a: 12) however that the correct lectotype of the name *Mucronoporus* is *Polyporus gilvus*; this makes of *Mucronoporus* a synonym of *Phellinus*, *Onnia* thus becoming the correct generic name.

(70). The next problem connected with *Onnia* (69) is the division of its contents, the *Polyporus tomentosus* complex, into taxa, together with the rank to be assigned to them. Although a few mycologists and phytopathologists (Gosselin, 1944) have claimed that they are able to distinguish between two groups without the use of a microscope others insist that the only tangible difference is in the setae (Whitney, 1962). These bodies may all be straight or else all to many of them distinctly curved to hooked. This difference was first appreciated by Ellis & Everhart (1889a) and it was particularly emphasized by Jørstad & Juul (1939) and Haddow (1941). It has become current practice to admit two taxa on this basis but there is still no concensus about the rank to be assigned to them. Most modern authors now admit two varieties but some prefer species, in which case they distinguish between *Polyporus tomentosus* (straight setae) and *P. circinatus* [which, assuming it to be broadly conceived,

should be called *P. triqueter*] (hooked setae). Recently Eriksson & Strid (1939: 136) "have become convinced that *Inonotus triqueter* is a species of its own." Another difficulty has been to find out which name should go with which type of setae; this problem was reviewed by Haddow (1941), who concluded that the forms with curved setal tips belonged to *Polyporus circinatus*.

Much of the confusion in this connection was due to Lloyd (1908: 2-4); originally he ascribed straight setae implicitly to both *P. tomentosus* and *P. circinatus*,¹³ supposing that the main difference (of the stalked forms), as indicated by Fries, lay in the degree of development of the tomentum on the cap, poor in *P. tomentosus* and strong in *P. circinatus*. This gave rise in North America to the conception of a species with straight setae (*P. tomentosus*) to which for some time the name *P. circinatus* was applied and for which the name *P. tomentosus* var. *americanus* Jørst. & Juul [1939 (MnS 6): 434] was introduced.

Of the two species recognized here *Onnia triqueter* (*O. circinata*) shows the greater variability in the shape of the fruitbodies; the shape ranges from centrally stalked (developing from buried roots or growing on duff from conifers) over sessile to even pulvinate (on stumps and trunks). According to Jørstad it would seem that in Norway *O. circinata* is always found with sessile fruitbodies or with a not clearly marked lateral stalk. This variation in shape has given rise to several specific names that now live on in the names of varieties and forms. The taxonomic value of these subdivisions, based primarily on the shape of the fruitbody, is as yet not well understood.

This separation of *Onnia* into only two species however may appear to be too simple a solution.

Oxyporus

(71). The genera *Oxyporus* and *Rigidoporus* as conceived by Donk (1967: 73-74) form two parallel series which agree in monomitic context and the lack of clamps in the fruitbody. (Clamps have been recorded in cultures for a few species.) This conformity induced Pouzar (1966c: 366-369) to combine the two under the name *Rigidoporus*. The differences between the two genera must still be formulated more precisely than has been done so far. Cultural characters should be helpful. In this respect the species referred to *Rigidoporus* appear to have a number of characters in common among which there is one expressed by Nobles's (1971: 184) code symbol 10 ("Hyphae differentiated to form cuticular cells, closely packed together to form a pseudoparenchyma.") This last character is negative in *Oxyporus populinus*, the type of the generic name *Oxyporus*.

Oxyporus will perhaps appear to be composed of two or three groups

¹³ Moreover, he described the spores of European *P. circinatus* as $12 \times 7 \mu$, which is much too big and certainly wrong.

the taxonomic rank of which is as yet uncertain. The typical subseries differs from the rest in a number of details of the cystidia. As far as is known the '*Poria*' group consists of species with non-amyloid hyphae and one with weakly amyloid hyphae. The latter has been placed in a group of its own, viz. *Rigidoporus* subgen. *Neoxyporus* Pouz. (1966c: 368); according to Nobles this species (*Oxyporus latemarginata*) agrees with *Rigidoporus* in forming 'cuticular cells' in cultures (code symbol 10).

The poria-like *Oxyporus* species are all supposed to be cystidiate but the number of cystidia may vary considerably to the point where they have even been reported to be absent. Of two putative synonyms of *O. latemarginata* (viz. *Poria consobrinoides* and *P. reticulatomarginata*) no cystidia have been reported. This raises the question of the importance of the character of 'cystidia present' in connection with the poria-like series in *Oxyporus*. In *Rigidoporus* cystidia may be present or absent, depending on the species, and they may vary in number in certain species.

On comparing *Chaetoporus* [*Oxyporus*] *philadelphi* (cystidia present) with *Poria millavensis* (cystidia lacking) a possibly significant similarity is apparent and I have been considering the transfer of *P. millavensis* to the neighbourhood of the other poria species in the genus *Oxyporus*. In any case, with our present incomplete knowledge the introduction of the genus *Riopa* for a species (*R. davidii*) lacking cystidia may have been premature, since in other respects *Riopa* seems to closely resemble the poria species of *Oxyporus*. Pending more information on these fungi it seems advisable to assign *Riopa* either to the rather indefinitely conceived genus *Oxyporus* of this Check list or (as is done in these pages) to *Poria*, the container for unclassified resupinate polypores.

(72). The correct name for the highly characteristic type species of the generic name *Oxyporus* is still in doubt. There are two rival epithets that have been used almost indiscriminately; these were validly published in the following combinations, viz. *Polyporus populinus* (Schum.) per Fr. 1821 and *Polyporus connatus* Weinm. 1826. Provided both names were based on the same species there should be no hesitation in accepting *P. populinus* as the correct basionym.

The trouble is that there is no absolute certainty about the identity of both taxa with the species under discussion. The name *Polyporus populinus* was a recombination of *Boletus populinus* Schum., although Fries (1821: 367) made some reservations. His citation of the devalidated basionym was: "Bol. Schum. Sael. p. 384, varietas videtur" and he listed the name in the index (1821: 519) as "[*Polyporus*] *populinus* (Schum.?)". It is clear that he hesitated, but in any case he did not explicitly exclude Schumacher's taxon, the original illustration of which was later published by Hornemann in the "Flora danica" (pl. 1791). After the publication of the plate (of which it is likely that Fries had seen the original before 1821) Fries (1838: 472) had no longer any scruples; this time he cited,

"Schum.! n. 1951." Still later (Fries, 1863 M. 2: 254) he rejected this point of view and remarked "*P. populinus* Fr. (noster primitus lignosus, hinc diversus a *B. populino* Schum.)." The context of the fruitbody changed in his descriptions from "carnoso-suberosus" (1821) to "suberoso-lignosus" (Fries, 1874: 564).

The original description of *Polyporus connatus* Weinm. runs: "Char. spec. Effuso-reflexus, seriato-confluens; pileo lateritio, velutino, subzonato; poris minutis, subrotundis albis. / Deser. Substantia suberoso-coriacea, tenax, elastica, alba, pallida: odore acidulo. Pileo 3-8 lin. lati, 1-2 pedis longus, 2-3 unc. et ultra latus, imbricato-connatus. / Patria: Ad trunco semiemortuos *Aceris platanoidis* sero autumno. Ante *Polyp. hirsutum* Fr. [1821:] pag. 376. ponendum." Fries (1828 E. 1: 92) saw a dried specimen from the type locality and considered it to be intermediate between *Polyporus neesii* Fr. (to which in 1828 he appended Weinmann's species as a variety) and *P. populinus*, "ab utroque forsan diversus ob odorem peculiarem acidulum." Later in connection with *P. connatus* Fries (1874: 563) remarked "[*P.*] *connatus* Weinm. Ross. p. 332 [= 1836: 332], in *Acere* quoque lectus, cum nostro convenit excepto pileo lateritio". A very good illustration of the *Polyporus connatus* of modern mycology was published posthumously under the name "*Polyporus connatus* Weinm.?" (Fries, 1884 I. 2: pl. 185 f. 2). The question mark shows that he continued to doubt the identity of Weinmann's species with his own interpretation.

One of the striking features of to-day's interpretation of *Polyporus populinus* (*P. connatus*) is that on section the tubes are very often many-layered. It is remarkable to find that this feature appeared only at a late stage in Fries's work and then only in his accounts of *P. connatus*. In 1838 it is stated of this species, "Perennans, reviviscens, sed non vere stratosus"; not until 1874 do we read, "intus porisque stratosis" (italics as in the original). Until the end (1874: 564) *Polyporus populinus* remained in a group, "Perennantes . . . , sed non stratosi . . ." After Secretan (1833 M. 3: 113) had given a good description of the now current interpretation of *P. populinus*, Fries (1838: 472) remarked "Uterque intus candidus nec stratosus, hinc Seer. n. 60 carne alutacea (nisi e succo arboris sit imbuta) recedit." From these notes it follows that eventually to Fries *P. populinus* was a species with one-layered tubes and growing only on *Populus*; and *P. connatus* a different species with many-layered tubes and growing on various kinds of trees, although *Acer* was originally mentioned as its only host.

To-day's *P. populinus* may be found with well-developed fruitbodies but still having one-layered tubes after a rapid initial growth; in such specimens the context of the cap is rather soft and more or less water-soaked ('carnoso-suberosus'). I have collected it on *Populus* in this condition in the dunes along the Dutch coast. As a result I am not yet prepared to deny (i) the fungus of Schumacher, (ii) that of Fries of 1821 named

P. populinus, and (iii) *P. connatus* sensu Fr. might all represent the single species to which these names are now applied. On the other hand I am not prepared to say the same of the original *P. connatus*. Keeping in mind that Fries saw material forwarded by Weinmann however it is difficult (without the study of an authentic specimen) completely to exclude the possibility of identity with the *P. populinus* of modern authors. On the Check list, in accordance with a long tradition, the name *Polyporus populinus* is retained as basionym for the correct name.

Should this conclusion not be accepted it will not be easy to decide on the correct name. *Polyporus neesii* Fr. 1821 is a nomen dubium (**O**). A sure name is *Trametes secretanii* Otth 1866, the next in succession to be taken into consideration.

(73). Seemingly when Fries (1838) published *Polyporus ravidus* he based this name on "*Bol. heteroclit.* Sowerb. t. 367." His original description (protologue) contains no other references, and no specimens or localities are cited. However, on comparing the description of *P. ravidus* with the (devalidated) protologue of *Boletus heteroclitus* Sow. (**O**) there can be no doubt that Fries's description was drawn up from a different source. In later work Fries (1874: 566) repeated his original description practically unaltered, but with the addition "*Sistotrema cinereo-lutescens* Pers. Myc. Eur. 2. p. 205. . . . in Gallia". This seems to be a possible clue to the identity of the hypothetic type collection: a specimen collected in France near Angers by Guépin on which Persoon had previously based *Sistotrema *lutescens* Pers. 1825: 205.¹⁴ Its description and that of Fries's *P. ravidus* show undeniable similarity. When Bresadola published his interpretation of *P. ravidus* he must have seen material either of the *Polyporus ravidus* as named by Fries or of Persoon's *Sistotrema lutescens*. There is no type of *Polyporus ravidus* in Fries's herbarium. Nor have I been able to locate the type of *Sistotrema lutescens* in Persoon's herbarium.

Should it be decided to accept the above, provisional, thesis, viz. that, perhaps by some error, in 1838 Fries did not mention the type of *P. ravidus* and that in fact he published a new name (typonym) for *Sistotrema lutescens*, it will be necessary to restore the earlier-published epithet of *Sistotrema lutescens* Pers. in a new combination. What must be done first however is to establish the basis of Bresadola's interpretation of *Polyporus ravidus* as published in 1903.

¹⁴ The asterisk indicates (Persoon, 1801: x) "obscure species, of which either the [taxonomical] position is doubtful, or which are still in need of a more exact investigation" (translated from the Latin). Such species were thus clearly set apart from varieties and subspecies. Fries took the asterisk to indicate a variety of the species preceding it in Persoon's work; therefore he should have mentioned it as '*Sistotrema cinereum* var. *lutescens*' but by some error he wrote '*Sistotrema cinereo-lutescens*'.

(74). The status of *Poria pearsonii* as a distinct species, different from *P. corticola*, needs further consideration. Lowe (1966: 19) considered them to be synonyms. If they are different the morphological differences are slight. A rather long set of specimens collected by the author of the species and preserved in BPI were all found on wood of *Abies* and I hesitate to identify them unconditionally with *P. corticola*. If the two are kept apart comparison of *P. pearsonii* with *P. vicina* Bres. (U.S.A., Washington) is recommended; Gilbertson [1956 (Ll 19): 66, 84] regarded the latter taxon as a synonym of *P. corticola*. Its three syntypes were all found on stems of *Abies grandis*.

According to Nobles (1958: 901), cultures of *P. pearsonii* have fiber hyphae and clamped septa and appear to be 'oxidase-negative'. Donk (1967: 74) suggests that this determination is incorrect.

Parmastomyces

(75). The protologue of *Tyromyces mollissimus* Maire [1935 (BAN 36): 37 f. 7bis; Algeria] strongly suggests that this may be an earlier name for *Parmastomyces kravtzevianus* or that Maire's species is one closely related to it. The type of *Tyromyces mollissimus* could not be located.

Perenniporia

(76). I have followed Lowe (1966: 110–111) in tentatively treating *Poria tenuis* and *P. pulchella* as together forming a single species. This meant investigating which name was first reduced to the synonymy of the other. For the present I leave the question unanswered; Lowe treats *Poria pulchella* as a variety of *P. tenuis*. The reason why this is not done on the Check list proper is to be found in the answer to quite a different question: Are the two taxa really conspecific? It may be pointed out that Lowe records *Poria tenuis* var. *pulchella* from "throughout the U.S. and in Europe," while *Poria tenuis* [var. *tenuis*] is said to occur "throughout Canada and throughout the U.S.", thus with no mention of Europe. Lowe is convinced that "they are not the same thing" (oral communication, Dec. 1969) and this has induced me to list *Poria pulchella* as European and *P. tenuis* as a questionable synonym.

The specific delimitations within the genus *Perenniporia* are far from settled; Lowe (1966: 111) concluded that "[*Poria tenuis*] and its variety intergrade with *P. medulla-panis* and *P. subacida* and the validity of the taxonomic concepts of these species and their synonyms is by no means clear." This and the current preparation of a European monograph on the group will explain much of the unsatisfactory treatment on this Check list, on which I preferred not to enter several personal and other unpublished conclusions.

Phellinus

(77). This is a big and heterogeneous group. The number of European species is high if compared with that of other genera but it must be called small in comparison with the extra-European genera, many of which occur almost only in the tropics. No attempt at a new classification should be made without a fair knowledge of the whole group. Moreover such an attempt should be preceded by improved terminology for the hyphal elements and the setae in all their variations.

(78). It would appear that in the names "*P.*" *salicinus*, "*P.*" *conchatus*, and "*P.*" *versatilis*, as published by Bourdot [1898 (RBo 11): 231], the 'P.' does not stand for '*P[lacodes]*' but rather for '*P[hellinus]*', the generic name that was not mentioned in full presumably by error. This is accepted here as having been the case.

(79). *Phellinus gilvus* is now considered to be widely distributed over the tropics and to occur there abundantly, as a species that varies greatly, mainly in the shape of the fruitbody. It becomes rarer towards the temperate regions and is recorded from Europe by an older generation of mycologists from only a few localities: France (Le Mans, Gironde, Pyrenees), Spain (Catalonia), and Italy (Piemonte, Lombardia, Sardinia). Some or all of these collections may have been incorrectly named; confusion with *Phellinus torulosus* in particular would not be unexpected. European material has served as types of two names that have subsequently been reduced to the synonymy of *Phellinus gilvus*: viz. *Placodes fucatus* Quél. and *Polyporus marcuccianus* Lloyd ex Trott.

Fries (1874: 548) was the first to record *P. gilvus* from Europe¹⁵ because he thought that *Boletus impuber* Sow., described from England, might belong to it but in my opinion this identification is not acceptable.

In accepting the absence of *Phellinus gilvus* in Europe (I have not yet studied any of the European collections attributed to it) I also assume as a thesis that (even in a broad circumscription) it is specifically distinct from *P. torulosus*, a point that has been questioned by a few leading American mycologists. Thus Overholts (1953: 72), who recorded *P. torulosus* from North America, stated that he "can only express the hypothesis . . . that *Fomes torulosus* may be a thick form of *P[olyporus] licnoides*", a taxon often reduced to subspecific rank under *Phellinus gilvus*. Lowe (1957a: 51, 90) went a step further and stated that the North American material reported by Lloyd and Overholts as *Fomes torulosus* "appear to be perennial specimens of *Polyporus licnoides* Mont." He even went so far as to make the more general statement that tropical

¹⁵ It is true that Wallroth (1833: 589) included *Polyporus gilvus* in his flora but this was because he thought a European species of *Hymenochaete* to be a form of it, "m[onstrum] *telephoreum* Wallr."

P. licnoides is the annual form of *Fomes torulosus* from southern Europe and subtropical America. It seems worth while to re-examine the question whether these American authors interpreted *Phellinus torulosus* consistently and correctly or not.

(80). Those who accept *Phellinus gilvus* as a European species (79) are confronted with still another problem: What is the exact scope of this versatile species? Some authors have made it very inclusive. Others divide it into several species; in addition to *P. gilvus* they also admit as autonomous *Polyporus hookeri* Lloyd (India), *Phellinus licnoides* (Mont.) Pat. & Har. (French Guiana), and so on. Pilát and, more recently, O. & M. E. P. K. Fidalgo [1968 (MNY 17²): 9], accepted the inclusive conception and brought together as synonyms not only all the names that had been reduced at one time or another to *P. gilvus* but also several that had merely been suspected of being related to it often on the questionable authority of Lloyd. In this way some species crept into the synonymy that do not even belong to *Phellinus*. I am not prepared to do the same and have left off the "List of omitted names" all synonyms, reliable or suggested, that are not based on European material. The number of these completely omitted names (not counting the recombinations and other isonyms) amounts to about two dozen.

(81). The *Phellinus igniarius* of many modern authors has grown out into a big conglomerate in which they have accumulated a considerable number of not only pileate but also resupinate forms; for a note on the latter, see (82). A few European authors have been engaged in a more critical study of the complex and they are now agreed not only that certain resupinate taxa should be excluded (*Phellinus laevigatus*, *P. rhamni*) but also that *P. tremulae* deserves treatment as a distinct species. This still leaves an imposing residue. Some authors divide this into a few more species, *P. igniarius* and *P. nigricans* and a third, often called *P. trivialis* (cf. Donk, 1971e), whose taxonomic status is as yet not firmly settled. I accept *P. nigricans* on this Check list. The delimitation by Bourdot & Galzin (1928: 618, as a subspecies) and by Jahn (1963: 98, as *Phellinus trivialis*) is too wide. The correct typification and nomenclature as well as the specific status of a narrowly conceived *P. trivialis* is still to be worked out. The latest segregate is *P. lundellii*.

Populus tremula harbours at least two species, sometimes on the same tree, or more often on different trees, viz. *Phellinus tremulae* and a form of *P. igniarius* with black, soon strongly rimose, crusted surface; the latter seems to agree with *P. igniarius* f. *tremulae* E. Komar. (not validly published).

(82). A fact similar to that mentioned for *Phellinus robustus* (86) exists in connection with *Phellinus laevigatus*; this is often considered to be only a resupinate form of *P. igniarius*. Fries described it

with a thin fruitbody ("vix lin. crasso"), "ad corticem arborum v.c. *Betulae*." Fruitbodies may however become thick at the middle, up to about 10–20 mm. Such thick portions recall certain 'resupinate', almost cushion-shaped conditions of certain pileate species of *Phellinus*. Bresadola [1897 (AAR III 3): 79] regarded *P. laevigatus* as barely autonomous; he preferred to consider it a form of *Fomes fulvus* [sensu Bres.] = *Phellinus pomaceus*. This view was firmly rejected by Bourdot & Galzin (1928: 624), but it must be recalled that their conception of *Phellinus laevigatus* was a different species that (at least in part) is now called *P. rhamni*. Nevertheless most European authors do not now doubt the autonomy of *P. laevigatus*; they consider it to be a species that in Europe is confined almost exclusively to *Betula*.

With this pronounced preference for *Betula* in Europe it seems almost a matter of course to hesitate before referring to *P. laevigatus* a number of other resupinate taxa described from other parts of the world and found on other substrata. Overholts (1942: 59; 1953: 63) listed only one synonymous taxon, *Fomitiporella betulina* Murrill. Lowe (1966: 156) goes much further; not only does he not uphold any real distinction between *Poria* [*Phellinus*] *laevigata* and 'resupinate' *Fomes igniarius*, but to the *F. igniarius* complex he also refers *Poria pereffusa* (Murrill) Sacc. & Trott. (O) and *Poria prunicola* (Murrill) Sacc. & Trott. (O), both of which Overholts (1942: 61, 62) treated as distinct. These as well as a few other names that have been reduced to *Phellinus laevigatus* will here be found only on the "List of omitted names".

(83). *Phellinus pini* was described twice, in two successive years, both times as *Boletus pini*, first by Thore (1803), then by Broterus (1804). In 1821 Fries revalidated the name of the second author; hence *Polyporus pini* (Brot.) per Fr. American authors, in the period before the introduction of the later starting-point date for 'Fungi caeteri', as a matter of course preferred the name by Thore published earlier. This will explain such incorrect authors' citations as 'Thore ex Fr.' and 'Thore ex Lloyd'. Because both Fries and Lloyd had in mind *Boletus pini* Brot. as basionym, it would seem correct to transcribe such citations into 'Fr.' and 'Lloyd' and, in the case of new combinations, to consider these shortened authors' citations as indirect references to 'Brot. ex Fr.' and 'Brot.'. These corrections proved necessary to disentangle the synonymy (recombinations) of the two devalidated homonyms.

As to the references to descriptions and illustrations, I have not tried to sort them out over these two competing names but cite them all under their 'correct' name, *Phellinus pini* (Brot. per Fr.) A. Ames.

(84). *Phellinus pini*, as it occurs in Europe, is readily separable into two (and perhaps three) taxa that have been assigned different rank by different authors. Among European mycologists there is now a strong

tendency to regard *P. pini* and *P. abietis* as distinct species. This thesis was recently defended at some length by Jahn (1967a: 85). Eriksson & Strid (1969: 136) came to the same conclusion: "After having seen [*Phellinus abietis*] numerous times in nature we have come to the opinion that it is a good species, distinct from *P. pini*." The correct name for *P. abietis*, however is, in my opinion, *Phellinus chrysoloma* (cf. Donk, 1971a: 39).

Other authors, like Pilát and his followers, and especially North American mycologists, like Overholts and Lowe, all of whom have studied material from more extensive areas or from different parts of the world (other than Europe), tend to conceive *P. pini* as an increasingly inclusive species. This may be correct but I am far from certain that it really is so; a more likely conclusion is that *P. pini* sensu lato is a species aggregate which, besides the main species, includes a number of satellite species, each with its own area of distribution and its own preference for hosts. Starting from this point of view I have omitted from the Check list as synonyms all specific names based on material collected outside Europe. These are *Phellinus piceinus* (Peck) Pat. (**0**), *Daedalea vorax* Harkn. (**0**), *Cryptoderma yamanoi* Imaz. (**0**).

Pilát [1942 (ACE 3): 521] recorded one collection of what he called *Phellinus pini* var. *abietis* f. *micropora* Pilát from Tirol, a form with small pores ("pores très petits, 0.2–0.3 mm de diam., arrondis à arrondis anguleux, rarement un peu allongés"). Small-pored forms might also be expected from northern Fennoscandia. They should be compared with *P. piceinus* (**0**).

(85). The precise host range of *Phellinus pomaceus* still requires the attention of collectors. The usual hosts are various species of the genus of Rosaceae trib. Pruneae, *Prunus* L. in a wide sense, including *Amygdalus* L., *Cerasus* Mill., *Persica* Mill., *Padus* Mill., and *Laurocerasus* Duham.; the fungus has been reported from all of these subdivisions.

It has also been recorded from *Pyrus* L. (including *Malus* Mill.), *Sorbus* L. (Kotlaba, 1966), and *Crataegus* L., genera of Rosaceae trib. Pomeae. Some of this second set of records may have been based on *Phellinus igniarius*, which includes a 'form', especially well-pronounced on apple (*Pyrus malus* L.), that superficially resembles certain fruitbodies of *P. pomaceus*. In this connection the following remark by Murrill [1903 (BTC 30): 113] is worth mentioning: "In an orchard near Mauritzberg, Sweden, where *P[yropolyporus] igniarius* was abundant on apple trees, *P[yropolyporus] fulvus* [= *Phellinus pomaceus*] was confined to the stumps and dead or dying trunks and branches of plum trees."

Other records of this second set of hosts (i.e. on *Crataegus*) could have been based on *P. robustus*. The colour of the context of *P. pomaceus* lies between the somewhat darker colour of *P. igniarius* and the much brighter colour of *P. robustus*.

Finally, quite a number of records of *P. pomaceus* mention the occurrence

of this species on hosts that do not belong to the Rosaceae, such as *Corylus avellana* L. (Bourdot & Galzin, 1928: 619, "coudrier"), *Syringa* L. (Kreisel, 1961: 136), *Vitis vinifera* L. [Malençon & Delécluse, 1937 (BMA 17): 136], *Cytisus laburnum* L., *Juglans regia* L., *Rhamnus frangula* L. (*Frangula alnus* Mill.), and *Morus* sp. [Pilát, 1942 (ACE 3): 513–514]. I would suggest re-examination of the collections on which these records are based before definitely including them in *P. pomaceus*. Thus the material from *Vitis* should be compared with *P. punctatus* (86).

A long time was needed before European mycologists started to accept *Phellinus pomaceus* as a good species and even now misdeterminations are not rare. Misgivings about its autonomous status were voiced as late as 1942 by Pilát [(ACE 3): 513]. The confusion in France can easily be proved by an analysis of Quélet's conceptions (1888: 399). What he called *Placodes igniarius* is very likely *Phellinus robustus* ("chair . . . brun rouillé"). His *Placodes igniarius* var. *fulvus* (Scop. per Fr.) Quél. is mainly *Phellinus igniarius* ("chair . . . brun foncé"), but it also included *Phellinus pomaceus* ("prunier"), which he called *Placodes igniarius* var. *pomaceus* (Pers. per S. F. Gray) Quél. ("chair brun fauve") as well. In confusing typical *Phellinus igniarius* with *P. robustus*, Quélet was following an old French tradition (cf. Donk 1971e: 411).

I assume that the epithet 'pomaceus' in this case really means 'of orchards' rather than 'of apple trees'. Persoon's first description (1799 0.2: 5) does not explicitly mention apple as a host. He wrote, "Hab. ad *Pyros*, praesentim vero ad caudices *Pruni domesticae* aut *Cerasi* . . ." At that period Persoon (1807: 40) called the apple *Pyrus malus*, but by 'Pyrus' he may also have meant *Pyrus communis*, the pear or a number of other species which he admitted to the genus. The name *Prunus* he used for a rather inclusive genus which for instance included *Prunus domestica* and *P. spinosa*. Konrad & Maublanc (1927 I. 5: text to pl. 459) considered the type form of *P. pomaceus* as growing on 'pommier'; the form from 'prunier' (*Prunus domesticus*) and 'cerisier' (*P. avium* presumably) they identified with Persoon's form 'prunastri'. This typification of *Phellinus pomaceus* was apparently caused by their interpretation of the meaning of the specific epithet. In later work Persoon (1801: 538) gave as the typical habitat merely, "in pomariis [orchards!] ad caudices arborum." I prefer to stress "praesentim vero ad caudices *Pruni domesticae* aut *Cerasi*" and select as 'typical' a specimen from *Prunus domesticus* answering to Persoon's first description. Later Persoon (1801: 538) segregated a form 'prunastri', which he characterized as "pileo subresupinato crasso laeui truncato". There is a specimen in Persoon's herbarium (L 910.263–397) labeled "*Polyporus pomaceus. Boletus. / Gallia Ad truncos praesentim Prunorum et Cerasorum.*" It is typical of the species.

This raises the question whether *Phellinus pomaceus* consists of genetically different taxa or not. Is there a form on Pomeae (*Pyrus*, *Sorbus*, *Crataegus*) distinguishable from one on Pruneae (*Prunus* sensu lato)?

Is the form on *Crataegus* worth distinguishing? (What Baxter [1925 (AJB 12): 563] described under the name *Fomes pomaceus* f. *crataegi* had a completely resupinate fruitbody; its author recorded it not only from *Crataegus* but also from *Prunus americana* and *P. persica*). Typical material on *Prunus domesticus* often develops sessile fruitbodies, but occasionally the position on the substratum also gives rise to 'subresupinate' fruitbodies on the same tree. Is this *Phellinus pomaceus* var. *prunastri* (Pers. ex S. F. Gray) Pat.? Or is there a more consistently and typically resupinate form that deserves this name, like a form from *Prunus spinosa* mentioned by Pilát (l.c.), of which Jahn (1963: 103) stated that "die Frk. meist kleiner und vorwiegend resupinat bleiben: f. *prunastri* (Pers.) . . ."? The specimens pictured on Konrad & Maublanc's plate (l.c.) I would refer to typical, pileate *P. pomaceus* rather than to something deserving of the special epithet 'prunastri', which taxon should be 'subresupinate'. *Phellinus prunicola* (O), described from North America, is a distinct species allied to *P. laevigatus*. It is now usually referred to *Phellinus laevigatus* as a form, but this is questionable.

(86). Many species of *Phellinus* have strikingly variable fruitbodies; these may range from effused or resupinate over effuso-reflexed to sessile. This has led to much-needed lumping, but on the other hand to insufficiently-founded extrapolation. Thus the conceptions of both *Phellinus robustus* and *P. igniarius* have been extended by some authors to also include a number of taxa with consistently effused (resupinate) fruitbodies. As far as Europe is concerned it would appear that lumping has gone too far.

The thesis I subscribe to is also defended by Jahn: although *Phellinus robustus* may occasionally be effused it is certainly not conspecific with the consistently effused *Phellinus punctatus*. American authors have referred many names first to *Poria punctata* but then to *Fomes robustus*, according to a contrary thesis. In a few cases the types were redescribed extensively enough for tentative inclusion under *P. punctatus*; these are *Fomitiporia laminata* Murrill and *F. obliquiformis* Murrill. In many other cases however the original (and a few supplementary) descriptions are either inadequate to justify a personal opinion or else they seem even positively to exclude inclusion under *P. punctatus*.

(87). Bourdot & Galzin (1928: 623) reported the occurrence of *Phellinus friesianus* [= *P. punctatus*] on *Vitis*: "Sur vigne: le champignon attaque les ceps dans le Midi et les tue assez vite; il est mal développé, en nodules souvent à peine porés, assez rare." Assuming that Gard (1922, as *Fomes igniarius* var. *viticidus* Gard) and Rezende-Pinto (1940, as *Poria viticola* Lázaro) were describing the same fungus it is very likely that this is also the fungus mentioned by Bourdot & Galzin: cystidia absent or very rare and then tawny, pointed, swollen at the base, 15–25 μ long (Gard) and spores globose, 7 μ in diameter (Rezende-Pinto).

In a second paper Rezende-Pinto (1942) concluded that *Poria viticola* (Schw.) Cooke, *Poria viticola* Lázaro, and *Poria friesiana* Bres. all belonged to the same species, which he called *Poria viticola* (Schw.) Sacc. Here this conclusion is partially accepted (identification with *P. friesiana*), but the identification with von Schweinitz's species is incorrect. The latter is now considered to be quite distinct from *Phellinus punctatus*. The identity of *Poria viticola* Lázaro with the poria on *Vitis* under discussion seems quite likely and for the time being I accept it.

(88). The history of true *Polyporus rimosus* Berk. (0) is intricate and will not be worked out here. Over a considerable part of the tropics as well as in North America and eastern Europe the name came to be misapplied to a different species, the correct basionym of which has been accepted as being *Pyropolyporus robiniae* Murrill. The confusion of the two species, apparently together with one or two others, has been intense. In the first place therefore I have selected descriptions that were drawn up by authors who lived in the regions where *Phellinus rimosus* does not occur, viz. the northern hemisphere north of the tropics.

In view of Patouillard's description and Lloyd's identification (apparently after study of the type) with "*Fomes rimosus*" there seems to be little possible doubt that *Xanthochrous tuniseus* is an earlier-published name for the species often misnamed *Fomes rimosus* (0) and now also known as *Phellinus robiniae*.

On this basis and referring the species to the genus *Phellinus* it would seem obligatory to introduce a new combination of Patouillard's specific epithet 'tuniseus' with this generic name. I refrain from doing so however because in my opinion in the near future *Phellinus* will fall apart and then the present species will almost certainly be removed from it and placed in a revived genus *Fulvifomes* Murrill, of which *Phellinus robiniae* is the type species.

(89). *Phellinus robustus* is generally conceived as a species mainly infecting *Quercus*, but its occurrence in Europe on a rather limited number of other angiosperms is now generally accepted. On some of these hosts the fruitbody may look rather distinct from that on oak, but this seems to be due chiefly to its smaller size and the much thinner branches from which it develops, resulting in a different attachment. The most striking example of this is the form on *Hippophaë*.

Phellinus hartigii is undoubtedly closely related to *P. robustus*. It can most easily be distinguished by its hosts, which are species of conifers (*Abies*, *Picea*, *Pinus*). Many mycologists doubt the autonomy of *P. hartigii* and reduce it to a form or variety of *P. robustus*. However, authors who have paid special attention to this question have upheld the two as distinct species; compare K. Lohwag (1937), who made a study of the fruitbodies, and Jacquier (1960), who based his conclusion on cultural

evidence. Since the question can hardly be called settled the two are maintained as distinct species.

Both of the above species may occur with effused fruitbodies more or less closely resembling certain taxa with consistently effused fruitbodies. It is either incorrect or premature to refer this last mentioned set to *Phellinus robustus* (86).

Polyporus

(90). I have accepted *Polyporus arcularius* (described from Italy) in the sense of Bourdot & Galzin's *Leucoporus arcularius* var. *strigosus* and assumed that it is specifically different from the *P. brumalis* of this Check list (= *Leucoporus arcularius* var. *scabellus* Bourd. & G., as "scabellus") notwithstanding the fact that the French authors found the two taxa to be "relées par trop d'intermédiaires". *Polyporus brumalis* is far more uniform in northern Europe than one would suspect from the description by Bourdot & Galzin based on French material. It is suggested that Italian mycologists pay renewed attention to this problem.

Although I have accepted that Kreisel interpreted *P. brumalis* correctly (Donk, 1969a: 242), the words "pileo . . . margine ciliato" in Persoon's original description have left an uneasy feeling in my mind; they could be taken as pointing to *P. arcularius* rather than *P. brumalis*.

Polyporus arcularius has been variously, but mostly very inclusively, conceived. In my (tentative) opinion it has also been misapplied to the complex that I now call *P. alveolarius* (Bosc) per Fr. All this has led to the reduction of a number of names to the synonymy of *P. arcularius*; some of these names were based on collections of *P. alveolarius*. It is difficult to reassess the correct status of these presumed 'synonyms' without renewed study; for this reason those based on material collected outside Europe and North America outside the tropics have not been entered on the "List of omitted names" (unless they have been entered on it for other reasons). The following enumeration mentions such names as have been reduced by various authors to the synonymy of *P. arcularius*; many of these were compiled by Pilát [1936 (ACE 3): 75-76].

Polyporus aemulans B. & C. (Cuba).

For *Polyporus agariceus*, see (0).

Polyporus armitii F. Muell. & Kalchbr. apud Cooke (Australia),

Polyporus binnendykei Kurz ex Cooke (Java),

Polyporus ciliaris Mont. (Madagascar),

Polyporus collybioides Kalchbr. ex Cooke (Australia),

Polyporus cremoricolor Berk. (India),

Polyporus maculatus Berk. ≡ *P. squamoso-maculatus* Sacc. (India),
not ~ Peck, not ~ (Cooke) ex Lloyd (n.v.p.?),

Polyporus obscurus Kalchbr. apud Kalchbr. & Thüm. (Mongolia),

Polyporus penningtonii Speg. (Argentina),

Polyporus similis Berk. (Brazil).

For *Polyporus umbilicatus* Jungh., see (O).

(91). From the description there can be little doubt but that *Polyporus rhombiporus* Pers. is the same as *Leucoporus arcularius* var. *strigosus* Bourd. & G., which I take as representing typical *P. arcularius*. The original description is rather full and differs in only one respect from that of Bourdot & Galzin, viz. in the fact that these authors do not mention small scales on the cap, while Persoon wrote "squamulis fuscis adpressis." However small scales are mentioned by Konrad & Maublanc [1935 I. 5: pl. 428 f. 2; "chapeau . . . plus ou moins squamuleux ou granuleux . . ."]. Precisely because of these scales *P. floccipes* comes to mind and this is strengthened by "margine strigosis . . . villo rudi hirtus"; this is also typical however of the fungus described by Bourdot & Galzin (1928: 532; "a bords fortement hispides et ciliés de poils rigides, fauvatres, assez longs"); they were certainly not describing what I call *P. floccipes* because their fungus has smaller, medium-sized spores. The same can be said of Konrad & Maublanc's conception. Compare also Donk (1933: 135), who wrote about a specimen in Persoon's herbarium that could be the type "Der gewimperte Rand sowie die Sporen weisen auf *P. arcularius*."

Persoon hesitated to identify *P. rhombiporus* with *P. arcularius* (with which he compared it) because in Micheli's figure the pores were drawn very schematically and crudely; of the fruitbody in the figure he wrote "... poros sistit fere quadrangulares et multo maiores, et hinc minore in copia (fere 30)".

The name *P. rhombiporus* was preceded by an asterisk, for the meaning of which see foot-note 14.

(92). It is with considerable hesitation that I maintain *Polyporus intermedius* Rostk. as a synonym of *P. arcularius*. Fries (1874: 526) suggested this identity and later authors accepted it as settled. If they are right then the specimens figured must have been old, weathered fruitbodies. Another suggestion is *P. floccipes*. For a very brief moment I thought of *Gyrodon lividus* (Bull. per Fr.) Sacc. (Boletales) because of the habitat, "auf alten Erlenwurzeln". Both of these last two suggestions I find untenable.

(93). The name *Polyporus brumalis* has often been used for an extremely broadly conceived species, but it has also been misapplied to what is called *P. ciliatus* on this Check list; compare Kreisel (1963a) and Donk (1969a). The synonyms referable to this complex are numerous. Many of them could be placed but others are so insufficiently known that they could not be disposed of with any degree of certainty; this latter category will be found mentioned only in the 'List of omitted names'.

(94). *Polyporus ciliatus* is now generally assumed to be a species with considerable variation in its fruitbodies; for instance their size ranges from minute (cap a few mm in diam.) to large (cap up to about 10 cm in diam.). Some of the synonyms now accepted could however represent elements that might perhaps better be treated as distinct species, for instance *P. vernalis*. I have reluctantly given up any hope of separating *P. ciliatus* sensu stricto from *P. lepideus*; the two are connected by such a gradual series of intermediates that I feel compelled to follow Kreisel in considering them merely as forms. On the other hand I have kept *P. corylinus* and *P. incendiarius* (96) separate until more is known about them.

(95). *Polyporus latiporus* Britz. is difficult to place. Killermann [1922 (Bba 15): 66] made it a synonym of *Polyporus elegans* [sensu auctt. = *P. varius* s. str.]; this cannot be correct because of the "sich bald abnützenden Faserschuppen" on the cap and its big spores ($14 \times 4 \mu$). Bresinsky & Stangl (1968: 78) referred it to *Polyporus forquignonii* [= *P. floccipes*]. This is a much more likely suggestion, although neither for the margin of the cap nor for the base of the stalk are whitish-hyaline bristles mentioned while the base of the stalk is black. I would tentatively assume that Britzelmayr described and depicted an old fruitbody with worn off surfaces. In an occasional fruitbody of *P. floccosus* the very base of the stalk may become black; this also seems to have been the case in this instance.

(96). Neither the correct status and synonymy nor the precise relationship of *Polyporus incendiarius* is as yet well established. Pilát [1936a: 15; 1936 (ACE 3): 64] reduced it to a form of *Polyporus brumalis* (which species he conceived in a very broad sense) and this was accepted by Bondarcev (1953: 463). The few and incomplete descriptions published by European authors would suggest that so far this reduction is a mere guess and that it needs further study. Other authors, like Muraškinsky (1940: 2), reduced *P. incendiarius* to infraspecific rank under *P. elegans* [= *P. varius*]. The identification with *P. brumalis* var. *albus* Allesch. is still doubtful.

The original material came from the Ukraine in southern Europe while Pilát and Muraškinsky based their descriptions and opinions on collections from various localities in Siberia—which raises the question of identity with the type.

Pilát [1937 (ACE 3): 104] also suggested that *P. incendiarius* might turn out to be the same as the North American *Polyporus albiceps* Peck (O), a species which Overholts (1953: 250–251) compared with *P. admirabilis* Peck (O), suggesting that it might represent only a depauperate condition of the latter. Both have white or cream-coloured caps when fresh and also in other respects agree with *P. incendiarius*.

Polyporus corylinus, described from Italy, also has a white-coloured cap.

As far as the descriptions go, the black layer that develops on the stalk of *Polyporus* subgen. *Melanopus* (Pat.) Maubl. is not much in evidence, if present at all, in either *P. incendiarius* or *P. albiceps*. The size of the spores mentioned by Pilát for *P. incendiarius* exclude it from *Polyporus* subgen. *Polyporus*. The proper place for these species might be in *Polyporus* subgen. *Leucoporus* (Quél.) Maubl.

(97). *Polyporus michelii* is maintained on this Check list as a species distinct from *P. squamosus*; it seems to differ in its snow-white somewhat silky looking cap, which becomes squamulose without the scales becoming conspicuous by turning dark; its smaller size; its preference for willows (*Salix* spp.); and its southern distribution. I have seen it in the field only once, and then quite old, so that I am not in a position to form a well-founded personal opinion about its true status. The species was upheld by Maire [1933 (TrB 15): 36], so that it should not be rashly reduced to a mere form of *P. squamosus* by those who do not really know it.

(98). *Polyporus mori* is another name for the species appearing in much of the European and North American literature as *Favolus europaeus* or as *Favolus/Polyphorellus alveolaris* (often erroneously spelt 'alveolarius'). The latter name has no relation to the *Polyporus alveolarius* of this Check list.

After collecting a long series of abundant material in Canada and the U.S.A. of what Overholts (1953: 156) called *Favolus alveolarius* I became hesitant about accepting unconditionally the identity of this material with the *Polyporus mori* of Europe. In North America a small-pored form (*Favolus striatus*; *Hexagona micropora*) is common and appears to be scarcely important taxonomically; I was unable to match it with any of the (rather few) European collections that I saw. Among the European specimens there occur fruitbodies of a bigger size and with much bigger pores than I found in any of the American collections. This will explain why I have left out all names based on American (and other non-European) collections from the synonymy of *Polyporus mori*; they have been relegated to the 'List of omitted names'.

If the North American fungus is considered to be a distinct species its name under *Polyporus* should be derived from *Favolus canadensis* as basionym. A careful study of the correct circumscription of *Polyporus mori* is recommended.

(99). *Polyporus squamosus* is a very variable species that, in Europe, is the cause of a wood decay of stems of various living deciduous trees. Under suitable conditions however infested dead and even worked wood is still capable of producing crops of fruitbodies over a period of several

years. It is on this second type of substratum and more particularly when exposure to day-light is strongly reduced (as is the case in sheds, cellars, caves, and the like) that more or less abnormal fruitbodies develop; these have received a long series of names: *Polyporus dissectus* Letell. (habitat not mentioned), *P. squamosus* f. *erectus* Bres., *P. squamosus* var. *glaber* Graff in part, *P. helopus* Har. & Pat., *P. infundibuliformis* Rostk. = *P. rostkovii* Fr., *P. pallidus* S. Schulz., *Boletus polymorphus* Bull. in part, *B. rangiferinus* Bolt., and others. In these cases the stalk is usually relatively long and tends to be erect; it may even become branched or very long without developing caps. If one wishes to use special names for these abnormal fruitbodies, forms that produce caps (often tending to become infundibuliform) may be called 'forma *erecta* Bres.'

(100). The black rind on the stalk in *Polyporus squamosus* may be limited to the very base of the stem in short-stemmed fruitbodies developing on living trees or else it may cover the entire, sometimes long stalk in the more or less 'aberrant' forms (99). I am inclined to regard it as a feature indicating the sclerotium-like nature of the black-rinded portions. Sometimes a distinct sclerotium-like body with black rind is formed first before the fruitbody proper develops from it. Usually the first stage is strongly suppressed, the two stages following each other without interruption, leaving the black rind at the base of the stalk as the only indication of the sclerotoid initial. Sometimes several fruitbodies (with black stipes) may develop from a common sclerotoid stroma or base (*P. helopus*). The specimen Bolton described and figures under the name *Boletus rangiferinus* had "a base or pedestal consisting of brown fungous tubercles, the size of hazel nuts, adhering together at their sides, and forming an irregular knotty surface on the upper side; on the under side, where it is adhered to the wood, it is smooth and a little hollow". Each of the abnormal fruitbodies seems to represent a 'tubercl' of this kind that did not stop at this stage but developed further into a fruitbody. This tendency to form black-rinded sclerotia is emphasized here in connection with a discussion on the status of *P. tuberaster* (103). It is interesting to find that Campbell & Munson (1936) suggested that the black 'lines' (plates) developing in wood form the limiting layer or rind of sclerotium-like bodies buried in attacked wood.

When reading descriptions of *P. squamosus* by North American authors I was struck by the habitat mentioned, for instance, by Shope [1931 (AMo 18): 356-357 pl. 29 fs. 1, 2] for Colorado: "... generally found growing from the base of cottonwood (*Populus* spp.) stumps." His figures show one somewhat excentrically stalked specimen and another, *in situ*, also practically centrally stalked and arising from the ground, though close to the base of a stem rather than from the stem itself. There are other records of this kind, some of which are mentioned by Graff (1936) for Montana, Wisconsin, and Minnesota on a limited number of tree

species. In Europe the normal habitat is stems of living or dead trees at some distance from the ground up to very high in the tree; this seems also to be the case in the north-eastern states of the U.S.A. I wonder whether the 'terrestrial' habitat might point to a special form in the mid-western states or whether confusion with *P. tuckahoe* (= *P. tuberaster*) is perhaps involved; Güssow reported this from "popular woods" in Saskatchewan and Manitoba, the neighbouring parts of Canada.

(101). The name *Boletus platyporus* Pers. [1794 (NMB 1): 107] is treated here as a typonym of *B. juglandis* Schaeff. This latter name itself was not cited but the plates were: "Schaeff. fung. tab. 101, fig. 2". To my mind there is no possible doubt but that 'fig. 2' is an error for '102'. The citation of the cited figure makes no sense unless it is corrected. Compare *Polyporus platyporus* Secr. (O).

(103). *Polyporus tuberaster* is in Europe in the first place a Mediterranean species, known especially from Italy and already esteemed by the Romans for its edible fruitbodies. It has also been recorded from a few northern outposts (for instance The Netherlands). It differs from *P. squamosus* (100) in its subterranean, big sclerotia from which the (often rather small) fruitbodies arise directly. Its North American counterpart is *P. tuckahoe*, which appeared to be interfertile with *P. tuberaster* from Europe (Vanterpool & Macrae, 1951).

In (100) attention is drawn to the sclerotoid nature of the base of the stalk in *P. squamosus* and to the formation of some kind of true sclerotia by this species when developing from and on dead wood under abnormal conditions. The note also mentions the formation of sclerotium-like bodies buried in the wood. Is it possible that some of these sclerotia may finally become strongly developed, persisting after the substratum from which they originated has disappeared? The sclerotia of *P. tuberaster* are subterranean and differ in their substance by consisting of a mycelial mass interspersed with earth particles. This mingled substance may be caused by its subterranean development; the 'externally' developed sclerotia and sclerotum-like bodies (stalk or stalk-base) of *P. squamosus* obviously lack such interspersions. Thus the question is raised whether after all the two fungi may not belong to the same species. If not, with our present knowledge it would seem difficult to answer the question as to what the specific differences between the fruitbodies (minus the sclerotia) of the two might be.

In connection with finds in Germany several authors [Bergstdt & al., 1969 (MMH 13): 83-88 *fs.* 5-7; Anonymus, 1970] have commented on the resemblance between the fruitbody of *P. tuberaster* and *P. forquignonii* [= *P. floccipes*]. A closer investigation of the true relationship between these two species seems worth while. It would be interesting for instance to know the results of interfertility experiments between *P. tuberaster*, *P. squamosus*, and *P. floccipes*.

(102) Modern French authors do not seem to have formed an opinion about *Polyporus tubarius*. The species was based by Quélet on a collection made by Boudier ("sur les racines de Bruyère"); later Quélet published a description and a plate of it of his own, based on a different collection sent to him by Barla ("comme récolté sur du bois mort des Cistes"). The figures published by the two French authors show a strong resemblance. As to the spores, these are stated by Quélet to be punctate, which is almost certainly an error (as in so many other cases); the spores were presumably smooth, with contents including guttules. In other respects Quélet described the spores as 'pruiniform', $8-9 \mu$, while Boudier called them avoid, $10-12 \times 5-6 \mu$ [most likely somewhat too big, as is usual with his later spore-measurements: cf. van Brummelen 1969 (Pe 5): 233]. The original description and redescription by Quélet calls the tubes, "très tenues" and the pores, "polygones"; Boudier wrote "Pores . . . petits mais assez longs, plus ou moins denticulés."

Bresadola identified *P. tubarius* with the species he first called *P. tubarius* (1897) and later (among other names) *P. agariceus* and for which I now accept the name *P. alveolarius*. I am not at all certain that Bresadola's identification is correct since (judging from Quélet's and Boudier's descriptions and figures) *P. tubarius* seems to differ in the general shape of the fruitbody (for instance longer and relatively more slender stalk), much smaller pores and longer tubes, and perhaps also more ovoid spores.

Poria

(104). This genus, as used on the Check list, is decidedly artificial: it comprises all strictly resupinate species of uncertain affinity, that is, uncertain as far as my personal knowledge and judgment go. For instance *Poria hippophaës* Bres. has been insufficiently described but since it is not unlikely that the type has been preserved it was not transferred to the 'List of omitted names'. Amyloidity and cyanophily of the spore-wall in themselves do not appeal to me as characters that are *ipso facto* of generic importance in resupinate species. This is for instance why *Anomoporia* Pouz. is not yet admitted as a distinct genus; the few species put together under this name may prove to be not mutually closely related. As another example a monomitic context does not make a resupinate whit(ish) polypore automatically a species of the pileate genus *Tyromyces*. It looks as though most porias have 'reduced' rather than 'primitive' fruitbodies.

The name *Poria* itself is retained here arbitrarily for a residual genus of ever-dwindling but still considerable size, irrespective of the correct taxonomic position of the type species. *Boletus medulla-panis* sensu Pers. is now often accepted as lectotype, usually in a conception that was fixed by Bresadola. This species will be found listed under *Perenniporia*.

For a more elaborate discussion on these and other points, see Donk (1967: 50–67).

(105). *Poria consobrina*. In the protologue Bourdot & Galzin (1925: 230) remarked: Même pourriture que *P. mucida* [sensu Bres.] avec lequel on le confond à simple vue; mais sa trame tendre ceracée le sépare bien de ce dernier qui est coriace." This, and other details in the original description, indicate that *P. consobrina* is presumably monomitic in contrast to *Schizopora paradoxa*, which is clearly dimitic, although this has generally been overlooked. Therefore, I distrust both von Höhnel's identification [*in litt. apud* Jaap 1922 (VBr 64): 44, "Bres. in herb."] of it with *Irpex deformis* [= *Schizopora paradoxa*] and that of Lowe [1962 (PMi 47): 186] with *Poria versipora*. On a previous occasion Lowe [1959 (Ll 21): 108] had thought of *Poria myceliosa*. Later he (1966: 61, in obs.) wrote that it may be the same species as *Poria mollusca* [sensu Lowe = *Poria mucida* sensu orig.] but at the same time (*op. cit.*, p. 65) he favoured its inclusion in *Poria hypolateritia* Berk. (see below), which he had previously included in *Poria versipora* as a variety.

Lowe [1959 (Ll 21): 101, 108] made of *Poria eyrei* another synonym of *P. hypolateritia*, with the annotation "cystidia reported by Bresadola not found on type". However, more recently he published a figure of the hymenium from the type, "showing variable cystidia" (Lowe, 1966: f. 41).

I am reluctant to accept the identification of these two species with *Poria hypolateritia* (O), a name denoting that the fruitbody is brick-coloured on the underside. The type came from India and Bresadola [1912 (Am 10): 504], Petch [1916 (APe 6): 136; 1923: 154, 199, 204 f. 57, pl. 2 fs. 10, 11; 1928 (TBS 13): 242],¹⁶ Boedijn [*apud* Schoorel & Boed., 1939 (ATH 13): 12 fs. 1–3], and I myself apply the name to a quite different and apparently tropical species that is considered to be the cause of a red-root disease of tea. Interpreted in this sense *P. hypolateritia* appears to be near, or to belong to, *P. vincta* (Berk.) Cooke, an extra-European species. As long as I am not completely convinced that the name *P. hypolateritia* in the sense of Petch is a misapplication I am not prepared to follow Lowe and report the species for Europe ("England, France"); the record for 'England' is apparently based on *P. eyrei*; and the one for France' on *P. consobrina*.

All three species are in need of renewed examination.

(106). Karsten described *Physisporus flavicans* twice, first in Latin (1896), then in Swedish (1898). This second description is almost a literal translation of the first; a brief remark was added. In the first publication

¹⁶ Pegler & Gibson [1972 (CDp): no. 322] referred *Poria hypolateritia* sensu Petch to *P. hypobrunnea* Petch. What they took as the type of *P. hypolateritia* was identified with *Schizopora paradoxa*.

the material mentioned was indicated as "m. Aug.", in the second this became "Oct. 1866 och Aug. 1895".

The two collections thus indicated appear to represent widely different species: the "Aug. 1895" collection belongs to *Poria [Chaetoporus] luteo-alba* (*fide* Lowe, 1956: 111–112), the "Oct. 1866" collection to a species that until now has been known as *Poria flavicans*, a tradition founded by Romell and later subscribed to by Egeland, Romell, and Baxter. Because in the first description (1896) only a single collection was mentioned explicitly Lowe felt bound to take this as the type. This resulted in *Physisporus flavicans* becoming a synonym of *Poria luteo-alba*; to him *Poria flavicans* sensu Romell became nameless.

The 'first' description, taken as a whole, however, points to this latter species rather than to *Poria luteo-alba*. The statement "Cystidia nulla" is especially significant since *Poria luteo-alba* has easily observable cystidia. For myself I consider the 1866 specimen as the type rather than the one actually selected by Lowe. It would appear that when first publishing the name, Karsten merely committed an error but in his next description he corrected it; the existence of the 'real' type was clearly implied by the first description.

(107). *Poria expansa* seems to be much more common in southern Europe (or at least in France and Spain) than in Germany and other more northern countries. It has been known in France under various names, often misapplications. Bourdot & Galzin (1928: 686) considered it "le type des champignons destructeurs des charpentes".

Its systematic position has not yet been settled. As far as I know it is a true 'poria', although it has been thought to form caps too; this seems to be due to confusion with the form of *Heterobasidion annosum* that was described as *Boletus cryptarum* Bull., which often produces superimposed and seriate caps. I cannot agree with its transfer to *Fomes* sensu stricto by Domański & Orlicz (1967a, 1967b). The best solution I can think of is to place it in a genus of its own. Before considering a new generic name it must first be decided whether *Spongiodes* Lázaro (0) should be taken up or not. Like that of Quélet and some other French descriptions that of Lázaro mentions caps (in addition to 'resupinate' fruitbodies), apparently as a result of confusion with '*Boletus cryptarum*'.¹⁷

¹⁷ The following is a translation from the Spanish (with apologies):—

Gen. *Spongiodes*. Nov. gen. / Sporophore formed of thick folds irregularly superimposed, strongly projecting, undulate and confluent in some spots which appear attached to the trunks. The upper as well as the lower surface are convex, generally the former more so than the latter; but the irregularity of its forms and the extensive development of its horizontal dimensions, often bigger than the vertical or height, remove its forms from the biconical, ungulate and flat-topped [types of fruitbody]. A single tube-layer, with the tubes vertical and rather long (on the average one or two centimeters). Pores small and equal.

Another problem to be resolved is the correct basionym to be used on transference to another genus. Although *Boletus expansus* Desm. (1823) is the earliest name available, so far the possibility that the correct basionym might be *Polyporus unitus* Pers. (1825) cannot be definitely excluded. Fries treated *Polyporus unitus* as an autonomous species in a volume of the starting-point book (1828 E. 1: 116) in contradistinction to *P. expansus*, which he mentioned under *Polyporus [Fomes] fomentarius* (Fries, op. cit., p. 109), suspecting that it might be a resupinate condition. It is entirely possible however that Fries misapplied the name *P. unitus* when drawing up his description from Norwegian material collected by Sommerfelt.

Until now I have not been able to locate the specimen (type) of *P. unitus* studied by Bresadola (from which he apparently took a fragment now in S) and which is the basis of his conclusion that it represented *Poria megalopora* (= *P. expansa*) but I have not given up hope of eventually unearthing it. Compare also Donk (1967: 116).

(108). *Polyporus spongiosus* Pers. (0) = *Boletus resupinatus* Bolt. was identified with *Poria expansa* and the name reintroduced as *Poria spongiosa* by Quélet [1892 (Crf 20²): 468 pl. 2 f. 19], whose description and figure are sufficiently detailed for recognition of the species. The identity of Bolton's taxon however is doubtful. *Polyporus spongiosus* was a mere substitute name for *Boletus resupinatus* Bolt. When renaming Bolton's fungus Persoon had not seen any specimens attributable to it and his account of it was certainly based exclusively on that of Bolton.¹⁸

Bolton collected his fungus near Halifax in northern England, apparently in the open air "on dry decayed hasle boughs" (branches of *Corylus avellanea*) which vary in diameter (when measured from the plate) from less than 1 cm up to 4 cm thick. Locality and substratum are together a strong indication that it was not *Poria expansa*; this is supported by several other features, such as the colour ("the colour, like all the other

Spongiodes cryptarum. (Bolt. [!]) Láz. / . . . / Description.—Sporophore distinct or resupinate [?], 10–20 centimeters in diameter, superimposed or assembled, of variable thickness, although never very large, wavy or folded, with the upper surface silky-tomentose, uneven, strongly sinuous, pale brown (pardo) coloured or lurid, becoming paler as time goes on. Flesh spongy or desiccated, rather pale brown. Tubes relatively long, thin, of the same colour as the flesh. Pores small, dirty yellowish. / Habitat.—Frequent on coniferous logs decaying in the dark, especially on those of pines used in mine galeries. / Distribution.—This species can be found in various localities of the northern, western, central and eastern regions of the [Iberian] Peninsula.

Several passages in the original text are not quite clear.

¹⁸ There can be no doubt about this conclusion, this in contradistinction to Massee's opinion (1892 B.F. 1: 226). Massee wrote: "Saccardo, in Sacc., Syll. Fung. vi. n. 6525, has given the present species [*Boletus resupinatus* Bolt.] as a synonym under *Fomes spongiosus*, Pers.; there is no evidence, however, that the two are identical . . ."

parts, is a rusty brown"). The rather soft context ("coriaceo-spongiosus") and the irregular shape of the fruitbodies with relatively long (one-layered) pores remind me of *Hapalopilus rutilans* but 'rusty brown' hardly applies to this species. Fries (1838: 455) reduced *Polyporus spongiosus* to a subspecies ("*") of *P. nidulans*, which is a synonym of *Hapalopilus rutilans*. In any case I am not prepared to accept the identity of Bolton's fungus with *Poria expansa* and since I do not recognize it with certainty I must treat *Polyporus spongiosus* Pers.: Fr. 1828 (≡ *Boletus resupinatus* Bolt.) as a nomen dubium.

According to Massee (1892 B.F. 1: 226) "there are specimens in the Kew Herbarium agreeing exactly with Bolton's species, and determined as such by the Rev. M. J. Berkeley." These specimens appear to have furnished the source for some of the features that Massee added to Bolton's description, as for instance, "spores colourless, elliptical, $4 \times 1.5 \mu$ " and "the absence of large, coloured cystidia projecting from the hymenial surface."

(109). A poria that produces a *Ptychogaster* state was called "*Oligoporus*" *friesii* R. & O. Falck. The authors believed they had found the imperfect state that Fries (1849: 564) had brought into relation with *Climacocystis borealis*; Fries wrote, ". . . *Ptychogaster*; est nempe monstrosa progenies *Polypori borealis*, his diebus a me plene observata." Because it produced a 'twin-fruitbody' consisting of both the perfect and imperfect states the species was placed in *Oligoporus* but it was concluded that the perfect state could not be *Polyporus borealis*.

This association by Fries of a *Ptychogaster* state with *Climacodon borealis* must still be confirmed. I have carefully searched through modern literature for additional records but have found no reliable data. I am reluctant to assume that Fries misnamed the perfect state.

Oligoporus friesii appears to be different from *Ptychogaster fuliginoides* = *Tyromyces ptychogaster* because of the structure of its imperfect state and because the chlamydospores are of a somewhat different shape. The fruitbody of this state is radially fibrous (the strands are said to be 'koremienartig') but the interior is not lacunose, as in the *P. fuliginoides* complex. On page 45 (R. & O. Falck, 1937) the chlamydospores are given as measuring $5-6 \times 4.5-5 \mu$ but on page 59 as $6-8 \times 5-6.5 \mu$. The species differs from *Oligoporus rennyi* for instance in the colour of the chlamydospores: "Macroskopisch erscheinen [die Chlamydosporen] im Zusammenschluss junger Anlagen erst hell, später dunkel rahmfarben, zuletzt tabakbraun gefärbt."

New collections and information on several characters are needed before the status and systematic position of *O. friesii* can be worked out.

I have interpreted this species as forming resupinate fruitbodies. This will explain its inclusion in the artificial genus *Poria*. The original description contains *inter alia*: "Die von uns gefundenen Früchte . . . besitzen

eine deutliche dem Substrat ansitzende Fruchtplatte. Konsolen . . . oder Hutbildung fanden wir nicht."

(110). Few species of *Poria* have been so diversely interpreted as *Poria incarnata* Pers. This may be the main reason why by now the name has been almost completely dropped. It is not improbable that in the near future, once the material in Persoon's herbarium has been exhaustively analyzed, the identity of his species will be securely re-established. Even so, however, if its identity with *Poria placenta* is confirmed, it would seem not unreasonable to treat the name as a nomen ambiguum.

On comparing Fries's earliest and personal description (1818 O. 2: 262) and the abbreviated description in his "Systema" (1821: 379) with Persoon's first description a number of discrepancies appear, but there is no indication that Fries wished to exclude the original fungus; in any case he acknowledged Persoon's authorship without any restriction. As is so often true in similar instances it is impossible, I believe, to form a definite opinion about the species that Fries used in 1821 for emending the Persoonian description. At one time Fries (1832^{Ind.}: 149) referred *Poria incarnata* Pers. to *Polyporus isabellinus* [(Schw.) Fr.], at the same time maintaining a *Polyporus "incarnatus* Fr. [Syst. myc.] 1. 379. El. 1. 119". This may be taken as the birth of a new but homonymous name, *Polyporus incarnatus* Fr., non (Pers.) ex Fr. Nevertheless in subsequent work Fries restored Persoon as the author (1849: 322; and cf. 1884 I. 2: 87) or excluded only Persoon's conception of 1825, apparently based on parasitized *Antrodia serialis* (cf. Donk, 1971b: 26).

It would seem as though Fries had no fixed opinion about his own conception of 1818 & 1821. In his first description the fruitbody is effused and immarginate but later he wrote "ambitu passim solvitur, sed pileum non formare potest" (Fries, 1838: 484) and "Margo superior passim reflexus" (Fries, 1874: 573). The published figure, referred to *Polyporus incarnatus* in posthumous work (Fries, 1884 I. 2: 87 pl. 189 f. 1), bears the name "*Polyporus helvolus* n. sp." (written in ink) on the original drawing; the name "*Polyporus incarnatus*" (in pencil) was added later but neither name was written by Fries. Romell (1911: 13) thought that the figure probably represented *Polyporus rixosus* [= *Chaetoporus collabens*], "though the margin is shown too radiate."

In 1821 Fries excluded the *Boletus incarnatus* as described by von Albertini & von Schweinitz (1805: 258; "Vix A.S. p. 258 hujus loci") but in 1828 (E. 1: 199) he changed his mind and stated that "*Boletus incarnatus*, A.S. p. 258" belonged there after all: "revera hujus loci, forma optima explicata." Accompanying the figure discussed above is the remark "Nominis auctor A.S. (vel potius forte Pers.) nec Fr." This may explain why some authors ascribe the name *Polyporus* (or *Poria*) *incarnatus* to 'A. & S.', but this is no more than an indirect reference to

the original name published by Persoon, unless the latter is simultaneously and expressly excluded. Persoon renamed the 'A. & S.' conception *Polyporus niskiensis*. There is no acceptable suggestion available as to the identity of this species.

In connection with *Polyporus incarnatus* Persoon committed an error of his own. In the "Mycologica europaea" (1825: 98), under this name he all at once described a different fungus, as mentioned above. However, his description in the "Synopsis" (1801: 546) clearly reflects the original fungus and not what he was later to describe under the name *Polyporus incarnatus*.

From Karsten's herbarium material and descriptions it is evident that during a considerable period he identified *Poria incarnata* with *Poria [Merulius] taxicola* (Pers.) Bres. (O); compare Donk [1962 (Pe 2): 229], who concluded that it was this interpretation that had served as the basis of the generic names *Caloporus* P. Karst. 1881 = *Caloporia* P. Karst. 1893. In Donk's opinion *Merulius taxicola* is a species of *Merulius* Fr. rather than a resupinate member of the Polyporaceae. It is not unlikely that in later years Karsten changed this interpretation [1896 (H 35): 44 & 1898: 12 / 1903 (BFi 62): 76 (*Caloporia*)] but I find it difficult to make a pertinent suggestion that can be relied on.

Bresadola's interpretation as published by Bourdot & Galzin (1925: 253; 1928: 689) agrees fairly closely with Persoon's original description. There were some followers, but still more recently even these have preferred the use of the name *Poria placenta* Fr. By calling this conception *Ceriporia incarnata* "(Bres. non Fr. nec al.)" Parmasto (1963: 112 f. 2) published a new (but not validly published) name, *Ceriporia incarnata* Parm.

(111). The publication of *Polyporus sericeo-mollis* Romell and its subsequent treatment by the author was a matter in which no fewer than at least four species were involved. A brief recapitulation may be useful.

(i) The name was based on a specimen from Nattavara (Sweden). It was pointed out by Lowe (1966: 84-85) that "the type has very abundant cystidia. By some mischance Romell did not mention them in his original description, nor did he correct this omission in later writings. His identifications and sketches with his specimens amply show that he knew cystidia were present in this specimen." Lowe did not record chlamydospores for this restricted conception.

(ii) The second element Romell mentioned in the observations to *Polyporus sericeo-mollis*; it was associated with a chlamydosporous state of "sulphureous or pallid colour." For some time this was taken to be the true *P. sericeo-mollis*, but Donk (1971c: 210) identified it with *Oligoporus farinosus* Bref. and *Ptychogaster citrinus* Boud., both of which in turn he referred to *Oligoporus rennyi*.

(iii) A third element, found at Femsjö (Sweden), was taken to be a variety "or perhaps distinct species." Like the preceding it was also associated with a chlamydosporous state, but of a different colour, "of about isabelline color, still more like small specimens of *Ptychogaster albus* [= *P. fuliginoides*]." For the present this element may be tentatively referred to *Tyromyces ptychogaster*.

(iv) Finally, in later work Romell included specimens of a fourth species that he later called *Polyporus subsericeo-mollis* Romell. This was referred to *Tyromyces floriformis* (Quél. apud Bres.) Bond. & S. by Kotlaba & Pouzar (1964: 217). For a note on the somewhat irregular publication of Romell's name for this element, see Donk (1972a: 176).

Pycnoporus

(112). By almost common consent this generic name is now restricted to a small group of species with fruitbodies of an eye-catching red colour (114). Two members (*P. cinnabarinus* and *P. sanguineus*) have been confused and often considered to belong to a single variable species. It is now generally agreed that the two taxa are distinct; this conclusion is supported by the fact that in Europe *P. sanguineus* (O) has not yet been found. In a monograph on the genus by Nobles & Frew (1962) a third species is recognized, viz. *P. coccineus* (O), from countries bordering on the Pacific or Indian Oceans. Certain synonyms now placed under *P. cinnabarinus* and *P. sanguineus* may belong to this third species.

Schizopora

(113). Bourdot & Galzin (1925: 237; 1928: 681) described an "état conidifère" of *Poria mucida* [sensu Bres.] = *S. paradoxa*. It was associated with what was "probablement *Irpe obliquus*," which they reduced to a form of their *P. mucida*. On the basis of this apparently chlamydo- (or, rather, aleurio-)sporous state that was found rarely "en bordure de la partie porée peu développée" R. & O. Falck (1937: 58) transferred "*Poria mucida* Bourdot et Galzin," with a question mark, to their new genus *Multiporus* (name not validly published), remarking that it was perhaps identical with *Multiporus chlamydoformans* R. & O. Falck. This seems improbable in view of the size of the conidia described by Bourdot & Galzin (8–12 × 5–7 μ), while those of *Multiporus chlamydoformans* were stated to be 10–15 × 9–12 μ .

I have not come across any reliable confirmation of the existence in nature of a chlamydosporous state of *Schizopora paradoxa*, which is an extremely common species throughout Europe. The question fully deserves special attention.

Trametes

(114). The unfinished classification of the polypores makes the acceptance of a number of artificial genera unavoidable; *Trametes* of this publication is one of them, *Fomitopsis* (33), *Tyromyces* (121) and *Poria* (104) are other examples. Even the definition of the generic character is artificial and arbitrary, especially where cultural characters are emphasized. As a working thesis I have assumed that the only representative in Europe taxonomically typical of *Trametes* is *T. suaveolens*. All other species are included here not only because I do not know where else to place them without more precise additional knowledge about various characters but also because the status of a number of proposed generic taxa (a few based on extra-European species) has not as yet been worked out. In any case all the species concentrated here under *Trametes* have a pale coloured, di- or trimitic, not-fleshy context, and lack sceletocystidia or conspicuous hymenial cystidia (but compare *Tyromyces pseudo-hoehnelii*); all of them possess typical skeletals; these features are shared by *Fomitopsis* (33). In both genera the generative hyphae possess clamps, in '*Trametes*' apparently with a sole exception, viz. *Polyporus onychoides* (116). The genus *Haploporus* is maintained as distinct.

Pycnoporus (112) is excluded mainly because of a contemporary fashion. The colour of the fruitbody is showy and has therefore been taken as important, but it should be remembered that white strains occur not only in cultures but also in nature, at least in the tropical and subtropical, extra-European *Pycnoporus sanguineus* (0). Of this species Murrill [1948 (Ll 10): 268] reported that "specimens in bright sunlight may bleach to pure white." If the red colour were less emphasized separation from the more typical species of '*Trametes*' would be more difficult.

Pseudotrametes, which is not excluded, is accepted by several European authors; so far it consists of a single variable species, *Trametes gibbosa*. It is conceivable that this species will be found to be related to certain tropical forms, such as *Daedalea* [*Trametes*] *palisotii* (0). In case these species are to be regarded as congeneric and as representing a distinct genus then an earlier generic name is available: *Artolenzites* Falck.

(115). The name *Coriolus genistae* appeared in literature for the first time as a synonym when *Poria vulgaris* (Fr.) Cooke "Var. ? B. *pileata* (*Polyporus genistae*, B. et G., in herb.)" was described in a paper by Bourdot & L. Maire [1920 (BmF 36): 84]. Later (Bourdot & Galzin, 1925: 145) the name was published as that of a subspecies: *Coriolus hoehnelii* [subsp.] "*C. genistae*". Eventually Bourdot & Galzin (1928: 569) published *Coriolus genistae* as a species distinct from both *Poria vulgaris* (Fr.) Cooke [sensu Bres. = *P. romellii*] and *Coriolus* ["*Trametes*"] *hoehnelii*. They reported it from "genêts", the substratum from which the specific epithet was derived; collections from the various other substrata mentioned were considered to be the same species ("identique"). This shows

that the lectotype must be a collection from *Genista*. From notes kindly supplied by Dr. J. L. Lowe a collection from Bourdot's herbarium (PC) marked "sur genêt, base de pins. Env. de Epinal, Vosges, legit Galzin Dec. 1904" (Bourdot no. 3975) accords well with the prerequisites; it is herewith selected as lectotype. Some descriptive notes on this specimen follow:—

Sporophore effuso-reflexed, up to 1 cm forward, 0.2 cm thick. Cap convex, the upper surface cream, appearing appressed-fibrillose, rather azonate and rather smooth, the margin resinous-translucent. Pore surface dark cream, the pores rounded, averaging 4 per mm, the dissepiments thin with entire edges. Context pale cream, homogeneous; texture leathery, up to 0.1–0.2 mm thick. Tubes dark to pale cream, coriaceous in texture, up to 1 mm long.

Hyphae of context of 2 types; the generative thin-walled, rarely simple-septate, usually nodose-septate (cross-walls with clamps), 2–3 μ in diam.; the skeletal hyphae nonseptate, thick-walled to solid, 2–4 μ in diam. Cystidia none; hyphal pegs present. Spores oblong, dorsally flattened to slightly depressed, 3–4 \times 1.5–2 μ .

One other collection from Bourdot's herbarium studied by Dr. Lowe agrees with the lectotype (Bourdot 6032; "sur genêt carbonisé. Vergnas, Aveyron, leg. Galzin 3914–17, 20 I 1909"); it also has a small amount of clamped hyphae as well as thick-walled to solid hyphae and spores of the same type. A third specimen ["sur genêt et bruyère. Chateau Charles (Allier), leg. H.B.] has thin-walled hyphae, 2.5–3.5 μ in diam., but these lack clamps, while the spores (3–4 \times 1.5–2 μ) are more ellipsoid-ovoid. This last specimen may appear to differ specifically and it should be compared with *Polyporus onychoides* (116).

Pilát [1939 (ACE 3): 271] reduced *Coriolus genistae* to the synonymy of *Leptoporus* ["*Trametes*"] *semisupinus*, but this should be reconsidered. As Dr. Lowe remarked in his notes, the spores of *Coriolus genistae* are perhaps too slender for that species. It may also be mentioned that Bourdot & Galzin (1928: 569) compared their material with "*Polyporus pallescens* Karst. Rom., Hym. of Lappl., p. 19" (119), a taxon which is now supposed to belong to "*Trametes*" *semisupinus*. They found it distinguishable by the hyphal structure, which they described for their *C. genistae* (apparently in error) thus: "les hyphes sont toutes similaires, flexueuses."

In view of the above I hesitate to reduce *Coriolus genistae* to a mere synonym of "*Trametes*" *semisupinus*, although it seems quite near it and may be a 'variety'. I follow Bourdot & Galzin in not reducing it to *Poria vulgaris* (Fr.) Cooke sensu Bres. (= *P. romellii*): "nous n'avons pas encore vu de forme de passage entre les deux plantes."

(116). The status of *Polyporus onychoides* is still undecided. The description suggests *Polyporus* ["*Trametes*"] *semisupinus* but the lack of clamps may appear to be an important difference. This conclusion is based on the following notes taken from the type collection. Dr. J. L. Lowe's notes run:—

Context hyphae closely and parallel-arranged, rarely branched, thick-walled, rarely to frequently septate, lacking clamps, $3-4 \mu$ in diam.; also a variable amount of very thin-walled, septate hyphae $2-3(-3.5) \mu$ in diam. with the cross-walls always thin and inconspicuous. — In a letter (January 6, 1970) he added, *inter alia*: When I studied the type, I evidently thought *P. onychoides* could be a synonym of *P. semisupinus*; but the presence of simple-septate hyphae in the context eliminates that possibility.

The lack of clamps is also underlined in a note by Mr. L. Ryvarden (*in litt.*, December 3, 1970):—

I have examined the type microscopically very thoroughly and can state the following: The hyphae are dimitic. The skeletal hyphae are thick-walled to almost solid with a diameter of $3-4.5 \mu$ and without septa as far as I could see, and I concentrated on that point: no septa at all. The generative hyphae are thin-walled and with a few simple cross-walls. I was unable to detect a single clamp during an examination of about one hour. . . . The type is small and in bad condition; it looks very much like a small specimen of *T. semisupinus*. As far as I can judge, the only really good separating character is the absence of clamps on the generative hyphae.

According to a suggestion by Dr. Lowe *Polyporus onychoides* may be the same species as the clampless element among Bourdot's material of *Coriolus genistae* (115).

(117). The specific epithet of *Tyromyces* ["*Trametes*"] *pseudohoehnelii* suggests a degree of similarity with *Trametes hoehnelii*; this is due, for instance, to the surface of the cap rather than the size of the fruitbody, which is much smaller than in the other species. In this and various other respects the description recalls *Tyromyces* ["*Trametes*"] *semisupinus*, but the presence of conspicuous cystidia separates the two and directs attention to *Tyromyces semisupiniformis* Murrill [1912 (BTC 39): 148 (Mexico)] as redescribed by Lowe [1961 (PMi 46): 200 f. 1; as *Polyporus*]. Comparison of the two taxa is suggested.

The hyphal structure of the *Tyromyces pseudohoehnelii* was not described but it may be dimitic by skeletals ("hyphae $2.5-4 \mu$ in diam., cum fibulis rariss"). According to Lowe's description the same seems to be true for *T. semisupiniformis*. He mentioned the presence of clamps in "a very small amount of thin-walled . . . hyphae" in the latter species; this does not suggest relationship with *Rigidoporus*, as he had inferred from the cystidia.

The original description does not clearly indicate the holotype, and the name *Tyromyces pseudohoehnelii* would seem not to be validly published, unless it is based on a single collection.

(118). Under the name *Polyporus semisupinus* I have brought together a few taxa that may not at all belong to a single species, but if the conception is heterogeneous a thorough analytical study will be needed to unravel the complex. For instance Lundell identified *Polyporus pallescens* Romell (119) [not ~ Fr. per Fr.; cf. (16)] with *P. semisupinus*

and Pilát does the same with *Coriolus genistae*, but Bourdot & Galzin (1928: 569) evidently hesitated to consider *P. pallescens* Romell and *Coriolus genistae* as conspecific (115). On the whole the small spores are not very carefully described so that it is not always clear whether or not there exists any real difference between the spores of the taxa here reduced to *P. semisupinus*.

Lowe (1966: 127) wrote that his conceptions of *Polyporus semisupinus* and the *Poria byssina* of Eriksson [= *Poria romellii*] "do not seem to differ". I think that there are just enough differences (Donk, 1967: 84–85), including the shape of the spores, to keep the two apart until further contra-indication is presented.

(119). Romell (1911: 19) introduced a *Polyporus pallescens* "Karst." thus: "Karsten, . . . has found this plant at Mustiala in Finland . . . His other collections so named belong to *Pol. velutinus* [= *Coriolus pubescens*], as also Fuckel's plant in Fungi rhen. 1379. — It is not *Pol. pallescens* of Fries . . ." What Romell did (according to the "Code") was to publish a new, but homonymous, species, based on the cited specimen of Karsten: "at Mustiala in Finland growing on the hymenium of *Polyp. fomentarius*". This taxon should be called *Polyporus pallescens* Romell (rather than 'Karst.'), not *P. pallescens* Fr. per Fr. 1821. Romell gave no reference to a publication by Karsten and it is misleading to cite Karsten's treatment of *Bjerkandera pallescens* (Fr.) P. Karst. 1882 (BFl 37): 36, as Lundell [1953 (LNF 43–44): 4 No. 2104] did when he cited Romell's species as a synonym of *Polyporus* ["*Trametes*"] *semisupinus*. In the publication referred to by Lundell Karsten did not even list the specimen just mentioned.

Romell's description of his conception of *Polyporus pallescens* "Karst." mentions the fruitbody as ". . . nunc totus resupinatus, usque ad 8 cm. vel ultra effusus . . . , nunc breviter (1–10 mm.) reflexus . . ." Lundell (l.c.) refers Romell's species to *Polyporus semisupinus*, which also suggests that the type is pileate, a conclusion that agrees not only with Karsten's determination of it as *P. pallescens* Fr. (another pileate species) but also with Karsten's inclusion of the latter species in *Bjerkandera* (which he instituted for pileate species). This conclusion raises the question as to whether the resupinate material included by Romell in his conception might, at least in part, not be *Poria vulgaris* (Fr.) Cooke sensu Bres. = *P. romellii*. Romell no longer mentioned his species in later publications; he did not take it into consideration in 1926 when discussing *Poria byssina* Romell ("Pers.") and *P. vulgaris*. According to Lowe (1956: 119) "most of Romell's type material is now at the Riksmuseet in Stockholm; these are the resupinate condition of *P[olyporus] semisupinus*."

Truncospora

(120). The occurrence of *Truncospora ochroleuca* in Europe is still

somewhat doubtful. The species is apparently not uncommon in Australia and New Zealand and the eastern tropics. It has also been reported from some of the warmer countries of America. Lloyd (1915b: 312) records it as "a frequent plant" from Africa as well; if it also occurs in north-western Africa the records from Portugal may not be altogether unexpected. *Trametes ochroleuca* var. *lusitanica* Torrend (1910: 36) was described from this last-mentioned country, but no microscopical details were given. In a later report Torrend [1913 (Bro 11): 68] stated that he had not seen spores but he recorded "conidiis sporiformibus numerosissimis 14–18 × 8–9 μ"; in size these 'conidia' may well have been the basidiospores of *Truncospora ochroleuca*.

Other material from Portugal was originally reported as "*Fomes*" *scutellatus* (**O**); it was later called *Trametes* [*Truncospora*] *ohiensis* (**O**) and finally listed by Pinto-Lopes (1953: 206–208) under *Ungulina* [*Truncospora*] *ochroleuca*. It should be kept in mind, however, that Pinto-Lopes reduced the North American species *Trametes ohiensis* as such to the synonymy of *Ungulina ochroleuca* (apparently an incorrect decision) and that he did not remedy the lack of microscopical details already conspicuous in Torrend's records of *Fomes scutellatus* and *Trametes ohiensis*. Other records of "*Ungulina*" *ochroleuca* were published by Farinha (1957: 20) and Almeida & al. (1964: 161), again with no description, except that Farinha mentioned that the species is distinguished by its thick-walled and truncate spores. This applies more or less to all species of *Truncospora* and does not really single out *T. ochroleuca*.

All and all, not only is the occurrence of *Truncospora ochroleuca* in Europe still in want of confirmation, but a renewed study of the distribution of the species on a world-wide scale is also needed. Moreover, a detailed study of its difference from *T. ohiensis* is desirable, particularly in connection with tropical American collections. Compare, for instance, *Fomes ohiensis* var. *macrosporus* A. Teix. [1948 (Bra 8): 78 pl. 5], from Brazil, and *Polyporus turbinatus* Pat. [1891 (Rm 13): 137], from Venezuela; in both taxa the recorded dimensions of the spores are comparable to those of *T. ochroleuca*. It is conceivable that other taxa now referred to *T. ochroleuca* and based on American material ought not to be included in this species (*Polyporus havannensis* B. & C.).

Tyromyces

(121). This genus is now accepted by most modern European mycologists, though not always with precisely the same contents. A rather broad version of it is also called *Leptotorus*, a name particularly entrenched in France because it was used by Bourdot & Galzin. An important core is formed by species with pileate, white (immutable or discolouring) fruitbodies with soft and often somewhat watery, cheesy or chalky

context. The interpretation of these species and their synonymies forms a thorny bunch of riddles.

It looks as though the supporters of the genus consider it sufficiently homogeneous. With very few exceptions the better known species have a monomitic context, and this feature has been made an important item in the generic character. Some authors include a number of strictly resupinate species with a context of this kind. So much weight has been attached to the term monomitic that there is a tendency to overemphasize it. An example is the incorporation of *Bjerkandera* (12) by Pouzar (1966c: 370). *Hapalopilus* barely escaped also being included in it.

During the last years my faith in the homogeneity of the genus has been shattered. This is the reason it is treated on this Check list as an essentially artificial genus and why I restricted it to pileate species by referring the strictly 'resupinate' species to *Poria*, another artificial genus. Some species have a dimitic context with skeletals or have an even more complicated hyphal make-up, for instance *Tyromyces spraguei* (supposed to be the same as *Polyporus castaneae* Bourd. & G.); other similar species are now excluded, like *Incrustoporia semipileata* and the "Trametes" *semisupina* group. The context of the cap of one species is monomitic, but the context of the dissepiments is dimitic with skeletals: *Tyromyces chioneus* (*T. albellus*). As far as is known clamps are typical of all the species except one, *T. mollis*.

Most species produce brown rot (and are 'oxidase-negative'); others produce white rot ('oxidase-positive'). The resurrection of the genus *Spongiporus* Murrill by Aoshima (apud Aoshima and Kobayashi, 1966; Japanese text without summary) seems to be due to the stressing of the oxidase-negative character for it. The type species of the name *Spongiporus* is *Tyromyces leucospongia* (Cooke & Harkn. apud Cooke) Bond. & S., a species first described from North America and not occurring in Europe; according to Overholts (1953: 290) and Bakshi & al. [1958 (CJB 36): 363] it is known to produce a "brown carbonizing cubical" rot. Aoshima transferred to this originally monotypic genus *Spongiporus* what he understood to be *T. lacteus* and also (Aoshima, 1967: 1) *Antrodia sinuosa* (10).

As was earlier pointed out (Donk, 1960: 273) the correct name for the genus in its now current circumscription is *Postia* Fr., but restoration of this name would not only require a considerable number of recombinations but it would also deprive phanerogamists of the name *Postia* Boiss. & Blanch. (Compositae), a later homonym. Donk suggested that there is much in favour of rejecting the fungus-name *Postia* Fr. in order to save *Tyromyces* P. Karst., at least until the taxonomy of that genus has been improved. Pouzar (1966c: 370) was of the same opinion. A formal proposal for conservation meets with various difficulties, one of which is that the exact identity of the type species of the name *Postia* Fr. (*Polyporus lacteus*) is far from settled (cf. Donk, 1972b: 294). In fact it is tempting

to conclude that the identity of *P. lacteus* is still in doubt so that both this specific name and the name *Postia* would have to be treated as nomina dubia. In case Aoshima hit the nail on the head in regard to his use of the name *Polyporus lacteus* the correct name for what he called *Spongiporus* (1905) would become *Postia* (1874).¹⁹

Tyromyces chioneus (*T. albellus*) might appear worthy of generic segregation not only on account of its hyphal make-up (briefly sketched above) but also because of several cultural characters that it shares with *Incrustoporia* (5). The trouble is that such a genus would quite likely claim the generic name *Tyromyces* and this in turn would necessitate deciding on the correct name for the rest, a path full of pitfalls. *Tyromyces mollis* (lacking clamps) might conceivably also be placed in a distinct genus, which would have to be called *Leptoporus* Quél. (1886). It has already been set apart in *Tyromyces* subgen. *Leptoporus* (Quél.) Pouzar (1966c: 370).

Tyromyces of this Check list also contains a distinct group with obovoid to ellipsoid spores and a pronouncedly fibrous context with the fibers inclining toward the surface of the cap; examples are *T. fissilis*, *T. alborubescens*; to these I would add *Polyporus croceus*. Bourdot & Galzin entered all three in their conception of *Phaeolus* (and not in *Leptoporus*). I have been tempted to transfer the group to *Spongipellis*, a genus with much the same macroscopic and also nuclear and cultural characters, apparently differing mainly in its thin-walled spores, at least if the emendation of *Spongipellis* by Kotlaba & Pouzar (1965: 76) is followed. If considered homogeneous and worthy of being set apart as a genus of its own the name *Aurantiporus* Murrill is available; this name would be very inapt for the group as a whole.

These few and incomplete notes will suffice as a forewarning that at the generic level no stability can be expected for some time to come. Renewed attempts at solving the riddles of the identity of *Polyporus lacteus* (in connection with the generic name *Postia*) and of the type of *Persooniana* Britz. (122) are necessary.

The problems at the specific level are also numerous. The following, together with previously published notes (Donk, 1972b) on separate specific taxa, are ample demonstration of the existence of numerous uncertainties within the limits of the genus *Tyromyces*.

(122). The genus *Persooniana* Britz. was published with one new species, *P. albocana*. It was differentiated from *Irper* Fr. (sensu lato) because "sowohl der Furchtkörper als auch das Sporenlager nicht leder-

¹⁹ Since *Polyporus lacteus* is a lectotype an improved typification might change the application or assumed impriorability (as a nomen dubium) of *Postia*. This would require evidence that the selection of *P. lacteus* was not in agreement with the "Code". The two other species of the three from which *P. lacteus* was chosen (cf. Donk, 1960: 274) are *Polyporus trabeus* Rostk. sensu Fr. (O) and *P. weinmannii*, both much debated names of uncertain application, although the latter seems identifiable with *Tyromyces fragilis* (cf. Donk, 1972b: 301).

artig, sondern weich fleischig ist." I studied the protologue in connection with *Irpicodon pendulus* and *Irpex lacteus* carefully but was forced to conclude that *Persooniana albocana* differs from both these species.

This I believe leaves only one other solution, viz. that *P. albocana* is a species, or form of a species, of *Tyromyces* in which the hymenophore is more or less typically irpicoid, as in the original *T. lacteus*, the original description of which contains: "... pileo carnoso, poris inaequalibus lacerisve. [Pileus] ... mollis ... Pori plani, flexuosi, sed valde subtiles & profundi, in dentes omnino Sistotremoideos lacerati. ..." I have also seen *T. caesius* with perfectly irpicoid hymenophore. The spores of *Persooniana albocana* support this general suggestion. They are drawn as allantoid, a shape that is hardly expressed by the published measurements, $4 \times 2 \mu$. It would seem premature to suggest the specific identity of Britzelmayr's species with a particular species of *Tyromyces*; this should wait until the species of that genus with allantoid, small spores has been worked out more thoroughly.

(123). The form-genus *Ptychogaster* is essentially 'artificial'. It is not correlated with a particular natural group of perfect fungi; the corresponding basidiforous states are found among several families of the Aphyllophorales, but this may be due to some extent to the somewhat indefinite generic character attributed to it. As far as the European polypores are concerned *Ptychogaster* states have been recorded for certain species of *Fistulina*, *Ganoderma*, *Abortiporus*, *Oxyporus*, *Laetiporus*, *Oligoporus*, *Poria* and *Tyromyces*. The rival generic name *Ceriomyces* must be dropped because it was presumably not based on a fungus state but rather on old galls produced by wasps (Donk, 1972a: 165).

The conidia are of the chlamydospore-type (thick-walled) and are of endogenous origin. This last condition often escapes observation since the chlamydospores may quickly disintegrate.

Bourdöt & Galzin (1928) mentioned the following species of *Tyromyces* as capable of producing *Ptychogaster* fruitbodies.

Tyromyces stipticus (as *Leptoporus albidus*), "quelquefois précédé ou accompagné d'un *Ptychogaster* (*P. rubescens* Boud.?) plutôt roussâtre que rougeâtre." Compare *P. rubescens* sensu F. & O. Falck (124).

Tyromyces floriformis (as *Leptoporus albidus* subsp. *floriformis*), "forme pétaлоide, ... accompagnée d'un *Ptychogaster* . . .," followed by a description.

Tyromyces apalus sensu Bourd. & G. (as *Coriolus kymatodes* subsp. *apalus*). "Ce champignon se développe soit totalement à l'état de *Ptychogaster*, soit partie *Ptychogaster* et partie *Polyporus*, soit uniquement *Polyporus*." This is succeeded by the description and the remark "Ce *Ptychogaster* paraît répondre à *P. rubescens* Boud., mais il est plus franchement rougeâtre et moins gros que celui qui accompagne *L. albidus* et *L. floriformis*."

To these must be added:

Tyromyces ptychogaster, with the chlamydosporous state *Ptychogaster fuliginoides*, formerly called *Ptychogaster albus*. The species was apparently unknown to Bourdot & Galzin, unless they included it in their *Leptoporus albidus* (= *Tyromyces sipticus*), listed above.

Chlamydospore formation in nature among the Polyporaceae (exclusive of Fistulinaceae, Hymenochaetaceae, and Ganodermataceae), but not amounting to the production of narrowly attached *Ptychogaster* fruitbodies, was recorded by Bourdot & Galzin for the following taxa, in which the imperfect states are effused.

Leptoporus [Tyromyces] revolutus: "Il est . . . fréquemment accompagné de conidies en tas plus ou moins épais . . ." Apparently this chlamydosporous state had not yielded the typical (narrowly attached) *Ptychogaster* fruitbodies known to the French authors. They compared it with the next species but decided that the two were different.

Leptoporus destructor subsp. *sericeo-mollis* sensu Bourd. & G. = *Oligoporus rennyi*, the conidial state of which is called *Ptychogaster citrinus* (cf. Donk, 1971c: 210).

Oxyporus obducens (as *Coriolus connatus* subsp. *obducens*).

Poria metamorphosa Fuck. (treated as a form of *Poria aneirina* by Bourdot & Galzin). I refer *Sporotrichum aureum* here.

Schizopora paradoxa (as *Poria mucida* "Etat conidifère"), see (113).

R. & O. Falck (1937) paid special attention to *Ptychogaster* states. The new taxa they described are *Ptychogaster flavescens*, mentioned elsewhere (124); and *Oligoporus friesii* (109) and *Multiporus chlamydiformans*, listed on this Check list as a species of *Poria*. Their interpretation of *Ptychogaster rubescens* will be found scrutinized in (124). Compare also (125).

It is mentioned above (1) that *Abortiporus biennis* apparently invariably produces chlamydospores in the hymenium or even in separate fruitbodies that have been described as a *Ptychogaster*.

(124). The name *Ptychogaster albus* Corda is now generally used in Europe for an imperfect state in which the 'chlamydospores' (often present as 'aleuriospores') finally end by forming a dark brown powdery mass more or less loosely held together by worn out hyphal strands. The darkening of these spores is rapidly progressive. When using the name *P. albus* for these states it is implied that Corda described a young stage in which the spores had not really started to ripen ("die Sporen . . . bilden ein . . . blasses Pulver"); the outside of the fruitbody is the last portion to turn brown. The epithet 'albus' indicates that no change of colour was visible on the outside. The question is whether all the states of the same structure as *P. albus* (lacunose by radiating hyphal strands and plates forming elongate cavities which become filled with spores and with a dark brown final colour of the spores) do not belong to the

same species. The earliest available name for the complex is *Trichoderma fuliginoides* Pers. \equiv *Ptychogaster fuliginoides* (Pers. per Steud.) Donk (1972a: 170). Under this last name I have assembled the following taxa. This conspecificity, tentatively assumed, is evidently in need of reconsideration through studies in nature and in culture.

Trichoderma fuliginoides Pers. 1801.—‘pulvere rutilo’. The spores in mass are now very dark brown in the type specimen. ‘Fuliginoides’ refers to a certain similarity with the genus *Fuligo* Haller (Myxomycetes) rather than to the colour of the spores.

Ptychogaster albus Corda 1838.—“Sporen ... bilden ein ... blasses Pulver”, & “sporis ochraceo-argillaceis”.

Polyporus ptychogaster F. Ludw. 1880.—Spores ‘braun’.

Oligoporus ustilaginoides Bref. 1888 (may be considered a substitute name for *Ptychogaster albus*).—The final stage disintegrates “in eine braun verstäubende Sporenmasse”.

Ceriomyces richonii Sacc. 1888.—“... pulpe ... blanche d'abord, puis couleur canelle ... spores ... [4–6 μ], jaune nankin ...” [repr. 1879 (Rm 1): 132].

Polyporus sericeomollis Romell (111), “a variety (or perhaps distinct species)” Romell 1911 in obs.—Associated with “a fibrous-pulvaceous *Ptychogaster* of about isabelline color ... like small specimens of *Ptychogaster albus*.”—Romell 1911: 22) also included in the same species a chlamydosporous state “of sulphureous or pallid color”, for which see under *Oligoporus rennyi* (68).

Ptychogaster rubescens Boud. sensu F. & O. Falck 1937.—“... der Beginn der Sporenbildung ... durch eine rosafarbene Verfärbung zu erkennen” and “... Beläge färben sich erst rötlich, dann rötlich-gelb bis rötlich braun, schliesslich braun bis dunkelbraun”. Compare (125). In

Ptychogaster flavescens R. & O. Falck 1937 is “diese erste Färbung hellgelblich” and “... Beläge färben sich erst gelblich, dann lehmgelb, schliesslich braun”. — “In grösseren Mengen zusammenliegend sehen die älteren Sporen beider Ptychogasterarten sehr ähnlich aus. Sie erscheinen als braune, rötlich-bräune oder schokoladefarbene Lager.”

All the taxa listed above were collected in nature. *Ptychogaster rubescens* sensu R. & O. Falck and *P. flavescens* alone were not only found in nature [cf. R. & O. Falck 1937 (HF 12): f. 6 and table on p. 11] but also in buildings; they were stated to be causal organisms of rot “des technisch verwerteten Coniferenholz” (p. 1).

(125). The correct assignment of *Ptychogaster rubescens* Boud. to a perfect state is in my opinion still problematic. Boudier himself found this chlamydosporic state in greenhouses, “parmi le *Polyporus vaporarius* fréquent dans les serres ... [et qui se tache] de rouge par le toucher ou par le froissement.” It is difficult to suggest which polypore Boudier had in mind. The true *Poria vaporaria* (O) is insufficiently known; what Fries called *Polyporus vaporarius* is now often considered to be a form of *Poria* [*Antrodia*] *sinuosa*, a species that does not turn reddish. I am acquainted with only one white poria that may be common in greenhouses in northern France and that turns red, viz. *Rigidoporus sanguinolentus*. A connection between this and *Ptychogaster rubescens* is not very likely.

This conclusion shifts attention to the case described by Hennings, who found a *Ptychogaster* state in greenhouses in Berlin associated with a (presumably) polymorphic fungus that is tentatively called *Polyporus [Tyromyces] henningsii* Bres. (131) on this Check list. *Tyromyces apalus* sensu Bourd. & G. (127) is another species producing a *Ptychogaster* state that 'seems to answer' to *P. rubescens*.

Another suggestion has been voiced by Davidson & al. (1946), who directed attention to the great similarity between cultures of two isolates identified as *Ptychogaster rubescens* and *Polyporus [Tyromyces] guttulatus*; this suggestion has been supported by O. Fidalgo (1959a). So far such a connection does not seem to have been established. The correct determination of the cultures named *Ptychogaster rubescens* is open to doubt; moreover as far as I am aware the two states have not yet been found together in nature and *Polyporus guttulatus* has not yet been reported from greenhouses in Europe. It would seem as though we are confronted with different *Ptychogaster* states with similar cultural characteristics.

What R. & O. Falck (1937) called *Ptychogaster rubescens* perhaps agrees better with *Ptychogaster fuliginoides* (124), which state I take to be conspecific with *P. albus* and *Tyromyces ptychogaster*.

(126). Among the many difficulties and problems still to be straightened out in *Tyromyces* are those connected with a taxonomically mixed group of species that may be indicated as the 'house fungi': species that occur in dwellings, mines, hothouses, and the like. They are of considerable economic importance and this presages inextricable confusion in literature. In fact it could not be worse. In order to compress the subject into the trammels of this Check list I have cut many knots without much personal knowledge; for this I tender my sincerest apologies.

I have admitted four species: *Tyromyces apalus* sensu Bourd. & G. (127), *T. destructor* sensu Bourd. & G. 1928 emend. (128), *Polyporus fodinarum* (129), and *Polyporus henningsii* (131). In this connection species with only strictly resupinate fruitbodies are not taken into consideration; they are referred to *Poria*.

(127). *Polyporus apalus* Lév. (0) has been variously interpreted. According to Bourdot & Galzin (1928: 566) Bresadola was of the opinion that Boudier considered the true *P. apalus* to be the same as *Polyporus kymatodes* sensu Bres. [= *Tyromyces balsameus*]. Lloyd (1915b: 375) could find no type; he added "almost passed out of European tradition excepting locally in France, where the specimens are *Polyporus [Bjerkandera] fumosus*." Finally, Bresadola [1931 (BIM 20): text to pl. 985 f. 2] listed *P. apalus* as a synonym of *Polyporus [Tyromyces] lacteus*, which seems to be contradicted by the original description.

Bourdot & Galzin applied the name to an infrageneric taxon which they appended as a subspecies to *Coriolus kymatodes* sensu Bres. [= *Tyro-*

myces balsameus]. The fungus they described also developed a *Ptychogaster* state (123). Their description of the basidiferous state agrees in many respects with Léveillé's original description but there are also serious discrepancies. The type of *Polyporus apalus* was found "ad trunco quercuum caesos", a quite different habitat from that of Bourdot & Galzin's fungus: "sur vieilles planches de sapin, dans une serre un peu chauffée et humide." I am far from convinced that their fungus was correctly named.

Still another matter is the presumed relationship of *Tyromyces apalus* sensu Bourd. & G. with *T. balsameus*. Again judging from Bourdot & Galzin's description, I am not prepared to accept close specific relationship between the two. For *T. balsameus* North American authors do not mention a *Ptychogaster* state. It looks as though *T. apalus* sensu Bourd. & G. is in need of a new name.

The habitat of the single collection thus far reported suggests that this may be a 'house fungus' (126). Its *Ptychogaster* state recalls *Ptychogaster rubescens* (125). *Polyporus henningsii* (131) was also collected in a hothouse and also in connection with a *Ptychogaster* state that has been identified with *P. rubescens*.

(128). What is *Polyporus destructor*? So many interpretations have been published that a reproduction and inspection of Schrader's original description may not be altogether superfluous as the best approach we have to the lost type:

Boletus c. Acaules α. Carnosi. "B. destructor, albidus, pileo inaequali rugoso, poris subrotundis obtusis. / Hab. in domibus recenter extractis et humoris obnoxiiis, quas secus ac *Merulius vastator* [= *Serpula lacrimans*] destruit. / Fungus variae figurae, magis vel minus explanatus, superficie rugosa, glabra. / Pori breves, minuti, subrotundi, obtusi. / Substantia fibrosa, per siccitatem, facile in pulverem farinaceam conterenda. / Color totius fungi albidus. / Odor gravis, sed haud ingratus."

This description contains so much information that it is surprising that no interpretation can be found in literature that really agrees with it entirely. When Fries (1821: 359) revalidated the name as *Polyporus destructor* he merely rewrote what Schrader had already written and there can be no doubt that he had not yet shown that he had a personal interpretation; the type of the revalidated name continues to be represented by Schrader's original account. It is true that Fries added "v.v.", but if the fungus he had in mind was different it made no real change in the phrase and description. It is not unlikely that what he associated with Schrader's fungus was something different; he did not find it "ad 'ligna putrida domestica'" (this is the way he cited the habitat of the original fungus) but "in silvis ad trunco udos pineos . . . per Annum."

When many years later Fries (1838: 454) redescribed *P. destructor* he emphasized the following characters: "pileo aquose-carnoso fragile effuso-reflexo fuscescenti-albido, intus zonatus, poris longis subrotundis

dentatis lacerisque albidis." (Italics as in the original.) No habitat. Still later Fries (1874: 547) also printed "aquose carnosus" in italics and gave the habitat as "Ad ligna, praecipue domestica et fabrefacta, quae more *Merulii lacrymantis* emollit et destruit." He referred *Polyporus alutaceus* Fr. (O) sensu Rostkovius [1830 (StP 4): 57 pl. 27] here. Mez (1908: 110 f. 42) claimed to have found such a fungus.

I feel compelled to interpret Schrader's fungus as 'resupinate'; although it is stated to be variously shaped ("fungus variae figurae") the only further elucidation is in the "magis vel minus explanatus" immediately following.²⁰ The table below contrasts Schrader's and Fries's fungi:

Schrader	Fries 1838, 1874
Fruitbody variable but flattened out. "Color totius fungi albidus."	Fruitbody effuso-reflexed. Cap 'fuscescente-albidus'; pore surface 'albidus'.
Flesh fibrous, when dry easily rubbed to a mealy powder. Tubes short, with obtuse edges.	Flesh watery-fleshy, zonate. Tubes long, with toothed and torn dissepiments.

Even if it is assumed that Schrader's fungus need not be consistently resupinate there can be little doubt but that more than likely the two are different species, as Bresadola [1908 (Am 6): 37-38] had concluded.

Another interpretation is that of Bourdot & Galzin (1928: 546 f. 155). They described the fungus from a single collection with sessile fruitbodies and an abnormal hymenophore: "pores céromycétoïde et altéré par un parasite". This condition recalls *Poroptyche candida* G. Beck, another house fungus, but with resupinate fruitbodies and perhaps similar basidiospores and also with a spongy (myriadoporous) hymenophore, but its rope-like mycelium apparently allying it differently.

In connection with a French specimen that he referred to *P. destructor* and which is referable to *Poria resupinata* (not to *Leptoporus destructor* sensu Bourd. & G.!) Bresadola (l.c.) suggested: "Species haec, quoad formam valde variabilis, saepe resupinata, mollis, friabilis, praecipue si in locis suffucatis obvia, meo sensu, tantum forma *Polypori albidi* Schaeff. qui tantum sub diu et optime evolutus tenax et lignosis est." Romell (1926: 4) came to the same conclusion after he was told by R. Falck that *P. albidus* [= *Tyromyces stipticus*] also occurs in houses. This last claim still needs verification. It should be remembered however that Romell stipulated that his interpretation of *P. stipticus* was not that of Bresadola, who for some time used this name to indicate *Dichomitus squaleus*. I do

²⁰ Schrader placed his species in a group that he indicated as "Acaules". It contained both pileate and resupinate species: "Pileo dimidiato . . . , altero latere horizontaliter inserte"

not recall having come across an explicit record of a *Tyromyces* house fungus in which an intensely bitter taste of the fruitbody is mentioned, a character typical of *Tyromyces stipticus* (*T. albidus*) (134).

Other authors (Bondarcev, 1953: 205; Domański, 1965b: 139) equated *P. destructor* (inclusive of Bourdot & Galzin's interpretation of 1928) with *Leptoporus fodinarum*; in my opinion this is not readily acceptable (128).

The above review has been written to stimulate renewed study of the 'white' house fungi. In order to focus attention on the problem connected with the identification of *P. destructor* this species as conceived by Bourdot & Galzin is entered on the Check list as distinct. It would seem reasonable to keep in mind the possibility that Schrader's fungus might also occur in the forest, as would be the case if it really could be proved identical with *Tyromyces stipticus*.

(129). *Polyporus fodinarum* Velen. is entered on this Check list as a third white 'house' fungus of the genus *Tyromyces* (126). This is done on the authority of Pilát, who claimed to have seen a specimen named by Velenovský and who gave it its present circumscription. At first he called it *Poria vaillantii* and listed *Polyporus henningsii* = *Polyporus vaporarius* sensu P. Henn. (131) as a synonym. When accepting the name *Polyporus fodinarum* as that of a good species he dropped this synonym; instead he listed *Polyporus destructor* "auctorum p. max. p. non Schrader nec Fries".

The species as conceived by Pilát is remarkable in its ability to develop extensive superficial mycelial growth with drooping portions not only in damp mines and caves but also in houses. This mycelial state commonly assumes striking and bizarre shapes; often it resembles the mycelium of *Serpula lacrimans* (Wulf. per Fr.) J. Schroet.; the two may have been confused when not found with well-developed fruitbodies. I would suggest that *Polyporus vaporarius* sensu Mez belongs here. To my knowledge no free-living chlamydosporous state has thus far been reported, as it has been for *Polyporus henningsii*, which also seems to produce a different kind of superficial mycelial state.

Polyporus fodinarum is placed here in *Tyromyces* rather than in *Poria* on account of Pilát's description, from which I conclude that the fruitbody may occasionally be pileate ("receptacle rèsupiné ou formant de petits chapeaux . . . aussi latéraux"). The mycelia Mez and Pilát depicted look very similar, but this does not hold true for the fruitbodies they associated with them. The question arises whether *Tyromyces fodinarum* is a homogeneous conception or not. The correctness of the name itself may also be doubted (130). Compare also *Boletus fodinalis* Humb. (0).

(130). Attention is drawn here to the existence of a possible earlier name for *Leptoporus fodinarum* of Pilát (129), viz. *Polyporus erosus*

Pers. \equiv *Boletus hybridus* Sow. The latter forms spectacular superficial mycelia ("spreading in large patches, forming more or less broad ramifications, often inosculating, of a cottony substance like [*Boletus (Serpula) lacrimans*]'") and it may produce pileate fruitbodies with rather long pores (as figured by Sowerby, pl. 289). On a later plate (Sowerby, pl. 387 f. 6) a long, mycelial 'stalactite' is depicted; it bears an orbicular disc of pores at the lower (free) end.

The original account (pl. 289) would seem to furnish sufficient evidence for not equating *Boletus hybridus* with *Poria vaillantii*, in contradistinction to the following citation: "An unlocalized specimen named [*Poria hybrida*] by Berkeley in Kew herbarium has been selected as a neotype by Prof. J. L. Lowe, according to his annotation of the packet. This collection . . . is *Poria vaillantii* (DC. ex Fr.) Cooke."—Reid & Austwick [1963 (GN 18): 309].

(131). Another species of house fungi that produces both resupinate and pileate fruitbodies is *Polyporus henningsii*; it has ovoid spores of $3-4 \times 2 \mu$, hence apparently different from those of *Tyromyces destructor* sensu Bourd. & G. It was described by Bresadola as a species with a flabelliform and stalked fruitbody, but according to Hennings (who had sent the material that became the type) such a form made up part of a long series of fruitbodies varying from completely resupinate to laterally or even more or less centrally stalked forms (the latter 'cyathoid'). Here it is tentatively assumed that all these various forms really represent a single species. I am not prepared to identify this species with *P. destructor* sensu Bourd. & G. for several reasons. Certain microscopical characters (spores) that Bresadola indicated for *Polyporus henningsii* support my view and further a superficial system of rhizomorphic mycelial strands from which the fruitbodies originate has not been recorded for *P. destructor*.

Hennings himself [1899 (VBr 40): 125–126] identified the strictly resupinate states with *Poria vaillantii*, which he in his turn identified with *Poria vaporaria*. The latter species is insufficiently known; it has often (incorrectly) been considered to be the same as *Poria vaillantii* (cf. Donk, 1967: 117). Since Hennings's drawing showed that the mycelial strands produce both resupinate and sessile fruitbodies I do not accept his identification with *Poria vaillantii* either; no modern author who described the current interpretation of *Poria vaillantii* has ever made any mention of pileate to stalked fruitbodies. (Hennings did not study the fungus microscopically.) Yet I must confess that his drawing of the resupinate fruitbodies is very suggestive of *Poria vaillantii*, though again assuming the conspecificity of the whole range of fruitbodies the microscopical details published by Bresadola for *P. henningsii* would also seem to exclude identification of the two taxa.

For the *Ptychogaster* state, see (123).

Modern authors, following Pilát, identify Hennings's fungus and

Polyporus destructor sensu Bourd. & G. with *Polyporus fodinarum*; this still needs confirmation (128).

(132). *Tyromyces cerifluus* (**O**) was known from a single collection made in South Carolina, U.S.A., when Lowe [1961 (PMi 46): 205] identified it with the European *Polystictus* [*Tyromyces*] *revolutus*. On comparing descriptions a number of discrepancies can be noted; these may appear to be unimportant when additional collections cause the American species to become better known; nevertheless for the time being the existing descriptions induce me to retain *Polystictus revolutus* as a distinct species. The strongly disjunct areas of distribution and the lack of knowledge of the existence of an accompanying imperfect state for the American fungus also seem to support cautious treatment.

It has also been suggested to me that *Polystictus revolutus* be the same species as *Tyromyces ptychogaster*. It is true that according to Bourdot & Galzin the species is often accompanied "de conidies en tas plus ou moins épais" but this quotation does not in the least suggest the *Ptychogaster* fruitbodies of often quite considerable size and globular shape which are typical of *T. ptychogaster*. Moreover, *P. revolutus* is recorded from a diversity of hosts, all of which are frondose trees, while *T. ptychogaster* I have invariably found on coniferous wood. Finally, the spores of *P. revolutus* are "subcylindriques, un peu déprimées latéralement" and as drawn by Bourdot & Galzin, different from the more ovoid and wider spores of *T. ptychogaster*.

(133). Both the status of *Tyromyces guttulatus* as a good species and its occurrence in Europe need some comment. It was described from North America. According to Overholts (1953: 288), "*P[olyporus] immitis* intergrades considerably with *P. guttulatus*, which is best distinguished by the thin, applanate, and typically spotted pileus." It is now often assumed that *P. immitis* Peck is the same as *Tyromyces sipticus* (which species has also been called *T. albidus*), an identification that is recommended for renewed critical study (134).

Lloyd (1915b: 301) was perhaps the first author who reported *Polyporus guttulatus* from Europe, although he adopted an old Friesian name for it, viz. *Polyporus alutaceus*. He did this because "the European plant, as named by Bresadola, appears to me to accord with Fries' description and the figure that he cites." Fries's description mentioned by Lloyd is not the original one; the figure that Fries cited is that of *Polyporus epixanthus* Rostk. (**O**). Neither the original description of *P. alutaceus* (**O**) nor Rostkovius's figure even remotely suggests *Tyromyces guttulatus* as I know it from North America. According to Bresadola (*in litt. apud* Bourd. & G., 1928: 545) his conception of *Polyporus alutaceus* "est très voisin de *L[epi]toporus albidus* [= *Tyromyces sipticus*] et en est peut-être une simple variété bien développée et jaunissante." This differential description is hardly, if at all, suggestive of *T. guttulatus*.

Romell (1926: 9) was not sure whether *Polyporus guttulatus* occurs in Sweden; Bourdot & Galzin (1928) do not report it; but Pilát [1938 (ACE 3): 204] mentioned a Czechoslovakian collection that he pronounced to be absolutely identical with North American collections [as *Leptoporus stipiticus* f. *guttulatus* (Peck) Pilát]. I have seen a few European collections that I would refer here.

(134). *Polyporus immitis* is a disputed species. At first it was confused with, and referred to [Murrill 1907 (NAF 9): 39], *Spongipellis galactina* (**O**). Kauffman (1926) pointed out that this interpretation was erroneous; his redescription suggests a species close to, or perhaps conspecific with, *Tyromyces stipiticus* (*T. albidus*). Although I repeatedly collected material of this complex both in Europe and in Michigan, U.S.A., at present I do not wish to commit myself as to the correct status of *Tyromyces immitis*.

Lowe (1934: 86; 1942: 79) was the first to accept the identity of the two taxa. On the other hand Pilát [1937-8 (ACE 3): 211 f. 66, pl. 130] keeps the two apart; in his key he contrasted them as follows:—

Leptoporus stipiticus: Chair de saveur amère, adstringente. Sur bois de conifères.
Leptoporus immitis: Chair sans saveur perceptible. Sur bois d'arbres feuillus.

This characterization is somewhat surprising because the epithet 'immitis' denotes an unpleasant taste or smell which the author of the name described as "a subacid odor." The suspicion arises that Pilát did not really taste the collections (from Czechoslovakia and the U.S.A.) which he referred to *Leptoporus* [*Tyromyces*] *immitis*, not only because he did not mention any taste in his description but also because it may safely be assumed that the North American collections cited were bitter. Overholts (1953: 288) attributed to *Polyporus immitis* "a very bitter taste in both fresh and dried condition." It would thus seem that the two taxa do not differ in taste. Neither Peck nor Kauffman (l.c.) who re-introduced the species, seem to have tasted it.

The host range may offer a more positive difference. The *Tyromyces immitis* of North American authors prefers deciduous trees. The type was found on a species of *Fraxinus* ("decaying ash trunks"); other species of *Fraxinus* and apple, *Acer*, and *Betula* have been recorded as additional substrata, although Overholts also reports it from various coniferous trees. This behaviour is at variance with the European *T. stipiticus*, which is known to nearly all authors from this continent from coniferous trees only. An exception is Romell (1926: 9), who stated that he had also found it on *Betula* and *Sorbus*. On the other hand Lundell [1946 (LNF 27-28): 8 No. 1316] reports that he found *T. stipiticus* to be rather common in Femsjö (where Fries lived in his youth) "always on spruce".

Compare also Lowe (1934: 141 pl. 14 fs. 1-3) and Overholts (1953: 426).

LIST OF OMITTED NAMES

The names on the following list have been omitted from the preceding Section, viz. the Check list proper. The list enumerates in alphabetical order names given to, or brought into connection with, European polypores but for various reasons thought to be unfit for incorporation in the preceding enumeration.

Many of these names (i) are not validly published; they are nomina nuda in the sense of the "Code". Identifiable devalidated names however have been included in the Check list proper. (ii) Other names included here cover taxa that are so insufficiently known that they amount to nomina dubia. (iii) Still other names are (or were) either so diversely interpreted that they should be dropped (cf. Art. 69 of the "Code"; nomina ambigua) or else are illegitimate (not available) in the light of Art. 70 (nomina confusa).

A considerable number of names are preceded by an asterisk (*); these are based on type material collected outside Europe. The reason for the inclusion of these names is (iv) that they are or for some time were identified on erroneous or, at least in my opinion, (still) dubious grounds with species thought to occur in Europe. In the case of some of these European species the number of these putative or doubtful synonyms is so considerable that it was convenient to leave them out altogether. In the "Notes" brief mention of this is in each case made separately. (v) A small category comprises aliens that were reported incidentally from Europe, usually from hot- or green-houses. Of a few of them the 'type locality' is Europe.

Genera like *Irpex*, *Merulius*, and *Sistotrema* were for a long time the recipients of polypores as well as non-polypores; as a rule specific names bestowed on this second category, of non-polypores, have been left out.

Mention of a family or order following a specific or generic name indicates that the species is not considered to belong to the 'polypores'. It will not be found treated elsewhere in this book.

The addition of '(0)' to a name indicates that the name is treated more fully elsewhere in the present list.

For a discussion on names published by Secretan, see Donk in *Taxon* 11: 170–173. 1962.

abietina, *Daedalea*, Secr. 1833 M. 2: 496 (Switzerland), not ~ (Bull.) Fr. 1818 (d.n.); [= *Daedalea abietina* (Bull.) Fr. sensu Secr., excl. of type].—Nomen dubium. Fr. 1874: 495 (Secr. "n. 17") referred this to *Lenzites* [*Antrodia*] *heteromorpha*, but Secretan's descr. does not agree.

- abietinum*, *Sistotrema*, Seer. 1833 M. 2: 501 (Switzerland) (nom. nud.: n.v.p.).—*Sistotrema violaceum* Pers. “(excl. syn.)” is cited as a syn. of “Var. A”, the description of which suggests *Hirschioporus fusco-violaceus*.
- abietinus*, *Boletus*, Cumino 1805: 224 (Italy) (d.n.), not ~ Anon. 1790 (d.n.) per Purt. 1821, not ~ Pers. apud J. F. Gmel. 1792 (d.n.) & (Pers. apud J. F. Gmel. per Fr.) S. F. Gray 1821; ≡ *Polyporus cumini* Pers. 1825.—Nomen dubium. Referred by Fr. 1832^{Ind.}: 55 to *Polyporus stereoides* (**O**).
- abnormis*.—“*D[aedalea] cinerea* Fr. (vel *abnormis* Kill.)” Killerm. 1940 (DrG 21): 75 *tpl. 31 f. 20* (lacking Latin descr.: n.v.p.) (Germany).—Nomen dubium. *Daedalea cinerea* Fr. = *Cerrena unicolor*.
- **abortivus*, *Polyporus*, Peck 1881 (BG 6): 274 (U.S.A., Illinois); *Daedalea* Pat. 1900.—This is conspecific with *Abortiporus distortus* (**O**) fide Murrill 1904 (BTC 31): 422, but like the latter taxon it has been reduced further to the synonymy of *Polyporus [Abortiporus] biennis*, for instance by Bres. 1926: 79 and Overh. 1953: 224. — Cf. (2). — Descr.: Peck 1885 (RNS 38): 90.
- acanthoides*, *Cladomeris*, Big. & Guill. 1909: 410 (syn.: n.v.p.); [= *Cladomeris acanthoides* (Bull. per Mérat) Quél. sensu Fr. (*Polyporus*), excl. of type, (Sweden)].—This name was listed by error as a syn. of *Cladomeris [Bondarzewia] montana*; simultaneously *Boletus acanthoides* Bull. [= *Meripilus giganteus*], which represents the ‘type’, was treated as a distinct sp. Fries’s conception of *B. acanthoides* belongs to *Abortiporus biennis*.
- acerinus*, *Polyporus*, Opiz 1852: 137 (Czechoslovakia) (nom. nud.: n.v.p.).—Nomen dubium.
- acidula*, *Bjerkandera*, (Fr.) P. Karst. 1882 (Mfe 9): 62; *Polyporus stipticus* var. Fr. 1828 E. 1: 86 (Sweden); *Boletus* Mussat 1901 (syn.: n.v.p.); *Polyporus* Romell 1912 (incidental mention: n.v.p.).—Romell 1926 (SbT 20): 19 referred this to *Polyporus [Tyromyces] stipticus*, but this seems doubtful. Fries separated this taxon because of its deviating taste, “sapor acidulus . . . , sapore haud stiptico”, although he thought it not specifically distinct (“certe tamen varietas”). — *Boletus acidulus* (Fr.) Mussat 1901 (SF 15): 62 is an error for *Polyporus stipticus* β. *acidulus* Fr. 1828 E. 2: 86 ≡ *Polyporus stipticus* [var.] “B.” *acidulus* Fr. 1838: 453 (“b.”), 1874: 546, Sacc. 1888 (SF 6): 113, the ‘B.’ being taken for the abbreviation of ‘*Boletus*’.
- **admirabilis*, *Polyporus*, Peck 1899 (BTC 26): 69 (U.S.A., Maine); *Poly-stictus* Lloyd 1914 (nom. nud.: n.v.p.).—This is another species (cf. also *P. albiceps*) that should be compared with *Polyporus incendiarius*. — Syn.: *Polyporus underwoodii* Murrill apud Peck 1906 (BNS 105): 27; Murrill 1907 (NAF 9): 61. — Descr.: B. O. Dodge 1916 (M 8): 7 *pl. 173*, *pl. 174 f. 2*; Overh. 1953: 249 *pl. 37 f. 233*, *pl. 128 fig.*
- **adpressa*, *Poria*, Murrill 1920 (M 12): 85 (Cuba).—Referred by Lowe

- 1947 (Ll 10): 45 to *Poria versipora* [= *Schizophora paradoxa*] and 1966: 65 to *Poria hypolateritia* (**O**).
affinis, *Polyporus*, Boud. in herb.—Fide Lloyd 1905 (LMW 4, Ap.): 375 = *Polyporus [Ganoderma] resinaceus*.
**agariceus*, *Polyporus*, (Kön.) ex Berk. 1843 (AM 10): 371 (Ceylon); *Boletus* Kön. in herb.; *Favolus* Lév. 1844; *Leucoporus* Pat. 1900; *Polyporellus* Pilát 1936.—Correct application not yet quite certain, cf. Petch 1916 (APe 6): 89, Donk 1969 (Pe 5): 238, 1971 (PNA 74): 17. —Sensu Bres. (European specimens) → *Polyporus alveolarius* (Bosc) per Fr.
agaricicola, *Polyporus*, F. Ludw. 1882 (H 21): 145 (Germany); 1883 (ZPf 1): 209 ("agaricinicola"); *Poria* Sacc. 1888.—Abnormal growth on the surface of the cap of *Amanita pantherina* (DC. per Fr.) Krombh., fide F. Ludw. 1908 (FwN): 116 and Malkovský 1931. *Daedalea parasitica* (**O**) is a similar abnormality.
agaricoides, *Boletus*, Thunb. → *Daedalea thunbergii* Fr. (**O**).
alba, *Daedalea*, Pers. 1801 (d.n.), not ~ Pers. 1828; [= *Agaricus daedaleis* *Sinibus minoribus* Batt. 1755: 72 pl. 38 fs. E, F (Italy)].—Nomen dubium. Pers. 1828: 5 (with doubt) and Fr. 1832^{Ind.}: 81 referred it to *Daedalea saligna* [= *Bjerkandera fumosa*].
alba, *Daedalea*, Pers. 1828, not ~ Pers. 1801 (d.n.); [= *Boletus albus* Huds. sensu Bolt. 1788: 78 pl. 78 (England)]; = *Polyporus albus* Wettst. 1888, typonym, misapplied?, not ~ (Huds.) per Fr. 1838.—Nomen dubium. Bolt. (1791: Ind. gener.) soon referred his interpretation to *Boletus salicinus* Bull. [= *Bjerkandera fumosa*]; Fr. 1874: 544 placed it under *Polyporus salignus* [= *Bjerkandera fumosa*], leading Wettst. to replace the name *P. salignus* by *P. albus*. Both Pers. and Wettst. apparently excluded the type of *Boletus albus* Huds., although not explicitly so. I tend to agree with Berk. 1836: 133, who thought that Bolton's fungus could be *Daedalea [Abortiporus] biennis*.
alba, *Mensularia*, Lázaro 1916 (RMa 14): 738 / 1917: 124 (Spain).—Nomen dubium. *Tyromyces* sp.?
**albertini*, [*Polyporus*], Lloyd 1912 (LMW 3, S.P.): 160 f. 460 (Australia, Queensland); *Phaeolus* D. Reid 1963.—The type was referred to *Polyporus [Phaeolus] schweinitzii* by Cooke in herb.; Bres. 1926: 26 thought it to be close to this sp.; G. Cunn. 1965: 201 referred it to *Inonotus rheades* [misnamed]; D. Reid 1963 (KB 17): 277 f. 1: 5 (descr.) treated it as a distinct sp. of *Phaeolus*. It differs from the type sp. of *Phaeolus* by the presence of "setal hyphae" (macrosetae) in the context of the dissepiments of the tubes and by the strongly coloured spores.
"albescens Quél." as cited by Killerm. 1922 (Dba 15): 87 as a syn. of *Polystictus [Coriolus] zonatus* "f. *lutescens* Bres." It is not clear what specific or other name Killerm. had in mind. I could not locate the name in Quélét's publications. The epithet haunts the literature in various combinations: *Polystictus zonatus* var. *albescens* [J. Rick 1906 (Am 4): 310 & Theiss. 1911 (DAW 83): 239; "Quél."; no descr., "det.

- Bres."], *Polystictus versicolor* var. *albescens* [Torrend 1909 (Bro 8): 132; "Quél."; no deser.]; "*Polyporus albescens* Quél. (sec. Killerm.)" cited as a syn. of *Polyporus zonatus* Quél. (Bond. 1953: 486). Possibly it originated as a printing or reading error for 'lutescens'.
albescens, *Polystictus*, Lázaro 1916 (RMa 14): 750 / 1917: 136 (Spain).—Nomen dubium. *Coriolus pubescens*?
**albiceps*, *Polyporus*, Peck 1900 (BTC 27): 19 (U.S.A., New Hampshire); *Polyphorellus* Pilát 1932.—This has been brought into relation with *Polyporus incendiarius* (96). — Deser.: Overh. 1953: 250 *pl. 37 f.* 224, *pl. 115 fs.* 627, 628.
**albida*, *Daedalea*, Schw. 1822: 93 (U.S.A., North Carolina), not ~ Fr. 1821; = *Daedalea discolor* Fr. 1828; *Striglia* O.K. 1891.—Fide Murrill 1905 (BTC 32): 86, 87 & Overh. 1953: 120 = *Agaricus* [*Daedalea* [*Daedaleopsis*] *confragosa*]. — Deser.: Fr. 1828 E. 1: 68 (*Daedalea discolor*). — *Daedalea discolor* Fr. sensu Kl. → *Lenzites klotzschii* Berk. (O) & L. *discolor* Fr. (O). — Cf. (31). — *Daedalea discolor* was reported for Switzerland by Trog 1857 (MiB): 39.
albidofuscus, *Polyporus*, Seer. 1833 M. 3: 67 (Switzerland) (as a sp. of *Boletus*: n.v.p.).—Almost certainly *Polyporus badius*, rather than *P. varius*. Referred by Fr. 1874: 536, with doubt, to *P. petalooides* [= *P. varius*].
albidus, *Polyporus*, Chev. 1837: no. 40 var. α (as a var. of *P. [Albatrellus] cristatus*: n.v.p.) (France), not ~ (Schaeff.) per Trog apud Fr. 1838, not ~ Saut. 1869.
albidus, *Polyporus*, Saut. 1869 (H 8): 41 (Austria), not ~ Chev. 1837 (n.v.p.), not ~ (Schaeff.) per Trog apud Fr. 1838.—Nomen dubium. Keissl. 1917 (AW 31): 110 referred this to *Polystictus albidus* [= *Tyromyces stipticus*], a suggestion in no way supported by the descr.
albocarneus, *Polyporus*, Velen. 1922: 642 [see Pilát 1948: 245 for Latin translation] (Czechoslovakia).—Fide Pilát 1943 (ACE 3): 394 = *Poria* [*Merulius*] *taxicola* (O).
albomarginatus, *Polyporus*, Opiz 1852: 137 (Czechoslovakia) (nom. nud.: n.v.p.).—Nomen dubium.
alboniger, *Polyporus*, Lloyd in herb. (Australia, Tasmania) = *Polyporus atromaculatus* Lloyd ex G. Cunn. [= *Incrustoporia semipileata*], fide G. Cunn. 1950 (PNW 75): 217.
albopallescens, *Poria*, Bourd. & G. 1925 (BmF 41): 216 (France); *Trechispora* D. P. Rog. 1944 (M 36): 79.—Fide Lundell 1947 (LNF 29–30): 11 No. 1415a = *Sistotrema muscicola* (Pers.) Lundell ('Corticiaceae'), a species usually not *Poria*-like. — *Poria aboluteescens* var. *albopallescens* Bourd. & G. 1914 (BmF 30): 253 (France) (nomen subnudum), must perhaps be taken as basionym.
**albovestitus*, *Polystictus*, Lloyd 1923 (LMW 7): 1192 *pl. 236 f.* 2401 (South Australia); *Coriolus* G. Cunn. 1950.—Referred to *Trichaptum* [*Hirschioporus*] *pargamenum* by G. Cunn. 1965: 100.

album, *Agarico-igniarium*, Paul. 1793 T. 2: 85 (descr.), Ind. (name) (d.n.).—Name based on various sterile mycelia; lectotype, “Celle qu'on voit ici sous la figure 1” = presumably sterile mycelium of *Serpula lacrimans* (O), “a pris naissance sur un mât de navire”. Some of the other pieces described may well have been sterile mycelia of polypores, such as *Xylostroma giganteum*. — The figures designed to accompany the descr. were published at a later date as *Pyreium giganteum* Paul. 1812–35: pl. 6 /s. 1–3. (generic name n.v.p.), of which Murrill 1903 (JM 9): 89 assumed that it was a recombination of *Xylostroma giganteum* Tode.

albus, *Agaricus*.—Occasionally [Harz 1868 (BSM 41): 3; P. Magn. 1905: 183] cited as a botanical syn. of *Polyporus [Agaricum] officinalis*. In my opinion it is merely the name of a drug and it was so used by T. Martius 1845 (BdN 23): 102–103.

albus, *Boletus*, Huds. 1762: 496 (England) (d.n.), not ~ Schaeff. 1774 (d.n.), not ~ Pers. 1818 (d.n.), &c.; *Polyporus* (Huds.) per Fr. 1838, misapplied, not ~ Wettst. 1888; *Leptoporus* Quél. 1886, misapplied; *Bjerkandera* P. Karst. 1889; *Polystictus* Big. & Guill. 1913, misapplied.—According to Donk 1971 (PNA 74): 21 this is not only a nomen dubium but also a nomen ambiguum. — Sensu Lightf., Bolt. = spp. incertae sedis; sensu Fr. → *Bjerkandera fumosa*; sensu Bres. → *Tyromyces fissilis*.

albus, *Boletus*, Schrank 1789: 615 (Germany) (d.n.), non/an ~ Huds. 1762 (d.n.), not ~ Schaeff. 1774 (d.n.), not ~ Pers. 1818 (d.n.), &c.— Nomen dubium.

albus, *Polyporus*, Wettst. → *Daedalea alba* Pers. 1828 (O).

alneum, *Sistotrema*, Seer. 1833 M. 2: 504 (Switzerland).—Nomen dubium. Secretan cited *Hydnum argutum* Fr. as a syn. Referred by Fr. 1838: 523 to *Irpex obliquus* [= *Schizopora paradoxa*, forma].

alni, *Polyporus*, Sorok. 1892: 142 pl. 22 / f. 230 (U.S.S.R., Caucasia), not ~ Velen. 1922; *Fomes* Sacc. 1895; *Scindalma* O.K. 1898.—Nomen dubium. Lloyd 1915 (LMW 4, F.): 278 thought of *Fomes* [*Fomitopsis*] *roseus* or *F.* [*Fomitopsis*] *pinicola*. Compare also Bond. 1953: 618.

alni, *Polyporus*, Velen. 1922: 650 [see Pilát 1948: 249 for Latin translation] (Czechoslovakia), not ~ Sorok. 1892.—Referred by Pilát 1938 (ACE 3): 185 to *Leptoporus* [*Tyromyces*] *lacteus* in a very inclusive sense. Velen. described the spores as ovoid-globose, 4–5 μ in diam.

alpinus, *Polyporus*, Saut. 1876 (H 15): 33 (Germany).—Nomen dubium. Insufficiently described; referred by Pilát 1936 (ACE 3): 87, 93 to *Polyporellus* [*Polyporus*] *squamulosus* f. *rostkowii* (Fr.) Pilát, but in my opinion this is an unacceptable guess. Saut. 1877 (H 16): 72 published a second descr. based on a different collection, which may well have been another species.

alutaceus, *Polyporus*, Fr. 1821: 360 (Sweden); *Boletus* Spreng. 1827, not ~ Fr. 1821 (syn., error for *B. alutarius* Fr.; n.v.p.); *Bjerkandera*

P. Karst. 1882; *Leptoporus* Quél. 1886; = *Polyporus delens* E. Krause 1930.—Nomen dubium v. *ambiguum*. Cf. Romell 1926 (SbT 20): 4. — Sensu Rostk. 1830 (StP 4): 57 *pl. 27* [= *Polyporus griseus* (Wint.) Pilát (**O**)] = ?; referred by Fr. 1838: 454 to *Polyporus* [*Tyromyces*] *destructor* var. b, but his interpretation of *P. destructor* (**O**) is an enigma; cf. also Romell 1926 (SbT 20): 9–10, Bourd. & G. 1928: 546, 547. — Sensu Britz. 1887 (BnS 29): 277 [*pl. 601 f. 31*], as *Polyporus destructor* f. *alutaceus* (Fr.) Britz. = ? (no descr.). — Sensu Bres. → *Tyromyces stipticus*, & cf. Romell 1926 (SbT 20): 3, 6, Lundell 1946 (LNF 27–28): 8 No. 1316, in obs. Fries's deser. is too ambiguous firmly to support this interpretation. Moreover, the specific autonomy of *Polyporus alutaceus* sensu Bres. has been doubted, even by Bresadola himself: cf. Bourd. & G. 1928: 545 in obs., "... *P. alutaceus* Fr., qui, selon M. Bresadola (in litt.), est très voisin de *L[eptoporus] albidus* [= *Tyromyces stipticus*] et en est peut-être une simple variété bien développée et jaunissante." Lundell 1946 (LNF 27–28): 8 was inclined to accept Bresadola's interpretation: "There are two and only two species described by Fries in Syst. myc. that may refer to [*Polyporus* [*Tyromyces*] *stipticus*], viz. *P. stipticus* and *P. alutaceus*. Fries attributed, to be sure, the latter name to old specimens of *P. stipticus*, in which the surface of the pileus had turned yellow." — Sensu Lloyd 1915 (LMW 4, Ap.): 301–302 → *Tyromyces guttulatus*, at least in part. Lloyd not only thought that Bresadola had applied the name to European material of *Polyporus guttulatus*, but he also accepted it as the correct name of this North American species; at the same time he reported it from Europe. The autonomous status of *Tyromyces guttulatus* accepted in this Check list still needs careful investigation (133). — Romell 1926 (SbT 20): 4 suggested *Polyporus velutinus* [= *Coriolus pubescens*], but this is not supported by the protologue. — The valid publication of the name *Polyporus delens* depends on the ref. (no deser.). The name was presumably intended as a substitute for *P. alutaceus* sensu Rostk., but since Fries's original conception was not explicitly excluded, the ref. "Pol. *alutaceus* St. 10, 27" must be regarded as an indirect ref. to *P. alutaceus* Fr. itself. Later E. Krause 1935 (ANM II 9): 13 referred his material to *Polyporus imberbis* [= *Bjerkandera fumosa*], but it is doubtful whether this correction is correct.

amanitoides, *Daedalea*, P. Beauv. → *Lenzites palisotii* (Fr.) Fr. (**O**).
***amara**, *Poria*, Burt in herb.—Fide Bres. 1926: 80 = *Poria* [*Perenniporia*] *medulla-panis* (forma). In my opinion 'amara' is an error for 'omaema' and apparently its use a misapplication of the name *Poria omaema* [= *Perenniporia subacida*].

amarissimus, *Polyporus*, Post in herb.—Fide Romell 1926 (SbT 20): 3, 6 = *Polyporus* [*Tyromyces*] *stipticus*.

***amesii**, *Polyporus*, Lloyd 1915 (LMW 4, Ap.): 309 & 1915 (LMW 4, L. 60): 9 (U.S.A., New York) (binomial introduced for a subdivision

of a sp.: n.v.p.).—Considered by its author to be a 'marked collection' and 'a marked deviation' of *Polyporus [Bjerkandera] fumosa*; & cf. Overh. 1953: 367.

Amphitretia Hill 1751 (pre-Linnaean name) [1960 (Pe 1): 185].—Apparently non-hymenomycetous.

amplissimus, *Fungus*, Scop. 1772 P.s.: 116 pl. 44 (Hungary, now Czechoslovakia) (nom. anam.?) (d.n.).—Nomen dubium. Tode 1790: 36 referred this to *Xylostroma giganteum* (29), but the mode of origin appears to be quite different.

**amurensis*, *Fomes*, Bond. in herb. (U.S.S.R., Russia, Siberia).—Fide Murašk. 1940: 10, a name given to a collection of *Ungulina [Fomitopsis] cytisina*.

**angolensis*, *Polyporus*, Lloyd 1920 (LMW 6): 997 pl. 163 f. 1801 (Angola).—Lloyd compared this with *Polyporus [Laetiporus] sulphureus*, and Pilát 1936 (ACE 3): 41 listed it with a question mark as a syn. of *Grifola [Laetiporus] sulphurea*. The sp. was described insufficiently.

angustata, *Lenzites*, S. Schulz. in MS. & litt.—Fide Fr. 1874: 494 = *Lenzites [Daedaleopsis] tricolor*, a determination refuted by S. Schulz. who published his sp. as *Lenzites bresadolae* (0).

aniseus, *sulfureo-albescens*, & *sulfurescens*, *Poria*, Romell in herb.—Herbarium names mentioned by Jo. Erikss. 1949 (SbT 43): 20–22 as syns. of *Poria xantha*.

Anisomyces Pilát 1936, 1940 (lacking Latin descr.: n.v.p.), not ~ Theiss. & Syd. 1914 (Ascomycetes) [1960 (Pe 1): 186]. — Monotype: *Trametes [Gloeophyllum] odorata*.

annosus, *Boletus*, P. Magn. 1905: 180 ("Swartz") (syn.: n.v.p.).—An error for *Polyporus [Fomitopsis] pinicola* "B. hornotinus et annosus" Fr. 1874: 561, in part.

**annularis*, *Polyporus*, Fr. sensu Overh. 1953: 103 pl. 63 f. 374 (*Fomes*).—Overh. used the wrong name for the sp. he described; he used it in error for *Fomes annularis* Lloyd 1912 (LMW 4, L. 40): 6 (Union of S. Africa). The same error was made when *P. annularis* Fr. was transferred to *Ganoderma* by R. L. Gilb. apud Lowe & Gilb. 1962 (M 53): 505 ("annularis"). The species should be called *Ganoderma annulare* (Lloyd) Boed. 1940 (BBu III 16): 391; Humphr. & Leus 1931 (PJS 45): 509, 528, 533, 565 (incidental mention: n.v.p.). — Kotl. & P. 1971 (ČM 25): 94, 99 listed "*Fomes annularis* Fr. sensu Overholts" as a possible syn. of *Ganoderma adspersum*, going by Overholts's descr.

**antarctica*, *Fistulina*, Spieg. 1887 (BCó 11): 20 (Argentina).—Referred to *Fistulina hepatica* by Bres. 1916 (Am 14): 222 but Sing. 1969 M.a.: 380 considers it a good sp.

**anthelminticus*, *Polyporus*, Berk. 1866 (GCh): 753 (Burma).—This was compared by Berk. with *Polyporus rufescens*, which resulted in the name being listed as a doubtful syn. of *Heteroporus [Abortiporus] biennis* by Pilát 1937 (ACE 3): 115. — Cf. (2).

- apalus*, *Polyporus* Lév. 1848 (ASn III 9): 124 (France), not ~ Berk. 1843; *Polydictus* Cooke 1886, Sacc. 1888 ("*hapalus*"); *Leptoporus* Pat. 1900 ("*hapalus*"); *Coriolus kymatodes* subsp. *C. apalus* Bourd. & G. 1928, misapplied; *Oligoporus* R. & O. Falek 1937 ("syn. *Coriolus apalus* Bourdot et Galzin"); *Coriolus* R. & O. Falek 1937 (syn.: n.v.p.); \equiv *Tyromyces leveilleanus* Bond. apud Bond. & S. 1941 (Am 39): 52 (nom. nud.: n.v.p.), *Polyporus* Bond. 1953 (syn.: n.v.p.), fide Bond. 1953: 714. — Sensu Bourd. & G. \rightarrow *Tyromyces apalus* sensu Bourd. & G. (127); sensu Kallenb. \rightarrow *Oligoporus rennyi*.
- **apiospora*, *Reticularia*, B. & Br. 1873 (JLS 14): 82 (Ceylon).—Cf. (41).
- Aporpium* Bond. & S. ex Sing. 1944 [1958 (Ta 7): 166]; holotype, *Poria canescens* P. Karst. (**O**) (Tremellaceae).
- **appendiculatus*, *Polyporus*, B. & Br. 1873 (JLS 14): 48 (Ceylon).—Referred to *Laetiporus miniatus* (**O**) by Overh. 1925 (IFm 12): 1, 4. Lloyd 1912 (LMW 3, S.P.): 154 considered *Polyporus* [*Laetiporus*] *miniatus* not specifically distinct from *Polyporus* [*Laetiporus*] *sulphureus*. — Descr.: Patch 1916 (APe 6): 94, 125.
- applicatus*, *Agarico-suber*, (Batsch) Paul. 1793 \rightarrow *Agaricus resupinus* Paul. (**O**).
- arboreus*, *Boletus*, Sow. 1802: pl. 346 (d.n.) per Purt. 1821 (England); \equiv *Xylomyzon pelliceum* Pers. 1825.—Not a polypore; apparently *Serpula* sp.
- **arctica*, *Trametes*, Berk. in herb. (Canada); Lloyd 1915 (LMW 4, F.): 225, 283 (as a form of *Trametes carnea* [sensu Lloyd]: n.v.p.); *Trametes carnea* var. Pilát 1940 (ACE 3): 321 (lacking Latin descr.: n.v.p.).—Fide Weir 1923 (Rh 25): 216 = *Trametes subrosea*; fide Lowe 1957 F.: 70 = *Fomes cajanderi*. Erroneously referred to *Fomes* [*Fomitopsis*] *roseus* by Overh. 1953: 56.
- **arcticus*, *Polyporus*, Fr. 1838: 479 ("Kamtschatka"); *Polydictus* Cooke 1886; *Microporus* O.K. 1898.—Nomen dubium. Murrill 1907 (NAF 9): 28 designated the specimen from Kamčatka as type ("not found") and concluded that the sp. was "evidently near *C[oriolus] nigromarginatus* [= *C. hirsutus*] or *C. [Hirschioporus] abietinus*"; judging from the descr. both suggestions seem doubtful. The other specimen mentioned by Fr. is presumably *Hirschioporus pargamenus*; cf. Berk. 1841 (AM 7): 452.
- **arctostaphyli*, *Fomes*, Long 1917 (U.S.A., Arizona).—Overh. 1953: 60, 62 referred this to *Fomes* [*Phellinus*] *igniarius* in the broad sense he accepted. However, specimens from Arizona are held to represent a distinct sp. by R. L. Gilb. (in herb.) and judging from some of his collections I would agree. — Descr.: Long 1917 (PNP 1): 2; Zeller 1934 (M 26): 299 *fs.* 4, 5; D. Baxt. 1952 (PMi 37): 96 *pl.* 1 *f.* 2 (*Fomes*).
- areolatus*, *Boletus*, Batsch \rightarrow *Boletus coriaceus* Batsch 1786 (**O**).
- argenteum* ("*Sistotrema argenteum*").—Fide Fr. 1828 E. 1: 94 = *Polyporus* [*Coriolus*] *versicolor*. — Error for *Polyporus argyraceus* Pers. [= *Cerrena unicolor*]? Fr., i.c., wrote, "Etiam sub *Sistotrema*. *argentei* nomine accepi."

- **argillaceus*, *Polyporus*, Cooke 1878 (G 7): 1 (U.S.A., California), not ~ (Murrill) Overh. 1926; *Poria* Cooke 1886.—Fide Teix. & Rog. 1955 (M 47): 413 = *Aporpium caryae* (**O**).
- **armoraceus*, *Polyporus*, Hook. f. in herb. (India).—Referred to *Polyporus crispus* [= *Bjerkandera adusta*] by Berk. 1851 (HJB 3): 82. — This is apparently the same as “*P[olyporus] armoracius* Berk.! Ined.” Fr. 1851 (NAu III 1): 53/37 (nom. nud.: n.v.p.) ex Sacc. 1888 (SF 6): 102. Fr. considered it to be close to *Polyporus secernibilis* (**O**).
- asbestinus*, *Boletus*, Scop. 1770: 148 (Hungary, now Czechoslovakia) (d.n.).—Fr. 1828 E. 1: 128 referred this to *Fistulina hepatica*, but the original descr. does not agree at all with this identification.
- atipes*, *Polyporus*, S. Schulz. 1866: 42 (Yugoslavia, Slavonia) (nom. nud.: n.v.p.).—Nomen dubium.
- atrofuscus*, *Polyporus*, Velen. “in herb.”, not ~ (Schaeff.) Seer. 1833.—Fide Pilát 1942 (ACE 3): 501 = *Phellinus torulosus*.
- atrorufus*, *Boletus*, Pers. 1800: 107 & Fr. 1821: 369 (syn.).—An error for *Boletus atrofuscus* Schaeff. [= *Coriolus versicolor*].
- aurantiacum*, *Sistotrema*, Seer. 1833 M. 2: 503 (Switzerland).—Nomen dubium.
- aurantiacus*, *Polyporus*, Rostk. 1838 (StP 4): 119 pl. 58 (Germany/Poland), not ~ Lasch 1853, not ~ Peck 1874; *Physisporus* P. Karst. 1887; *Poria* Sacc. 1891; *Hapalopilus* Bond. & S. 1941 [“(Karst.)”].—Nomen dubium, fide Donk 1967 (Pe 5): 80. — Sensu Bres. → *Poria salmonicolor*.
- aurantiacus*, *Tyromyces*, (E. Komar.) E. Komar. 1964; *Tyromyces albellus* forma E. Komar. 1959 (U.S.S.R., White Russia).—Apparently lacking indication of type, hence both names n.v.p.? — Descr.: E. Komar. 1959 (BMs 12): 254 f. 6 (*Tyromyces albellus* f.); 1964: 89 f. 27 (*Tyromyces*).
- aurantius*, *Mucor*, Bull. 1790: pl. 504 f. 5 & 1791 H.: 103 (nom. anam.) (d.n.); *Aegerita* DC. 1805: 72 (d.n.), Fr. 1832: 423 (“*aurantiaca*”; syn.: n.v.p.).—This was reduced to the synonymy of *Sporotrichum aureum* Link [= *S. aurantiacum* Fr. = imperfect state of *Poria metamorphosa*] by Link 1824: 15, in which he was followed by Fr. 1832: 423. It is certainly a different sp. from the modern interpretation of *S. aurantiacum*. No recent interpretation known to me.
- aurea*, *Lenzites*, Velen. 1930 (MP 7): 18, 19 (Czechoslovakia).—Velen. compared this with *Lenzites flaccida* [= *L. betulina* forma] but his descr., although incomplete, strongly suggests to me *Phylloporopsis nidulans* (Pers. ex Fr.) Sing. Not mentioned by Pilát 1936–42 (ACE 3).
- **aurea*, *Poria*, Peck 1890 (U.S.A., New York); *Leptoporus* Pat. 1900; *Chaetoporellus* Bond. 1953.—Recorded from Europe by Pilát 1933 (H 73): 31 f. 1, pl. 1, 1941 (ACE 3): 401 f. 171, pl. 254, but according to Lowe 1966: 68 these records were based “on specimens similar to the type except in the intensely orange-red color of the context, which is very different from the much paler context in the American plant.” More recently Dr. J. L. Lowe (oral communication, Dec. 1969) told

me that as far as he knew *Poria aurea* had not been found in Europe. Descriptions drawn up from Pilát's collections [Pilát, I.I. c.c.; Domański 1965 (FpG 2): 120 f. 42] do not show the remarkable two- to many-rooted bases of the cystidia revealed by the figures and mentioned in the descriptions based on American material: Overh. 1919 (BNS 205–206): 74 pl. 3, pl. 4 fs. 1, 2; Lowe 1966: 67 f. 44 (*Poria*).

aureum, *Acrosporium*, Pers. 1822: 25 (nom. anam.); *Oidium* Link 1824 (excl. of *Trichoderma aureum* Pers., cf. Link 1824: 59), Steud. 1824: Fr. 1832: 429 (excl. of *Trichoderma aureum* Pers., cf. p. 418); *Torula* Corda 1829; *Oospora* Wallr.; [= *Trichoderma aureum* Pers. sensu Link 1809 (MBe 3): 18 pl. 1 f. 29 (*Oidium*), excl. of type, (Germany)].—S. Hugh. 1958 (CJB 36): 811 cited this sp. in the synonymy of *Trichoderma aureum* Pers. [= imperfect state of *Poria metamorphosa*] in my opinion incorrectly so because, by the exclusion of the type of *Oidium aureum* (Pers.) Link sensu Link 1809, the 'new' names *Acrosporium aureum* Pers., *Oidium aureum* Link 1824: Fr. 1832, &c. came into being, all based on the same new type, viz. Link's material of 1809. Cf. also Donk 1962 (Ta 11): 91–92.

aureus, *Agaricus*, Graff 1936 (M 28): 159 (syn.: n.v.p.); [= *Agaricus aureus flabelli effigie* Batt. 1755: 68 pl. 37 fs. A, B (Italy)].—A syn. of *Polyporus squamosus*.

aureus, *Polyporus*, Berk. 1843 (AM 10): 373 ("Without habitat"), not ~ Secr. 1833 (n.v.p.), not ~ Lloyd 1917; *Trametes* Sacc. 1888.—Nomen dubium. P. Cout. 1919: 57 suggested that a collection from Welwitsch ("Fung. Lusit. n. 129 — Febr. 1844") found in Portugal (of which he mentioned some features taken from Welwitsch's notes) is perhaps a portion of the type. This is not likely since Welwitsch's specimen was collected in 1844 and the species was described in 1843.

aureus, *Polyporus*, Secr. 1833 M. 3: 153 (Switzerland) (as a sp. of *Boletus*: n.v.p.), not ~ Berk. 1843, not ~ Lloyd 1917.—Nomen dubium. Secr. cited *Boletus lacrymans* [= *Serpula lacrimans*] (O) sensu Bolt. 1789: 167 pl. 167 f. 1; figure and deser. by Bolt. are poor, but it is not impossible that Bolton's determination was correct. However, the descr. by Secr. does not agree at all with *Serpula lacrimans*; he apparently described some abnormal condition of a fungus found "dans un vivier des bains soufres sur les planches ... qui en formaient l'encaissement."

auricoma, *Polyporus*, Lév. ("in Herb.") ex Cooke 1886 (G 15): 2b (Marquesas Is.); *Poria* Cooke 1886 (nom. nud., not definitely accepted: n.v.p.), Lowe 1963 (incomplete ref.: n.v.p.).—Lowe 1966: 86 stated that "*P. auricoma* (Lév.) Cooke, *P. chlorina* Massee, and *P. mellea* (Berk. & Br.) Cooke . . . are very similar [to *Poria* [*Ceriporia*] *reticulata*] and very probably synonyms." — Descr.: Lowe 1963 (M 55): 458 (*Poria*).

auricomum, *Ozonium*, Link 1809 (MBe 3): 21 (Germany) (nom. anam.) (d.n.) per Link 1824: 138, type of *Ozonium* Link 1809 (d.n.) per Fr.

- 1821, a genus of sterile mycelia (Deuteromycetes). — Pilát 1927 (Séz 2): 481, 483 applied the name *O. auricomum* to mycelial growth of *Trametes [Gloeophyllum] odorata*, which is evidently a misapplication. For a more current interpretation, see Donk 1962 (Ta 11): 94. The correct 'specific' name must still be worked out.
- auricula-major*, *Conchites*, Paul. → *Fungoides hyosotis* Paul. (**0**).
auriculatus, *Boletus*, Vill. 1779: 56 (*auticulatus*) (France) (d.n.); ≡ *Boletus normalis* Vill. 1798 (d.n.).—Nomen dubium.
**australis*, *Polyporus*, Fr. 1828 E. 1: 108 ("in insulis Oceani pacifici"); *Fomes* Cooke 1885; *Placodes* Quél. 1886, *Ganoderma* Pat. 1888.—Nomen dubium. — Sensu Pat. 1889, at least in part, → *Ganoderma appplanatum*; sensu Fr. in herb. K. → *G. adspersum*. — Cf. Donk 1969 (PNA 72): 276.
**avellanei-albus*, *Tyromyces*, Murrill 1939 (BTC 65): 657 (U.S.A., Florida).—Lowe apud Overh. 1953: 426 remarked, "appears to agree with *Polyporus [Tyromyces] fumidiceps*."
**badius*, *Polyporus*, Berk. 1841 (AM 7): 462 (Arctic N. America is an error), not ~ (Pers. per S. F. Gray) Schw. 1832, not ~ (Berk.) Lév. 1846, not ~ Jungh. ex Bres. 1912; *Fomes* Cooke 1885 (nom. nud.: n.v.p.), 1886, typonym; *Scindalma* O.K. 1898; *Phellinus* G. Cunn. 1965.—Murrill 1903 (BTC 30): 111 referred this sp. to *Pyropolyporus [Phellinus] igniarius*, which is an error, fide Murrill 1908 (NAF 9): 111, Lloyd 1915 (LMW 4, F.): 249, and Lowe 1957 F.: 29.
balloui, *Polyporus*, (Lloyd) Lloyd 1915; *Polyporus rufescens* forma Lloyd 1914 (U.S.A., New York); *Spongiosus* Torrend 1924.—Lloyd 1915 (LMW 4, L. 58): 7 listed *Polyporus [Abortiporus] tropicalis* [= *P. fractipes* (**0**)] as a syn.; Overh. 1953: 224 referred it to *Polyporus biennis* [sensu Overh. = *Abortiporus distortus* (**0**)]; and Fid. 1969 (Ri 4): 150, 153, 162, 167 to *Heteroporus biennis* var. *flabelliformis* ("Mont") Fid. [sensu Fid. = *Abortiporus distortus*; see Donk 1971 (PNA 74): 2]. — V.s.: "balloni". — Cf. (2). — Descr.: Lloyd 1923 (LMW 7): 1191 pl. 236 f. 2395 (*Polyporus*).
balticum, *Sistotrema*, A. Dietr. apud P. Karst. 1882 (BFi 37): 83 ("Heimar i Estland").—Nomen dubium. A sp. with stalked, brown-black fruitbody.
**bambusarum*, *Poria*, J. Rick 1937 (Bro 6): 146 (Brazil).—Referred by Lowe 1966: 163 to *Poria [Phellinus] punctata* but in view of the presence of setae, previously recorded by Lowe 1963 (M 55): 472, this determination is doubtful.
**bankeri*, *Inonotus*, Lloyd 1910 (LMW 3): 475 ("McGinty"; not accepted: n.v.p.); *Polyporus* Lloyd 1915 ("McGinty"; syn.: n.v.p.); [= *Hydnus strigosum* Sw. sensu Schw. 1832: 162, excl. of type, (lacking descr.) (U.S.A.)].—Fide Lloyd, l.c., 1915 = *Polyporus [Inonotus] hispidus*, "with large split pores".
barbigenus, *Polyporus*, Opiz in herb.—Fide Pilát 1942 (ACE 3): 592 = *Trametes [Coriolus] hirsuta*. Error for 'barbizonus'?
**barteri*, [*Polyporus*], Berk. in herb. (type locality not mentioned).—Fide

- Cooke 1886 (G 15): 53 = "variety of *biformis*, Fr. [= "*Trametes cervina*]."
- **bartholomaei*, *Polyporus*, Peck 1896 (BTC 23): 418 (U.S.A., Kansas); *Tyromyces* Murrill 1907.—Referred by Lloyd to *Polystictus velutinus* [sensu Lloyd = *Coriolus* sp.], but cf. Overh. 1953: 254, who thought of *Polyporus [Abortiporus] fractipes* (**O**).
- bathyporus*, *Polyporus*, Rostk. 1838 (StP 4): 121 pl. 59 (Germany/Poland); *Poria* Cooke 1886.—Nomen dubium. Pilát 1942 (ACE 3): 592 referred it, with doubt, to *Inonotus radiatus* f. *nodulosus* Donk [= *Inonotus nodulosus*] but the protologue does not support this suggestion.
- batschii*, *Polyporus*, Pers. → *Boletus coriaceus* Batsch 1786 (**O**).
- **bicolor*, *Lenzites*, Fr. 1851 (NAu III 1): 43/27 (Mexico), not ~ Falek 1909.—Referred to *Agaricus [Daedaleopsis] confragosus* by Murrill 1905 (BTC 32): 86, 87. — Cf. (31).
- bicolor*, *Polyporus*, Wallr. 1833: 583 (Germany), not ~ Pers. apud Gaud. 1827 (n.v.p.), not ~ Jungh. 1838.—Nomen dubium. This was described as resupinate and, therefore, should not be compared with sessile *Polyporus varius* as was done by Saec. 1888 (SF 6): 84.
- **bicolor*, *Poria*, Ell. & Langl. in herb. (U.S.A., ? Louisiana), not ~ Bres. ex Theiss. 1911.—Fide Bres. 1920 (Am 18): 68 = *Poria [Rigidoporus] nigrescens*.
- **bifasciata*, *Lenzites*, Cooke & Mass. apud Cooke 1892 (G 21): 37 (Australia, Victoria); *Cellularia* O.K. 1898.—Referred by G. Cunn. 1950 (PNW 75): 243 first to *Daedalea [Gloeophyllum] subferruginea* (Berk.) G. Cunn., an extra-European sp., later (G. Cunn. 1965: 252, 253) to *Gloeophyllum abietinum*. The former identification was retracted by G. Cunn. himself; the latter is doubtful as his descr. of *G. abietinum* does not suggest this sp.
- **bireflexus*, *Polyporus*, B. & Br. ("MSS.") ex Cooke 1882 (G 10): 101 (Australia, Queensland); *Polystictus* Cooke 1886; *Microporus* O.K. 1898.—G. Cunn. 1965: 167, 168 referred this to *Trametes [Coriolus] zonata*. His interpretation of the latter sp. needs confirmation.
- **boganiensis*, *Daedalea*, J. Boršč. 1856: 142 (U.S.S.R., Siberia).—Nomen dubium. This was referred to *Trametes [Antrodia] serpens* by Killerm. 1943 (Am 41): 244, perhaps for no other reason than that its author compared it with that species. The descr. hardly suggests the identification.
- boltonii*, *Hydnus*, Spreng. → *Boletus obliquus* Bolt. (**O**).
- bombacina*, *Institale*, (Fr. apud Weinm.) Fr. sensu Lloyd.—See under *Septocylindrium lindneri* (**O**) and (41).
- **bonariensis*, *Daedalea*, Speg. 1902 (ABA III 1 / 8): 52 (Argentina).—Bres. 1916 (Am 14): 230 referred this to *Polyporus [Abortiporus] biennis* [sensu lato] and Speg. 1926 (BCó 28): 370 followed him ("forma truncicola merismoideo-frondosa, hymenio daedaloideo"). Fid. 1969 (Ri 4): 150, 162 made it a syn. of *Heteroporus biennis* var. *flabelliformis* ("Mont.")

Fid. [sensu Fid. = *Abortiporus distortus* (**O**); see Donk 1971 (PNA 74): 2], apparently without having seen the type. — Cf. (2).

**borealis*, *Fomes*, Lloyd 1915 (LMW 4, F.): 247 (Canada, Ontario).— Insufficiently described; no re-description available. Lowe 1957 F.: 56 referred it to a very inclusively conceived *Fomes* [*Phellinus*] *igniarius*. The poor descr. contains, “Pileus . . . with a thin, pale, smooth, hard crust, variegated with darker spots”. This, in combination with the host (*Betula*), would perhaps suggest *Phellinus nigricans* s. str.

botryites = *botryoides*

botryoides, *Boletus*, Humb. 1793: 103 pl. 3 f. 9 (“*botryoeides*” & “*botryites*”) (Germany) (d.n.) per Steud. 1824; *Polyporus* Pers. 1825, not ~ Lév. 1846.—Nomen dubium; approximate systematic position in doubt, apparently not a polypore or else a monstrosity, found in mines. Recorded from Austria by Wettst. 1885 (VW 35): 362 (no descr.).

botulatus, *Polyporus*, Seer. 1833 M. 3: 80 (Switzerland) (nom. nud. & as a sp. of *Boletus*: n.v.p.).—As to var. A. possibly *Phellinus robustus*.

boucheanus, *Favolus*, Kl. 1833 (Li 8): 316 pl. 5 (Germany); *Polyporus* Fr. 1838; *Polyporellus* P. Karst. 1882; *Cerioporus* Quél. 1886.—Nomen dubium & ambiguum. Interpreted in different ways, none of which is satisfactorily supported by the original figures: cf. Donk 1969 (Pe 5): 241. — Sensu Lloyd → *Polyporus floccipes*; sensu Bres. 1915 → *Polyporus alveolarius* (Bosc) per Fr.; sensu Berk. in Lea 1849: 58 (lacking descr.), fide Morg. 1886 (JCl 9): 5, = *Favolus* [*Polyporus*] *canadensis* (**O**). *brachyporus*, *Boletus*, Pers. “ined.”—Referred by Fr. 1828 E. 1: 63 (“sec. specimen a Cel. Chaillet missum, *Boletus brachyporus* Pers.! ined. dictum . . .”) to *Xylomyzon crustosum* Pers. 1825, which he listed as syn. of *Merulius serpens* Tode per Fr. (‘Corticiaceae’).

brachytubus, *Polyporus*, S. Schulz. “Manuscript, p. 760, 1869” (unpublished: n.v.p.) (Hungary).—Fide Igmády 1970 (Aph 5): 287, 288 = *Phellinus robustus*.

bresadolae, *Lenzites*, S. Schulz. 1885 (H 24): 142 (“Hungaria et Slavonia”); lectotype, depicted by Kalchbr. 1875: pl. 30 f. 4a as *Lenzites* [*Daedaleopsis*] *tricolor*. Previously published as *Lenzites angustata* S. Schulz. (nom. nud.: n.v.p.) (**O**), apud Kalchbr. 1875: 49 (syn.: n.v.p.).—Nomen dubium.

bresadolae, *Polyporus*, S. Schulz. 1885 (H 24): 145 (Yugoslavia, Slavonia), not ~ (Bourd. & G.) Lowe apud Gilb. & Lowe 1962 (n.v.p.); *Poly-stictus* Sacc. 1888; *Microporus* O.K. 1898.—Nomen dubium.

brevipes, *Polyporus*, Opiz 1855 (Lo 5): 87 (Czechoslovakia).—Nomen dubium.

brevipora*, *Poria*, Speg. 1899 (ABA 4): 172 (Argentina).—This was referred to *Porothelium* [*Stromatoscypha*] *fimbriatum* (O**) by Bres. 1916 (Am 14): 228, but according to Lowe 1966: 47 it “appears to be better referred to the genus *Merulius* [‘Corticiaceae’].”

brevizonatus, *Polyporus*, Harz 1868 (BSM 41): 18 (as a “Form” of *Polyporus*

- [*Agaricum*] *officinalis*: n.v.p.) ("von unbekannter Herkunft").—Nomen dubium. Insufficiently described.
- **brisbanensis*, [*Polyporus*], B. & Br. in herb. (Australia, Queensland).—Listed by Cooke 1886 (G 15): 53 as a syn. of *Trametes [Truncospora] ochroleuca*; & cf. Lloyd 1915 (LMW 4, Ap.): 376, G. Cunn. 1965: 266.
- britzelmayri*, *Lenzites*, Killerm. 1925 (Dba 16): 31 (Germany).—Nomen dubium. Insufficiently described. Based on a personal collection (lectotype) and *Agaricus flaccidus* Bull. sensu Blitz. 1893 (BCb 54): 100 [pl. 557 f. 6]. The latter is certainly not a sp. of *Lenzites*, but a true agaric.
- **brownii*, *Elvingia*, Murrill 1915 W.P.: 29 (U.S.A., California); *Fomes* Lloyd 1924 (syn.: n.v.p.), Sacc. & Trott. apud Trott. 1925; *Ganoderma* R. L. Gilb. apud Lowe & Gilb. 1962. — Kotl. & P. 1971 (ČM 25): 94, 99 listed this sp. as a possible syn. of *Ganoderma adspersum*, going by Overholts's deser. — Descr. Humphr. & Leus 1931 (PJS 115): 531, 565 pl. 6, pl. 23 f. 1, pl. 25 f. 3, pl. 29 f. 2, pl. 30 f. 2, pl. 31 f. 3, pl. 33 fs. 9-12 (*Ganoderma appianatum* var.); Overh. 1953: 104 pl. 78 f. 444, pl. 125 fig. (*Fomes*).
- **brunneo-adherens*, *Poria*, Clel. & Rodw. 1929 (PTa 1928): 42 (South Australia).—Referred by G. Cunn. 1965: 200 to *Fuscoporia [Phellinus] laevigata*, but cf. (82).
- brunneus*, *Polyporus*, Opiz 1852: 136 (Czechoslovakia) (nom. nud.: n.v.p.), not ~ Pers. 1825, not ~ Schw. (n.v.p.).—Nomen dubium.
- **brunneus*, *Polyporus*, Schw. in herb. (U.S.A.), not ~ Pers. 1825, not ~ Opiz 1852 (n.v.p.).—B. & C. 1856 (JAP II 3): 214 reported on it as follows, "This appears to be the same with *P. crocatus* Fr., which is very near to, if not identical with *P. cupreus*, Berk." Referred by Lloyd 1913 (LMW 4, L. 50): 8 to *Polyporus [Inonotus] radiatus*; & cf. Lloyd 1915 (LMW 4, Ap.): 376.
- brusinae*, *Polyporus*, S. Schulz. 1886 (H 25): 9 (Yugoslavia, Slavonia); *Polystictus* Sacc. 1888; *Microporus* O.K. 1898.—Nomen dubium. *Coriolus* sp.?
- **bulbipes*, *Polyporus*, Fr. 1846 Pr.: 135 (Australia), not ~ G. Beck 1889; *Trametes* Fr. 1848 (n.v.p.?); *Polystictus* Fr. 1851; *Microporus* O.K. 1898; *Xanthochrous* Pat. 1900.—Referred by Bres. 1916 (Am 14): 233 to *Polyporus connatus* Schw. [= *Coltricia focicola*], and by Pilát 1942 (ACE 3): 580, 582 to *Polystictus perennis* f. *cinnamomeus* (Jacq. per S. F. Gray) Pilát [= *Coltricia cinnamomea*]. — *Polyporus [Coltricia] oblectans* (O) is an earlier name for this extra-European sp., which is taken here as a sp. of its own.
- bullosus*, *Polyporus*, Fr. apud Weinm. 1826 (nom. nud.: n.v.p.), 1836: 336 (U.S.S.R., European Russia); *Physisporus* P. Karst. 1882; *Poria* Cooke 1886, Quél. 1886.—Nomen dubium. Sensu Bres. in herb. and Bourd. & G. 1928: 675 = *Poria lenis*. Fide Dománski 1964 (APo 33): 171 specimens named by Pilát as *Poria calcea* var. *bullosa* (Fr. apud Weinm.) Pilát belong to *Poria xantha* f. *pachymeris* Jo. Erikss. q.v.

- byssinoides*, *ciliato-byssina*, & *subpallescens*, *Polyporus*, Romell in herb.—Herbarium names mentioned by Jo. Erikss. 1949 (SbT 43): 7 as syns. of *Poria byssina* Romell [= *P. romellii* Donk].
- byssinus*, *Boletus*, Schrad. 1794: 172 pl. 3 f. 1 (Germany) (d.n.); *Poria* Fr. 1832 (syn.: n.v.p.), Seer. 1833 (as a sp. of *Boletus*: n.v.p.), (Schrad.) per Quél. 1888 misapplied; *Physisporus* Cost. & Duf. 1891, misapplied; *Polyporus* E. Krause 1930, misapplied; *Tyromyces* Bond. 1953 (incomplete ref.: n.v.p.; "Pers."), misapplied.—Fide Fr. 1821: 506, Pers. 1825: 108 & Donk 1959 (Pe 1): 81, 82 = *Polyporus fimbriatus* ≡ *Stromatotscypha fimbriatum* (**O**). — Sensu Quél. → *Cristella molleusca*; sensu Romell ("Pers.") → *Poria romellii*; sensu E. Krause 1930 B.r.: 97 = ?
- byssinus*, *Fungus*, Scop. 1772 P.s.: 113 pl. 40 (Hungary, now Czechoslovakia) (d.n.); *Polyporus* (Scop.) per Pers. 1825, not ~ (Schrad. per Quél.) E. Krause 1930.—Nomen dubium.
- byssoides*, *Polyporus*, S. Schulz. 1858 (VW 7): 140 (without descr.) ≡ *Merulius* [*Phlebia*] *rufus* Pers. per Fr. ('Corticaceae').
- caespitosus*, *Irpea*, S. Schulz. 1866: 40 (Yugoslavia, Slavonia) (nom. nud.: n.v.p.).—Nomen dubium.
- **caespitulans*, *Polyporus*, Schw. "olim".—Cited by Schw. 1832: 156 as a syn. of *Polyporus [Coriolus] pubescens*. This may not be correct.
- calceus*, *Polyporus*, (Fr. ex Pers.) Schw. 1832, not ~ B. & Br. 1873; [= *Polyporus vulgaris* "β. *P. calceus*" Fr. 1821: 381 (Sweden)]; *Polyporus vulgaris* var. Fr. ex Pers. 1825; *Poria* Cooke 1886, Bres. 1908, not ~ (B. & Br.) Cooke 1886; *Physisporus* P. Karst. 1893; *Amyloporia* Bond. & S. 1941 (generic name n.v.p.), Sing. 1944.—Nomen dubium, fide Donk 1967 (Pe 5): 85. Variously applied. — Sensu Bres. 1897 → *Poria lenis*; sensu M. P. Christ. → *Incrustoporia subincarnata*; sensu Bond. & S. → *Poria xantha*.
- Caloporia* P. Karst. → *Caloporus* P. Karst. (**O**).
- Caloporus* P. Karst. 1881 [1960 (Pe 1): 192], not ~ Quél. 1886; ≡ *Caloporia* P. Karst. 1893 [1960 (Pe 1): 192].—Fide Donk 1962 (Pe 2): 227 the monotype, "*C[aloporus] incarnatus* (Alb. et Schw.)", as interpreted by Karsten, = *Merulius taxicola* (**O**). — (110).
- ameleon*, *Polyporus*, Chev. 1837: no. 40 var. β (as var. of *P. cristatus*: n.v.p.) (France) = *Albatrellus cristatus*.
- **canadensis*, *Favolus*, Kl. 1832 (Canada): Fr. 1832.—This has been identified with *Hexagona/Favolus alveolaris* and *Favolus europaeus* [= *Polyporus mori*] by North American mycologists like Murrill 1904 (BTC 31): 327; Lloyd 1909 (LMW 3, P.I.): 19; Overh. 1953: 157. Cf. however (98). — Descr.: Kl. 1832 (Li 7): 197; Berk. 1839 (AM 3): 380; Morg. 1886 (JCI 9): 5; Hard 1908: 430 f. 359; Overh. 1914 (AMo 1): 148 (*Favolus canadensis*); A. Ames 1913 (Am 11): 241 pl. 13 f. 67; Overh. 1953: 156 pl. 80 f. 453, pl. 102 fs. 575, 576, pl. 125 fig. (*Favolus alveolaris*).
- **canaliculatus*, *Polyporus*, Pat. 1898 (BmF 14): 153, not ~ Overh. 1941;

Leptoporus Pat. 1900; *Baeostratoporus* Bond. & S. 1941; *Flaviporus* Bond. 1953 (incomplete ref.: n.v.p.).—Fide Bres. 1912 (Am 10): 494 = “*Polyporus*” *pusiulus* Ces. Incorrectly cited by C. & D. Over. 1922 (BBu III 4): 63 & Pilát 1938 (ACE 3): 220 as a syn. of *Fomes*? *Leptoporus rufoflavus* [= *Flaviporus brownei*], presumably because Lloyd 1915 (LMW 4, F.): 278 wrote, “Compared by author to *Fomes rufo-flavus*.”

**candicans*, *Daedalea*, P. Karst. 1911 (Ttk 12^{1,2}): 110 (U.S.S.R., ‘Transbaikal’).—Fide Lowe 1956 (M 48): 105 = *Daedalea* [*Daedaleopsis*] *confragosa* (forma). — Cf. (31).

candida, *Poroptyche*, G. Beck 1888 (VW 38): 657 figs. (Austria).—Nomen dubium & anam.: hymenophore abnormal, sponge-like. A resupinate species as far as described, found in a court-yard on soil. The scanty deser. to some degree recalls *Poria vaillantii* (“subtus mycelii ramis funiformibus solo indefinite sed arte affixus”) but the spores as drawn are too narrow. Type of the name *Poroptyche* G. Beck, which is listed elsewhere in this publication as a syn. of *Poria*.

**candidus*, *Gloeoporus*, Speg. 1884 (ASa 17): 70 (Paraguay); *Leptoporus* Pat. 1900, not ~ (Roth per Pers.) Quél. 1886; *Polyporus* Lloyd 1913 (nom. nud. & as a form of [P.] “*conchoides*”; n.v.p.), not ~ (Pers. per Steud.) Pers. 1825, not ~ (Roth per Pers.) Fr. 1838.—Referred by Bres. 1912 (H 53): 74 to *Gloeoporus dichrous*; by Lloyd 1915 (LMW 4, Ap.): 376 to *Polyporus* [*Gloeoporus*] *conchoides*; by Bres. apud Speg. 1919 (BCó 23): 411 to *Gloeoporus thelephorooides* (var.); but later Speg. 1926 (BCó 28): 365 claimed that it was a distinct sp. — Cf. (51).

canescens, *Fomes*, Bres. apud Torrend 1910 F.e.: No. 16 (Portugal) (nom. nud.; n.v.p.).—This name appears on a list of names printed on a single unpage sheet, apparently distributed with Torrend’s “*Fungi selecti exsiccati. . . Series I–IV. N. os 1–100*” (1910), but also inserted as a folder in the periodical “Brotária” (1912). The name appears as “16. *F[omes] canescens* Bres.”, without any deser. I have seen only one packet of this number (BPI): the name is not to be found on its label, which bears the determination “*Poria Friesiana* Bres.”, written in ink. This replacement of the original name is in agreement with later-published notes, which referred *Fomes canescens* to *Poria friesiana* [= *Phellinus punctatus*] and *Fomes* [*Phellinus*] *igniarius*, by Bres. apud Torrend and by Torrend 1913 (Bro 11): 64, 65.

canescens, *Poria*, P. Karst. 1887 (Rm 9): 10 (Finland); *Aporpium* Sing. 1944.—Fide Teix. & Rog. 1955 (M 47): 410 = *Aporpium caryae* (**0**).

capricida, *Boletus*, Rox. Clem. 1864: 64 (Spain) (nom. nud.; n.v.p.).—Since the author of this name did not distinguish between the genera *Boletus* and *Polyporus* this may be a name given to a polypore. In any case a nomen dubium.

carbonarius, *Polyporus*, Fr. 1821; *Polystictus* Cooke 1886; *Leucoporus* Quél. 1886; *Microporus* O.K. 1898; [= *Polyporus lignosus*, & caespi-

- tosus, infundibulum imitans, superne nigricans, inferne cum pediculo albus, areolis carbonariis innascens* Mich. 1729: 131 pl. 70 f. 6 (Italy).—Nomen dubium. The habitat and the figure suggest a species of *Coltricia*, particularly *C. perennis* or *C. focicola*, but the colours (see Micheli's phrase above) do not agree. I would suggest that Micheli entered his species in *Polyporus* instead of *Erinaceus* (= *Hydnus* sensu lato) by error and that he had before him a species of *Phellodon* P. Karst., e.g. *P. melaleucus* (Sw. per Fr.) P. Karst.
- **carbonarius, Tyromyces*, Murrill 1912 (M 4): 94 (U.S.A., Washington); *Polyporus* Murrill (nom. altern.), not ~ Fr. 1821.—Referred by Bres. 1926: 79 to *Polyporus albidus* [= *Tyromyces stipticus*], but Overh. 1953: 296 treated it as a distinct sp.
- carnea, Trametes*, Wettst. 1886 [1887?] (SbW 94): 64 (Austria), not ~ (Bl. & Nees) Lloyd 1915.—Nomen dubium. Perhaps an alien ("in caldario").
- carneo-albus, Irpex*, Fr. 1838: 521 (Sweden); *Xylodon* O.K. 1898.—Nomen dubium. Sensu Velen. 1922: 741 = *Leptoporus* [*Tyromyces*] *mollis*, fide Pilát 1942 (ACE 3): 594.
- **carneus, Polyporus*, Bl. & Nees 1826: 14 pl. 3 fig.: Fr. 1828 E. 1: 99 (Indonesia, Java); *Fomes* Cooke 1885; *Scindalma* O.K. 1898; *Ungulina* Pat. 1900; *Trametes* Lloyd 1915, Pilát 1932 & 1939, misapplied; *Fomitopsis* Imaz. 1943.—A species of the eastern tropics. — Sensu Ravenel, Berk. 1872 → *Fomitopsis cajanderi*. Also recorded for England by B. & Br. 1873 (AM IV 11): 342, almost certainly in error. — For some time this species was also confused with *Fomitopsis roseus*.
- carpinea, Polyporus*, S. Schulz. 1866: 41 (Yugoslavia, Slavonia) (nom. nud.: n.v.p.), not ~ (Sow. per S. F. Gray) Trog 1844.—Nomen dubium.
- carpini, Irpex*, S. Schulz. 1866: 40 (Yugoslavia, Slavonia) (nom. nud.: n.v.p.).—Nomen dubium.
- **carteri, Poria*, (Berk.) ex Cooke sensu G. Cunn. 1948 (BPZ 73) 10 tpl. I f. 7.—Referred to *Fuscoporia* [*Phellinus*] *punctata* by G. Cunn. 1965: 215, but this determination is doubtful. For a brief descr. of *Poria carteri* sensu stricto, see Lowe 1963 (M 55): 472.
- **caryae, Polyporus*, Schw. 1832 (U.S.A., Pennsylvania); *Poria* Cooke 1886 ≡ *Aporpium caryae* (Schw.) Teix. & Rog. (Tremellaceae). — Descr.: Teix. & Rog. 1955 (M 47): 410 fss. 1–9 (*Aporpium*).
- castaneus, Boletus*, Web. 1787: 13 (Germany) (d.n.), not ~ Bull. 1786 (d.n.) per Fr. 1821, not ~ Fr. 1835 ("Müll.").—A sp. of Boletales, perhaps *Gyroporus castaneus* (Bull. per Fr.) Quél.: the descr. deviates on one point, "Stipes . . . reticulatim". In any case not *Polyporus* [*Ganoderma*] *lucidus*, with which Fr. 1821: 533 identified it.
- castaneus, Polyporus*, Fr. 1821: 369; ≡ *Boletus populneus* Pollini 1816 H.: 34 (Italy) (d.n.); *Boletus* Pollini per Pollini 1824, not ~ Web. 1787 (d.n.), not ~ Bull. per Fr. 1821, not ~ Fr. 1835 ("Müll."); *Scindalma* O.K. 1898; *Fomes* Sacc. 1916; ≡ *Boletus veronensis* Spreng. 1827.—Nomen dubium. Lloyd's suggestion 1915 (LMW 4, F.): 278 that "the

description seems to be *Fomes annosus*" is certainly incorrect. — Descr.: Pollini 1824: 611 pl. 2 f. 5 (*Boletus populneus*). — Sensu Rostk. = ?; sensu Britz. (citing "Rostk.") → *Inonotus rheades* (*I. vulpinus*).
castanicola, *Polystictoides*, Lázaro 1916 (RMa 14): 834 / 1917: 146 (Spain); *Polystictus* Sacc. & Trott. apud Trott. 1925.—Nomen dubium.
cavernatus, *Phellinus*, Haracsí, Erdészeti növénykortan 275. 1969 (nom. nud.). — Fide Igmándy 1970 (Aph 5): 298 = *Phellinus pilatii*.
ceciliae, *Polyporus*, Roum. 1888 F.e.: No. 4420 (France); *Poria* Sacc. 1888.—Nomen dubium.
cellaris, *Boletus*, Chaill. "in litt." ; *Polyporus dryadeus* var. *cellaris* (Chaill.) ex Fr. 1828 E. 1: 108 (Switzerland).—Nomen dubium. *Phellinus contiguus* or *Poria expansa*?
cellulosus, *Boletus*, O. F. Müll. 1776 (Fd 4 / F. 12): 6 pl. 716 f. 1 (presumably Denmark) (d.n.), not ~ Lightf. 1778 (d.n.); *Boletus* O. F. Müll. per Wahl. 1826.—Nomen dubium. Wahl. 1826: 961 used the name to replace *Polyporus vulgaris* Fr. [= *Poria lenis*] after Fries 1821: 381 had declared the two to be synonymous.
celottianus, *Polystictus*, Sacc. & Manc. apud Sacc. → *Polyporus pulcher* Speg. (O).
cephalotes, *Poria*, Pers. 1799 O. 2: 15 (Germany) (d.n.); *Polyporus* (Pers.) per Pers. 1825.—Nomen dubium. Found in a mine; apparently an abnormal growth-form.
cerasi, *Daedalea*, S. Schulz. in MS. & in litt.—Fide Fr. 1874: 494 = *Lenzites* [*Daedaleopsis*] *tricolor*, of which it is "forma hymenio poroso insignis", fide Kalchbr. 1875: 49.
cerasi, *Odontia*, Pers. 1799 O. 2: 16 (Germany) (d.n.); *Sistotrema* Pers. 1801 (d.n.); *Hydnus* Poir. 1808 (d.n.); *Polyporus* (Pers.) per Fr. 1821, misapplied, not ~ Richon 1889 (O); *Hydnus* Mérat 1821; *Sistotrema* Schw. 1822 (n.v.p.), Chev. 1826; *Irpea* Fr. 1828, misapplied; *Coriolus* Pat. 1900 ("Fr."); = *Hydnus* [*Hyphoderma*] *radula* Fr. ('Corticaceae'). — Sensu Fr. 1821, 1828 → *Schizopora paradoxus*, fide Fr. 1838: 523 (sub *Irpea p.*) & cf. Donk 1967 (Pe 5): 86; sensu Rostk. 1838 (StP 4): 125 f. 61 (*Polyporus*), referred by Bres. 1897 (AAR III 3): 77 to "*Polystictus*" *fibula* [sensu Bres. = *Coriolus hirsutus* forma], but in my opinion Rostkovius's plate and descr. are insufficient for determining the correctness of this suggestion.
cerasi, *Polyporus*, Richon 1889: 98 (France), not ~ (Pers.) per Fr. 1821.—Nomen dubium. In certain respect the descr. suggests *Phellinus pomaceus*, but "tubes assez grands" appears to disagree.
cerasicola, *Irpea*, S. Schulz. 1866: 41 (Yugoslavia, Slavonia) (nom. nud.; n.v.p.).—Nomen dubium.
ceratoniae, *Pseudofomes*, Lázaro 1916 (RMa 14): 586 / 1917: 87 pl. 9 f. 19 (Spain); *Fomes* Sacc. & Trott. apud Trott. 1925.—Nomen dubium. Cf. Bres. apud Trott. 1925 (SF 23): 388, "Videtur affinis *Fomes* [*Phellinus*] *Ribis* (sic!)."

Ceratophora Bond. & S. 1941 (Am 39): 54 (lacking Latin descr.: n.v.p.), not ~ Humb. 1793 (d.n.) per Corda 1842 [1960 (Pe 1): 195]; [= *Ceratophora* Humb. per Corda sensu Bond. & S., i.e., excl. of type]; holotype, *Trametes [Gloeophyllum] odorata* (Wulf. per Fr.) Fr.—*Ceratophora* Humb. per Corda (nom. anam.) was emended also to include the perfect state; this automatically shifted the type from the imperfect to the perfect state and in this way introduced a 'new' generic but homonymous name.

cerea, *Poria*, Scop. 1772 P.s.: 104 pl. 22 f. 2 (Hungary, now Czechoslovakia) (d.n.), not ~ (Berk.) Cooke 1886; [= *Polyporus cerinus* Pers. 1825.—Nomen dubium. Found in a mine: apparently an abnormal growth-form. — Sensu Hoffm. → *Polyporus cereus* Pers. [= *Rigidoporus undatus*].

**cerifluus*, *Polyporus*, B. & C. apud Berk. 1872 (U.S.A., South Carolina); *Tyromyces* Murrill 1907.—See (132). — Deser.: Lowe 1961 (PMi 46): 205 (*Polyporus*).

cerinus, *Polyporus*, Pers. → *Poria cærea* Scop. (0).

Ceriomyces Batt. 1755: 62 pl. 24 f. A (not a generic name), not ~ Corda 1837 (gall), not ~ Murrill 1909 (Boletales) [1960 (Pe 1): 195].—A monoverbal specific name for *Polyporus tuberaster*.

Ceriomyces Corda 1837 [1960 (Pe 1): 196], not ~ Murrill 1909 (Boletaceae); monotype, *Ceriomyces fischeri* Corda (0).—Presumably based on a gall, cf. Donk 1972 (PNA 75): 165.

chailletianus, *Polyporus*, Pers. in herb. (Switzerland) (n.v.p.) [= *Polyporus aureolus* Pers.—Fide Donk 1933: 167 = *Gloeoporus [Skeletocutis] amorphus*.

chlorina, *Poria*, Mass. 1906 (BmI); 93 (Christmas I.).—See under *Polyporus auricoma* (0). At first Lowe 1962 (PMi 47): 184 referred this to *Poria mellea* (0). G. Cunn. 1950 (PNW 75): 246, 1965: 63 listed it as a syn. of *Poria versipora* [= *Schizopora paradoxa*].

ciliatus, *Boletus*, Hornem. 1806 (Fd 8 / F. 22): 7 pl. 1297 (Denmark) (d.n.), not *Polyporus ciliatus* Fr. 1818 (d.n.) per Fr. 1821.—This is referable to *Polyporus* subgen. *Leucoporus* (Quél.) Maubl. but it is difficult to be more precise. Fr. 1821: 348 referred it to *Polyporus brumalis* var. b. *vernalis* (not *P. vernalis*) as "forma singularis".

cinctus, *Polyporus*, Velen. "in herb."—Fide Pilát 1937 (ACE 3): 162 = *Gloeoporus [Bjerkandera] fumosus*.

cinereus, *Boletus*, Schum. 1803: 390 (Denmark) (d.n.), not ~ Pers. 1801 (d.n.) per Pers. 1825.—Nomen dubium. Lind 1913: 392 listed this as a syn. of *Polyporus [Antrodia] serialis*, but the protologue hardly supports this identification.

**cinereus*, *Polyporus*, Schw. 1832: 159 (U.S.A., Pennsylvania), not ~ Lév. 1846.—Nomen dubium. Cf. Teix. & Rog. 1955 (M 47): 414.

**cinnabarinum*, *Sistotrema*, Schw. 1822: 102 (U.S.A., Georgia); *Hydnnum* Spreng. 1827: Fr. 1828; *Acia* P. Karst. 1879.—According to B. & C.

- 1856 (JAP II 3): 217, "This is . . . only a peculiar condition of *Pol.* [*Pycnoporus*] *cinnabarinus*"; but cf. Lloyd 1911 (LMW 3, L. 35): 3 and Rog. & Mart. 1958 (M 50): 307–308. A nomen dubium. — *Hydnnum rubrum* Pers. 1825 was made a syn. of *H. cinnabarinum* and in this way the latter sp. came to be recorded for Europe by Fr. 1874: 615.
 cinnamomeus*, *Irpea*, Fr. 1838: 524 (North America); *Hydnochaete* Pat. 1900, not ~ J. Rick 1959 (n.v.p.) = *Hydnochaete olivacea* (Schw.: Fr.) Banker, an extra-European sp.—See under *Ceratium ferrugineum* Wallr. (O**).
circulatus, *Polyporus*, Velen. 1922: 920 [see Pilát 1948: 255 for Latin translation]; = *Polyporus zonatus* Velen. 1922: 671 (Czechoslovakia) (simultaneously published but rejected name: n.v.p.), not ~ (Nees) per Fr. 1821.—Nomen dubium. Referred by Pilát 1937 (ACE 3): 110, with doubt, to *Polyporellus varius* var. *podlachicus* [= *Polyporus podlachicus*], but the original descr. does not support this disposition.
circumscriptus, *Polyporus*, Lév. ("in Litt., De Guernisac") apud Crouan 1867: 65 (France).—Nomen subnudum & dubium.
citrinus, *Oligoporus*, R. & O. Falck 1937 (HF 12): 58, 59 (lacking Latin descr.: n.v.p.).—This is a new name for *Ptychogaster citrinus* Boud. (nom. anam.) plus the basidiferous (perfect) state (from France) described by Boud. but not included by him under *Ptychogaster citrinus* [cf. Donk 1971 (Pe 6): 212]. The inclusion of this state by O. & R. Falck, implied *inter alia* by the use of the combination *Oligoporus citrinus*, automatically created a new specific name (Code, Art. 59) for a taxon based on the perfect state described by Boud. (type), and later by Bref. under the name *Oligoporus farinosus*, which was cited as a syn.
citrinus, *Polyporus*, Chev. 1837: no. 40 var. δ (as a var. of *P. [Albatrellus] cristatus*: n.v.p.) (Germany), not ~ (Plan. per S. F. Gray) Pers. 1825.
clavata, *Helvella*, Schaeff. → *Boletus elvela* Batsch. (**O**).
clavatus.—"Polyporus clavatus" of Fries" Hussey c. 1847 I. 1: pl. 46 in obs. (syn.: n.v.p.); [= *Polyporus sulphureus*, "Var. . . . b) clavatus, undique porosus; Sowerb. [t. 135]" Fr. 1838: 450, unnamed var. (England)]. — Fr. did not publish the specific name, nor did he validly publish the varietal epithet 'clavatus'. Hussey used the supposed specific name as basionym for a new name, *Polyporus sulphureus* var. *clavatus* Hussey, i.e., which is based on the monstrosity depicted by Sow., i.e.
 **clelandii*, *Lenzites*, Lloyd 1919 (LMW 6): 887 pl. 130 f. 1535 (Australia, New South Wales).—Referred to *Gloeophyllum trabeum* by G. Cunn. 1965: 253. It should be remembered that G. Cunn. did not distinguish between *G. trabeum* and *G. striatum*.
cobelliana, *Lenzites*, (Sacc.) Sacc. 1882 (syn.: n.v.p.); *Lenzites cinnamomea* subsp. *L. cobelliana* Sacc. 1882 (Mi 2): 529 (Italy).—Fide Sacc. 1882 (Mi 2): 682 = *Lenzites crocata* [= *Gloeophyllum sepiarium*].

- **coccineus*, *Polyporus*, Fr. 1851 (NAu III 1): 67/51 (Marquesas Is.); *Fomes* Cooke 1885; *Scindalma* O.K. 1898; *Trametes* Pat. 1906; *Poly-stictus* Lloyd 1916 (as a form of *P. sanguineus*: n.v.p.), Doidge 1950; *Pycnoporus* Bond. & S. 1941.—This has been referred to *Trametes* [*Pycnoporus*] *cinnabrina* sensu lato by, for instance, G. Cunn. 1965: 169, but cf. (112).
- cocos*, *Poria*, F. A. Wolf, see *Sclerotium cocos* (**O**).
- **cocos*, *Sclerotium*, Schw. 1822: 56 (U.S.A., North Carolina) (nom. anam.); *Pachyma* Fr. 1822.—A basidiferous state (but perhaps not the full-grown ‘perfect’ state) is now known as *Poria cocos* F. A. Wolf 1922 (JMS 38): 134 *pls.* 34–37; *Polyporus* Over. 1927 (“[Fries] Weber”). Here records of *Sclerotium cocos* from Europe are supposed to be based on the sclerotia of *Polyporus tuberaster* (or closely related spp.); such records are by Ott 1866 (MiB 1865): 170, Prilleux 1889, 1890, and Heinricher & Elsler 1910, as *Pachyma cocos*. — Now often incorrectly cited as *Poria cocos* (Schw.) Wolf; but the name for the perfect state dates from 1922, as cited above. According to Ginns 1969 (M 60): 1219 *Merulius albus* Burt 1917 (AMo 4): 334 *f.* 18 is a synonym. It antedates the name *Poria cocos*.
- **cognatus*, *Polyporus*, (Bres.) Speg. 1925; *Polyporus rheades* var. Bres. 1920 (Am 18): 34 (Argentina).—Speg. 1925 (BCó 28): 371 considered this a distinct sp., but more recently Pegl. 1964 (TBS 47): 188 treated it as a var. of *Inonotus rheades*.
- **columbiensis*, *Polyporus*, Berk. 1842 (LJB 1): 454 (U.S.A., Oregon).—This was listed by Pilát 1936 (ACE 3): 76 as a syn. of *Polyporellus* [*Polyporus*] *arcularius* [sensu lato]. According to Lloyd 1912 (LMW 3, S.P.): 178, “The type is a little discolored frustule that tells nothing and which should never have been named.” Not mentioned by Overholts 1953. The type locality is Columbia River in Oregon (cf. Lloyd, l.c.) not in South Carolina, as was stated by Murrill 1907 (NAF 9): 58. — Descr.: Murrill 1904 (BTC 31): 35; 1907 (NAF 9): 58.
- compactum*, *Hydnum*, Pers. 1800: 57 (Germany) (d.n.) per Fr. 1821, misapplied; *Hydnellum* P. Karst. 1879, Nikol. 1954; *Calodon* P. Karst. 1882; *Phaeodon* J. Schroet. 1888; ≡ *Hydnellum compactum* (Pers. per Fr.) P. Karst. (Thelephoraceae). — Sensu Inz. → *Abortiporus biennis*.
- complanatus*, *Boletus*, Latourr. 1785: 39 (d.n.).—This is a binomial name provided for *Polyporus sessilis*, *convexo planus*, *inferne albidus*, *superne fulvis*, *discoloribus zonis* Haller 1768 H. 3: 143 (no. 2289), which judging from both the descr. and the syns. cited is a very compound species.
- concentricus*, *Polyporus*, Pers. → *Boletus latus* Sow. (**O**).
- **conchoides*, *Gloeoporus*, Mont. 1842 C.: 385 *pl.* 15 *f.* 1 (Cuba); *Leptoporus* Pat. 1900; *Polyporus* Lloyd 1915.—Referred by Bres. 1912 (H 53): 74 to *Gloeoporus dichrous*, cf. Overh. 1953: 363 *pl.* 26 *fs.* 157, 158 (*Polyporus*) for descr. (correct interpretation?). “In American tradition”,

- fide Lloyd 1915 (LMW 4, Ap.): 330 = *Polyporus [Gloeoporus] dichrous*. — Cf. (51).
- confluens*, *Podoporia*, P. Karst. 1892 (H 31): 297 (Finland, now U.S.S.R., European Russia); *Poria* Sacc. 1895.—Nomen dubium. Lowe 1956 (M 48): 116 thought of *Polyporus [Gloeoporus] pannocinctus*; in my opinion this is incorrect.
- **confragosa*, *Trametes*, Lloyd 1912 (LMW 4, L. 42): 15 ("a . . . form of *Daedalea [Daedaleopsis] confragosa*"; n.v.p.) ex Hara 1927: 392 (Japan).—Fide Imaz. = *Daedaleopsis nipponica* Imaz. 1943 (BTS 6): 78 for desers. of which see S. Ito 1955: 251 f. 196 and Imaz. & Hongo 1957 C. I. [1]: 113 pl. 53 f. 294.
- conglobatus*, *Polypilus*, P. Karst. 1904 (ÖfF 46¹¹): 2 (Finland); *Polyporus* Sacc. & D. Sacc. 1905 (SF 17): 108, not ~ Berk. 1845.—Nomen dubium. Lloyd 1912 (LMW 3, S.P.): 161 remarked, "description reads much like *distortus* [= *Abortiporus distortus* (O)]." I would have suspected *Abortiporus biennis*, but Lowe 1956 (M 48): 116, who saw the type, concluded, "It is unknown to me."
- constrictus*.—*Boletus albidus* var. "β. *Boletus constrictus*. Bolt. funguss." Pers. 1801: 516 (syn.: n.v.p.), not *Boletus constrictus* Pers. 1801 (d.n.).—An error for *Boletus 'substrictus'* Bolt. [= *Polyporus ciliatus*].
- **contrarius*, *Fomes*, (B. & C.) ex Cooke 1886 (G 15): 21; *Polyporus* B. & C. "in Herb." (n.v.p.); *Fomes* Cooke 1885 (G 14): 19 (nom. nud.; n.v.p.); *Scindalma* (B. & C. ex Cooke) O.K. 1898; *Rigidoporus* Murrill 1907; = *Polyporus contrarius* B. & C. apud B. & Br. 1883 (TLS II 2): 60 pl. 11 fs. 2-4 (Cuba), earlier typonym.—Lloyd 1915 (LMW 4, F.): 279 wrote, "appears to me to be probably subresupinate *Fomes annosus*", which explains the inclusion of the name *Fomes contrarius* Cooke by Pilát as a syn. (with query) of *Fomes [Heteroporus] annosus*. (The type is not from Brazil as stated by Lloyd.) — This is an extra-European sp. Descr.: Lowe 1957 F.: 86 f. 68 (*Fomes*).
- contrarius*, *Polyporus*, B. & C. apud B. & Br. → *Fomes contrarius* (B. & C.) ex Cooke (O).
- **cookei*, *Lenzites*, Berk. 1876 (G 4): 161 (U.S.A., New York); *Cellularia* O.K. 1898.—Fide Bres. 1897 (AAR III 3): 92 = *Trametes rubescens* [= *Daedaleopsis confragosa*]. — Cf. (31).
- corallinus*, *Boletus*, Humb. 1793: 98 pl. 3 f. 11 (Germany) (d.n.); *Boletus* Humb. per Steud. 1824; *Polyporus* Pers. 1825.—Nomen dubium.
- cordonii* → *gordonii* (O).
- **cordylina*, *Poria*, G. Cunn. 1947 (BPZ 72): 23, 39 f. 17 (New Zealand).—Fide Teix. & Rog. 1955 (M 47): 411, 414 = *Aporpium caryae* (O).
- coriacea grisea*, *Daedalea*, Seer. 1833 M. 2: 488 (Switzerland) (double epithet: n.v.p.) = *Lenzites betulina*.
- coriacea subtusrufa*, *Daedalea*, Seer. 1833 M. 2: 486 (Switzerland) (nom. nud. & double epithet: n.v.p.).—Fide Fr. 1874: 493 ("Secret. n. 6")

- = *Lenzites betulinus*. — Secr. cited *Agaricus coriaceus* Bull. [= *Lenzites betulinus*] as a syn. of his var. A.
- coriaceus*, *Boletus*, Batsch 1783 (d.n.), not ~ Scop. 1772 (d.n.) per Bergam. 1823, not ~ Huds. 1778 (d.n.), not ~ Batsch 1786 (d.n.); = *Helvella infundibuliformis* Schaeff. 1774: 110 [pl. 277] (Germany); *Heletium* (Schaeff.) per S. F. Gray 1821; *Leotia* Fr. 1822; = *Boletus milleporous* Batsch 1789 (d.n.). — Nomen dubium. Fries 1822: 26 accepted the species sensu Sow. 1798: pl. 153 (*Helvella infundibuliformis*). The discomycetous nature of this fungus is also very doubtful, both in its original sense and in that of Sowerby.
- **coriaceus*, *Boletus*, Batsch 1786: 177 pl. 24 f. 127 (type locality unknown, perhaps tropical Africa), not ~ Scop. 1772 (d.n.) per Bergam. 1823, not ~ Huds. 1778 (d.n.), not ~ Batsch 1783: 105 (d.n.); *Polyporus* D. Dietr. 1847; not ~ (Batsch per Bergam.) Endl. 1830; = *Boletus areolatus* Batsch 1789 (d.n.); = *Polyporus batschii* Pers. 1825.—Referred by Fr. 1832^{Ind.}: 57 to *Polyporus* [*Coriolus*] *zonatus*. This cannot be correct. If one assumes that the fungus was collected in Germany then the only possibility would be *Daedaleopsis confragosa*. The protologue, however, calls the fruitbody "membranaceus" and the figure strongly suggests "*Hexagonia*" cf. *discopoda* Pat. & Har. described from tropical Africa. The fact that Batsch stated "locum vero regionis . . . ignoro" in my opinion makes this last suggestion almost certain.
- **corium*, *Bornetina*, Mang. & Viala 1903 (CrP 136): 398, 1699 (Israel) (nom. anam.). — Reported from, but apparently not yet found in, Europe: cf. Donk 1971 (PNA 74): 27, 28.
- corium*. — "*Polyporus corium* Pers., Mycol. Eur. vol. 2, p. 60, 1825" G. Cunn. 1950 (BPZ 83): 2 (syn.: n.v.p.), not ~ Kunze (n.v.p.), an error; = *Thelephora incarnata* var. *corium* (Pers.) per Pers. 1822: 131 = *Merulius corium* (Pers. per Pers.) Fr. ('Corticiaceae').
- **corium*, *Polyporus*, Kunze apud Cooke 1882 (G 10): 103 (nom. nud.: n.v.p.) & 1886 (G 14): 114 (syn.: n.v.p.) (Australia, New South Wales), not ~ (Pers.) G. Cunn. (n.v.p.). — Referred by Cooke, l.c., 1886 to *Poria* [*Phellinus*] *ferruginosus*. Fide G. Cunn. 1965: 268 = "*Trichaptum*" *flavum* (Jungh.) G. Cunn., an extra-European sp.
- corni*, *Polyporus*, Velen. 1925 (MP 2): 98 (Czechoslovakia). — Referred by Pilát 1942 (ACE 3): 511 to *Phellinus igniarius* subsp. *trivialis* [= *P. igniarius*?] (forma). The original descr. is very incomplete.
- cornucopiae*, *Poria*, Hoffm. 1797–1811 V.s.: 14, in obs. (Germany) as a var. of *Poria scutata*. — This seems to be a growth form of *Poria scutata* = *Heterobasidion annosum*. Found in mines.
- **corrugata*, *Daedalea*, Kl. 1833 (Li 8): 481 (Canada); *Lenzites* Berk. 1872; *Striglia* O.K. 1891; *Cellularia* O.K. 1898. — Fide Murrill 1905 (BTC 32): 86 = *Agaricus* [*Daedaleopsis*] *confragosa*; according to Lloyd 1913 (LMW 4, L. 44): 10 a thin form of the southern U.S.A. of *Daedalea* [*Daedaleopsis*] *confragosa*, a somewhat surprising statement for a sp.

- described from boreal North America. — Descr.: Berk. 1839 (AM 3): 382 (*Daedalea*). — Cf. (31).
- corticola salicis*, *Poria*, Seer. 1833 M. 3: 174 (Switzerland) (as a sp. of *Boletus* & double epithet; n.v.p.).—Nomen dubium. Seer. identified his fungus with *Polyporus [Oxyporus] corticola* var. *b fagineus* Fr. 1821: 385; Fr. 1874: 580 accepted it as *Polyporus [Oxyporus] corticola* var. *d salicinus* Fr.
- corylicola*, *Polystictus*, Lázaro 1916 (RMa 14): 751 / 1917: 137 (Spain).—Nomen dubium. *Coriolus* sp.?
- **costaricensis*, *Fuscoporella*, Murrill 1907 (Costa Rica); *Poria* Sacc. & Trott. 1912.—Referred by Lowe 1966: 163 to *Poria [Phellinus] punctata*, but cf. (86).
- **cotyledoneus*, *Polyporus*, Spieg. in herb. & nom. prov. (Argentina).—Listed by Spieg. 1925 (BCó 28): 375 as a syn. of *Polyporus [Truncospora] ochroleuca*, fide Bres. in litt.
- crassidens*, [*Sistotrema*?]. Delastre, "Lettre . . . à J. B. Mougeot".—Fide Quél. apud Moug. & Ferry 1887: 499 = *Sistotrema [Spongipellis] pachyodon*.
- crassus*, *Polyporus*, Fr. 1838: 451 (Germany); *Xylopilus* P. Karst. 1882; *Fomes* Cooke 1885, not ~ (P. Karst.) E. Komar. 1964 (n.v.p.); *Scindalma* O.K. 1898.—Nomen dubium. Cf. Fr. 1874: 543: "Structura et color exakte *P[olypori] fomentarii*, ut hujus Iusum maxime abnormem suspicor, licet saepius conformis sit lectus."
- **crataegi*, *Lenzites*, Berk. 1847 (LJB 6): 323 (U.S.A., Ohio); *Cellularia* O.K. 1898.—Fide Peck 1878 (RNS 30): 73–74 = *Daedalea [Daedaleopsis] confragosa* (var.). — Cf. (31).
- cremaceus*, *Ceriomyces*, P. Henn. 1899 (VBr 40): 132 (Germany) (nom. anam.).—Needs redescription. Perhaps an alien, found in the palmhouse of the former botanical garden, Berlin. According to Ulbr. 1941 (NBe 15): 579, 583 this was referred by Killerm. in herb. B to *Ceriomyces [Ptychogaster] albus* [= *Ptychogaster fuliginoides*], but the descr. disagrees. — A doubtful species of *Ptychogaster*, cf. ". . . mit einer dünnen, faserigen, seidigglänzenden Oberhaut bedeckt . . ."
- **cremoriflorus*, *Polyporus*, Crag. 1884 (nom. prov.: n.v.p.); [= *Polyporus fissus* Berk. sensu Crag. 1884 (BWb 1): 22 (U.S.A., Kansas)].—Cf. *Polyporus varius* (*P. elegans* sensu Fr.).
- cretaceus*, *Polyporus*, S. Schulz. 1878 (Fl 61): 11 (Europe), not ~ Lloyd 1915.—Nomen subnudum & dubium. Previously published?
- crispum*, *Hydnnum*, Schaeff. 1774: 97 [pl. 147] (Germany) (d.n.), not ~ Scop. 1772 (d.n.); *Hydnum* Schaeff. per Fr. 1821; *Irpea* Fr. 1838.—Nomen dubium, fide Maas G. 1960 (Pe 1): 353. — Sensu Inz. → *Abortiporus biennis*.
- crispus*, *Cantharellus*, Pers. 1794 (d.n.); *Merulius* Pers. 1800 (d.n.), not ~ (Bull.) J. F. Gmel. 1792 (d.n.); *Cantharellus* Pers. per Fr. 1821; *Merulius* Schleich. 1821; *Trogia* Fr. 1861; *Plicaturopsis* D. Reid 1964; ≡ *Plicatura*

crispa (Pers. per Fr.) Rea 1922. — Descr.: D. Reid 1964 (Pe 3): 130 *fs.* 49, 50 (*Plicaturopsis*). — *Favolus europaeus* [= *Polyporus mori*] sensu Velen. 1922: 696 *f.* 119 = *Plicatura faginea* (Schrad. per J. Schroet.) P. Karst. [= *P. crispa*], fide Pilát 1936 (ACE 3): 85.

**cristata*, *Trametes*, Cooke 1882 (G 10): 132 (Australia, Queensland); *Polystictus* Cooke 1886; *Microporus* O.K. 1898.—This was referred by Bres. 1897 (AAR III 3): 90, 1908 (Am 6): 39 to *Trametes lutescens* forma *umbrina* and *T. favus* [both names, sensu Bres., = *Funalia gallica*]. More recently the species has been treated as distinct e.g. by Lloyd and G. Cunn. — Cf. (36).

cristatus, *Boletus*, Baumg. 1790: 634 (d.n.) & *B. cristatus* J. F. Gmel. 1792: 1435 (d.n.), not ~ Gouan 1762 (d.n.), not ~ Schaeff. 1774 (d.n.) & (Schaeff. per Fr.) Pollini 1824; [= VIII. *Boletus* . . . Gled. 1753: 75 (Germany)].—Nomen dubium. Gleditsch's Latin phrase and German description taken together do not evoke any suggestion in my mind; neither *Albatrellus cristatus* nor *Grifola frondosa* agree, cf. "Ein . . . Sammet-hafter Erd-Bülz, mit Purpur-farbenen kraus-fältig zertheilten Lappen . . ."

cristatus, *Boletus*, J. F. Gmel. → *Boletus cristatus* Baumg. (0).

cristatus, *Boletus*, Gouan 1762: 540 (France) (d.n.), not Baumg. 1790 and J. F. Gmel. 1792 (d.n.), not ~ Schaeff. 1774 (d.n.) and (Schaeff. per Fr.) Pollini 1824.—Nomen dubium. Fr. 1821: 355 referred this to *Polyporus* [*Grifola*] *frondosus*. As published Gouan's species consisted of several vars.; the type var. was identified with "*Agaricus seu fungus ramosus cristatus medius*. Barr. Icon. 1271" which was also cited when *Polyporus barrelieri* Viv. [= *Grifola frondosa*] was introduced. Gouan recorded it for Montpellier, France, "Magnitudo capitidis humani. Albus." The white colour does not agree with the European spp. of *Grifola*. It might suggest a sp. of *Sparassis*, although the inclusion in *Boletus* ("pileus . . . subitus porosus") hardly supports this suggestion. The citation of Barrelier's figure under *Merisma cristatum* Pers. [= *Sebacina incrassans* (Pers. per Fr.) Tul., Tremellaceae] by Lapl. 1894: 353 is an error.

cristatus, *Boletus*, "Plan."—An error by Fr. 1832^{Ind.}: 57 for *B. crustatus* [= *Ganoderma lucidum*].

**cristula*, *Polyporus*, Kl. ("in Herb.") ex Berk. 1839 (AM 3): 387 (India?).—Sacc. 1888 (SF 6): 245 appended this as a subsp. to *Polyporus* [*Pycnoporus*] *cinnabarinus*, with the remark, "Affinis, nisi idem cum *Pol. cinnabarinus*." This was caused by a remark by Fr. 1851 (NAU III 1): 75/59.

**croceopallens*, *Gloeoporus*, Bres. 1912 (Am 10): 506 (Indonesia, Java); *Polyporus* Lloyd 1915 (n.v.p.).—Considered by Lloyd 1915 (LMW 4, Ap.): 331 to be a mere form of *Polyporus* [*Gloeoporus*] *dichrous*. — Cf. (51).

**croceus* (Fr.) ex P. Karst. 1859: 39, apud Nyl. & Sael. 1859: 102; [= *Polyporus nitidus* "b. croceus. Schwein. in litt." Fr. 1828 E. 1: 117 (apparently not an infragenetic name: n.v.p.?) (U.S.A.)]; *Polyporus*

nitidus var. *croceus* Mont. 1854 ("Schwz."); lacking further references, no descr.: n.v.p.), typonym.—Nomen dubium. Fries's "b. croceus" has been interpreted not as a one-word phrase (as I do), but as an infraspecific epithet. Schw. 1832: 158 listed this taxon as "*P[olyporus] nitidus*, Fr. n. 8, Pers. 122, olim *croceus*, L. v. S." This use of 'croceus' should most probably not be confused with *Boletus croceus* Pers. as previously used by Schw. 1822: 96 for a sp. that he placed in *Boletus* c) *Apodes*; hence it had a pileate fruitbody in contradistinction to the taxon described by Fr., which is 'resupinate'. Overh. 1923 (M 15): 213 evidently confused these two taxa when he stated of "*Boletus* [!] *croceus* Schw." 1822: 96 that no type was preserved in PH and the Michener collection. — Fries's taxon was reported from Finland under the name *Polyporus croceus* "Schwein." by P. Karst. (ll. cc.) with ref. to Fries's publication; it may be assumed that he misapplied the name to *Chaetoporus collabens*.

**crocicolor*, *Polyporus*, J. B. Ell. "mss. at Kew".—Fide Lloyd 1915 (LMW 4, Ap.): 377 = *Polyporus aurantiacus* Peck [= *Pycnoporellus fulgens*].

**cruentatus*, *Polyporus*, Mont. 1854 (ASn IV 1): 129; 1856: 161 (French Guinea); *Poria* Cooke 1886.—Bres. 1916 (Am 14): 228 thought that this was a resupinate form of *Polyporus* [*Gloeoporus*] *dichrous*, but Wakef. 1934 (BmI): 249 denied this and accepted it as a good sp.; Murrill 1921 (M 13): 96 and Lowe 1963 (M 55): 458 & 1966: 37 referred it to *Poria spissa* (Schw. apud Fr.) Cooke, an extra-European sp.

**crustacea*, *Laschia*, Jungh. 1838: 75 ["fig. 40" (n.v.)] (Indonesia, Java); *Polyporus* Lév. 1844; *Hymenogramme* Sacc. & Cub. apud Sacc. 1887; *Aschersonia* O.K. 1898 ("crustata"); *Poria* Cooke 1886, Bres. 1910.—This was recorded from France by Richon 1889: 99 as "*Polyp. crustaceus* Lév.", without descr.; I take this to be an erroneous determination; compare Ryv. 1972 (Pe 7): 18.

cryptarum, *Agaricus*, P. Beauv. 1806 (AMP 8): 346 pl. 57 /s. 2, 3 (France).—Nomen dubium. A poria (or poria states) found in cellars, caves, and mines, insufficiently described for certain recognition; referred by DC. 1815: 38 to *Boletus* [*Poria*] *vaillantii*. May be a nomen confusum: it is not unlikely that states of more than one sp. were thought to be conspecific and developing from each other, but cf. also *Polyporus* [*Tyromyces*] *fodinarum*.

cryptarum, *Spongiodes*, (Bull. per Fr.) Lázaro sensu Lázaro → *Spongiodes* (O).

**cubensis*, *Lenzites*, B. & C. 1868 (JLS 10): 303 (Cuba), an extra-European sp.—Pilát 1940 (ACE 3): 327, 328 made this a variety of *Trametes* [*Lenzites*] *betulina*, but this identification is doubtful. According to Bond. & Ljub. 1964 (NSn): 182 collections referred to *Trametes betulina* var. *cubensis* (B. & C.) Pilát are "*Lenzites*" *acuta* Berk., another extra-European sp.

- cumini*, *Polyporus*, Pers. → *Boletus abietinus* Cumino (**O**).
cupreolaccatus, *Polyporus*, Kalchbr. (in litt. ad A. von Kerner, 1882) apud Wettst. 1885 (ÖbZ 35): 81 (syn.: n.v.p.); Ferd. & W. 1943 (lacking Latin descr.: n.v.p.); *Fomes* Ferd. & Jørg. 1939: 332 (lacking descr.: n.v.p.); *Ganoderma* Igmády 1968 (lacking Latin descr.: n.v.p.); ≡ *Polyporus laccatus* Kalchbr. apud Wettst. [= *Ganoderma pfeifferi*]. — Descr. Ferd. & W. 1943: 95 fig.
- **curreyanus*, *Polyporus*, Berk. ex Cooke 1886 (G 15): 20 (New Zealand); *Poria* G. Cunn. 1947.—Bres. 1916 (Am 14): 224 referred this to *Polyporus [Gloeoporus] dichrous*, and Lloyd 1915 (LMW 4, Ap.): 377 to *Polyporus [Bjerkandera] adustus*. It is treated by G. Cunn. 1965: 50 (*Poria*; with descr.) as distinct from both spp. and as strictly resupinate. — Cf. (51).
- **curtisii*, *Polyporus*, Berk. ("MSS.") apud B. & C. 1849 (HJB 1): 101 (U.S.A., South Carolina); *Fomes* Cooke 1885, not ~ Lloyd 1922 (n.v.p.); *Scindalma* O.K. 1898; *Ganoderma* Murrill 1908.—At first taken to be conspecific with *Ganoderma pseudoboletus* [= *G. lucidum*] by Murrill 1902 (BTC 29): 602, 604, but later correctly accepted by him, Murrill 1908 (NAF 9): 120, as a distinct sp. of *Ganoderma*. Extra-European.
- cuticularis*, *Boletus*, Thore 1803: 487 (France) (d.n.) ex Duby 1830, not ~ Bull. 1789 & ~ (Bull. per Fr.) Mérat 1821.—Nomen dubium.
- Cyanosporus* Lloyd 1909 (not accepted by publishing author: n.v.p.) [1960 (Pe 1): 202]; monotype, *Polyporus [Tyromyces] caesius*.
- cymatoides*, *Polyporus*, E. Krause 1928 B.r.: 53; [= *Polyporus kymatodes* Rostk. sensu E. Krause 1925 (ANM II 1): 129, excl. of type, (lacking descr.) (Germany)].—Nomen dubium. Apparently not validly published: "Entspricht Fr. t. 183, 1 gut, Habitus wie *serialis* St[urm = Rostk.] 17, 49, Farben fast wie *hirsutus* St. 16, 44. Aber nicht *P. kymatodes* St. 10, 24."
- daedalea*, *Trametes*, Speg. → *Daedalea trametes* Speg. (**O**).
dapsilis, *Polyporus*, Britz. 1887 (BnS 29): 274 [pl. 591 f. 3] & 1910 (BbC 26): 208 (Germany).—According to Killerm. 1922 (Dba 15): 62, "dürfte [*Polyporus*] *melanopus* od. [*P.*] *varius* sein"; both guesses are undoubtedly far off the mark. Referred by Bres. apud Killerm. 1925 (Dba 16): 118 to *Polyporus subsquamosus* [sensu Bres. = *Boletopsis grisea*] (17). I have thought it might be either *Abatrellus ovinus* or *A. similis*, but could not convince myself one way or another. No spores mentioned. — Rather, a nomen dubium.
- debilis*, *Polyporus*, Wallr. 1833: 600 (Germany).—Nomen dubium. Referred by Fr. 1838: 430 to *Polyporus brumalis*, but the original descr. is quite insufficient for correct determination.
- **decipiens*, *Polyporus*, Schw. 1832: 157 (U.S.A., Pennsylvania); *Polystictus* Fr. 1851; *Hansenia* P. Karst. 1879; *Microporus* O.K. 1898; *Coriolus* Pat. 1900.—Nomen dubium. Schw. stated "Ambit inter *P. versicolorem* et *abietinum*." Murrill 1907 (NAF 9): 27–28 and Lloyd 1913 (LMW 4, L. 50): 8 could not find the type or any authentic specimen. The species

has been referred to *Coriolus versicolor*, *Polystictus ochraceus* [= *Coriolus zonatus*], *Coriolus pavonius* (Hook.) Murrill (the last sp. extra-European). Not mentioned by Overh. 1953. Murrill thought that the description called for a plant near *Coriolus prolificans* [= *Hirschioporus paragmenus*].

deformis, *Boletus*, Schaeff. 1774: 90 [pl. 264] (Germany) (d.n.) per Steud. 1824; *Polyporus* Fr. 1832, 1838; *Fomes* Cooke 1885; *Placodes* Quél. 1886; *Scindalma* O.K. 1898.—Nomen dubium. Pers. 1800: 106 thought that this might be a var. of *Boletus* [*Albatrellus*] *ovinus*. The sp. was accepted by Fr. 1838: 441, after he had supposed for a while (Fr. 1832^{Ind.}: 147) that it was the correct name for *Polyporus* [*Albatrellus*] *pes-caprae*. The original plate suggests something abnormal; the context was indicated as “lignosus”. A polypore overgrown by a mould?

delens, *Polyporus*, E. Krause → *Polyporus alutaceus* Fr. (**O**).

delicatissima*, *Daedalea*, Speg. 1890 (ABA 6): 175 (Argentina).—Bres. 1916 (Am 14): 230 found the type to be a mixture (“[*Pol.*] *aculeifer* Berk. et *Pol.* *biennis* Bull. commixti”) while Speg. 1926 (BCó 28): 370 apparently considered the last element to be typical (lectotype), accepting it as a syn. of *Polyporus* [*Abortiporus*] *biennis* [sensu lato] as “forma truncicola dimidiato-sessilis hymenio daedaloideo”. Fid. 1969 (Ri 4): 150, 162, 165 made it a syn. of *Heteroporus biennis* var. *flabelliformis* (“Mont.”) Fid. [sensu Fid. = *Abortiporus distortus* (O**); see Donk 1971 (PNA 74): 2]. — Cf. (2).

delicatus*, *Polyporus*, B. & C. apud Berk. 1872 (G 1): 37 (U.S.A., Alabama); *Favolus* A. Ames 1913.—Referred by Lloyd 1912 (LMW 3, S.P.): 146 to *Polyporus* [*Abortiporus*] *fractipes* (O**) and Overh. 1953: 254 was inclined to accept this disposition, but Fid. 1969 (Ri 4): 121, 150, 154, 166 identified it with *Heteroporus biennis* var. *flabelliformis* [sensu Fid. = *Abortiporus distortus* (**O**); see Donk 1972 (PNA 74): 2].

demissus*, *Polyporus*, Berk. 1845 (LJB 4): 52 (West Australia); *Merulius* Pat. 1908.—This has been referred to *Polyporus* [*Bjerkandera*] *adustus* by Cooke and G. Cunn. 1949 (BPZ 81): 2, to *Polyporus* [*Bjerkandera*] *fumosus* by Lloyd 1915 (LMW 4, A.): 377, and to *Gloeoporus thelephoroides* (O**) by G. Cunn. 1965: 111, 112. — Cf. (51).

**dendroidea*, *Hymenochaete*, B. & C. apud B. & Br. 1873 (JLS 14): 69 (Ceylon). — Cf. (41).

dense-lamellata, *Lenzites*, Opiz, “n.n.” (n.v.p.)—Fide Pilát 1940 (ACE 3): 339 = *Gloeophyllum trabeum*.

dentatus, *Polyporus*, Velen. 1922: 650 [see Pilát 1948: 248 for Latin translation] (Czechoslovakia).—Referred by Pilát 1938 (ACE 3): 185 without comment to *Leptoporus* [*Tyromyces*] *lacteus* in a very inclusive sense.

destructior, *Boletus*, Schrad. 1794: 166 (Germany) (d.n.); *Polyporus* (Schrad.) Fr. 1815 (d.n.); *Polyporus* (Schrad.) per Fr. 1821; *Boletus* Spreng. 1827; *Bjerkandera* P. Karst. 1882; *Leptoporus* Quél. 1886; *Polystictus* Gillot & Luc. 1890; *Cladomeris* Lázaro 1916; *Fibroporia* Parm. 1968; ≡ *Poria*

- destruens* S. F. Gray 1821.—Nomen dubium & ambiguum (128). — Sensu Fr. 1838, Mez 1908: 110 f. 42 (*Polyporus*) = ?; sensu Bres., in part → *Poria resupinata*; sensu Bond. → *Tyromyces fodinarum*? *destruens*, *Boletus*, S. F. Gray → *Boletus destructor* Schrad. (**O**). *destruens*, *Leptoporus*, Pilát 1937–8 (ACE 3): 197, 198 f. 57 (lacking Latin descr.: n.v.p.).—This name is the precursor of *Leptoporus* [*Tyromyces*] *fodinarum*, which replaced it farther on in the book.
- detmoldiense*, *Ganoderma*, Kreis. & Jahn in herb. (Germany).—Fide H. Jahn 1963 (WPb 4): 86 = *Ganoderma europaeum* [= *G. adspersum*]. *Dictyoporus* F. Clem. → *Retiporus* Endl. (**O**). *diformis*, *Boletus*, Willd. ("Plant. Cryptog. ined.") ex Humb. 1793: 102 (Germany) (d.n.).—Nomen dubium. Found in mines: perhaps an abnormal growth. *diformis*, *Poria*, Scop. 1772 P.s.: 105 pl. 26 (Hungary, now Czechoslovakia) (d.n.); ≡ *Polyporus voluta* Pers. 1825.—Nomen dubium. This was referred to *Polyporus* [*Coriolus*] *hirsutus* by Fr. 1832^{Ind.}: 149. *discolor*, *Daedalea*, Fr. → *Daedalea albida* Schw. (**O**). *discolor*, *Lenzites*, Fr. → *Lenzites klotzschii* Berk. (**O**). **discolor*, *Polyporus*, Kl. 1833 (Li 8): 483 (Mauritius).—Regarded as a syn. of *Polyporus* [*Laetiporus*] *sulphureus* by Lloyd 1912 (LMW 3, S.P.): 156. This may be incorrect. **dispar*, *Polyporus* Kalchbr. in Thüm. 1878 (Fl 61): 441 (Australia, Victoria); *Polystictus* Sacc. 1888; *Microporus* O.K. 1898.—Referred at first to *Polystictus* [*Hirschiaporus*] *pargamenus* by Bres. 1903 (Am 1): 76, but later to "Polyporus" [*Hirschiaporus*] *elongatus* Berk., an extra-European species. **dissitus*, *Polyporus*, B. & Br. 1873 (JLS 14): 48 (Ceylon).—Referred by Lloyd 1915 (LMW 4, Ap.): 378 and Bres. 1916 (Am 14): 224 to *Polyporus* [*Bjerkandera*] *adustus*. However Petch 1916 (APe 6): 94, 100, 119 identified it with "Polyporus" *secernibilis* Berk. (**O**) and his brief descriptive note would not at once exclude a sp. of *Gloeoporus*. He referred the *P. secernibilis* "of Lloyd" to "Polyporus" *introfuscus* Petch (Ceylon). **distortus*, *Boletus*, Schw. 1822: 97 (U.S.A., North Carolina); *Polyporus* Steud. 1824; Fr. 1828; *Daedalea* Pat. 1900; *Abortiporus* Murrill 1904; *Heteroporus* Bond. & S. 1941.—This has been referred to *Polyporus*/*Daedalea* [*Abortiporus*] *biennis*, for instance, by Schw. 1832: 160, Bres. 1926: 79, and Overh. 1953: 224; but cf. (2). — Descr.: Murrill 1907 (NAF 9): 64 (*Abortiporus*); Lloyd 1912 (LMW 3, S.P.): 158 f. 458; Overh. 1914 (AMo 1): 105 & 1915 (WUS 3¹): 84 pl. 1 f. 3; Lloyd 1916 (LMW 4): 549 f. 753 (*Polyporus*); &c. Other descrs. under misapplied names: Buller 1922a (*Polyporus rufescens*); Fid. 1969 (Ri 4): 149 fs. 18–37, 51 (as *Heteroporus biennis* var. *flabelliformis*). Cf. Donk 1971 (PNA 74): 2 on the epithet 'flabelliformis'. — Sensu Pilát, in part (as to European specimens), → *Abortiporus biennis*, typical variety.

- **doidgei*, *Polystictus*, Lloyd 1924 (LMW 7): 1294 (nom. nud.), 1329 and 1925 (LMW 7): pl. 314 f. 3039 (South Africa).—Lloyd, l.c., remarked, "We would put it in . . . 'Microporus'"; G. Cunn. 1965: 166 referred it to *Trametes* [*Coriolus*] *versicolor*.
- **dolosa*, *Thelephora*, Lév. 1844 (ASn III 2): 209 (Indonesia, Java).—Referred by Bres. 1912 (H 51): 318 to *Gloeoporus dichrous* and later, Bres. 1912 (H 53): 74, to *Gloeoporus conchooides* (**O**). — Cf. (51).
- **dorsale*, *Ganoderma* (Lloyd) Torrend 1920; *Polyporus* Lloyd 1917 (LMW 5): 658 f. 939 (Brazil).—Steyaert 1967 (BBB 100): 198 tentatively reported this sp. from a garden in Antwerp (Belgium); he considered it an alien.
— Syn.: *Polyporus perturbatus* Lloyd (**O**).
- dryinus virescens*, *Polyporus*, Seer. 1833 M. 3: 137 (Switzerland) (as a sp. of *Boletus* & double epithet & nom. nud.: n.v.p.).—Nomen dubium.
- **dryophila*, *Fomitoporia*, Murrill 1907 (NAF 9): 8 (U.S.A., Mississippi); *Poria* Sacc. & Trott. 1912; *Fuscoporia* G. Cunn. 1948.—Referred by Lowe 1949 (Ll 11): 167 & Overh. 1953: 87 to resupinate *Fomes* [*Phellinus*] *robustus* but cf. (86). A re-description of the type is needed. Cf. D. Baxt. 1937 (PMi 22): 282 pl. 33; 1952 (PMi 37): 100 pl. 8 (*Fomitoporia*).
- dubius*, *Boletus*, Plan. 1788 I.F.: 27 (Germany) (d.n.), not ~ Retz. 1795 (d.n.), not ~ Fr. (n.v.p.).—Nomen dubium. Fr. 1821: 370 referred this to *Polyporus* [*Hirschioporus*] *abietinus*. In his copy of Planer's booklet Persoon wrote, "Est *Merulius serpens* Tode" [sensu Pers.]; I am reminded of *Merulius tremellosus* Schrad. per Fr. (both, 'Corticiaceae').
- dubius*, *Boletus*, Retz. 1795: 318 (d.n.), not ~ Plan. 1788 (d.n.), not ~ Fr. (n.v.p.); = "*Merulius*" *crispatus* O. F. Müll. 1777 (Fd 4 / F. 12): 6 pl. 716 f. 2 (d.n.) per Fr. 1821 ('Corticiaceae').
- dubius*, *Polyporus*, Fr. "in litt." (type locality?); Lloyd 1914 (LMW 4, L. 52): 10 (matter of record: n.v.p.), not ~ Plan. 1788 (d.n.), not ~ Retz. 1795 (d.n.).—It appears to be the plant called [*Tyromyces*] '*lacteus*' now'. It is not clear what sp. Lloyd thought was called '*lacteus*' at that time; cf. Donk 1972 (PNA 75): 289.
- **dussii*, *Myriadoporus*, Pat. 1889 (BmF 5): 85 (Martinique).—Referred by Bres. 1890 (Rm 12): 104 to *Fomes fomentarius* as a myriadoporous form. Perhaps *Fomes sclerodermeus* (Lév.) Cooke, an extra-European sp.
- **earleae*, *Fomitiporia*, Murrill 1907 (NAF 9): 9 (U.S.A., Mississippi); *Poria* Sacc. & Trott. 1912.—Referred by Lowe 1949 (Ll 11): 167 & 1957 F.: 56 to *Poria* [*Phellinus*] *punctata* which he considered to be resupinate *Fomes* [*Phellinus*] *robustus* but cf. (86). A re-description of the type is needed.
- **earlei*, *Lenzites*, Murrill 1908 (NAF 9): 128 (Jamaica).—Lloyd 1917 (LMW 5): 709 referred this to *Lenzites tenuis* Lév. (q.v.), which on the base of Japanese material so named by Lloyd was referred to

- Lenzites* [*Trametes*] *gibbosa*, together with *L. earlei*. The original fungus is likely to be a syn. of "Trametes" *palisotii* (**O**).
eburneus, *Polyporus*, Wallr. 1833: 599 (Germany).—At first Fr. 1838: 448 considered this to be *Polyporus lobatus* [sensu Fr. = ?] "status senilis leuciticus", but later Fr. 1874: 541 thought that it could perhaps be *Polyporus osseus* [= *Osteina obductus*]. My suggestion is white-weathered specimens of *Polyporus varius*.
echinata.—"Lenzites echinata" in 1894 (BmF 9): xxxiii is an error for 'Lycoperdon echinata'; cf. 1894 (BmF 10): 100.
**effusa*, *Daedalea*, Speg. 1909 (ABA 19 / III 12): 274 (Argentina).—Referred by Bres. 1916 (Am 14): 229 to *Poria* [*Phellinus*] *contigua*.
effusa, *Trametes*, S. Schulz. 1866: 41 (Yugoslavia, Slavonia) (nom. nud.; n.v.p.).—Fide S. Schulz. 1880 (ÖbZ 30): 108 ≡ *Polyporus schulzeri* Kalchbr. [= *Funalia gallica*]. Cf. Donk 1972 (PNA 75): 166.
effusus, *Boletus*, Latourr. 1785: 39 (d.n.); [= *Polyporus crustaceus effusus*, *farinosus albus* Haller 1768 H. 3: 139 no. 2272 (Switzerland) ≡ *Polyporus effusus*, *crustaceus albus* Haller 1769: 201].—Nomen dubium. Haller's sp. was referred to *Polyporus* [*Perenniporia*] *medulla-panis* by Fr. 1821: 380, apparently because Haller cited *Agaricum album*, *terrestris*, *medullam panis referens* Mich. 1729: 121 pl. 63 f. 2 as being an illustration of the sp. he had in mind. Jacq. also cited Michel's sp. when he published *Boletus medulla-panis*, cf. Donk 1960 (Pe 1): 266, who doubted whether it was the same as Jacquin's fungus. It is also doubtful, to say the least, whether Haller correctly identified his insufficiently described sp. with Michel's.
ellipticus, *Polyporus*, Secr. 1833 M. 3: 154 (Switzerland) (as a sp. of *Boletus* & nom. nud.; n.v.p.).—Nomen dubium. Secr. cited *Odontia cerasi* Pers. (**O**) as a syn. of his var. A.
elvela, *Boletus*, Batsch 1783: 105 (d.n.); ≡ *Helvella clavata* Schaeff. 1774: 100 [pl. 149] (Germany) (d.n.); *Spathularia* (Schaeff.) per Sacc.; = *S. flavidula* Pers. per Fr. (Discomycetes), fide Fr. 1821: 491.
**endoxantha*, *Fistulina*, Speg. 1921 (BCó 25): 21 (Chile).—Fide J. E. Wright 1961 (BaB 9): 225, 227 = *Fistulina hepatica* (var.) but Sing. 1969 M.a.: 381 considers it a good sp.
epidryphloea, *Daedalea*, E. Krause 1928 B.r.: 55 ("Daedaleus") (Germany).—Nomen dubium. Presumably a sp. of *Merulius* Fr. sensu lato ('Corticiaceae'), hence excluded.
epigaeus, *Polyporus*, S. Schulz, 1866: 41 (Yugoslavia, Slavonia) (nom. nud.).—Nomen dubium.
epigeus.—"epigeus [, *Polyporus*], Europe, Link. Specimens in his herbarium Berlin are *Polyporus* [*Skeletocutis*] *amorphus* . . ."—Lloyd 1915 (LMW 4, Ap.): 378. — This quotation implies the specific name '*Polyporus epigeus*', which in its turn must be connected with *Polyporus amorphus* b. *epigeus* Fr. 1818 O. 2: 259 ≡ *Polyporus* [*Skeletocutis*] *amorphus*. Not *Polyporus epigaeus* S. Schulz. 1866 (n.v.p.).

- epileucus*, *Polyporus*, Fr. 1838: 452 (Sweden); *Bjerkandera* P. Karst. 1882; *Leptoporus* Quél. 1886; *Polystictus* Gillot & Luc. 1890; *Coriolus* Bond. 1953.—Nomen dubium. Variously interpreted: cf. Romell 1926 (SbT 20): 10 and Bourd. & G. 1928: 543, in obs. — Sensu Morg. ("of Morgan's flora" [?]) = *Polyporus [Tyromyces] spraguei*, fide Lloyd 1915 (LMW 4, Ap.): 305; sensu Peck 1885 (RNS 38): 91 (*Polyporus epileucus* var. *candidus* Peck) = *Polyporus immitus* [= *Tyromyces stipiticus*? (134)] fide Overh. 1953: 289; sensu Lloyd, in part, → "Trametes" *hoechnei*.
- epiphegum*, *Polyporus*, Pers. 1825: 88, epithet preceded by an asterisk; [= *Boletus cryptarum* Bull. sensu Schum. 1803: 389 (Denmark)].—Nomen dubium. Fr. 1828 E. 1: 109 thought this was a cryptophilous form of *Polyporus nigricans* (p. 128); if one relies on the descr. this is a highly improbable guess.
- epiphylla*, *Poria*, Pers. 1799 O. 2: 15 (Germany) (d.n.); *Polyporus* Fr. 1815 (d.n.); *Polyporus molluscus* var. (Pers.) per Pers. 1825; *Polyporus* Wettst. 1888.—Nomen dubium. Referred by Fr. 1821: 384 to *Polyporus molluscus* (forma) [sensu Fr. = *Poria* sp. indet.] and taken up by Wettst. as the correct name for this species.
- epitheleus*, *Polyporus*, Fr. 1852 (ÖVS 9): 129 (Sweden); *Poria* Cooke 1886.—Nomen dubium. "Fungus maxime abnormis".
- epixanthus*, *Polyporus*, Rostk. 1830 (StP 4): 63 pl. 30 (Germany/Poland).—Nomen dubium. Fr. 1832^{Ind.}: 146, 1838: 453 referred this to his *Polyporus alutaceus* (O). Lloyd 1915 (LMW 4, Ap.): 302 thought the plate a "fairly good" representation of his interpretation of *P. alutaceus*, which he identified with *Polyporus [Tyromyces] guttulatus*. — Kallenb. 1927 (ZP 6): 59 suggested *Polyporus [Laetiporus] sulphureus*.
- eurystegon*, *Polyporus*, E. Krause 1929 B.r.: 78 (Germany).—Nomen dubium. E. Krause 1930 B.r.: 97 soon referred this to *Polyporus byssinus* (Schrad. per Quél.) E. Krause [= *Stromatoscypha fimbriatum* (O)], but his original descr. does not support him.
- **eutelea*, *Trametes*, Pat. 1912 (BmF 28): 144 (Mauretania); *Poria* Trott. 1925.—Lowe 1963 (M 55): 465 referred this to *Trametes [Antrodia] serialis*, but the original descr. does not seem to support him.
- **everhartii*, *Mucronoporus*, Ell. & Gall. 1889 (JM 5): 141 pl. 12 (U.S.A., New Jersey); *Xanthochrous* Pat. 1898; *Scindalma* O.K. 1898; *Pyropolyphorus* Murrill 1903; *Fomes* Schrenk & Spauld. 1909, Lloyd 1909 (n.v.p.), Overh. 1914; *Phellinus* A. Ames 1913, Pilát 1942; *Fulvifomes* Murrill 1914.—Certain collections from Czechoslovakia were named *Phellinus everhartii* by Černý; these were later referred to *Phellinus pilatii*, cf. Kotl. 1968 (ČM 22): 174. Thus far not reported from Europe with certainty. — Descr.: Hirt 1930; Overh. 1953: 82 pl. 69 fs. 402, 403, pl. 73 f. 425 pl. 107 f. 593, pl. 127 fig.; Lowe 1957 F.: 34 f. 19 (*Fomes*). — Special literature: Hirt, 1930.
- fagineus*, *Boletus*, Schrad. apud J. F. Gmel. 1792: 1435, Schrad. 1794:

- 161 (Germany) (d.n.), not ~ With. 1776 (d.n.).—Nomen dubium. Fr. 1838: 456 referred this to *Polyporus albus* (Huds.) per Fr. [sensu Fr. = *Bjerkandera fumosa*].
- favolus albus*, *Polyporus*, Secr. 1833 M. 3: 51 (Switzerland) (as a sp. of *Boletus* & double epithet & nom. nud.: n.v.p.).—Fide Fr. 1874: 533 = *Polyporus michelii*.
- favolus juglandis*, *Polyporus*, Secr. 1833 M. 3: 49, 615 (Switzerland) (as a sp. of *Boletus*; double epithet: n.v.p.) ≡ *Boletus juglandis* Schaeff. [= *Polyporus squamosus*].
- **favus*, *Boletus*, L. 1759: 1349 & 1763: 1645 (China) (d.n.) per Spreng. 1827, in part; *Hexagonia* Hariat 1891 (nom. prov.: n.v.p.), not ~ Quél. 1888; ≡ *Polyporus [Scenidium] sinensis* Fr. (extra-European).—Variously misapplied by European authors: sensu O. F. Müll. (with "?") → *Polyporus squamosus*; sensu "Nonnull." (which became "Quorund." in Fr. 1832^{Ind.}: 58), fide Fr. 1821: 367, = *Polyporus [Coriolus] hirsutus*. This seems to refer to Liljebl. 1798: 453, who admitted a *Boletus favus* from Sweden, whose descr. suggests *Coriolus hirsutus*. He added as a syn. "Bolet. hirsutulus?", which perhaps stands for *B. hirsutulus* J. F. Gmel. > *B. [Coriolus] hirsutus*. — Sensu Bull. → *Funalia gallica*.
- **fendleri*, *Polyporus*, B. & C. 1868 (JLS 10): 317 (Venezuela); *Polystictus* Cooke 1886; *Microporus* O.K. 1898; *Poria* Lowe 1947.—Fide Lowe 1966: 132 = *Aporpium caryaee* (O). — V.s.: "fendzleri".
- **fergussonii*, *Polystictus* (Berk.) ex Cooke 1886 (G 15): 23 (South Africa); *Trametes* Berk. in herb. (n.v.p.); *Microporus* O.K. 1898.—Referred by Lloyd 1910 (LMW 3, M.): 68 and Bres. 1916 (Am 14): 229 to *Trametes hispida* [= *Funalia gallica*]. — Cf. (36).
- **ferox*, *Poria*, Long & Baxt. apud D. Baxt. 1940 (PMi 25): 149 pl. 4 (U.S.A., Arkansas, fide Dr. J. L. Lowe MS. notes).—For some time Lowe 1959 (Ll 21): 105 thought that this might be a form of *Trametes [Antrodia] serialis*, but later Lowe 1966: 94 f. 75 treated it as a distinct sp.
- farinaceus*, *Boletus*, Pers. in herb. (Europe); ≡ *Polyporus versiporus* var. *farinosus* Pers. 1825: 106.—Fide Donk 1933: 226 = *Polyporus versiporus* [= *Schizophora paradoxa*].
- farinaceus*, *Polyporus*, Pers. 1825: 120, epithet preceded by an asterisk (Europe).—Nomen dubium.
- **farlowii*, *Polyporus*, Lloyd 1915 (LMW 4, Ap.): 363 f. 697 (U.S.A., Arizona).—A sp. of *Inonotus*. Long 1945 (Ll 8): 235 cited *Polyporus [Inonotus] munzii* (O) and *Inonotus schinii* (O) as syns. Overh. 1953: 421 apparently did not know of Long's paper (1945); he wrote "certainly it might be surmised that the species is synonymous with *Polyporus munzii*." — Descr.: Long, l.c. ("setae . . . straight or catclaw shaped"); Overh., l.c.
- fasciatus*, *Polyporus*, Paul. 1812–35 pl. 164 fs. 5, 6 ("*fascietus*") (type locality not indicated; presumably France).—Nomen dubium. Lév.

1855: 90 referred this to *Polyporus [Coltricia] perennis*; no other suggestion comes readily to mind. The figures may be fakes that perhaps found inspiration in *Fungus lignosus, fasciatus* Vaill. 1727: 61 pl. 12 f. 7, which however is a sp. of *Lactarius*.

**favillaceus*, *Polyporus*, B. & C. apud Frost 1869 (PB 12): 78 (nom. nud.); apud Berk. 1872 (G 1): 53 (U.S.A., "New England").—Nomen dubium. Bres. 1896 (H 35): 283 thought of *Polyporus crispus* [= *Bjerkandera adusta*] resupinate form; Lowe 1947 (Ll 10): 49 at first concluded that it "seems scarcely determinable", but later, 1959 (Ll 21): 111, he referred it to *Polyporus [Hirschioporus] abietinus*.

**ferreus*, *Polyporus*, Berk. 1847 (LJB 4): 502 (Ceylon), not ~ Pers. 1825; *Fomes* Cooke 1885; *Scindalma* O.K. 1898; *Ganoderma* Over. & Steinm. 1923, misapplied; *Trametes* G. Cunn. 1950.—This was referred to *Fomes fomentarius* by Bres. 1890 (Rm 12): 104 but afterwards he rejected this identification. "*Fomes ferreus*" is a distinct species of the eastern tropics, the correct genus and name of which are not yet quite certain. It is not a sp. of *Ganoderma*.

ferruginea, *Daedalea*, Schum. 1803: 373 (Denmark) (d.n.); *Daedalea* Schum. per Fr. 1821; *Striglia* O.K. 1891.—Nomen dubium.

ferrugineum, *Ceratium*, Wallr. 1833: 305 (Germany); *Xylodon* O.K. 1898.—Nomen dubium. Fr. 1838: 524 thought that this differed little from *Irpex [Hydnochaete] cinnamomeus* Fr. [= *Hydnochaete olivacea* (Schw.) Bunker] "forma suffocato-byssina". The sp. with which Fr. compared it is extra-European so that the suggested identity appears unacceptable. Wallroth's fungus is apparently non-polyporaceous and might be some underdeveloped state.

fibula, *Boletus*, Sow. 1803: pl. 387 f. 8 (England) (d.n.); *Polyporus* Secr. 1833 (as a sp. of *Boletus*: n.v.p.); *Polyporus* (Sow.) per Fr. 1838, misapplied; *Polystictus* Fr. 1851, misapplied; *Bjerkandera* P. Karst. 1882, misapplied; *Coriolus* Quél. 1886, misapplied; *Microporus* O.K. 1898; = *Polyporus peltatus* Pers. 1825, not ~ Pers. 1825, not ~ Fr. 1851.—Nomen dubium. — Sensu Fr., Bres. *Coriolus hirsutus*.

filamentosus, *Boletus*, Humb. 1793: 95 pl. 3 f 14 (Germany) (d.n.); *Boletus* (Humb.) per Steud. 1824; *Polyporus* Pers. 1825.—Nomen dubium. Apparently an abnormal growth, found in mines.

fimbriata, *Daedalea*, Schleich. 1821: 57 (Switzerland) (nom. nud.: n.v.p.).—Nomen dubium. Any connection with *Hydnum [Steccherinum] fimbriatum* (Pers.) DC. sensu DC.?

fimbriata, *Poria*, Pers. 1794 (NMB 1): 109 / 1797 T. 29 (Germany) (d.n.); *Boletus* Pers. 1801 (d.n.), not ~ Bull. 1785 (d.n.) per St-Am. 1821; *Porotheleum* Fr. 1818 (d.n.); *Polyporus* (Pers.) per Fr. 1821, not ~ Fr. 1830: Fr. 1832, not ~ (Bull. per St-Am.) Gillet 1878; *Porotheleum* Fr. 1832; *Poria* Lloyd 1910 (syn.: n.v.p.), 1917; = *Polyporus fimbriatus supinus* Secr. 1833 M. 3: 164 (double epithet & as a sp. of *Boletus*:

- n.v.p.); \equiv *Stromatoscypha fimbriatum* (Pers. per Fr.) Donk ('Cyphellaceae' or Schizophyllaceae). — Sensu Quél. \rightarrow *Cristella mollusca*.
- fimbriatum*, *Sistotrema*, Pers. sensu DC 1815: 37 (*Hydnum*).—The descr. was drawn up from material sent in by de Chaillet and from a sample of "*Boletus abietinus*. Schleich. cent. exs. n. 93, non Pers.", specimens from material that Pers. 1825: 77 later referred to *Polyporus dolosus* [= *Hirschioporus abietinus*]. In his copy of de Candolle's book Persoon crossed out rather vigorously not only the ref. to his own *Sistotrema [Steccherinum] fimbriatum* (a non-polyporaceous, resupinate 'hydnum') but also the one to Schleicher's material.
- fimbriatus supinus*, *Polyporus*, Secr. \rightarrow *Poria fimbriata* Pers. (0).
- **fimbriporus*, *Polyporus*, Schw. 1832: 155 (U.S.A., Pennsylvania).—Lloyd 1913 (LMW 4, L. 50): 6 thought that this might perhaps be *Polyporus [Tyromyces] fragilis*, which is not suggested by the description. Not mentioned by Overh. 1953.
- firmitas*, *Boletus*, Spreng. 1807: 23 (Germany) (d.n.).—Nomen dubium. Fr. 1821: 380 referred this to *Polyporus [Perenniporia] medulla-panis*, but the too brief phrase hardly suggests this ("... subtus zonatus fuscus ..."). *Heterobasidion annosum*?
- fischeri*, *Ceriomyces*, Corda 1837 (StP 3): 133 pl. 61 (Czechoslovakia).—Donk 1972 (PNA 75): 165 suggested that this may be a gall caused by a wasp.
- fissus*, *Polyporus*, Berk. sensu Crag. — *Polyporus cremoriflorus* Crag. (0).
- Flabellaria* Chev. 1826 (nom. prov.: n.v.p.), not \sim Pers. 1818 (n.v.p.) (Schizophyllaceae) [1960 (Pe 1): 214]; \equiv *Polyporus* trib. *Merisma* Fr. [= *Grifola*].
- flabellatus*, *Polyporus*, Schulz. & Bres. apud S. Schulz. 1885 (H 24): 145 (Yugoslavia, Slavonia).—Nomen dubium. At first Quél. 1890 (Crf 18²): 512 referred this, with doubt, to *Coriolus helveolus* [sensu Quél. = *Buglossoporus pulvinus*], but afterwards he dissociated it from this species (which he then called *Caloporus fuscopellis*). Lloyd 1912 (LMW 3, S.P.): 156 thought of abnormal *Polyporus [Laetiporus] sulphureus*. The published descr. does not support these identifications.
- flabelliformis*, *Boletus*, (Batsch) Sow. 1799: text to pl. 231 (syn.: n.v.p.); *Boletus suberosus* var. Batsch 1789: 117 pl. 41 f. 226 (Germany) (d.n.).—Sow. listed the specific combination as a syn. of *Boletus carpineus* Sow. [= *Berkandera adusta* forma].
- flabellum*, *Boletus*, Hoffm. 1797–1811 V.s.: 33 pl. 18 f. 1 (Germany).—Nomen dubium. Fruitbody laterally attached, white, thin, flaccid, subcoriaceous when dry, irregular in shape; on rotten wood in mines. Apparently an abnormal growth.
- flammea*, *Auricula*, Graff 1936 (M 28): 155, 159 (syn.: n.v.p.) \equiv (an error for) *Auricula flammea* Malchi Sterb. 1675 & 1712: 105 pl. 13 [= *Polyporus squamosus*].
- flavescens*, *Polyporus*, Secr. 1833 M. 3: 155 (Switzerland) (as a sp. of

Boletus: n.v.p.), not ~ Mont. 1856.—Nomen dubium. The collection described by Secr. (leg. Chaill.) was said by its collector to have been used for the descr. of *Hydnus obliquum* DC. 1815: 36 (**O**), although the two descriptions do not readily suggest this.

flavicans, *Trametes*, Jørst. ("Bres.") = (an error for) *Trametes flavescens* Bres.

flavidus, *Polyporus*, Peck → *P. peckianus* Cooke (**O**).

flaviporus, *Fomes*, Quél. in herb. (France).—Fide Lloyd 1915 (LMW 4, F.): 267, 280 = *Fomes laccatus* (Kalchbr. apud Wettst.) Sacc. [= *Ganoderma pfeifferi*].

flavovirens, *Polyporus*, Romell in herb. (Sweden), D. Baxt. 1938 (PMi 23): 290 pl. 3 f. 2 (incidental mention, lacking Latin descr.: n.v.p.).—Nomen dubium. Resupinate.

floriformis, *Boletus*, Pers. 1801: 522 (as var. of *B. cristatus*) = (an error for) *Boletus flabelliformis* Schaeff. [= *Albatrellus cristatus*].

fluctuosus, *Polyporus*, Weinm. 1836: 337 (U.S.S.R., European Russia).—Nomen dubium. Fr. 1838: 484 thought of *Polyporus [Perenniporia] medulla-panis*, but it is difficult to know precisely what sp. he had in mind under the latter name.

fodinalis, *Boletus*, Humb. 1793: 99 pl. 2 f. 8 (Germany) (d.n.) per Steud. 1824; = *Polyporus pera* Pers. 1825.—Nomen dubium. Found in mines. von Humboldt's figure shows the fruitbody as though it were erect and had a superior tube-layer (that is, with the tubes opening upward), with the text in agreement ("superne poroso"); he also stated that the fruitbody was infundibuliform. The picture makes the impression that the tube-layer was convex; it is perhaps also likely that in reality the fruitbody was growing downward, in which case it rather suggests a fruitbody depicted by Sow. pl. 387 f. 6 as *Boletus hybridus* Sow. (= *Polyporus [Tyromyces] fodinarum*?). "Substantia carnoso mollis"!

foetens, *Polyporus*, Velen. 1922: 650 [see Pilát 1948: 248 for Latin translation] (Czechoslovakia), not ~ J. Rick 1935.—Referred by Pilát 1938 (ACE 3): 185 without comment to *Leptoporus [Tyromyces] lacteus* in a widely inclusive sense. Velen. described the spores as ellipsoid, 4–5 μ !

foetidus, *Polyporus*, Lloyd in herb. (U.S.A., Ohio), not ~ Velen. 1937.—Fide Lloyd 1915 (LMW 4, Ap.): 305 = *Polyporus [Tyromyces] spraguei*.

foliacea, *Poria*, Scop. 1772 P.s.: 104 pl. 22 f. 1 (Hungary, now Czechoslovakia) (d.n.); *Polyporus* (Scop.) per Pers. 1825, not ~ Jungh. (n.v.p.).—Nomen dubium. Found in a mine; apparently an abnormal growth.

fomentarius, *Irpea*, Mont. 1856: 174 (France); *Xylodon* O.K. 1898.—Nomen dubium.

**fractipes*, *Polyporus*, B. & C. apud Berk. 1872 (U.S.A., South Carolina); *Grifola* Murrill 1904, misapplied; *Petaloides* Torrend 1924; *Polyporus* Bond. & S. 1941; *Abortiporus* Bond. apud E. Komar. 1956 (incomplete

ref.: n.v.p.); *Spongipellis* E. Komar. 1964 (incomplete ref.: n.v.p.); *Heteroporus* Fid. 1969.—Reported from Europe (White Russia) by E. Komar. 1956 (VBb 2): 125 *fs.* 1–3, 1959 (BMs 12): 251 *fs.* 1, 2 (*Abortiporus*), and 1964: 120 *f.* 43, *pl.* 12 *f.* 52 (*Spongipellis*), but according to Fid. 1969 (Ri 4): 171 the descr. and figures do not support the correctness of the record.—Descr.: Lloyd 1912 (LMW 3, S.P.): 131, 191; Overh. 1953: 253 *pl.* 35 *fs.* 207, 208, *pl.* 36 *f.* 220, *pl.* 129 *fig.* (*Polyporus*), Fid. 1969 (Ri 4): 169 *fs.* 38–48, 52 (*Heteroporus*). — Syns. (basionyms only): *Polyporus humilis* Peck 1874 (U.S.A., New York); *Polyporus bartholomaei* Peck (U.S.A., Kansas)? (**O**); *Fomes cremeotomentosus* P. Henn. 1904 (Brazil); *Abortiporus tropicalis* Murrill 1910 (Jamaica); and cf. *Polyporus delicatus* (**O**). — Sensu Murrill 1904 (*Grifola* → *Polyporus* [*Albatrellus*] *peckianus*) (**O**), fide Murrill 1920 (M 12): 11.

fragilis, *Polyporus*, Velen. 1922: 651 [see Pilát 1948: 249 for Latin translation] (Czechoslovakia), not ~ Fr. 1828.—Pilát 1937 (ACE 3): 176 referred this to *Leptoporus* [*Tyromyces*] *fragilis* without any comment. His interpretation of *L. fragilis* is not homogeneous. Both *Tyromyces fragilis* and *T. gloeocystidiatus* apparently do not agree because for Velenovský's (translated) descr. contains "totus vivus et exsiccatus pure albus" and "sporis subglobosus, 4 μ".

fraxinicola, *Polyporus*, S. Schulz. 1882 (RjA 64): 179 (Yugoslavia, Slavonia) (nom. nud.: n.v.p.), not ~ Velen. (n.v.p.).—Nomen dubium.

fraxinicola, *Polyporus*, Velen. "in herb.", not ~ S. Schulz. 1882 (n.v.p.). —Fide Pilát 1937 (ACE 3): 162 = *Gloeoporus* [*Bjerkandera*] *fumosus*.

friesii, *Poria*, Romell 1926 (SbT 20): 24 (nom. prov.: n.v.p.).—New name suggested for *Poria vaporaria* Pers. sensu Fr. [= *Antrodia sinuosa*].

frondosus, *Polyporus*, Secr. 1833 M. 3: 57 (Switzerland) (as a sp. of *Boletus*: n.v.p.), not ~ (Dicks.) per Fr. 1821.—Nomen dubium: see Donk 1971 (Pe 6): 205.

fuscatus, *Placodes*, Quél. 1887 (Crf 15²): 487 *pl.* 9 *f.* 7; 1888: 399 (France); *Fomes* Sacc. 1891; *Scindalma* O.K. 1898; *Polyporus* Pat. apud Rolland 1890; *Xanthochrous* Pat. 1900; *Chaetoporus* Romell 1901; *Boudiera* Lázaro 1916; *Lazaroa* Gonz. 1917. — Fide Bres. 1920 (Am 18): 67 = *Polyporus* [*Phellinus*] *gilvus* (**O**) but cf. also (79). The protologue calls to mind such forms as *Phellinus torulosus* f. *subsalicinus* Bourd. & G. 1928: 620.

jugax, *Poria*, Pers. 1805 I.p.: 36 *pl.* 16 *f.* 2 (Germany) (d.n.); *Polyporus* (Pers.) per Steud. 1824; *Poria* Lloyd 1910 (incidental mention: n.v.p.). —Nomen dubium.

fulgens, *Poria*, (Fr.) Cooke 1886; *Polyporus nitidus* **P. fulgens* Fr. 1874: 574; [= *Polyporus micans* (Ehrenb.) per Fr. sensu Rostk. 1838 (StP 4): 129 *pl.* 63 (Germany/Poland)].—Nomen dubium. This has been associated with *Polyporus* [*Chaetoporus*] *nitidus* (from the start), *Poria eupora* [= *Chaetoporus nitidus*], and *Polyporus medulla-panis* var.

pulchella (Schw.) Bres. apud J. Riek 1898 (ÖbZ 48): 137 [= *Perenniporia pulchella*].

fuligineo-albus, *Polyporus*, Trog 1857 (MiB): 38 (Switzerland).—Nomen dubium.

fuligineus, *Boletus*, Pers. → *Boletus polyporus* Bull. (**O**).

fulvus, *Boletus*, Scop. 1772: 469 (Yugoslavia, Carniola) (d.n.), not ~ Schaeff. 1774 (d.n.), not ~ Willd. 1787 (d.n.); *Polyporus* (Scop.) per Fr. 1838, not ~ Fr. 1863; *Boletus* Lenz 1840, not ~ Willd. per Pollini 1824; *Trametes* Fr. 1848, 1849, and Otth 1866 (nom. nud.: n.v.p.), Fuck. 1870, not ~ (Fr.) Kalchbr. 1868; *Fomes* Gillet 1877; *Phellinus* Quélet 1886; *Ochroporus* J. Schroet. 1888; *Inonotus* P. Karst. 1889; *Placodes* Bourd. 1894; *Xanthochrous* Pat. 1897; *Scindalma* O.K. 1898; *Pyropolyporus* Murrill 1903; *Mensularia* Lázaro 1916.—Nomen dubium, fide Donk 1971 (PNA 74): 419. — Sensu Pers., Bres. → *Phellinus pomaceus*; sensu Fr. 1838, 1874 → *Inonotus rheades*, & cf. *Polyporus fulvus* Fr. 1863 [= *Inonotus rheades*; sensu Quél., J. Schroet. → *Phellinus hartigii*, sensu Velen. → *Fomes fomentarius*.

fulvus, *Boletus*, Willd. 1787: 391 (Germany) (d.n.) per Pollini 1824, not ~ Scop. 1772 (d.n.), not ~ Schaeff. 1774 (d.n.).—Nomen dubium. Willd. cited Mich. 1729: 121 *pl. 62* as a syn., which represents the type of *Mison* Adans. ≡ *Scindalma* [Hill] O.K., typonym, = *Phellinus*. Referred by Fr. 1821: 375 to *Polyporus* [*Phellinus*] *igniarius* sensu latissimo. Willdenow's deser. is too indefinite to place his fungus with any degree of certainty.

Fungoides Tourn. 1700 (pre-Linnaean name) [1960 (Pe 1): 219], see *Fungoides hyosotis* Paul.

fusca, *Scalaria*, Lázaro 1916 (RMa 14): 741 / 1917: 127 (Spain); *Fomes* Sacc. & Trott. apud Trott. 1925.—Nomen dubium. See also *Scalaria*. (**O**).

fuscatus, *Polyporus*, Lázaro 1916 (RMa 15): 96 / 1917: 188 (Spain), not ~ (Fr. per Fr.) Cooke 1878, not ~ Lloyd 1920.—Nomen dubium. Bres. apud Trott. 1925 (SF 23): 369 thought of *Polyporus arcularius* ("juvenilis"). Another possibility is *P. alveolarius*. However, the stalk was said to be lateral and the cap semicircular in outline, which would be abnormal for both these species.

fuscidulus, *Boletus*, Schrad. apud J. F. Gmel. 1792 & Sehrad. 1794: 153 (Germany) (d.n.); *Polyporus* (Schrad.) per Fr. 1838; *Polyporellus* P. Karst. 1879; *Leucoporus* Quél. 1886.—Nomen dubium. Fr. 1821: 349 thought that this might be *Polyporus leptocephalus* [= *P. varius*]. Later Fr. 1838: 431 accepted it as a distinct species, but it is difficult to decide whether or not he interpreted it correctly. Sacc. 1916: 960 changed the name of Fries's conception to *Polyporus substrictus* because Fr. had cited this last name as a syn. Pilát 1936 (ACE 3): 64, 67 listed *P. fuscidulus* with doubt as a syn. of *Polyporellus* [*Polyporus*] *brumalis* var. *vernalis* (Fr.) Pilát. — Cf. Lloyd 1912 (LMW 3, S.P.): 171.

- **fuscofusca*, *Polyporus*, Schw. 1832: 157 (U.S.A., Pennsylvania) (syn.: n.v.p.).—Fide Berk. 1872 (G 1): 52 = *Polyporus [Inonotus] radiatus*.
- fuscopallidus*, *Polyporus*, Saut. 1878 (Msa 18): 180 (Austria).—Nomen dubium.
- **fuscovelutinus*, *Xanthochrous*, Pat. 1908 (BmF 24): 6 (U.S.A., Louisiana).—Referred by Lloyd 1915 (LMW 4, Ap.): 379 to *Polyporus [Inonotus] cuticularis*; and by Murrill 1915 S.P.: 41 to *Inonotus ludovicianus* (Pat.) Murrill (O), an extra-European sp. The original descr. suggests the latter disposition as the most probable.
- fuscus*, *Polydictoides*, Lázaro 1916 (RMa 14): 755 / 1917: 141, 293 (Spain); *Polydictus* Sacc. & Trott. apud Trott. 1925 (syn.: n.v.p.); *Polyporus* Sacc. & Trott. apud Trott. 1925, not ~ Lév. 1846, not ~ (Pers. per Wahl.) Lloyd 1915.—Nomen dubium.
- **galactinus*, *Polyporus*, Berk. 1847 (LJB 6): 321 (U.S.A., Ohio); *Spongipellis* Pat. 1900; *Leptoporus* Pat. 1900, Pilát 1937.—Reported by Pilát 1937 (BmF 53): 85, 1938 (ACE 3): 225 pl. 140 f. a (*Leptoporus*) for Europe from Yugoslavia on the basis of a single collection with fruit-bodies “un peu déformés-ptychogastérique” and spores formed “sur les hyphes des dissépiments, comme conidies, en grand nombre”; no basidia. Apparently an abnormal collection and a doubtful record. — No syns. of this sp. are mentioned on this list. — Descr.: Overh. 1953: 317 pl. 20 fs. 119–121, pl. 130 fig. (*Polyporus*).
- **gausapata*, *Trametes*, (B. & Rav.) ex Cooke 1891 (G 19): 102; [*Polyporus*] B. & Rav. in herb. (U.S.A., South Carolina), Cooke 1886 (nom. nud.: n.v.p.)—In selecting the lectotype, material from the first-cited locality (“United States”) has been chosen: Lowe 1957 F.: 88 indicated as lectotype “Ravenel No. 1327 at K” and identified it as “*Trametes*” *carbonaria* (B. & C. apud Berk.) Overh., stating simultaneously that another American specimen (“Ravenel No. 2922 at K”) is “*Irpex*” *farinaceus* (Link) ex Fr.; both extra-European spp. I do not know on which specimen (or specimens) previous assessments of the name were based. Murrill 1905 (BTC 32): 368 referred *Trametes gausapata* to *Porodaedalea [Phellinus] pini*, for which see (84), but according to Wakef. apud Haddow 1938 (TBS 22): 185 the original collection is not this sp.
- gelsorum*, *Polyporus*, Fr. 1821: 377 (incidental mention: n.v.p.) ex ?Steud. 1824 (“†”), ex Fr. 1832^{Ind.}: 146 & 1838: 469; *Boletus* Pollini (as var. of *B. ignarius*: n.v.p.); *Fomes* Cooke 1885, Bizzoz. 1885; *Placodes* Quél. 1886; *Scindalma* O.K. 1898; [= *Agaricus stratosus* *Gelsorum* Batt. 1755: 70 pl. 37 f. D (Italy)]; *Agaricus stratosus* Fr. 1821: 377 (syn.: n.v.p.).—Nomen dubium & ambiguum. Cf. Bres. 1891 (BSb 9): 30, “... est species valde dubia, quia interum non inventa. Valde probabiliter ad *Polyporum [Heterobasidion] annosum* vel ad *Polyporum [Rigidoporum] ulmarium*, non vero ad *Polyp. [Phellinum] igniarium*

adscribenda est." I would add as a probability *Ganoderma* cf. *applanatum*, Pers. 1825: 81 made it a var. of *Polyporus* [*Fomes*] *fomentarius*. — Sensu Martelli → *Inonotus hispidus*. — Batt., i.e., wrote, "Hie apud Mich. ord. 2. n. 4. pag. 118. prostat"; this ref. became in Fr. 1838: 469–470, "Mich. gen. p. 118 n. 4." It is likely that he had in mind Mich. 1729: 118 no. 3 (*Agaricum Gelsis*, seu *Moris adnascens ex obscuro ferrugineum, inferne album, tenuissime, & densissime perforatum, foraminulis rotundis*). Later Fr. 1874: 562 compounded the confusion by changing 'n. 4' into "no. 7", which refers to a quite different fungus, "*Agaricum Gelsis, seu Moris adnascens, squamosum & lignosum, sordide luteum ubique, superne subhirsutum, inferne tenuissime, & breviter perforatum, foraminulis rotundis* Mich. 1729: 118. All this will explain to some extent the confusion around *Polyporus gelsorum*.

**Gemmularia* Rafin. 1819 (JPC 89): 106 & 1820 (JBD 1): 243 (nom. anam.) per Steud. 1824 [1962 (Ta 11): 85]; = *Tucahus* Rafin. 1830, 1833 [1962 (Ta 11): 101]; = *Rugosaria* Rafin. 1833 (nom. prov.: n.v.p.) [1962 (Ta 11): 98]; lectotype, *Gemmularia rugosa* Rafin. (O).

geophilus, *Polyporus*, S. Schulz. 1866: 42 (Yugoslavia, Slavonia) (nom. nud.: n.v.p.).—Nomen dubium.

**geotropus*, *Polyporus*, Cooke 1884 (British Guiana); *Fomes* Cooke 1885; *Scindalma* O.K. 1898; *Rigidoporus* Imaz. apud S. Ito 1955.—Bres. 1920 (Am 18): 68 and other authors have identified this with *Fomes* [*Rigidoporus*] *ulmarius*, q.v., but Lowe [1955 (M 47): 217; 1957 F.: 80, 81 (*Fomes*), 1963 (PMi 48): 173 (*Polyporus*)] considered the type distinct. — Cf. *Polyporus glabrescens* Berk. (O).

gibbus, *Polyporus*, S. Schulz. "Mpt., p. 772. 1869" (n.v.p.).—Igmády 1968 (Aph 3): 353 referred this, with doubt, to *Ischnoderma resinosum* [sensu Fr. = *I. benzoinum* sensu lato].

**gilvooides*, *Trametes*, Lloyd 1912 (LMW 4): 520 f. 516 (U.S.A., Florida); *Phellinus* Imaz. 1943; *Inonotus* Teng 1964.—This was referred to *Fomes tenuis* [= *Phellinus viticola*] by Overh. 1953: 67, 69, but Lowe 1954 (M 46): 492 stated that it "appears to be a distinct species". — Deser.: Lloyd, i.e.; Bres. 1920 (Am 18): 61, 62; Lloyd 1924 (LMW 7): 1216 pl. 280 f. 2766 (*Trametes*).

**gilvus*, *Phellinus*, (Schw.) Pat. 1900 (79, 80); *Boletus* Schw. 1822 (U.S.A., North Carolina); *Polyporus* Steud. 1824: Fr. 1828; *Mucronoporus* Ell. & Ev. 1889; *Chaetoporus* Romell 1901; *Hapalopilus* Murrill 1904; *Fomes* Speg. 1898, not ~ Lloyd 1912.—The notes cited above give the reasons why I hesitate to enter this species on the list of European polypores. — Deser. (all drawn up from North American material): Berk. 1839 (AM 3): 389; Overh. 1914 (AMo 1): 117; Lloyd 1915 (LMW 3, Ap.): 346; Hirt 1926, 1928; Bourd. & G. 1928: 621; Corner 1932 (TBS 17): 78; Overh. 1953: 401 pl. 48 fs. 292, 293, pl. 51 f. 309, pl. 130 fig. (*Polyporus*). — Cf. also *Placodes fucatus* (O) and *Polyporus marcuccianus* (O). — Special literature: Hirt, 1926, 1928.

- glabrata*, *Lenzites*, Opiz, "n.n."—Fide Pilát 1940 (ACE 3): 339 = *Gloeo-phylum trabeum*.
- **glabrescens*, *Daedalea*, Berk. 1877 (JLS 16): 39 (Australia, New South Wales); *Strigia* O.K. 1891; *Lenzites* G. Cunn. 1950.—Referred by Lloyd 1914 (LMW 4, L. 53): 10, in obs., as a form to *Daedalea quercina*, certainly in error. Bres. 1916 (Am 14): 230 considered it a form of "*Elmerina*" *vespacea* (Pers.) Bres. while G. Cunn. 1965: 178 referred it to "*Daedalea*" *beckleri* (Berk.) G. Cunn., both extra-European spp.
- **glabrescens*, *Polyporus*, Berk. 1839 (AM 3): 391 (Mauritius); *Trametes* Fr. 1851; *Fomes* Cooke 1885; *Scindalma* O.K. 1898.—Cf. Bres. 1912 (Am 10): 496, "Forte tantum varietas *Fomitopsis ulmarii* Fr."; and Bres. 1916 (Am 14): 240, "... *Trametes Marchioniae* Mont., cum quo valde probabiliter identica". Lloyd 1915 (LMW 4, Ap.): 280 thought of *Fomes* [*Rigidoporus*] *geotropus* (Cooke) Cooke.
- glaucus*, "Leptoporus".—An error in 1958 (BsM 1957): 25 for '*Leptotus*' *glaucus* (Batsch per Fr.) Maire (Agaricales).
- gordonii*, *Polyporus*, "Berkeley, nomen nudum", Lloyd 1915 (LMW 4, Ap.): 379 (Scotland?) (incidental mention: n.v.p.); Pilát 1936 (ACE 3): 64 ("*Cordonii*") (syn.).—According to Lloyd, i.e., "type a remnant. Probably *Polyporus brumalis*."
- **gossypium*, *Poria*, Speg. 1898 (ABA 6): 169 (Argentina); *Fibroporia* Parm. 1968.—Referred by Bres. 1916 (Am 14): 229 to *Poria vaillantii*, but Lowe 1966: 118 accepted it as a good sp. that he also recorded for Europe, presumably because he listed *Leptoporus destructor* var. *resupinatus* Bourd. & G. ≡ *L. [Poria] resupinatus* as a syn.
- **gratus*, *Polyporus*, Berk. 1854 (HJB 6): 163 (India); *Polystictus* Cooke 1886; *Microporus* O.K. 1898.—According to Lloyd 1915 (LMW 4, Ap.): 379, "seems same as *Polyporus* [*Tyromyces*] *floriformis*".
- **gratzianus*, *Polyporus*, Murrill 1945 (QFA 8): 197 (n.v.) (U.S.A., Florida).—Lowe apud Overh. 1953: 426 thinks that it "does not appear to differ from *P[oly]porus* [*Abortiporus*] *biennis*." Cf. (2). Fid. 1969 (Ri 4): 150, 153, 162 referred it to *Heteroporus biennis* var. *flabelliformis* ("Mont.") Fid. [sensu Fid. = *Abortiporus distortus* (O); see Donk 1971 (PNA 74): 2], without having seen the type.
- grisea*, *Bulliardia*, Lázaro 1916 (RMa 14): 841 / 1917: 153 (Spain); *Daedalea* Sacc. & Trott. apud Trott. 1925.—Nomen dubium, Cf. Bres. apud Trott. 1925 (SF 23): 449, "... species haec vix forma *Daed.* [*Cerrenae*] *unicoloris* habenda."
- griseopora*, *Trametes*, Lázaro 1917 (RMa 15): 371 / 1917: 285 (Spain).—Nomen dubium.
- griseus*, *Polyporus*, (Wint.) Pilát 1938 (syn.: n.v.p.), not ~ Peck 1873, not ~ Bres. 1912; *Polyporus destructor* var. Wint. 1882 (RKF I): 433; [= *Polyporus alutaceus* Fr. sensu Rostk. 1830 (StP 4): 57 pl. 27 (Germany/Poland)].—Pilát 1938 (ACE 3): 183 (& cf. p. 200) referred this to

Leptoporus [Incrustoporia] semipileatus, which cannot be correct. — See further under *Polyporus alutaceus*.

griseus violaceus, *Polyporus*, Seer. 1833 M. 3: 157 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.).—Fide Fr. 1838: 479 ("n. 107") = *Polyporus [Hirschiporus] abietinus*.

**grossus*, *Irplex*, Kalchbr. 1881 (G 10): 57 (South Africa); *Xylodon* O.K. 1898.—Fide Bres. 1920 (Am. 18): 70 = *Trametes [Funalia] gallica* [sensu lato]. The original descr. states, "substantia ligneo-patens" [-palente", fide Sacc. 1888 (SF 6): 487]. — Cf. (36).

guttatus, *Polyporus*, Preuss 1846 (BCR 1): 202 (Germany) (nom. nud.: n.v.p.), not ~ Weinm. 1826.—Nomen dubium.

Gymnoderma Humb. 1793: 109 (nom. anam.?) (d.n.) per Steud. 1824 [1957 (Ta 6): 72], monotype, *Gymnoderma sinuatum* Humb. (O).

Gyrophana Pat. 1897 [1958 (Fu 28): 9] = *Gyrophora* Pat. 1887, basionym, not ~ Ach. 1803 (Gyrophoraceae, Lichenes) [1958 (Fu 28): 10]; lectotype, *Merulius lacrimans* (Coniophoraceae) (O). Correct name, *Serpula* (O).

Gyrophora Pat. → *Gyrophana* Pat.

haematodes, *Polyporus*, Fr. "in litt." (type locality not mentioned), not ~ Rostk. 1838.—Cited by Fr. 1851 (NAu III 1): 55/39 as a syn. of *Polyporus hypococcinus* [= *Polyporus [Tyromyces] croceus*].

haematodes, *Polyporus*, Rostk. 1838 (StP 4): 127 pl. 62 ("haematodus") (Germany/Poland), not ~ Fr. (n.v.p.); *Poria* Egeland 1912.—Nomen dubium. Referred by Fr. 1874: 573 to *Polyporus rufus* [→ *Boletus rufus* Schrad. (O)], by Bres. 1903 (Am 1): 76 to *Poria [Merulius] taxicola* (O).

**haematoxyli*, *Pyropolyporus*, Murrill 1903 (BTC 30): 117 (Jamaica); *Fomes* Sacc. & D. Sacc. 1905.—Referred with some reservations to *Fomes [Phellinus] robustus* by Lowe 1957 F.: 55. — Descr.: Murrill 1908 (NAF 9): 111.

hapalus = *apalus*.

**hartmannii*, *Polyporus*, Cooke 1884 (G 12): 14 (Australia, Queensland); *Caloporus* R. Heim 1962, presumably misapplied.—Reported by R. Heim 1962 (RM 27): 93 from near Paris, France, as an alien, but I doubt the correctness of his determination. He described the spores as "phaséoliformes en profil frontal, . . . de 5–6 × 3.9–4.2 μ . . ."; this does not agree with the descriptions based on Australian material as published by Clel. 1935: 211 f. 15 ("spores narrow, oblique, mummy shaped, . . . 7 to 9 × 2.5 to 3.5 μ") and G. Cunn. 1965: 79 f. 10 ("spores narrowly cylindrical or fusiform, . . . 7–9 × 3–3.5 μ"). — Apparently also different from *Albatrellus syringae*.

heloporus = *holoporus*

Henningsomyces O.K. 1898 [1951 (Re 1): 212].—A genus of 'Cyphellaceae', formerly occasionally included in the Polyporaceae.

hepaticus, *Ceriomyces*, Seyn. 1890 (BbF 37): 112 (nom. nud.; n.v.p.), non/an ~ Sacc. 1888; = chlamydosporous state of *Fistulina hepatica*.

heteroclitus, *Boletus*, Bolt. 1791: 164 *pl. 164* (England) (d.n.); *Polyporus* (Bolt.) per Fr. 1821; *Boletus* S. F. Gray 1821, Purt. 1821.—Nomen dubium. None of the suggestions about the identity made so far are acceptable to me. Cf. Fr. 1828 E. 1: 78, "Ambiguus ille *P. heteroclitus* Bolt. num hinc [*P. alligatus*], an *P. squamoso* affinior?" Lloyd 1915 (LMW 4, Ap.): 380 did not question that it was *Polyporus [Albatrellus] cristatus*; he also stated that Cooke referred *Polyporus rufescens* [= *Abortiporus biennis*] here. The original descr. states that the upper surface is thickly covered with a rough hairy pile or shag, the young fruitbody a golden colour, changing to orange brown with age, and the colour of the pores varying with age from a pale bright yellow to an orange brown; internal substance white, leathery. — Sensu Sow. 1802: *pl. 367* is certainly different; Fr. 1838: 475 referred this fungus to *Polyporus [Oxyporus] ravidus*, in my opinion an unlikely disposition.

heteroporus, *Polyporus*, Pers. "in Litt." (n.v.p.), not ~ Mont. 1841, not ~ Fr. apud Quél. 1872.—Referred by Cooke 1886 (G 15): 25 to *Poria pinguedinea* (**O**).

heufleri, *Polyporus*, S. Schulz. 1866 (nom. nud.), 1879 (VW 28): 431 ("Huefieri") (Yugoslavia, Slavonia) (nomen subnudum)—Nomen dubium. Insufficiently described.

Hexagona Bond. 1953: 47, 524 (lacking Latin descr.: n.v.p.), not ~ Pollini 1816 (d.n.) per Fr. 1835; [= *Hexagonia* Pollini per Fr. 1835 F.s.: 339, 1838: 496 ("Hexagona") sensu Bond., i.e., excl. of type, viz. *Polyporus mori*, cf. Bond. 1953: 446]; holotype, *Hexagonia [Apoxona] nitida*.

hippocastani, *Polyporus*, Saut. 1869 (H 8): 41 (Austria).—Nomen dubium.

hirsutulus, *Boletus*, see under *Boletus favus* (**O**).

hirsutus, *Boletus*, Batsch 1783 (d.n.), not ~ Scop. 1772 (d.n.), not ~ Latourr. 1785 (d.n.), not ~ Wulf. 1788 (d.n.); [= *Polyporus Alpinus*, *cinereus* . . . Mich. 1729: 130 *pl. 71 f. 2* (Italy)]; = *Polyporus tessulatus* Fr. 1818 (d.n.) per Fr. 1821; *Boletus* Pollini 1824.—Insufficiently described and crudely depicted. Nevertheless I would suggest that this may well be *Strobilomyces floccopus* (Vahl per Fr.) P. Karst. (Boletales). Quél. 1888: 405 referred *P. tessulatus* to *Caloporus subsquamosus* [sensu Quél. = *Boletopsis grisea*].

hirsutus, *Boletus*, Latourr. 1785: 39 (d.n.), not ~ Scop. 1772 (d.n.), not ~ Batsch 1873 (d.n.), not ~ Wulf. 1788 (d.n.); [= *Polyporus sessilis*, *convexo planus*, *anulis versicoloribus*, *poris albis tenuissimis* Haller 1768 H. 3: 140 no. 2283 (Switzerland)].—Nomen dubium. Latourr. gave no descr., but only a ref. to Haller's non-binomial sp. Fr. 1821: 368 referred this to *Polyporus [Coriolus] zonatus* (sub forma b). Haller's descr. and the syns. cited show that he had no clear conception of his sp.; he made it a strongly heterogeneous one, lacking *Coriolus hirsutus* as a constituent element.

**hirsutus*, *Trametes*, Lloyd 1924 (LMW 7): 1319 (Australia, Victoria) (nom. nud.: n.v.p.) [cf. Stev. & Cash 1936: 144], not ~ (Wulf. per Fr.)

Pilát 1939.—Fide Lloyd, l.c., “a trametoid form of *Polyporus [Coriolus] hirsutus*”.

hirsutus ramealis, *Polyporus*, Seer. 1833 M. 3: 131 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.).—Apparently a sp. of *Coriolus*, perhaps a form of *C. hirsutus*.

hirtus juglandis, *Polyporus*, Seer. 1833 M. 3: 86 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.).—Fr. 1874: 552 referred this to *Polyporus [Spongipellis] spumeus*. I would suggest *Tyromyces fissilis*. *hispida*, *Lenzites*, Lázaro 1916 (RMa 14): 847 / 1917: 159 (Spain).—Nomen dubium. *Lenzites betulina*?

hispidus, *Boletus*, Rox. Clem. 1864: 64 (Spain) (syn.: n.v.p.), non/an ~ Bull. 1784 (d.n.) & ~ (Bull. per Fr.) St-Am. 1821.—This was reduced (apparently by the editor of the paper, Colm.) to *Polyporus [Coriolus] hirsutus*. There is no descr., only the indication, “En los troncos de morera.” This was perhaps not a new name but merely a record of *Boletus [Inonotus] hispidus* Bull.

holoporus, *Polyporus*, Pers. 1825: 107 [1822: pl. 6 fs. 3, 4] (Germany); Fr. 1828 E. 1: 117 (“*heloporus*”; syn.); *Irpea* Sacc. & Trav. 1910.—Nomen dubium. Referred by Fr. 1828 E. 1: 117 to *Polyporus [Poria] xanthus*. Considered to be a form of *Poria [Antrodia] sinuosa* by Bourd. & G. 1928: 672, who relied on the descr. only. The epithet should apparently be corrected into ‘*heloporus*’, as was done by Fr., l.c., cf. Persoon’s remark, “... tubulos decumbentes glabros fere solos constituens.” No type could be traced in Persoon’s herbarium.

hornotinus, *Boletus*, P. Magn. 1905: 180 (“*Swartz*”) (syn.: n.v.p.).—An error for *Polyporus marginatus* [status] “*B. hornotinus et annosus*” Fr. 1874: 561, in part [= *Fomitopsis pinicola*].

hornotinus, *Boletus*, (Fr.) Mussat 1901 (SF 15): 65 (syn.: n.v.p.).—An error for *Polyporus resinosus* [status] “*B.*” *hornotinus*” Fr. 1874: 554, Sacc. 1888 (SF 6): 137, the ‘*B.*’ being taken for the abbreviation of ‘*Boletus*’.

hrabatii, *Polyporus*, Opiz 1855 (Lo 5): 87 (Czechoslovakia).—Nomen dubium.

huefneri = *heufleri*

**hyalinus*, *Polyporus*, Berk. 1859 Ta.: 255 (Australia, Tasmania); *Poria* Cooke 1886.—Nomen dubium, fide Lowe 1966: 136, but cf. G. Cunn. 1965: 46 who gives a full descr. Here mentioned because J. Rick 1960 (Ih 7): 271 referred *Poria byssopora* J. Rick [= *P. xylostromatoides*] to this sp. as a var.

hybridus, *Boletus*, “Willd. plant cryptog. ined.”—A herbarium name (n.v.p.) mentioned by Humb. 1793: 99 in an observation on *Boletus fodinalis* (O).

hydnoides, *Boletus*, Gaterau 1789: 191 (France) (d.n.).—Nomen dubium.

hygrophanus, *Polyporus*, Romell 1926 (nom. prov.: n.v.p.) (Germany).—This is *Tyromyces gloeocystidiata* fide Kotl. & P. 1964 (ČM 18): 207,

217 [*T. leucomallelus*]. Lundell 1946 (LNF 27-28): 8 concluded that the illustration Fr. 1884 I. 2: *pl. 181 f. 2* matches a sp. related to *Polyporus [Tyromyces] fragilis* and "without doubt identical with *P. trabeus* sensu Bres. [= *Tyromyces leucomallelus*] and with *P. hygrophanus* Romell ad interim [1926 (SbT 20): 18]." Romell, i.e., wrote in connection with certain specimens, "It may be a distinct species (provisionally called *Pol. hygrophanus* in my herbarium.)"

hymenopus, *Daedalea*, F. Brig. 1847 (Italy).—Nomen dubium. Sacc. 1916: 955 referred this to *Polyporus rufescens* [= *Abortiporus biennis*], but several details of the descr. contradict this disposition.

hyosotis, *Fungoides*, Paul. 1812-35: *pl. 185 fs. 1, 2* (generic name n.v.p.) = *Conchites auricula-major* Paul. 1793 (d.n.).—This sp. has been identified with *Polyporus varius* and *P. melanopus*, but Donk 1960 (Pe 1): 219 suggests that it may be one of the large Pezizaceae (Discomycetes).

**hyperborea*, *Poria*, Berk. in herb. (Canada) & cf. Cooke 1886 (G 14): 114 (nom. nud.), 1886 (G 15): 27, Sacc. 1886 (SF 6): 325 (incidental mention: n.v.p.).—Fide Bres. 1926: 80 = *Polyporus [Hirschioporus] pargamenus* (resupinate).

**hypocitrinus*, *Polyporus*, Berk. 1876 (JLS 15): 50 (Brazil).—Considered to be a form of *Polyporus [Tyromyces] lacteus* by Bres. 1916 (Am 14): 225, but cf. Speg. 1925 (BCÓ 28): 374.

hypocrateriformis, *Boletus*, Schrank 1789: 621 (Germany) (d.n.).—Nomen dubium. This was referred to *Polyporus brumalis* by Fr. 1821: 348, but the original descr. is too incomplete for certain determination. A sp. with white fruitbody.

**hypilateritia*, *Poria* (Berk.) ex Cooke 1886 (G 15): 24; *Polyporus* Berk. in herb. (India); *Schizophora* (Berk. ex Cooke) Parm. 1968.—At first this was referred by Lowe 1962 (PMi 47): 186 to *Poria versipora* [= *Schizophora paradoxa*]; later he treated it as a distinct, but closely related, sp. (Lowe 1966: 65) but I doubt his interpretation (105). Its being recorded for Europe is because Lowe considered *Poria eyrei* and *P. consobrina* to be syns.

**hypopolius*, *Polyporus*, Kalchbr. apud Cooke 1882 (G 10): 20 (Australia, Queensland).—Fide G. Cunn. 1950 (PNW 75): 228 & 1965: 147 = *Fomitopsis/Heterobasidion hemitephra* (extra-European). Also cited as a syn. of *Heterobasidion annosum* because Lloyd 1915 (LMW 4, Fo.): 281 thought that the "description indicates *Fomes annosus*."

impolitus, *Polyporus*, Fr. 1851 (NAu III 1): 58/42 (Costa Rica).—A nomen dubium. According to Lloyd 1915 (LMW 4, Ap.): 381 "no type exists." — Reported from Portugal by Thüm. 1878 (JSL 6): 243, a record almost certainly based on a misidentification. In later Portuguese literature sometimes listed as *Boletus impolitus* Fr. (Boletaceae), a quite different sp.

impuber, *Boletus*, Sow. 1799: *pl. 195* ("Bull.") (d.n.); *Polyporus* (Sow.)

per Pers. 1825.—The specific epithet was ascribed to Bull.; perhaps Sow. had *Boletus 'imberbis'* Bull. in mind, although this suggestion is not very likely. If treated as a new species, then the name could better be qualified as nomen dubium. — During the course of his life Fr. made various suggestions; in 1874: 548 he referred Sowerby's fungus to *Polyporus [Phellinus] gilvus*, an unacceptable identification (79).

incarnatus, *Polyporus*, Fr. 1832^{Ind.}: 149 (Sweden), not ~ (Pers.) per Fr. 1821.—Nomen dubium. Cf. also (110).

**induratus*, *Polyporus*, Peck 1879 (RNS 31): 37 (U.S.A., New York) [repr. 1881 (H 20): 141], not ~ Berk. 1875, not ~ Lloyd 1918; *Myriadoporus* Peck 1884 (nom. prov.: n.v.p.); *Poria* Cooke 1886.—Pat. 1889 (BmF 5): 84 referred this to *Polyporus [Oxyporus] obducens* (myriadoporous), Murrill 1920 (M 12): 80 made it a doubtful syn. of *Poria [Perenniporia] subacida*. Not mentioned by Lowe 1966. — Deser.: Overh. 1919 (BNS 205–206): 82 pl. 6 fs. 6–7, pl. 7 fs. 1–3 (*Poria*). *informis*, *Boletus*, Cumino 1805: 223 (Italy) (d.n.) per Pollini 1824; *Polyporus* Pers. 1825.—Nomen dubium. Referred by Fr. 1838: 455 to *Polyporus [Tyromyces] croceus*, and 1874: 540 to *Polyporus lobatus* [sensu Fr. = *Albatrellus cristatus*?]. The descr. is insufficient to determine the identity, I believe.

infularis = *insularis*

infundibuliformis, *Helvella*, Schaeff. → *Boletus coriaceus* Batsch 1783 (0).

infundibuliformis, *Polyporus*, "Roth".—Cited by Fr. 1832^{Ind.}: 146; "Roth" is an error for 'Rostk.' — A syn. of *Polyporus squamosus*.

infundibulum, *Agaricus*, Paul. 1812–35: pl. 4 f. 2 (d.n.?); [= Agaric-iris en entonnoir Paul. 1793 T. 2: 81 (France)].—Nomen dubium. Lév. 1855: 4 called this *Polyporus [Coriolus] versicolor* var. *infundibuliformis* Lév. However, the protologue is so poor that nothing definite can be suggested. It is even doubtful whether it is a polypore at all.

inodora, *Trametes*, Fr. 1849 (nom. nud.: n.v.p.), 1863 M. 2: 273 (Sweden); *Daedalea* E. Krause 1925.—Nomen dubium. Pilát 1934 (BmF 49): 264 reduced this to the rank of a form of *Trametes suaveolens* [sensu Fr.], differing only in the lack of the odour of anise. Fries also emphasized other differences: "... sed minor, firmior, semper alba (pori non fuscescens), poris minoribus, rotundis et odore nullo distincta." — Fr. 1884 I. 2: pl. 191 f. 1 reminds me of *Trametes gibbosa* (small fruitbody) by the shape and size of the pores.

insularis, *Polyporus*, Pers. → *Boletus terrestris* Sow. (0).

intermedius, *Polyporus*, Sing. 1922 (PK 5): 265 (Germany), not ~ Rostk.

1837.—Nomen dubium. Sing. 1962: 159 referred this to *Polyporus arcularius*; in the original descr. he thought it to be intermediate between *P. arcularius* and *P. ciliatus*. The descr. is insufficient to decide on its identity, but cf. *P. brumalis*; Singer's conceptions of *P. arcularius* (of 1922 and of 1962) and *P. ciliatus* (of 1922) are not clear to me.

- **internus*, *Polyporus*, Schw. 1832: 159 (U.S.A., Pennsylvania); *Poria* Cooke 1886.—Referred by Bres. 1926: 30 to *Poria monticola* [= *Poria placenta*]; but it is not clear what conception Bres. had of the latter sp. Overh. 1923 (M 15): 215 could not find a type in herb. Schw. and in the Michener collection, but a portion of it may be at K.
- interruptus*, *Boletus*, Pers. "Mscr." ≡ *Polyporus frustulatus* Pers. = *Rigidoporus undatus*.—Cited by Fr. 1828 E. 1: 93 as a syn. of *Polyporus [Antrodia] serialis* (forma).
- **interruptus*, *Polyporus*, B. & Br. 1873 (JLS 14): 55 (Ceylon); *Poria* Cooke 1886.—This name is mentioned because Petch 1919 (APe 7): 5 here referred *Poria aquosa* Petch, which Lowe listed as a syn. of *Poria xylostromatoides*.
- inversus*, *Boletus*, "[Gunn.] Fl. N. 540", 1779: 249 (d.n.), not ~ Vill. 1789 (d.n.) per Steud. 1824 or per Pollini 1824.—Nomen dubium. Retz. cited "Fl. N. 540" = J. E. Gunnerus, Fl. norv. 2. "1772" [1776]; I have been unable to locate this name in the cited work.
- inversus*, *Boletus*, Vill. 1789: 1042 (France) (d.n.), not ~ Retz. 1779 (d.n.); *Boletus* Vill. per Steud. 1824 or per Pollini 1824.—Nomen dubium. Referred by Fr. 1821: 381 to *Polyporus vulgaris* [sensu typo = *Poria lenis*], which means scarcely anything.
- inversus*, *Polystictus*, Lázaro 1916 (RMa 14): 746 / 1917: 132 (Spain).—Nomen dubium. *Coriolus hirsutus*?
- investiens*, *Polyporus*, Desm. in herb. Pers. (n.v.p.).—Fide Pers. in herb. = *Boletus abietinus* [sensu] DC. [= *Skeletocutis amorphus*], as mentioned by Lloyd 1915 (LMW 4, Ap.): 381.
- **irpicoides*, *Daedalea*, P. Henn. 1898 (BJ 25): 501 (New Guinea) was cited in error by Bond. 1953: 478 as a syn. of *Cerrena unicolor* var. *irpicoides* (Bres. ex Bourd. & G.) Bond.
- **isabellina*, *Lenzites*, Lloyd 1922-3 (LMW 7): 1156 pl. 220 f. 2274 (Philippine Is.) (n.v.p.).—Fide Lloyd, i.e., a form of *Lenzites betulina*.
- **isabellinum*, *Chromosporium*, Ell. & Sacc. apud J. B. Ell. 1885 N.A.F.: No. 1391 ("ined."); n.v.p.) (U.S.A., New Jersey).—Fide Ell. & Ev. 1890 (JM 6): 79 = *Mucronoporus [Inonotus] andersonii*, spore print; "on old *Polyporus (obliquus)*? and on rotten wood adjacent" is mentioned on the original label. Cf. Donk 1971 (PNA 74): 8 for similar cases.
- isidioides*, *Polyporus*, Opiz 1852: 136 (Czechoslovakia) (nom. nud.; n.v.p.), not ~ Berk. 1843.—Nomen dubium.
- isopora*, *Daedalea*, (Pers.) E. Krause 1928 ("*Daedaleus*"); *Xylomyzon* Pers. 1825: 33 pl. 16 fs. 1, 2 (France); *Merulius* Duby 1830; = *Merulius rufus* Pers. per Fr. ('Corticiaceae') fide Fr. 1828 E. 1: 63 ("*isopyrum*") & Bres. 1903 (Am 1): 83.
- **jamaicensis*, *Fomitiporia*, Murrill 1907 (NAF 9): 11 (Jamaica); *Poria* Sacc. & Trott. 1912.—Referred by Lowe 1949 (Ll 11): 167 & 1957 F.: 56 to *Poria [Phellinus] punctatus*, which he regarded as resupinate

Fomes [Phellinus] robustus but cf. (86). A re-description of the type is needed.

**jamaicensis*, *Inonotus*, Murrill 1904 (BTC 31): 597 & 1908 (NAF 9): 88 (Jamaica); *Polyporus* Sacc. & Trott. 1912.—Lloyd 1915 (LMW 4, Ap.): 381 was inclined to refer this to *Polyporus [Inonotus] cuticularis*, but it is a distinct sp. — Descr. : D. Reid 1955: 12 f. 1; Pegl. 1964 (TBS 47): 190 f. 2; 10 (*Inonotus*).

**japonica*, *Lenzites*, B. & C. 1858 (PAA 4): 121 (Japan); *Cellularia* O.K. 1898.—Bres. 1916 (Am 14): 221 referred this to *Lenzites betulina* "f. biennalis"; Imaz. 1943 (BTS 6): 73 and S. Ito 1955: 232 consider it to be a syn. of *Trametes acuta* (Berk.) Imaz. [= *Lenzites acuta* Berk.], an extra-European sp.

**javanicus*, *Xanthochrous*, Pat. 1897 (ABu, S. 1): 113 pl. 24 fs. 8–10 (Indonesia, Java); *Cyclomyces* Sacc. & Syd. 1899.—This was referred to *Cyclomyces greenei* [= *Polyporus [Coltricia] montagnei* var. *greenei* (Berk.) R. L. Gilb.] by Lloyd 1917 (LMW 5): 633.

**jezoensis*, *Daedalea*, Yamano 1930 (Goryorin No. 25): 70 fs. 1, 3, 7, 8 (n.v.) (Japan); *Fomes* Tochinai & Kamei 1933 (n.v.); *Cryptoderma* Imaz. 1943 ("yezoense").—See under *Cryptoderma yamanoi*.

jodiolens, *gilvescens*, *givrotacta*, *farinella*, *microspora*, *minutosinuosa*, *radiosa*, *senescens*, *suecia*, *Poria*, Romell in herb., and *jodoformicus*, *lunaris*, *tactus*, *Polyporus*, Romell in herb.—Herbarium names mentioned by Jo. Erikss. 1949 (SbT 43): 7–15 as syns. of *Poria lenis*.

**junguhnnii*, *Lenzites*, Lév. 1844 (ASn III 2): 180 (Indonesia, Java); *Cellularia* O.K. 1898.—This has been referred to *Lenzites guineensis*, which in its turn has been referred to *Lenzites betulina*; cf. Fr. 1851 (NAu III 1): 44–45/28–29, "Non igitur dubitamus esse *L. Junghuhnii* Lev. . . , quam Cel. Junghuhn ipse pro *L. betulina guineensi* habuit, quae lamellis acie subvelutinis modo recedit." Bres. treated it as a distinct sp. from *L. betulina*.

**juniperina*, *Fuscoporia*, Murrill 1907 (NAF 9): 4 (U.S.A., Louisiana); *Poria* Sacc. & Trott. 1912.—Referred by Lowe 1949 (Ll 11): 168 to *Poria [Phellinus] punctata* and 1957 F.: 56 to resupinate *Fomes [Phellinus] robustus*, but cf. (86). Redescription of the type is needed. Cf. D. Baxt. 1941 (PMi 26): 111 f. 4 (*Fuscoporia*); 1952 (PMi 37): 103, 104 (*Fomes robustus* forma).

**juniperinus*, *Agaricus*, Murrill 1905 (BTC 32): 85 (U.S.A., Kansas); *Daedalea* Murrill 1908; = *Daedalea kansensis* J. B. Ell. in herb. [cf. Lloyd 1906 (LMW 2, L. 10): 3, 1911 (LMW 3, L. 38): 11].—This sp. was referred by Bres. 1920 (Am 18): 64 as a form to *Daedalea quercina*, but I believe that it can be better kept apart. It may be referred to *Antrodia*. — Lloyd 1911 (LMW 3, L. 38): 10, 11 recorded it from Russia, with the remark, "This is the first record of the plant in Europe". The record needs verification; modern Russian authors do not report it from Europe.

- kansensis*, *Daedalea*, J. B. Ell. → *Agaricus juniperinus* Murrill (**O**).
 kansensis*, *Trametes*, Crag. 1884 (BWb 1): 24 [repr. 1884 (JM 1): 28] (U.S.A., Kansas).—Nomen dubium. Murrill 1908 (NAF 9): 125 referred this, with doubt, to *Daedalea quercina*. Cf. also Overh. 1953: 124. The type grew “on dry oak planks”, which would exclude *Daedalea juniperina*. This should not be confused with *Daedalea kansensis* J. B. Ell. in herb. ≡ *D. [Antrodia] juniperina* (O**).
karelicus, *Polyporus*, Jač. 1913 O.G. 1: 635 (n.v.).—Nomen dubium, fide Bond. 1953: 619, who thought of a sp. of *Coriolus*, perhaps even *C. versicolor*.
 kauffmannii*, *Favolus*, Lloyd 1916 (LMW 5): 614 f. 869 (U.S.A., Michigan) (“I think it is a variation of *Favolus europaeus*”: n.v.p.).—Fide Overh. 1953: 157 = *Favolus alveolarius* (O**). I am not convinced that this is correct, judging from the figure only.
 **kerensis*, *Polyporus*, Passerini 1875 (NGi 7): 181 [repr. Martelli 1886: 132] (Abyssinia).—Lloyd 1915 (LMW 4, Ap.): 381 thought that the descr. “reads like *Polyporus [Truncospora] ochroleucus*”, an unlikely guess.
kirchneri, *Favolus*, Wallr. (“in litt.”) apud L. Kirchn. 1856 (Lo 6): 246 (Czechoslovakia).—Nomen dubium. *Polyporus mori*?
 **klotzschii*, *Lenzites*, Berk. 1841 (AM 7): 452; *Cellularia* O.K. 1898; [= *Daedalea discolor* Fr. sensu Kl. 1833 (Li 8): 481 (Canada) (lacking descr.)]; ≡ *Lenzites discolor* Fr. 1851, typonym.—Fide Murrill 1905 (BTC 32): 86, 87 = *Agaricus [Daedaleopsis] confragosa*. — Cf. (31).
 kusanoi*, *Coriolellus*, Murrill 1909 (M 1): 165 (Japan); *Trametes* Sacc. & Trott. 1912.—Imaz. 1939 (JJB 15): 302 referred this to *Trametes [Antrodia] albida*, but Aosh. 1967 (TmJ 8): 3 considers it a syn. of *Daedalea [Antrodia] tanakae* (O**). — Descr.: Nohara 1910 (BMT 24): (8) fs. 4, 6d (*Coriolellus*); & see next entry.
 kusanoi*, *Daedalea*, Murrill sensu Lloyd 1924–5 (LMW 7): 1331 pl. 317 f. 3054.—Referred to *Trametes [Antrodia] albida* by Imaz. 1939 (JJB 15): 302, but his conception perhaps coincided with *Irpicoporus [Antrodia] tanakae* (O**).
Labirinthia S. Schulz.—Published as a syn. in the combination *Labirinthia truncata* (**O**).
laburni, *Polyporus*, Opiz 1852: 136 (Czechoslovakia) (nom. nud.: n.v.p.). —Nomen dubium.
labyrinthica, *Lenzites*, Quél. & Schulz. apud S. Schulz. 1885 (H 24): 141 (Yugoslavia, Slavonia); *Cellularia* O.K. 1898.—Nomen dubium.
labyrinthicus, *Polyporus*, Fr. → *Sistotrema spongiosum* Schw. (**O**).
lacerum, *Porotheleum*, Fr. 1818 O. 2: 273 (Sweden) (d.n.) per Fr. 1828.—Fide Lloyd 1917 (LMW 5): 740 = *Porotheleum fimbriatum* [= *Stromatocystpha fimbriatum* (**O**)].
lacrimans, *Boletus*, Wulf. 1781 (MaJ 2): 111 pl. 8 f. 2 (“*lacrymans*”) (Austria) (d.n.); *Merulius* Schum. 1803 (d.n.); *Xylophagus* Siemss. 1809 (n.v.) (d.n.); *Merulius* (Wulf.) per Fr. 1821 (“*lacrimans*”); *Boletus*

- Purt. 1821; *Gyrophora* Pat. 1887 (nom. nud.: n.v.p.); *Gyrophana* Pat. 1900; *Sesia* P. Karst. 1899; *Xylomyzon* E. Krause 1932; \equiv *Merulius lacrymabundus* Link 1833; \equiv *Serpula lacrymans* (Wulf. per Fr.) J. Schroet. 1888 (Coniophoraceae).
lacrimans, *Ptychogaster*, P. Henn. in herb.—P. Henn. 1889 (VBr 30): v rejected this name in favour of *Ptychogaster rubescens* (125).
lacrymabundus, *Merulius*, Link \rightarrow *Boletus lacrimans* Wulf. (O).
lacrymans, *Polyporus*, Saut. 1876 (H 15): 150 (Austria); *Poria* Cooke 1886.—Nomen dubium.
**lamelliformis*, *Irpex*, Lloyd 1917 (LMW 5): 715 f. 1073; [\equiv *Irpiciporus noharae* Murrill sensu Lloyd 1916 (LMW 5): 601 f. 851 (*Irpex*) (Japan)].—Considered to be a syn. of *Hirschioporus fuscoviolaceus* by Imaz. 1944 (JJB 20): 286, from which sp. it seems to differ in some respects.
lanatus pruni, *Polyporus*, Secr. 1833 M. 3: 152 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.).—Nomen dubium.
**langloisi*, *Fomitiporia*, Murrill 1907 (NAF 9): 9 (U.S.A., Louisiana); *Poria* Sacc. & Trott. 1912.—Referred by Bres. 1926: 30 and Lowe 1949 (Ll 11): 167 to *Poria friesiana* [= *Phellinus punctatus*] (86). A redescription of the type is needed.
lapidum, *Boletus*, Raddi 1807: 361 (Italy) (nom. nud.).—To judge from the epithet alone, this may be *Polyporus tuberaster*. Since Raddi did not add "nob." to the name it may perhaps have been previously published by another author.
laricis, *Boletus*, Schleich. 1821: 56 (Switzerland) (nom. nud.), not \sim Rubel 1778 (d.n.) per Roques 1821.—Nomen dubium. This was described by Secr. 1833 M. 3: 160 as *Polyporus [Poria] vulgaris* var. B. (unnamed var.).
**laricis*, [Trametes?], Jač. in litt. (U.S.S.R., Russia, Siberia) \equiv *Xanthochrous pini* var. *laricis* (Jač.) ex Pilát 1934 (BmF 49): 272 pl. 23 fs. 1, 2.—Fide Pilát 1942 (ACE 3): 521 = *Phellinus pini* var. *abietis* (P. Karst.) Pilát [= *Phellinus chrysoloma*] (forma). — Cf. (84).
lateralis, *Polyporus*, Pers. apud Gaud. 1827: 175 (New Guinea, Rawak I.); *Melanopus* Pat. 1927 ("*lateris*").—Lloyd 1912 (LMW 3, S.P.): 185 ("*lateratus*") wrote, "In my opinion, it is a lateral stemmed form of [*Polyporus*] *elegans* [= *P. varius*] of Europe." To be verified.
latus, *Boletus*, Sow. 1803: pl. 387 f. 9 (England) (d.n.); *Polyporus* (Sow.) per Steud. 1824, not \sim Berk. 1839; \equiv *Polyporus concentricus* Pers. 1825, not \sim Cooke 1880.—Nomen dubium. Cf. Fr. 1828 E. 1: 122.
**lavendulus*, *Polystictus*, Lloyd 1922 (LMW 7): 1121 pl. 201 f. 2142 (U.S.A.: Minnesota) (as a form of *P. parchmentinus*: n.v.p.).—Fide Overh. 1953, 336, 338 = *Polyporus [Hirschioporus] parchmentinus*, "spores reported by Lloyd ... are undoubtedly foreign".
laxus, *Polyporus*, Otth apud Trog 1857 (MiB): 39 (Switzerland).—Nomen dubium.
lazaroi, *Polyporus*, Trott. \rightarrow *Polyporus parvulus* Lázaro (O).

- **leoninus*, *Polyporus*, Kl. 1833 (Li 8): 486 (East Indies); *Polystictus* Fr. 1851; *Microporus* O.K. 1898; *Coriolus* G. Cunn. 1950; *Trametes* Imaz. 1952; *Spongipellis* Teng 1964; \equiv *Funalia leonina* (Kl.) Pat. 1900. —When Karsten 1859: 30 published the name *Polyporus fibrillosus* [= *Pycnoporellus fulgens*] he cited *Polyporus leoninus* (extra-European), with doubt, as a syn. The latter sp. is widely different.
- Leptopora* Rafin. 1808 (d.n.) [1960 (Pe 1): 236], not *Leptoporus* Quél. 1886; \equiv "Leptostroma. Rafin." Reichenb. 1828 (error; incidental mention: n.v.p.).—Nomen dubium.
- Leptostroma* "Rafin." \rightarrow *Leptopora* Rafin. (**O**).
- **leucogriseus*, *Boletopsis*, Malenç. 1956 (nom. prov.: n.v.p.); [\equiv *Boletopsis grisea* (Peck) Bond. & S. sensu Malenç. 1956 (BmF 71): 272 (Morocco)] (18).
- leucomelaena*, *Polystictoides*, Lázaro 1916 (RMa 14): 832 / 1917: 145 ("leucomelas") (Spain); *Polystictus* Sacc. & Trott. apud Trott. 1925. —Nomen dubium.
- leveilleanus*, *Tyromyces*, Bond. apud Bond. & S. \rightarrow *Polyporus apalus* (**O**).
- ligoniformis*, *Polyporus*, Bon. 1876 (H 15): 76 (Germany).—Nomen dubium. I would suggest, without conviction, *Buglossoporus pulvinus*.
- lilacino-roseus*, *Polyporus*, S. Schulz, "Mpt., p. 763, 1869" (n.v.p.).—Fide Igmándy 1968 (Aph 3): 225 = *Fomes* [*Fomitopsis*] *roseus*.
- **lilacinus*, *Boletus*, Schw. 1822: 100 (U.S.A., North Carolina); *Polyporus* Steud. 1824; Fr. 1832.—Nomen dubium. Referred by Fr. 1828 E. 1: 118 & 1838: 484 to *Polyporus* [*Ceriporia*] *purpureus*. Overh. 1923 (M 15): 216 reported that no type existed.
- lilacinus*, *Polyporus*, (Batsch per Opiz) D. Dietr. 1847 ("lilacineus"); *Helvella lilacina* Batsch 1786: 187 pl. 25 f. 131 (Germany) (d.n.); = *Stereum purpureum* (Pers. per Fr.) Fr. \equiv *Chondrostereum purpureum* (Pers. per Fr.) Pouz. ('Stereaceae').
- **lindheimeri*, *Trametes*, B. & C. apud Berk. 1872 (G 1): 66 (U.S.A., Texas); *Polystictus* Cooke 1886; *Microporus* O.K. 1898; *Polyporus* Murrill 1905 (incidental mention: n.v.p.).—Fide Murrill 1908 (NAF 9): 79 & Lloyd 1910 (LMW 3, M.): 65, 68 = *Funalia/Polystictus stuppea* which in its turn has been referred to *Funalia hispida* = *F. gallica*, but cf. Bres. 1926: 25, "a *Trametes stuppea* . . . prorsus est diversus." — For figure of type, see Lloyd, op. cit., f. 355 (as *Polystictus stuppeus*). — Cf. (36).
- lindtneri*, *Septocylindrium*, W. Kirschst. 1936 (ZP 15): 118 pl. 15 f. 2 (Yugoslavia) (nom. anam.).—This has been considered a chlamydosporous state of *Ganoderma appplanatum* by Pilát 1942 (ACE 3): 491, but this conclusion is still open to considerable doubt. Similar growths were described as *Hymenochaete dendroidea* B. & C. apud B. & Br.,

- Reticularia apiospora* B. & Br., and *Institale bombacina* (Fr. apud Weinm.) Fr. sensu Lloyd. — Cf. (41).
- linearisporus*, *Polyporus*, Velen. 1922: 654 [see Pilát 1948: 250 for Latin translation] (Czechoslovakia).—Referred by Pilát 1938 (ACE 3): 185, without comment, to *Leptoporus* [*Tyromyces*] *lacteus* in a very inclusive sense.
- **lloydii*, *Fomitiporia*, Murrill 1907 (NAF 9): 10 (U.S.A., Ohio); *Poria* Sacc. & Trott. 1912.—Referred by Bres. 1926: 80 and Lowe 1949 (LI 11): 167 to *Poria friesiana* [= *Phellinus punctatus*], cf. (86). A re-description of the type is needed.
- lobatum*, *Xylometron*, Paul. → *Agarico-suber lobulatum* Paul. (0).
- lobulatum*, *Agarico-suber*, Paul. 1793 T. 2: 78 (descr.), Ind. (name) [pl. 3 f. 1] (France) (d.n.); ≡ *Xylometron lobatum* Paul. 1812–35 (generic name n.v.p.).—Nomen dubium.
- **loennbohmii*, *Poria*, P. Karst. 1904 (ÖFF 46 II): 8 (U.S.S.R., Baikal region).—Referred to *Daedalea* [*Daedaleopsis*] *confragosa* by Lowe 1956 (M 48): 121. — Cf. (31).
- **lucidus*, *Ptychogaster*, Lloyd 1920 (LMW 5): 699 f. 1046 (Brazil) (nom. anam.).—Lloyd considered this to be an imperfect state of *Polyporus* [*Ganoderma*] *lucidus*, but this is certainly wrong. The presence of “large setal hyphae” observed by R. W. Davids. & al. 1942 (M 34): 145 refer it to the Hymenochaetaceae.
- **ludovicianus*, *Xanthochrous*, Pat. 1908 (BmF 24): 6 (U.S.A., Louisiana); *Polyporus* Sacc. & Trott. 1912; *Inonotus* Murrill 1915, Bond. & S. 1941, not ~ Murrill 1939.—Lloyd 1915 (LMW 4, Ap.): 381 referred this to *Polyporus* [*Inonotus*] *cuticularis*, but it appears to be a good sp. — Deser.: Overh. 1953: 414 pl. 44 f. 267, pl. 45 fs. 268, 269, pl. 130 fig. (*Polyporus*); Pegl. 1964 (TBS 47): 190 f. 2: 12 (*Inonotus*).
- lunata*, *Poria*, Romell 1926 (SbT 20): 12, 20 (syn.: n.v.p.).—Fide Romell, i.e., “*Pol. lenis* Karst, as understood in Hym. Lapp.” [= *Poria lenis*].
- luteiporus* = *luteoporus*
- luteocinereus*, *Polyporus*, Britz. 1897 (BCb 71): 57 [pl. 659 f. 230] (Germany). — Nomen dubium. Britz., i.e., thought it was related to *Polyporus crispus* [= *Bjerkandera adusta*] but this cannot be correct. It may be *Coriolus hirsutus* or *Funalia trogii* but in certain details the protologue contradicts both suggestions.
- luteolamellosa*, *Lenzites*, Opiz in herb.—Fide Pilát 1942: 607 = *Gloeophyllum sepiarium*.
- luteoluteus*, *Polyporus*, Lloyd 1911 (“McGinty”; not accepted; n.v.p.) ≡ *Scutiger laeticolor* Murrill [= *Albatrellus confluens*].
- luteopora*, *Poria*, Bond. 1940 (U.S.S.R., European Russia); *Asterostromella* Bond. & S. 1941; *Vararia* Sing. 1943, Bond. 1953.—Descr. and illustration by Bond. 1953: 592 f. 160 (*Vararia*) are barely suggestive of a sp. of *Vararia* P. Karst. (‘Corticiaceae’). According to Parm. 1971: 87,

- 145, "Probably synonymous with *V. granulosa*; the type is not preserved." "*Vararia granulosa* (Fr.) Laurila" is a misapplied name.
- luteoporosus*, *Polyporus*, Opiz 1855 (Lo 5): 87 (Czechoslovakia).—Nomen dubium. Not a nom. nud. as stated by Pilát 1942 (ACE 3): 607 ("*luteiporus*"). *Coriolus versicolor*? — Listed by Sacc. 1888 (SF 6): 149 as *P. luteiporus*.
- luteosubulatum*, *Sistotrema*, Seer. 1833 M. 2: 502 (Switzerland).—Nomen dubium. Found in mines; apparently an abnormal condition.
- **lutescens*, *Lenzites*, H. & P. Syd. 1900 (MHB 4): 1 (Argentina).—Singer 1930 (BbC 46): 78 stated, "Sicherlich nur Abart von [*Lenzites*] *betulina* (wie auch Bresadola meint)" but this is not readily suggested by the descr. Bres. may have had in mind *Lenzites betulina* var. *lutescens* Sacc. 1873, which is a different taxon.
- lutescens*, *Poria*, Lázaro 1917 (RMa 15): 370 / 1917: 284 (Spain).—Nomen dubium.
- lutescens*, *Trametes*, Lázaro 1916 (RMa 14): 520 & 1917 (RMa 15): pl. 10 f. 23 / 1917: 71 pl. 10 f. 23 (Spain), not ~ (Pers. per Nocca & Balb.) Bres. 1896.—Nomen dubium. Cf. Bres. apud Trott. 1925 (SF 23): 435, "E diagnosi videtur *Tram. flavescens* Bres." Lázaro himself differentiated it from *Trametes [Funalia] trogii*, which sp. is another possibility to be kept in mind.
- **lyallii*, *Lenzites*, Berk.—I have been unable to locate the place of publication. Murrill 1905 (BTC 32): 87 mentioned it and stated its origin ("from Vancouver"); he thought that it "seems to be a form" of *Agaricus [Dedaleopsis] confragosa*, but the type was in poor condition. — Cf. (31).
- lychneus*, *Fomes*, Lázaro 1916 (RMa 14): 666 / 1917: 105 (Spain).—Nomen dubium.
- lycoperdiformis*, *Polyporus*, Pers. → *Poria pulvinata* Scop. (O).
- **macounii*, *Polystictus*, Lloyd 1914 (LMW 4, L. 53): 6, 9 (Canada, British Columbia) (as a "var. of *versicolor*": n.v.p.).—Fide Overh. 1953: 342, 344 = *Polyporus [Coriolus] versicolor*.
- **macowanii*, *Polyporus*, Kalchbr. 1881 (G 10): 54 (South Africa).—Referred by Bres. 1890 (BmF 6): xl ("Mac Ovani") to *Polyporus [Gloeoporus] dichrous* and by Lloyd 1915 (LMW 4, Ap.): 382 to *Polyporus [Bjerkandera] adustus*. According to Wakef. apud Doidge 1950 (Bo 5): 527, the poor type suggested *Polyporus dichrous* rather than *P. adustus*. — *Polyporus macounii* Peck drifted into the company of *Polyporus dichrous* as a var. through a clerical error by Sacc. 1888 (SF 6): 126, perhaps because it was confused with *P. macowanii*; it is a syn. of *Phellinus ferruginosus*, — Cf. (51). — V.s.: "marcowanii".
- macrodon*, *Hydnnum*, Pers. sensu Fr. → *Hydnnum nodulosum* Fr. (O).
- macroporus*, *Polyporus*, S. Schulz. 1866: 42 (Yugoslavia, Slavonia) (nom. nud.: n.v.p.), not ~ Lév. 1848.—Nomen dubium.
- macrorrhizus*, *Boletus*, Ach. "in litt. (Sweden?).—Fide Fr. 1821: 384 = *Polyporus [Poria] vaillantii*.

- macrospora*, *Trametes*, S. Schulz. 1866: 41 (Yugoslavia, Slavonia) (nom. nud.: n.v.p.).—Nomen dubium.
- **madagascarensis*, *Polyporus*, Lloyd 1913 (LMW 4, L. 48): 6 (Madagascar) (as a var. of *Polyporus [Gloeoporus] dichrous*: n.v.p.). — Cf. (51).
- malum*, *Agarico-carnis*, Paul. 1793 T. 2: 99 (descr.), Ind. (name) (France); \equiv *Dendrosarcos rutilenii* Paul. 1812-35: pl. 13/10 (generic name n.v.p.). — Nomen dubium. Referred by Lév. 1855: 7 to *Polyporus [Inonotus] hispidus*, but there is very little in the protologue to substantiate this guess.
- manubriatus*, *Polyporus*, Seer. 1833 M. 3: 89 (Switzerland) (as a sp. of *Boletus*: n.v.p.), not \sim Lév. apud Zoll. 1854.—Nomen dubium.
- marcuccianus*, *Polyporus*, Lloyd 1915 (LMW 4, Ap.): 348 ("Southern Italy or one of the Mediterranean islands") (as a form of *P. gilvus*: n.v.p.) ex Trott. 1925; [\equiv *Boletus fulvus* Scop. sensu Marcucci ?1867 U.: No. 70 (*Polyporus*) (Italy, Sardinia)]. — *Phellinus torulosus*? — Cf. (79).
- **marmoratus*, *Polyporus*, B. & C. 1858 (PAA 4): 122 (Nicaragua); *Fomes* Cooke 1885; *Scindalma* O.K. 1898; *Elvingiella* Murrill 1920 (nom. prov.?), 1948.—Fide Lowe 1957 F.: 43 = *Fomes sclerodermeus* (Lév.) Cooke, a species of the neotropics, often erroneously identified with "*Boletus*" *fasciatus* Sw. Listed by various authors as a syn. of *Fomes fomentarius*. — Descr.: Overh. 1953: 94 pl. 68 fs. 397, 398 (*Fomes marmoratus*); Lowe 1957 F.: 43 f. 28 (*Fomes sclerodermeus*); A. Teix. 1962 (Ri 1): 73 tpls. 3 (*Fomes fasciatus*).
- martellii*, [*Polyporus*], (Bres.) Lloyd 1915 (LMW 4, Ap.): 382 (syn.: n.v.p.); *Ganoderma resinaceum* var. Bres. 1892 F.t. 2: 31 pl. 137 (Italy). — As yet not treated as a sp. distinct from *G. resinaceum*.
- **maxonii*, *Fomitiporia*, Murrill 1907 (NAF 9): 11 (Costa Rica); *Poria* Sacc. & Trott. 1912.—Referred by Lowe 1949 (LJ 11): 167, 1957 F.: 56 to *Poria [Phellinus] punctata* which in turn was referred to *Fomes [Phellinus] robustus* (resupinate), but cf. (86). A redescription of the type is needed.
- medullaris*, *Daedalea*, Purt. 1821: 250 (England) (d.n.).—Purt. himself identified his fungus with *Daedalea assercularum* (Schrad.) Pers. [= *Gloeophyllum abietinum*] as distributed by Moug. & Nestl. 1815 S.C.: No. 491; in addition he mentioned *Boletus angustatus* Sow. [*Daedaleopsis confragosa*] as a possible synonym. Purton's descr. hardly suggests *Gloeophyllum abietinum* to me. Perhaps to be regarded as a substitute name for '*Daedalea assercularum*', but Purton's specific epithet was suggested by his own specimen: "I have therefore adopted a new name which is more applicable to the character of my specimen."
- melanostroma*, *Poria*, Seer. 1833 M. 3: 176 (Switzerland) (as a sp. of *Boletus*: n.v.p.).—Nomen dubium and perhaps also a nomen confusum. Seer. himself thought of the possibility that this was a species of poria growing over another fungus, "la *Tremella glandulosa*?"
- melleus*, *Polyporus*, B & Br. 1873 (JLS 14): 53 (Ceylon); *Poria* Cooke

- 1886, not ~ Bond. & Ljub. 1959 (n.v.p.).—See under *Polyporus auricomus* (**O**). — Descr.: Petch 1916 (APe 6): 134; Boed. 1940 (BBu III 16): 383, colour when fresh; Lowe 1962 (PMi 47): 184 (*Poria*). *mellinus*, *Polyporus*, Pers. 1825: 96 (Europe).—Nomen dubium. Referred by Fr. 1828 E. 1: 120 to *Polyporus [Antrodia] sinuosus*. I could not find the type in Persoon's herb.
- membrana*, *Boletus*, Batsch → *Helvella pileus* Schaeff. (**O**).
- membranacea*, *Poria*, Scop. 1772 P.s.: 106 pl. 28 f. 2 (Hungary, now Czechoslovakia) (d.n.); ≡ *Polyporus scopolii* Pers. 1825.—Nomen dubium. Found in a mine: apparently an abnormal growth.
- Merulioporia* Bond. & S. 1941 (n.v.p.), 1943 [1958 (Fu 28): 12], not *Meruliporia* Murrill 1942 (Coniophoraceae); ≡ *Merulopsis* Bond. apud Parm. 1959, Bond. 1961; holotype; *Poria taxicola* (**O**).
- Merulopsis* Bond. apud Parm.; Bond. → *Merulioporia* Bond. & S. (**O**).
- Merulius* Fr. 1821 [1958 (Fu 28): 10], not ~ [Haller] St-Am. 1821 (Cantharellaceae); lectotype, *Merulius tremellosus* Schrad. per Fr. ('Corticiaceae').—Now excluded from the Polyporaceae.
- metallicus*, *Polyporus*, Lloyd 1921 (LMW 6): 1099 ("... of course only a form ... of *Polyporus lucidus*: n.v.p.) (U.S.A., New York).—This has been referred to *Ganoderma/Polyporus lucidum* by Lowe 1934: 125 and Overh. 1953: 208, which leaves it undecided whether it is *G. resinaceum* or *G. lucidus*.
- **micheneri*, *Polyporus*, Berk. (in herb.) (U.S.A.).—Fide Cooke 1885 (G 13): 115 = *Polyporus [Ischnoderma] benzoinus*.
- **micropora*, *Hexagonia*, Murrill 1904 (U.S.A., Maine); *Favolus* Sacc. & D. Sacc. 1905 ("microsporus").—Referred to *Hexagonia striatula* [= *Favolus [Polyporus] canadensis* (**O**)] by Murrill 1907 (NAF 9): 48 and to *Favolus alveolaris* [= *Polyporus mori*] by Overh. 1953: 157, but cf. (98). — Descr.: Murrill 1904 (BTC 31): 328 (*Hexagonia*); Lloyd 1909 (LMW 3, P.I.): 19 f. 257 (*Favolus*).
- **mikadoi*, *Polyporus*, Lloyd 1912 (LMW 4, L. 43): 3 (Japan); *Xanthochrous* Murašk. 1940; *Inonotus* Bond. 1953 (incomplete ref.: n.v.p.).—This was referred to *Polyporus [Inonotus] cuticularis* by Lloyd 1915 (LMW 4, Ap.): 360 and others, but the sp. is now treated as distinct. — Descr.: Lloyd 1915 (LMW 4, Ap.): 360 f. 695 (*Polyporus*); Kawam. 1954 I. 1: 125 f. 115 (*Polyporus cuticularis* var.); Pegl. 1964 (TBS 47): 190 f. 2: 13 (*Inonotus*).
- milleporous*, *Boletus*, Batsch → *Boletus coriaceus* Batsch 1783 (**O**).
- Milleporus* Pfeiff. 1874 (incidental mention: n.v.p.) [1960 (Pe 1): 244]; [= *Boletus "subordo"* *Millepori* Batsch 1783: 101 (inadmissible term denoting rank)]; lectotype, *Polyporus lacteus* Batsch [in part, = *Polyporus tuberaster*]. — A taxon introduced for the stalked polypores.
- **miniatus*, *Polyporus*, Jungh. 1838: 68 (Indonesia, Java), not ~ Liboš. ex Steud. 1824: Fr. 1832; *Polyporellus* P. Karst. 1879; *Laetiporus* Over. 1925, Bond. 1953 (incomplete ref.: n.v.p.); *Tyromyces* Teng 1964.

—Sometimes regarded as belonging to *Laetiporus sulphureus*. If not conspecific, it is certainly closely related. — Descr.: Bres. 1912 (H 53); 52 (*Polyporus*); Over. 1925 (IFM 7): 1 *fig.*, *pl. 12* (*Laetiporus*). — The name *Polyporus miniatus* Jungh. is illegitimate as a later homonym. Cf. also *Polyporus discolor* Kl. — (65).

**minima*, *Trametes*, Berk. in MS. (presumably U.S.A.).—Fide Lloyd 1919 (LMW 5): 850 *f. 1421* = *Trametes [Antrodia] sepium* (forma); he did not validly publish the binomial because he applied it to a “form of *Trametes sepium*”.

minusculus, *Polyporus*, Boud. 1902 (France); *Leptoporus* Big. & Guill. 1913 (syn.: n.v.p.), Bourd. & G. 1925; *Polystictus* Big. & Guill. 1913. — Apparently an alien found only once in a greenhouse. According to notes on the type made by Dr. J. L. Lowe the hyphae are of one type, very thin-walled, abundantly septate without clamps, and occasionally branched. These and other characters indicate that the species may not belong to *Leptoporus [Tyromyces]*. — Descr.: Boud. 1902 (BmF 18): 141 *pl. 6 f. 3.* (*Polyporus*).

**minutipora* Rodw. & Clel. 1929 (PTa): 17 (Australia, New South Wales). — Referred by G. Cunn. 1965: 57, 58 to *Poria lenis*. — Descr.: Rodw. & Clel., l.c., Clel. 1935: 238.

**miyabei*, *Irpex*, Lloyd 1923 (LMW 7): 1126 (nom. nud.: n.v.p.), 1175 *pl. 228 f. 2336* (Japan). — Nomen dubium. Referred, with doubt, to *Irpex lacteus* by S. Ito 1955: 254, but Lloyd's miserable protologue seems to contradict this.

molluscus, *Boletus*, Fr. 1821: 384 (not definitely accepted: n.v.p.); [= *Boletus molluscus* Pers. sensu Nees 1816: 223 *pl. 11 f. 223* (Germany)]. — Nomen dubium. Nees described this fungus from collections he had studied himself and for which “Herr Sturm” (as “St.”, cf. p. 329) had drawn the figures. He referred his material to *Boletus molluscus* Pers. but at the same time indicated his doubt (“?”) as to this identification. By adopting *Polyporus molluscus* (Pers.) per Fr. and at the same time separately listing “*B. molluscus* Nees Syst. *f. 223. poris rubris*” however, he introduced a new taxon, without validly publishing it (mentioned incidentally as a matter of record).

molluscus, *Merulius*, Fr. sensu Berk. 1860: 255.—Fide Romell 1911 (ABS 11³): 30 = *Polyporus haematodes* Rostk. [sensu Romell = *Merulius taxicola* (O)].

molluscus sebaceus, *Polyporus*, Secr. 1833 M. 3: 168 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.). — Nomen dubium.

Monka Adans. 1763 (d.n.) [1960 (Pe 1): 245] = *Verpa* Sw. per Fr. (Discomycetes).

mori, *Boletus*, Pollini in herb., not ~ (Pollini per Fr.) Pollini 1824.—Fide Sacc. 1873 (ASv 2): 99 = *Polyporus [Inonotus] hispidus*. This may have been published as *Boletus flavus* Pollini (n.v.p.) ≡ *Polyporus pollinii* Heufl. = *Inonotus hispidus*.

- **morincola*, *Hydnnum*, Schw. ("olim"), in herb. (U.S.A., Pennsylvania).—Listed as a syn. of *Irpex sinuosus* [cf. *I. lacteus*] by Schw. 1832: 164.
- morinus*, *Boletus*, Gaterau 1789: 190 (France) (d.n.).—Nomen dubium. Deser., "en sabot de cheval, d'un jaune rougeâtre à sa surface et parsemée de poils, les bords d'un jaune clair; les pores jaunes. / Sur les mûriers."
- mucidus*, *Boletus*, Scop. 1770: 149 (Hungary, now Czechoslovakia) (d.n.), not ~ (Pers.) Pers. 1801 (d.n.), not ~ (Pers. per Fr.) Pollini 1824.—Nomen dubium. Referred by Fr. 1828 E. 1: 78 to *Polyporus alligatus* [= *Bjerkandera fumosa*] and listed as a syn. of *Heteroporus* [*Abortiporus*] *biennis* by Fid. 1969 (Ri 4): 116 ("*mucidus*").
- Mucilago* Hoffm. 1796 [1960 (Pe 1): 245], presumably ≡ *Mucilago* Mich. 1729 (pre-Linnaean name) ≡ *Mucilago* [Mich.] Adans., a name presumably based on *Myxomycetes*.
- Muciporus* Juel 1897 (nom. conf.) [1957 (Ta 6): 84]; ≡ *Myxoporus* F. Clem. 1902 (nom. nud.: n.v.p.); lectotype, *Muciporus corticola* (Fr.) Juel sensu Juel.—Based on a resupinate polypore, *Oxyporus corticola*, overgrown by a species of *Tulasnella* J. Schroet. (Tulasnellaceae), hence a nomen confusum.
- Mucronoporus* Domański apud Domański & al. 1967 (FpG 2): 316 (lacking Latin descr.: n.v.p.); [= *Mucronoporus* Ell. & Ev. sensu Domański, i.e., in part: excl. of type]. — Lectotype: *Polyporus circinatus* (Fr.) Fr. — Cf. (69) and Donk 1971 (PNA 74): 12.
- Multiporoides* R. & O. Falck 1937 (lacking Latin descr.: n.v.p.) [1960 (Pe 1): 246]; monotype, *Multiporoides* [*Poria*] *chlamydoformans* R. & O. Falck. — A second species was referred to this genus with a question mark.
- **multisetosus*, *Polyporus*, Lloyd 1920 (LMW 6): 976 (Australia).—Erroneously referred to *Phellinus robustus* by G. Cunn. 1965: 227, 228.
- **munzii*, *Polyporus*, Lloyd 1922 (LMW 7): 1163 (U.S.A., California); *Inonotus* R. L. Gilb. 1969.—This was taken by Pegl. 1964 (TBS 47): 185 as a thick form with very rare setae of *Inonotus cuticularis*. However, Overh. and more recently R. L. Gilb. 1969 (SwN 14): 125 treated it as a distinct sp. Long 1945 (Ll 8): 235, 237 listed it as a syn. of *Polyporus* [*Inonotus*] *farlowii* (extra-European). — Deser.: Overh. 1953: 425 pl. 124 fs. 672, 673, pl. 132 fig. (*Polyporus*).
- murinus*, *Boletus*, (Pers.) C. & T. Nees 1820: clxxii (d.n.); *Boletus sub-tomentosus* var. "B. murinus" Pers. 1799 O. 2: 10 (d.n.).—*Boletus substrictus* Bolt. [= *Polyporus ciliatus*] was cited as a syn. by error. There is no reason to assume that Persoon's var. is not a taxon of the Boletaceae. Fries 1838: 431 cited "B. murinus Nees" as a syn. of *Polyporus fuscidulus* (O.).
- muscicola*, *Polyporus*, Wettst. 1885 (VW 35): 563 [repr. 1886 (BCb 27): 86] (Austria); *Polystictus* Sacc. 1891; *Microporus* O.K. 1898.—Nomen dubium. The descr. suggests *Tyromyces wynnei*, though there are several discrepancies.

muscidus = *mucidus*

Myxoporus F. Clem. → *Muciporus* Juel (O).

**nambui*, *Polyporus*, Yas. "mss. name" (Japan).—Lloyd 1919 (LMW 5): 843 ("Nambui") mentioned this as a syn. of *Polyporus greenei* Lloyd [= *P. greenei* Yas. = *Polyporus [Coltricia] montagnei* var. *greenei* (Berk.) R. L. Gilb.], which was based on the same collection.

nanus discoides, *Polyporus*, Seer. 1833 M. 3: 157 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.).—Fide Fr. 1838 479 ("n. 106") = *Polyporus [Hirschioporus] abietinus*.

neesii, *Polyporus*, Fr. 1821: 370 (Sweden); *Trametes* Fr. 1848 (n.v.p.), 1849; *Fomes* Cooke 1885; *Placodes* Quél. 1888; *Scindalma* O.K. 1898; *Polystictus* Rick. 1918.—Nomen dubium. Bres. 1897 (AAR III 3): 76–77 remarked in connection with *Fomes [Oxyporus] populinus*, "Forte hue etiam *Fomes neesii* ducendus." The substratum (cf. Fr. 1874: 564), "ad ramos dejectos *Fagi*", hardly supports this guess.

nepevnyi, *Trametes*, Opiz 1852: 147 (Czechoslovakia) (nom. nud.: n.v.p.). —Fide Pilát 1942 (ACE 3): 609 = *Trametes gibbosa*.

nieskyensis = *niskiensis*

nigrescens, *Fomes*, Lloyd 1915 (LMW 4, F.): 237, 288 ("Klotzsch") (as a form of *Fomes fomentarius*: n.v.p.).—Introduced for *Polyporus nigricans* Fr. 1838: 466 (in part, viz. as to "e Scotia Klotzsch", which specimen represents black-crusted *Fomes fomentarius*, fide Lloyd, i.e. *nigrescens*, *Trametes*, Lázaro 1916 (RMa 14): 523 / 1917: 74 pl. 1 (Spain), not ~ Bres. 1905.—Nomen dubium. The protologue calls to mind *Fomitopsis cystisina*, but it also shows discrepancies, for instance as to the pores.

**nigroaspera*, *Trametes*, Lloyd 1924 (LMW 7): 1272 pl. 285 f. 2793 (Japan) ("A thick form of *Daedalea [Daedaleopsis] confragosa*": n.v.p.). — Cf. (31).

nigroporus, *Fomes*, Lázaro 1916 (RMa 14): 662 / 1917: 101 (Spain). —Nomen dubium. *Phellinus* sp.?

**nigropurpurascens*, *Polyporus*, Schw. 1832: 156 (U.S.A., North Carolina); *Leptoporus* Pat. 1928.—Referred by Fr. 1851 (NAU III 1): 55/39 & Bres. 1912 (H. 53): 74 to *Polyporus [Gloeoporus] dichrous*. — Cf. (51).

nigrozonatus, *Polyporus*, Saut. 1876 (H 15): 33 (Austria); *Polystictus* Cooke 1886; *Microporus* O.K. 1898.—Nomen dubium. Keissl. 1917. (AW 31): 111 thought that this might be *Daedalea [Cerrena] unicolor* but the descr. does not support this.

nisiensis = *niskiensis*

niskiennis = *niskiensis*

niskiensis, *Polyporus*, Pers. 1825: 258; [= *Boletus incarnatus* (Pers.) Pers. sensu A. & S. 1805: 258 (Germany)].—Nomen dubium. The original descr. is too brief; it may perhaps faintly suggest *Poria placenta*, but to assume this as a reasonable identification would be going too far.

- V.s.: the epithet has been often misspelt, “*niskiennis*”, “*Nisetiensis*”, “*Nieskyensis*”. — (110).
- nitens*, *Ganoderma*, Big. & Guill. 1913: 360 (“Batsch”) (syn.: n.v.p.)
≡ *Boletus nitens* var. *crocatus* Batsch. ≡ *Ganoderma nitens* Lázaro,
typonym [= *G. lucidum*]. — Cf. also Donk 1971 (PNA 74): 10.
- niveus*, *Boletus*, Jullien apud Vill. 1789: 1040 (France) (d.n.). — Nomen
dubium. Apparently not a polypore.
- **nivosus*, *Polyporus*, Berk. 1856 (HJB 8): 196 (Brazil). — For this sp.
see Lloyd 1915 (LMW 4, Ap.): 310 f. 650 but also Bres. 1926: 78. — This
sp. is mentioned here because Morg. 1885 (JCi 8): 101 misinterpreted it;
according to Lloyd 1915 (LMW 4, Ap.): 316 he applied the name to
Polyporus [“*Trametes*”] *semisupinus*, which Lloyd confused with
Polyporus [*Incrustoporia*] *semipileatus* Peck.
- nodosum*, *Hydnnum*, Fr. 1874: 616; *Acia* P. Karst. 1879, Pilát 1925
misapplied; *Dryodon* Quél. 1886, Cejp 1928 misapplied; *Odontia* Cost. &
Duf. 1895; *Hericium* Nikol. 1956 (incomplete ref.: n.v.p.), misapplied;
[≡ *Hydnnum macrodon* Pers. per Fr. sensu Fr. 1863 M. 2: 279 (Sweden)].
— Nomen dubium. Fide Lundell 1914 (LNF 21–22): 13 No. 1019,
in obs., “a juvenile polypore, either *Trametes* [*Antrodia*] *serialis* (Fr.)
Fr. or *Polyporus radiatus* Sow. ex Fr. var. *nodosus* (Fr.) [*Inonotus*
nodosus].” — Sensu Pilát = *Dentipellis fragilis* (Pers. per Fr.) Donk
(Hericiaceae), fide Donk 1962 (Pe 2): 233, 234; sensu Bourd. & G. =
Mycoacia stenodon (Pers.) Donk (Corticiaceae).
- notharae*, *Irpiciporus*, Murrill sensu Lloyd → *Irpea lamelliformis* Lloyd (**O**).
normalis, *Boletus*, Vill. → *Boletus auriculatus* Vill. (**O**).
- notarisi*, *Polyporus*, Berk. in herb. — Mentioned by Lloyd 1915 (LMW 4,
Ap.): 383, “nomen nudum. Not ‘described’ and no specimen found
by me.” — Is this *Sistotrema notarisi* [= *Abortiporus biennis*]?
- Nothotrechispora* Sing. 1944 (n.v.p.) [1960 (Pe 1): 247], presumably
= *Phlebiella* P. Karst. (n.v.p.) (Corticiaceae).
- **novae-angliae*, *Polyporus*, B. & C. apud Berk. 1872 (G 1): 51 (“New
England”); *Fomes* Lloyd 1906, &c. (n.v.p.). — Nomen dubium. Referred
with doubt to *Pyropolyporus* [*Phellinus*] *igniarius* by Murrill 1908
(NAF 9): 103, certainly by error, fide Lloyd 1915 (LMW 4, F.): 283
and Lowe 1954 (M 46): 493, 1957 F.: 89.
- **oblectans*, *Polyporus*, Berk. 1845 (LJB 4): 51 (West Australia); *Poly-
stictus* Cooke 1886; *Xanthochrous* Pat. 1897; *Microporus* O.K. 1898;
Coltricia G. Cunn. 1948. — Referred by Bres. 1890 (BmF 6): xlii, Murrill
1904 (BTC 31): 343, and Lloyd to *Polystictus/Coltricia cinnamomea*
and in consequence of this to *Polystictus* [*Coltricia*] *perennis* f. *cinnamomeus*
(Jacq. per S. F. Gray) Pilát by Pilát 1942 (ACE 3): 579, 582.
— Descr.: Clel. 1935: 217 (*Polystictus*); G. Cunn. 1965: 191 pl. 4 f. a
(*Coltricia*).
- obliquum*, *Hydnnum*, DC. 1815: 36 (Switzerland) (d.n.), not ~ Schrad.
1794. — Nomen dubium. DC. cited only one syn. and then with doubt

(“*Sistotrema obliquum*, Alb. & Schwein. n. 780?” [≡ *Hydnnum obliquum* Schrad.]), hence, *H. obliquum* DC. and *H. obliquum* Schrad. may be considered to be based on different types (different taxa). — Mentioned in connection with *Polyporus flavescens* Seer. (**O**).

obliquus, *Boletus*, Bolt. 1788: 74 pl. 74 (England) (d.n.); *Sistotrema* C. & T. Nees 1820 (d.n.); *Boletus* Bolt. per Purt. 1821, not ~ (Pers. per Fr.) Wahl. 1826; = *Hydnnum boltonii* Spreng. 1827.—Nomen dubium. At first referred to *Merulius* [*Serpula*] *lacrimans* (Wulf.) ex Fr. (forma) (Coniophoraceae) by Fr. 1821: 328 (“ipso teste”) and afterwards by Fr. 1838: 515 to *Hydnnum squalinum* Fr. (“e deser.”), itself a nomen dubium.

obliteratus*, *Boletus*, Schw. “in Hook, Herb.”—Fide B. & C. 1856 (JAP II 3): 214 = *Porotheleum pezizoides* (Schw.) Schw. [= *Stromatoscyphus fimbriatum* (O**)].

obtusus*, *Polyporus*, Berk. 1839 (AM 3): 390 (North America); *Trametes* Berk. 1841, Lohw. 1931; *Daedalea* Neuman 1914; *Leptoporus* Pilát 1937.—Pilát 1939 (ACE 3): 242–243 and Kotl. & P. 1957 (ČM 11): 233 suggested that *Spongipellis litschaueri* [= *S. schulzeri*] might belong to this sp., but later Kotl. & P. 1965 (ČM 19): 75 decided in favour of keeping the two taxa specifically distinct. — The correct name is still debatable, cf. also under *Sistotrema spongiosum* (O**) and *Boletus unicolor* Schw. (**O**). — Descr.: Lloyd 1915 (LMW 4, Ap.): 323 f. 666; Lohw. 1931 (APr 75): 305 fs. 1, 2, pl. 19 fs. 1, 6; Overh. 1953: 322 pl. 21 fs. 127, 128, pl. 131 fig. (*Polyporus*).

obversus, *Polyporus*, S. Schulz. 1880 (Fl 63): 80 (Yugoslavia, Slavonia). — Nomen dubium. — Schulzer von Müggenburg promised a more detailed Latin description, which, as far as I am aware, was not published. — Special literature: Schulzer von Müggenburg, 1880c.

**ochracea*, *Daedalea*, Lloyd 1914 (LMW 4, L. 49): 12 (as a form of *Daedalea* [*Cerrena*] *unicolor*: n.v.p.) (U.S.A., Massachusetts).

**ochracea*, *Lenzites*, Lloyd 1922 (LMW 7): 1106 pl. 187 f. 2023 (Brazil) (“A form of *Lenzites flaccida* for me”: n.v.p.), non/an ~ Lloyd 1922, simultaneously published. — *Lenzites flaccida* = *L. betulina* forma.

**ochraceo-stuppeus*, *Polystictus*, Lloyd 1916 (LMW 5, L. 63): 11 (Australia, New South Wales).—Fide G. Cunn. 1965: 114, 115 = *Gloeoporus* [*Bjerkandera*] *adusta*.

ochraceus tremulae, *Polyporus*, Seer. 1833 M. 3: 132 (Switzerland) (as a sp. of *Boletus* & double epithet & nom. nud.: n.v.p.).—Nomen dubium. Referred by Fr. 1874: 568 (“n. 81”) to *Polyporus* [*Coriolus*] *zonatus*.

**ochrohirsutus*, *Polystictus*, Lloyd 1923 (LMW 7): 1233 pl. 262 f. 2591 (as a form of *Polystictus hirsutus*: n.v.p.) (Japan).

**odontoporos* Kalchbr. in herb. K. (unknown locality).—Lowe 1966: 19 thinks that this “is probably a synonym” or *Poria* [*Oxyporus*] *late-marginata*; G. Cunn. determined a specimen named by Cooke from Australia (New South Wales) first [1950 PNW 75]: 234] as *Poria*

- versipora* [= *Schizopora paradoxa*], then (1965: 276) as *Steccherinum ochraceum* (Pers. per Fr.) S. F. Gray ("Hydnaceae").
- odoratus zonatus*, *Polyporus*, Secr. 1833 M. 3: 106 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.).—This was identified by Secr. with Bull. pl. 310 = *Boletus suaveolens* L. sensu Bull. [= *Daedaleopsis confragosa*].
- **ohiensis*, *Favolus*, B. & Mont. apud Mont. 1856: 171 (U.S.A., Ohio).—This has been referred to *Hexagonia alveolaris* by Murrill 1904 (BTC 31): 327 and to *Favolus europaeus* by Lloyd 1909 (LMW 3, P.I.): 19, both names being now placed in the synonymy of *Polyporus mori* but cf. (98).
- **ohiensis*, *Trametes*, Berk. 1872 (G 1): 66 (U.S.A., Ohio), (Berk.) Bres. "in litt." apud Torrend 1910 (as a "forme" of *Fomes scutellatus*: n.v.p.), Bres. apud Torrend 1913; *Ungulina* Pat. 1900, Murašk. 1940, Kotl. & P. 1957; *Ganoderma* Romell 1901, Coker, 1927; *Fomes* Murrill 1903; *Fomitopsis* Bond. & S. 1941; *Truncospora* Pilát 1942 (generic name n.v.p.), 1953 (incomplete ref.: n.v.p.); *Poria* Kotl. & P. 1959, not *P. ohioensis* (Murrill) Sacc. & Trott. 1912 ("ohiensis").—Reported from Portugal by Torrend 1913 (Bro 11): 67, 68, who had previously referred the material to *Fomes* [*Fomitopsis* ?] *scutellatus* (O). The identification with *Truncospora ohiensis* is considered here to be improbable and the latter sp. is therefore not reported for Europe; but cf. *Truncospora ochroleuca*. — Descr.: Coker 1927 (JMS 43): 133, 134 pl. 14, pl. 22 figs. 10, 11 (*Ganoderma*); Overh. 1953: 44 pl. 69 f. 404, pl. 93 f. 523, pl. 126 fig.; Lowe 1957 F.: 82 f. 63 (*Fomes*).
- oleae*, *Polyporus*, Panizzi 1886 (NGi 18): 65 (Italy).—Nomen dubium. Pilát 1942 (ACE 3): 610 suggested *Grifola frondosa* or *G. [Meripilus] gigantea*. Perhaps *Laetiporus sulphureus*?
- olivaceozonatus*, *Polyporus*, Secr. 1833 M. 3: 136 (Switzerland) (as a sp. of *Boletus*: n.v.p.).—Nomen dubium.
- orbicularis*, *Daedalea*, Bagl. 1865 (Cci 2): 265 (Italy); *Striglia* O.K. 1891.—Nomen dubium.
- orbicularis*, *Polyporus*, Saut. 1876 (H 15): 150 (Austria), not ~ Berk. 1839, not ~ Velen. 1922.—Nomen dubium. Judging from the poor descr. I would suggest *Polyporus mori* but the substratum does not agree. Keissl. 1919 (AW 31): 111 thought of *Polyporus arcularius* but this cannot be correct. Lloyd 1912 (LMW 3, S.P.): 176 f. 474 (fig. magnified?) published an interpretation that must also be dismissed as incorrect. (Pilát 1936 (ACE 3): 75, 78 saw in Lloyd's interpretation a form of *P. arcularius*.)
- **orbiculatus*, *Polyporus*, Colenso "a herbarium name" (New Zealand).—Fide G. Cunn. 1965: 167, 168 = *Trametes [Coriolus] zonatus*. His interpretation of this sp. needs confirmation.
- orthoporus*, *Polyporus*, Pers. 1825: 91, in obs. (Switzerland) (not definitely accepted as a distinct sp.: n.v.p.).—Fide Donk 1967 (Pe 5): 102 = *Polyporus [Rigidoporus] undatus*.

- ostrea*, *Boletus*, Hoffm. 1797–1811 V.s.: 27 *pl.* 15 *f.* 2 (Germany) (d.n.).—Nomen dubium. Fruitbody of imbricate, sessile caps, white, not typically zonate; pores becoming somewhat grey; context soft, somewhat fleshy, flexible. On rotten wood, and if found in a mine (which seems likely) perhaps based on an abnormal growth.
- ostrea*, *Poria*, Scop. 1772 P.s.: 105 *pl.* 24 (Hungary, now Czechoslovakia). (d.n.); *Polyporus* (Scop.) per Pers. 1825.—Nomen dubium. Found in a mine: apparently an abnormal growth.
- oxyporus*, *Polyporus*, Saut. 1876 (H 15): 150 (Austria); *Fomes* W. Cooke 1949 (syn.: n.v.p.).—Nomen dubium. Bres. 1920 (Am 18): 68 referred this to *Fomes [Oxyporus] populinus*. The descr. does not support this identification.
- **Oxyuris* Lloyd 1915 (n.v.p.), not ~ Linstow 1907 (n.v.) [1960 (Pe 1): 249]; type, *Fomes [Phellinus] pachyphloeus* Pat. (extra-European).
- **Pachyma* Fr. 1822: 242 (nom. anam.) [1962 (Ta 11): 94]; lectotype, *Sclerotium cocos* Schw. (**O**).
- pachyus*, *Polyporus*, Rostk. 1848 (StP Fs. 27–28): 9 *pl.* 5 (Germany/Poland).—Nomen dubium. Fries 1863 M. 2: 339 remarked on the discrepancy in colour as indicated in the text and on the plate; he thought of *Polyporus [Phellinus] contiguus*, a sp. about which he had no clear idea. Bourd. & G. 1928: 739 suggested, with doubt, *Ungulina [Heterobasidion] annosa*.
- **palisotii*, *Daedalea*, Fr. 1821: 335; *Lenzites* Fr. 1838; *Trametes* Imaz. 1952; = *Daedalea amanitoides* P. Beauv. 1805 (Nigeria, Oware) (d.n.); *Lenzites* (P. Beauv.) per Hariot 1891; *Cellularia* O.K. 1898 ("amanitoides"); *Daedalea* Murrill 1907.—The name "5. *Lenzites Palisoti* Fr." appears on the same list, mentioned under *Fomes canescens* (**O**) in such a manner that one would conclude that the corresponding material (Torrend, Fungi sel. exs. No. 5) had been collected in Portugal: it was actually reported from that country by S. Cám. 1956: 60 on the base of this distribution number. A package of it (BPI) gives "Timor", an island south of the Moluccas, as the locality where it was collected.
- **pallidofulva*, *Daedalea*, Berk. 1847 (LJB 6): 322 (U.S.A., Ohio); *Striglia* O.K. 1891; *Sesia* Murrill 1904, misapplied; *Gloeophyllum* Murrill 1905, misapplied.—Fide Murrill 1908 (NAF 9): 126 = ?*Daedalea aesculi* (Fr.) Murrill [sensu Murrill = *Trametes ambigua* Berk. = ? "Trametes" *palisotii* (Fr.) Imaz. (**O**)]; fide O. & K. Fid. 1967 (M 58): 868 = *Daedalea elegans* Spreng. ex Fr. [= "Trametes" *palisotii* (Fr.) Imaz.]. — Sensu Bres., Murrill 1904, 1905 → *Gloeophyllum trabeum*.
- pallidomicans*, *Polyporus*, Britz. 1897 (BCb 71): 58 [*pl.* 658 *f.* 232], 1909 (BbC 26): 211 (Germany).—Rather a nomen dubium. Killerm. 1922 (Dba 15): 86 referred this to *Polystictus [Coriolus] zonatus* as a form. I think this is the best suggestion available, although the substratum ("an Weiden") would be exceptional for it. The determination by Bresinsky & Stangl 1969 (ZP 34): 78 (with doubt) as *Phellinus conchatus*

is not acceptable to me; Britz. gave the context as white; further the spores are quite different.

palmatus, *Polyporus*, Saut. 1876 (H 15): 151 (Austria), not ~ (Hook.) Berk. 1839; = *Polystictus subpalmatus* Sacc. 1888.—Nomen dubium.

**pampeana*, *Daedalea*, Speg. 1898 (ABA 6): 175 (Argentina).—Bres. 1916 (Am 14): 230 referred this to *Polyporus [Abortiporus] biennis*, and Speg. 1926 (BAA 28): 370 followed ("forma terrestris stipitata hymenio sublenzitoideo"). Fid. 1969 (Ri 4): 150, 162, 165 made it a syn. of *Heteroporus biennis* var. *flabelliformis* ("Mont.") Fid. [sensu Fid. = *Abortiporus distortus* (O); see Donk 1971 (PNA 74): 2]. Cf. (2).

papilio melanopus, *Polyporus*, Seer. 1833 M. 3: 62 (Switzerland) (as a sp. of *Boletus* & double epithet & nom. nud.: n.v.p.).—Fide Fr. 1838: 439 ("n. 13") = *Polyporus melanopus*.

papyraceus, *Boletus*, Schrank 1789: 618 (Germany) (d.n.), not ~ Schw. 1822; *Polyporus* (Schrank) per Wettst. 1888, not ~ Fr. 1828, not ~ (Schw.) Schw. 1832.—Nomen dubium. This was referred to *Polyporus vulgaris* Fr. [sensu stricto = *Poria lenis*] by Fr. 1821: 381 (as *Boletus "papyrae"*), therefore Wettst. revived it as the correct name for *P. vulgaris*.

papyrae, *Boletus*, Fr. → *Boletus papyraceus* Schrank (O).

papyrina, *Daedalea*, (Bull. per St-Am.) E. Krause 1928 ("*Daedaleus*"); *Auricularia* Bull. 1788: pl. 402 (France) (d.n.); *Thelephora* DC. 1805 (d.n.) per St-Am. 1821; *Auricularia* Mérat 1821; *Merulius* Quél. 1888; = *Merulius corium* (O).

**paradoxa*, *Bresadolia*, Speg. 1883 (ASa 16): 277 (Paraguay).—This was referred to *Polyporus squamosus* ("vetustus, poris laceratis") by Bres. 1916 (Am 14): 222. Sing. and J. E. Wright apud Sing. 1962: 161 compared it with *Polyporus discoideus* B. & C., but it is not clear what these authors had in mind by this name (apparently covering a mixture, judging from the syns. given by Sing. 1962: 159). Cf. also Lloyd 1923 (LMW 7): 1191 pl. 235 fs. 2389, 2390.

paradoxus, *Hydnogaster*, P. Henn. in herb. B.—Fide Ulbr. 1941 (NBe 15): (incidental mention) the fruitbody developed after "*Oligiporus*" [in this case = *Ptychogaster rubescens*] in a hothouse at Berlin. He thought that it "vielleicht auch nur eine abweichende Fruchtkörperbildung von *Poria vaporaria* darstellt." For '*Poria vaporaria*' sensu P. Henn. one should in this case perhaps read resupinate *Polyporus [Tyromyces] henningsii*.

Paramyces Oehm 1937 (BbC A 57): 253–258, 261 (nom. anam.; nom. prov.: n.v.p.).—Introduced in connection with two imperfect states, viz. of *Polyporus squamosus* and of *Polystictus [Coriolus] hirsutus*, but no species were assigned to the genus *Paramyces*, which was introduced as such in anticipation of the description of imperfect states that do not form basidiferous fruitbodies anymore.

parasitica, *Daedalea*, Velen. 1922: 690 [see Pilát 1948: 262 for Latin

- translation] (Czechoslovakia).—Fide Malkovský 1931 this represents abnormal growth on the surface of the cap of *Amanita spissa* (Fr.) Opiz (Agaricales). Cf. also *Polyporus agaricicola* F. Ludw. (O).
- parasiticum*, *Hydnus*, L. 1763: 1648 (Europe) (d.n.) per Schleich. 1821; *Agaricus* E. Krause 1932 B.r.: 141.—Nomen dubium: insufficiently described. Fide Schrad. 1794: 180 the name *Hydnus parasiticum* had been used by Willd. and/or Timm for *Hydnus decipiens* [= *Hirschioporus fuscoviolaceus*]. As a result of this identification *H. parasiticum* "Timm" was also used for *Hirschioporus abietinus*.
- parvula*, *Ungularia*, Lázaro 1916 (RMa 14): 671 / 1917: 110 (Spain); *Polyporus* Sacc. & Trott. apud Trott. 1925, not ~ Schw. 1832, &c. —Nomen dubium.
- parvulus*, *Polyporus*, Lázaro 1916 (RMa 14): 671 / 1917: 110 (Spain), not ~ Schw. 1832, &c.; ≡ *Polyporus lazaroii* Trott. 1925.—Nomen dubium. Presumably a sp. of *Polyporus* subg. *Melanopus* (Pat.) Maubl. Cf. Bres. apud Trott. 1925 (SF 23): 369, "probabiliter est *Pol. melanopus*." Other spp. of the subgenus also come to mind.
- patella*, *Boletus*, Humb. 1793: 97 (Germany) (d.n.) per Steud. 1824; *Polyporus* Pers. 1825.—Nomen dubium.
- **pauperculus*, *Polyporus*, Speg. 1889 (BCó 9): 435 (Brazil).—Referred by Bres. 1916 (Am 14): 226 to *Polyporus brumalis* (sensu Bres. = *P. ciliatus*) "juvenilis".
- pavichii*, *Irpex*, Kalchbr. 1868 (nom. nud.: n.v.p.) ex Fr. 1874: 621 (Yugoslavia, Croatia); *Xyloodon* O.K. 1898.—Nomen dubium. I compared Kalchbrenner's descr. and figures with the protologue of *Irpex foliaceo-dentata* but was forced to conclude that the two taxa could hardly be the same. Apparently does not agree either with *Irpex lacteus*. Cf. *Hirschioporus pargamenus*? — Deser.: Kalchbr. 1877: 60 pl. 37 f. 2.
- pavonium*, *Agaricum*, Latourr. 1785: 38 (France) (nom. nud.: n.v.p.). —The foot-note "An *Boleti versicoloris* var.?" would suggest a form of *Coriolus versicolor*, although the sp. was described in *Agaricum* rather than *Boletus*.
- **peckianus*, *Polyporus*, Cooke 1878; *Polystictus* Sacc. 1888; *Microporus* O.K. 1898; *Grifola* Murrill 1914; *Scutiger* Parm. 1962; *Albatrellus* Niemelä 1970; ≡ *Polyporus flavidus* Peck 1873 (BBf 1): 61 & 1874 (RNS 26): 68 (U.S.A., New York), not ~ Berk. 1854; *Polystictus* Cooke 1886. — Sensu Malenç. → *Albatrellus syringae*. — Cf. (3). — Deser.: Lowe 1942: 34; Overh. 1953: 218 pl. 28 f. 171, pl. 32 f. 195, pl. 36 f. 221, pl. 131 fig. (*Polyporus*); Niemelä 1970 (Abf 7): 54 fs. 3, 5 (*Albatrellus*).
- **peckii*, *Trametes*, Kalchbr. apud Peck 1881 (BG 6): 274 (U.S.A., Dakota). — Reduced to the synonymy of *Trametes hispida* [= *Funalia gallica*] by modern North American authors, for instance, Overh. 1953: 147. — The flesh was described as "substance wood-colour", according to Peck's translation [repr. Murrill 1905 (BTC 32): 356], and cf. Bres. 1920

(Am 18): 69 who referred it to *Trametes gallica* var. *trogii* (Berk.) Bres. [= *Funalia trogii*]. — Cf. (36).

**pectinatus*, *Polyporus*, Kl. 1833 (Li 8): 485 (India); *Fomes* Gillet 1884; *Phellinus* Quél. 1886, misapplied; *Scindalma* O.K. 1898; *Xanthochrous* Pat. 1900; *Mucronoporus* Romell 1901; *Pyropolyporus* Murrill 1907; *Boudiera* Lázaro 1916, misapplied; *Lazaroa* Gonz. 1917; *Porodaedalea* Aosh. 1966 (incomplete ref.: n.v.p.). — An extra-European sp. Descr.: Lowe 1957 F.: 17 f. 1 (*Fomes*). — No taxonomic syns. of this taxon are included in this list. — Sensu Fr., in part, Quél. → *Phellinus ribis*.

pellicineum, *Xylomyzon*, Pers. → *Boletus arboreus* Sow. (O).

pelliculum, *Agaricum*, Latourr. 1785: 39 (nom. anam.) (d.n.); [= *'Agaricus, seu Boletus pelliceus'* Dana 1771 (Italy?), a pharmaceutic rather than a botanical name]. — Cf. (29).

pellitus, *Polyporus*, S. Schulz. 1866: 41 (Yugoslavia, Slavonia) (nom. nud.: n.v.p.), not ~ G. Meyer per Fr. 1821, not ~ (P. Karst.) Sacc. 1896. — Nomen dubium.

Pelloporus Bond. & S. 1941 (Am 39): 54 ("Quél. sens. str.", but excl. of type) (lacking Latin descr.: n.v.p.); monotype, *Polyporus corrugis* Fr. [= *Ischnoderma trogii*].

pelloporus, *Cladomeris*, Big. & Guill. 1909: 410 ("Sow."; syn.: n.v.p.); [= *Boletus pelloporus* Bull. sensu Sow. 1799: pl. 230, excl. of type, (England)]. — Cited by Big. & Guill. as a syn. of *Cladomeris* [*Bjerkandera*] *imberbis* sensu Quél. but here Sowerby's plate is referred to *Abortiporus biennis*.

pellucidus, *Boletus*, With. 1796: 309 (England) (d.n.); *Polyporus* (With.) per Steud. 1824. — Nomen dubium. With. compared his fungus with *Boletus [Albatrellus] ovinus* Schaeff. pl. 122 (excl. of pl. 121), a form apparently induced by a spell of dry weather, but there is little in his descr. to make this comparison understandable.

peltata, *Poria*, Scop. 1772 P.s.: 104 pl. 23 (Hungary, now Czechoslovakia) (d.n.); *Polyporus* (Scop.) per Pers. 1825, not ~ Pers. 1825, not ~ Fr. 1851. — Nomen dubium. Found in a mine: apparently an abnormal growth. Cf. Fr. 1828 E. 1: 87.

peltatus, *Polyporus*, Pers. → *Boletus fibula* Sow. (O).

pelviformis. — Pers. 1825: 86 cited a *Poria pelviformis* Scop. of which he stated that Hoffm. had reduced it to a var. of *Poria scutata* Scop. What actually happened is that Hoffm. 1797–1811 V.s.: 14 mentioned (but did not name) a variety of *Poria scutata* Scop. [= *Heterobasidion annosum*] which he described as being 'pelviformis' and depicted on pl. 10 upper fig. as *Poria scutata*. As far as I know there is no '*Poria pelviformis* Scop.'

**pendula*, *Daedalea*, Berk. 1855 N.Z.: 180 pl. 150 f. 4 (New Zealand); *Striglia* O.K. 1891. — At first this was identified with *Lenzites* [*Cerrena*] *unicolor* by G. Cunn. 1949 (BPZ 81): 21, but later G. Cunn. 1965: 97, 282

referred it to "Trichaptum" *venustum* (Berk.) G. Cunn., an extra-European species.

penetralis, *Polyporus*, W. G. Sm. 1875 (JBL 13): 98 *pl. 162 fs. 4-8* (England); *Polyporellus* Pilát 1936.—An alien found in a nursery.

peponius*, *Favolus*, (B. & C.) Lloyd 1917 (as a form of *Favolus europaeus*: n.v.p.); *Polyporus boucheanus* var. B. & C. 1853 (AM II 12): 432 (U.S.A., South Carolina).—Cf. *Favolus* [*Polyporus*] *canadensis* (O**).

pera, *Polyporus*, Pers. → *Boletus fodinalis* Humb. (**O**).

perdurans*, *Polyporus*, Kalchbr. apud Kalehbr. & Cooke 1880 (G 9): 1 (Australia, Tasmania).—Referred by Bres. 1890 (BmF 6): xlili to *Polyporus bulbipes* Fr. [= *Coltricia oblectans* (O**)]. Listed as a syn. of *Polystictus perennis* f. *cinnamomeus* (Jacq. per S. F. Gray) Pilát [*Coltricia cinnamomea*] by Pilát 1942 (ACE 3): 580, 582.

**pereffusa*, *Fomitiporia*, Murrill 1907 (U.S.A., Pennsylvania); *Poria* Sacc. & Trott. 1912.—Referred by Lowe 1949 (Ll 11): 166 & 1966: 156 to *Poria* [*Phellinus*] *laevigatus*, which was simultaneously considered to be resupinate *Fomes* [*Phellinus*] *igniarius*, but cf. (82); fide Niemelä 1972 (Abf 9): 50 microscopically "hardly distinguishable" from *Phellinus laevigatus*. — Descr.: Overh. 1942: 61; Lowe 1946: 81; D. Baxt. 1948 (PMi 32): 207 *pl. 9 f. 1* (*Poria*); Niemelä, l.c. (*Fomitiporia*).

**pergamena*, *Trametes*, Lloyd 1917 (LMW 5, L. 65): 9 (U.S.A., Montana) ("a thick . . . form of *Polystictus* [*Hirschioporus*] *pergamenus*": n.v.p.).

**perplexus*, *Polyporus*, Peck 1896 (RNS 49): 33 (U.S.A., New York); *Inonotus* Murrill 1904, misapplied; *Polystictus* A. Ames 1913.—Lloyd 1918 (LMW 5): 755 suggested *Polyporus* [*Inonotus*] *rheades* [sensu lato] (59) but so far the precise identity does not seem to have been settled. The substratum of the type is trunks of *Fagus*. — Sensu Murrill → *Inonotus cuticularis*; sensu Lloyd 1912 → *Onnia triqueter*.

**pertenuis*, [*Polyporus*], (Kalchbr. apud Thüm.) Lloyd 1912 (incidental mention: n.v.p.); *Polyporus varius* var. Kalehbr. apud Thüm. 1877 (BSM 52): 144–145 (U.S.S.R., Russia, Siberia).—Fide Pilát 1936 (BbC 56): 64 & 1937 (ACE 3): 103 = *Polyporellus picipes* [= *Polyporus badius*] (forma).

perturbatus*, *Polyporus*, Lloyd 1918 (LMW 5, L. 68): 11 (Brazil); *Ganoderma* Torrend 1920.—Mentioned by Steyaert 1967 (BBB 100): 198 as a syn. of *Ganoderma dorsale* (O**). — The type material was distributed by J. Rick as *Polyporus formosissimus* Speg. which is the name of a different species.

pertusus, *Polyporus*, Pers. 1825: 103 (France); *Poria* Bres. 1903.—Nomen dubium. Referred by Fr. 1828 E. 1: 124 ("quoad descript.!") to *Polyporus* [*Oxyporus*] *corticola* var. *quercinum* Fr. The collection that Bres. 1903 (Am 1): 80 named *Poria pertusa* was insufficiently described.

petropolitana, *Daedalea*, (Fr. apud Weinm.) E. Krause 1928 ("*Daedaleus*"); *Merulius* Fr. apud Weinm. 1836: 348 (U.S.S.R., European Russia); *Xylomyzon* E. Krause 1934; = *Plicatura nivea* (Sommerf. apud Fr.) P. Karst. (Schizophyllaceae?).

- **pezizoides*, *Boletus*, Schw. 1822: 100 (U.S.A., North Carolina); *Polyporus* Steud. 1824; *Porotheleum* Schw. 1832.—Fide Donk 1959 (Pe 1): 81, 83 = *Stromatoscypha fimbriatum* (**O**).
- Phaeolus* Sart. & M. 1921: 22 (lacking ref. and descr.: n.v.p.), not ~ Pat. 1900; [= *Phaeolus* Pat. sensu Sart. & M., i.e., excl. of type]; monotype: *Polyporus [Hapalopilus] rutilans*.
- phalliodorus*, *Polyporus*, S. Schulz., "Mpt., p. 780. 1869" (n.v.p.).—Fide Igmándy 1968 (Aph 3): 352 and Tort. & Jel. 1969 (Abe 28): 382 ≡ *Polyporus cadaverinus* [= *Buglossoporus pulvinus*?].
- Physisporinus* P. Karst. 1889 [1960 (Pe 1): 256]; monotype, "Poria vitrea Pers." sensu P. Karst.—Nomen dubium.
- piceae*, *Trametes*, A. Möll. 1914 (ZFJ 46): 204 (Germany) (not definitely accepted: n.v.p.), not *T. picei* Yamano 1930; = *Phellinus chrysoloma*.
- **picei*, *Trametes*, Yamano 1930 (Goryōrin No. 25): 69 fs. 2, 5 (n.v.) (Japan), not *T. piceae* A. Möll. 1914 (n.v.p.).—See under *Cryptoderma yamanoi* (**O**).
- **piceinus*, *Polyporus*, Peck 1889 (RNS 42): 121 (U.S.A., New York); *Polystictus* Sacc. 1891; *Microporus* O.K. 1898; *Phellinus* Pat. 1900; *Trametes* Peck 1901.—Bres. 1920 (Am 18): 68 referred this to *Trametes abietis* [= *Phellinus chrysoloma*], but cf. (84). —Descr.: Peck 1901 (RNS 54): 169; Lloyd 1915 (LMW 4, F.): 277 f. 276 (*Trametes*); & cf. Haddow 1928 (TBS 22): 186.
- pictus*, *Boletus*, Ehrenb. 1818: 19, 31 (Germany) (d.n.), not ~ K. F. Schultz 1806 (d.n.), not ~ Peck 1872.—Nomen dubium. Insufficiently described. Referred by Fr. 1821: 348 to *Polyporus brumalis* (forma).
- pilatii*, *Poria*, Bourd. 1932 (BmF 48): 230 pl. 25 ("Tchéchoslovaquie", now U.S.S.R., Ukraine); *Aporpium* Bond. 1953.—Fide Teix. & Rog. 1955 (M 47): 411, 414 = *Aporpium caryae* (Schw.) Teix. & Rog. (Tremellaceae).
- pileatus*, *Boletus*, (Schaeff.) Lapl. 1894: 475 (incidental mention: n.v.p.); ≡ *Boletus ramosissimus* var. *pileatus* Schaeff. 1774: Ind. secundus [pl. 111] (Germany) = *Grimula umbellata*.
- pileus*, *Helvella*, Schaeff. 1774: 111 [pl. 281] (Germany) (d.n.); ≡ (by lectotypification) *Boletus membrana* Batsch 1783 (d.n.).—Fr. 1821: 348 referred Schaeffer's plate 281 to *Polyporus brumalis*, certainly by error. The German descr. gives the context as 'wachsartig', the Latin, as 'cartilagineus', while no tubes were mentioned. In my opinion a species of *Peziza* (modern emendation), cf. *Peziza cerea* Sow. ex Mérat.
- pinguedinea*, *Poria*, (Gaill.) ex Cooke 1886 (G 15): 3; *Polyporus* "Gaill. in Herb. Desm.; in Herb. Berk. ex Desmazières, No. 2888" [no locality mentioned by Cooke, i.e.; Sacc. 1888 (SF 6): 312 suggested "... in Gallia (?)"].—Nomen dubium and subnudum: "We fail to find any description of this. It has large, very irregular, often oblique pores, and is wholly whitish" (Cooke, i.e.). Cooke referred here "*Polyporus heteroporus*, Pers. in Litt."
- pininus*, *Polyporus*, E. Krause 1930 B.r.: 98 (Germany); *Polystictus*

E. Krause 1934.—Nomen dubium. This was equated with only a part of *Polyporus [Coriolus] hirsutus* (Wulf.) per Fr. and in any case with the exclusion of its type, mentioned as “*Bol. hirsutus* [Wulf. in] Jacq. coll. II S. 149”. The original descr. may be rendered thus: “... die oberseits ganz schwarze Form ([*Polyporus hirsutus*] var. F. [Fr. 1874: 568]). Aber in der Jugend ist dieselbe hellgrau, dem *P. abietinus* sehr ähnlich. ... An Nadelholzrinde. Dez.-Mai.” Later the following information was given: “Alle von November bis April gesammelten sind ganz schwarz, ein in September gefundener mit noch weichem Rande ist etwas bunt, doch schon durch blauschwarze kahle Zonen auffällig. Poren werden bald orange. An Nadelholz” (E. Krause 1934 M.B.; 18). Next year followed: “Im Dezember erschien die Nadelholzform des Versicolorkreises in Menge. Die frischen Hüten sind braun oder gelbbraun, ziemlich gleichfarbig mit dunkleren kahlen Zonen und blassem Rande, eigentlich matt (glanzlos). Die Poren sind weiss, trocknend bald orange” [E. Krause 1935 (ANM II 9): 14]. However, E. Krause 1936 (ANM II 10): 53 soon indicated that this last descr. must be excluded from his conception of *Polyporus pininus*; the specimens were not found on coniferous wood but on stumps of birches; he referred them to *P. multicolor* [= *Coriolus zonatus*] but this name was perhaps misapplied.

piniperda, *Boletus*, Link 1804: 243 (Portugal) (nomen subnudum; d.n.); *Polyporus* (Link) per Colm. 1867; *Fomes* Sacc. 1893.—Nomen dubium. Not really described. Referred by some authors to *Trametes [Phellinus] pini* (for instance by P. Cout. 1919: 57), but others suspected that it might be *Fomes unguis* [= *Fomitopsis pinicola*] (cf. Torrend 1913 (Bro 11): 65). Cf. also Pinto-L. 1953 (RCL 3): 205–206. — The basionym has also been ascribed to “Hoffm. ex Link”. Portuguese authors cite from the French edition of Link’s book.

**pinsitus*, *Polyporus*, Fr. 1828 (Brazil); *Polystictus* Fr. 1851; *Microporus* O.K. 1898; *Coriolus* Pat. 1900; *Trametes* O. & K. Fid. 1957.—Listed by Govi 1969 (MBo 20): 42 fs. 65–67, pl. 10 f. b (*Coriolus*) from Italy. I have seen a representative fruitbody of this record and refer it to *Coriolus versicolor*. The correct basionym for the American sp., of which *Coriolus pinsitus* is a syn., is *Polyporus villosus* (Sw.) per Fr., an earlier published name for this highly variable and much-named sp. — Descr.: Overh. 1953: 326 pl. 4 fs. 19, 20, pl. 5 f. 27, pl. 132 fig. (*Polyporus pinsitus*); O. & K. Fid. 1967 (M 59): 833 fs. 1, 2 (*Polyporus villosus*).

pithysus, *Polyporus*, (Fr.) Seer. 1833 M. 3: 171 (as a sp. of *Boletus*: n.v.p.); *Polyporus nitidus* var. *pithysus* Fr. 1818 O. 2: 263 (Sweden).—Nomen dubium. — Sensu Seer. = ?

pithyus, *Boletus*, Chaill. “in litt.”—Fide Fr. 1828 E. 1: 85 = *Polyporus [Climacocystis] borealis* (var.).

**placentaeformis*, *Polyporus*, Berk. “in Herb.”; *Polystictus* (Berk.) ex

- Cooke 1886 (G 15): 24 ('British North America'); *Microporus* O.K. 1898.—Nomen dubium. Cf. Murrill 1907 (NAF 9): 28: "The small type specimens . . . resemble forms of *C[oriolus] nigromarginatus* [= *C. hirsutus*] or *C. pubescens*, . . . but the pores are much too large for the former and the surface too hirsute for the latter."
- planus*, *Polyporus*, Wallr. 1833: 602 (Germany), not ~ Peck 1879.—Nomen dubium. Referred by Pilát 1936 (ACE 3): 64 to *Polyporellus* [*Polyporus*] *brumalis* [sensu lato], but the species is said to be terrestrial and the description is too vague.
- **platyporus*, *Polyporus*, Berk. 1851 (HJB 3): 81 (India), not ~ (Pers.) Fr. 1815 (d.n.), not ~ Seer. 1833 (n.v.p.).—This has been cited as a syn. of *Heteroporus* [*Abortiporus*] *biennis* by Pilát 1937 (ACE 3): 115 because Lloyd 1912 (LMW 3, S.P.): 162 thought it might be "*Polyporus rufescens* form *heteroporus*". — Cf. (2).
- platyporus*, *Polyporus*, Seer. 1833 M. 3: 50 (Switzerland) (as a sp. of *Boletus*: n.v.p.), not *Boletus platyporus* Pers. 1794 (d.n.), not ~ Berk. 1851; = *Polyporus squamosus*. This is "*Polyporus*" [= *Boletus*] *platyporus* "Pers. Syn. f. p. 521 (pro parte)" exclusive of the type, which is cited under *P. favolus juglandis* Seer. 1833 M. 3: 49 as "Schaeff. t. 101–102. *B. Juglandis*" (101).
- pleuropus*, *Daedalea*, Sacc. 1891 (SF 9): 200 (Germany); Lind. & Syd. 1917 T. 5: 190 (incidental mention: n.v.p.).—Nomen dubium. In my opinion this specific name is the result of a misrepresentation of the original text [1831 (IO): 1011]: "... Steinheim . . . zeigte . . . einen in Hamburgs Nähe gefundenen Pilz, *Daedalea*, *Pleuropus*, [follows a brief Latin descr.]." What was actually published was an unnamed sp. of '*Daedalea* sect. *Pleuropus*'.
- **plumbea*, *Daedalea*, Lév. 1846 (ASn III 5): 302 (U.S.A., New York).—Nomen dubium. Not mentioned by Overh. 1953. Murrill 1905 (BTC 32): 95, 1907 (NAF 9): 125 referred this with doubt to *Agaricus/Daedalea quercina*.
- Podoporia* P. Karst. 1892 [1960 (Pe 1): 259]; monotype, *Podoporia confluens* P. Karst. (O).—Nomen dubium. The name has been misapplied: *Podoporia* sensu Donk → *Rigidoporus*, 'resupinate' species.
- polygonius* = *polyzonius*
- polymorpha*, *Daedalea*, Opiz 1852: 119 (Czechoslovakia) (nom. nud.: n.v.p.).—Fide Pilát 1942 (ACE 3): 612 = *Gloeophyllum sepiarium*.
- polyporus*, *Boletus*, Bull. 1789: pl. 469 & 1791 H.: 331 (France) (d.n.), not ~ Retz. 1769 (d.n.); *Boletus* Bull. per St-Am. 1821, Purt. 1821; ≡ *Boletus fuligineus* Pers. 1801 (d.n.), not ~ Fr. 1835; *Polyporus* (Pers.) per Fr. 1821; *Albatrellus* S. F. Gray 1821; *Boletus* Spreng. 1827; *Leucoporus* Quél. 1890 (incidental mention: n.v.p.); *Agaricus* E. Krause 1933.—Nomen dubium. For a long time treated as a distinct species. Pilát 1936 (ACE 3): 64, 69 considered it a form of *Polyporellus* [*Polyporus*] *brumalis* [sensu lato]. This is doubtful, although *Polyporus*

lepidus [= *P. ciliatus* forma] comes to mind. Bulliard's protologue gives the species as terrestrial. I have compared it with *Polyporus politus* Fr. (cf. Fr. 1884 I. 2: 79 *pl. 179 f. 2*), a form of *Albatrellus confluens*, but the colour disagrees; and with *Polyporus melanopus*, but in this case too there is much that disagrees. Cf. also Quél. 1872 (MMb II 5): 268 (*P. fuligineus*) and a remark by Bourd. & G. 1928: 530–531 under *Leucoporus* [*Polyporus*] *brumalis* f. *crassior* Bourd. & G. — Sensu Lenz 1840: 93, (*Boletus*) = ?

polyporus, *Boletus*, Retz. 1769 (SVH 30): 253 (Sweden) (d.n.), not ~ Bull. 1789 (d.n.) per St-Am. 1821, Part. 1821, not ~ Fr. 1835; *Poly-porellus* Murrill 1903 (generic name not accepted: n.v.p.); *Polyporus* Murrill 1904, presumably misapplied.—Nomen dubium. Referred by Fr. 1821: 348 to *Polyporus brumalis* (forma), but there is little in the original descr. to substantiate this claim. Original descr.: “stipitatus, perennis, pileo subhemisphaerico, subtus planiusculo fulvo”; Mich. 1729: *pl. 70 f. 9* listed as a syn. — Sensu Murrill = *Polyporus brumalis* and other species confused with it.

polyporus perennis, *Fungus*, Paul. 1793 T. 2: 361 (descr.), Ind. (name) [*pl. 164 fs. 1, 2*] (France) (double epithet); = *Polyporus umbilicatus* Paul. 1812–35 (d.n.?), not ~ Jungh. 1838, &c.—If typified by the depicted specimen (as is done here), then to me a nomen dubium, perhaps *Polyporus lepidus* = *P. ciliatus* forma. Lév. 1855: 90 referred this to *Favolus* [*Polyporus*] *arcularius* but Paul. mentioned the pores as “très-fins” and depicted them as radially elongate. Among the synonyms cited by Paulet are Mich. 1729: *pl. 70 f. 7*, *Boletus* [*Coltricia*] *perennis*, and *B. lacteus* Batsch [= *Polyporus brumalis*].

polyporus, *Polyporus*, Pers. 1825: 102; [= *Agaricum album, terrestre medullam panis referens* Mich. sensu Batt. 1755: 66 *pl. 32 f. A* (Italy)]. —Nomen dubium. It is with considerable hesitation that I suggest that this might represent an abnormal condition of *Heterobasidion annosum*, developing fruitbodies on the soil surface, but connected to buried tree-roots by ‘roots’.

Polysticta 'Fr.' [1960 (Pe 1): 264].—Sometimes listed as a generic name, but perhaps never validly published as such; = *Polyporus* subgen. *Polysticta* Fr., based on two effused polypores, *Polyporus* [*Oxyporus*] *corticola* Fr. and *P. [Ceriporia] reticulata* (Hoffm.) per Fr. Not *Polystictus* Fr. 1851.

Polystictus Bond. 1953: 43, 419 (lacking Latin descr. or validating ref.: n.v.p.), not ~ Fr. 1851 (“*Polyporaceae*”) [1960 (Pe 1): 265, in obs.]; [= *Polystictus* Fr. sensu Sing. 1944 (M 36): 68, in obs. (provisional emendation) & Bond., i.e., excl. of type); holotype, *Polyporus tomentosus* Fr.

**polyzonus*, *Polyporus*, Pers. apud Gaud. 1827: 171 (New Guinea); *Polystictus* Cooke 1886, Sacc. 1888 (“*polygonius*”, error); *Microporus* O.K. 1898 (“*polygonius*”); *Trametes* Petch 1916; *Daedalea* C. & D. Over.

- 1922, non/an ~ Pers. 1828; *Coriolus* Imaz. 1943.—Pers. wrote “n'est vraisemblable qu'une simple variété de *polyporus lutescens* (Mycol. Europ.)”. Referred by Pat. 1914 (LPB 6): 2248 (as a var.) and Lloyd 1929 (LMW 6): 1089 (as a form) to *Polystictus [Coriolus] hirsutus*, but this needs further study. — Descr.: Bres. 1913 (H 53): 65; Kawam. 1954 I, 1: 148 f. 131: 2 (*Polystictus*).
pomariorum, *Agaricus*, Dubois 1803: 179 (France) (d.n.) per Dubois 1833.—Nomen dubium.
populina, *Ungularia*, Lázaro 1916 (RMa 14): 670, 1917 (RMa 15): 378 / 1917: 109, 292 (Spain); *Polyporus* Sacc. & Trott. apud Trott. 1925, not ~ (Schum.) per Fr. 1821.—Nomen dubium. *Fomes fomentarius?*
populneus, *Boletus*, Pollini → *Polyporus castaneus* Fr. (O).
Poria [Hill] Adans. 1763 (d.n.) [1960 (Pe 1): 265], not ~ Pers. per S. F. Gray 1821, not *Porium* Hill 1751 (pre-Linnaean name).—A name introduced for polypores in general.
Poria Bond. 1953: 156 [(Fr.) Karst.] (lacking Latin descr. or valid ref.: n.v.p.), excl. of types of *Polyporus* “series” [subgen.] *Poria* Fr. 1851 (NAu III 1): 70/54 [= *Poria* Pers. per S. F. Gray 1821] and of *Poria* P. Karst. 1881 (Rm 3 / No. 9): 19 [= *Poria* Pers. 1794, in part.] — Cf. Donk 1960 (Pe 1): 268–269.
porinoides, *Trametes*, Lázaro 1917 (RMa 15): 372 / 1917: 286 (Spain). —Nomen dubium.
**poripes*, *Polyporus*, Fr. 1821 (NAu III 1): 48/32 (U.S.A., North Carolina); *Grifola* Murrill 1904, misapplied?—A nomen dubium, fide Lloyd 1911 (LMW 3, O.): 90. — Sensu Ravenel, Murrill → *Albatrellus cristatus*.
Porium Hill 1751 (pre-Linnaean name) [1960 (Pe 1): 270], not *Poria* [Hill] Adans. 1763 (d.n.); not ~ Pers. per S. F. Gray 1821, not ~ P. Karst. 1881.—In the main this genus is the same as *Polyporus* Mich. 1729 (pre-Linnaean name), introduced for stalked polypores.
Porodon Fr. 1821 (nom. nud.: n.v.p.), 1851 (nom. nud. & prov.: n.v.p.) [1962 (Pe 2): 209]; holotype: *Polyporus acanthoides* (Bull. per Mérat) Fr. sensu Fr. [= *Abortiporus biennis*].
Porothelium Fr. 1818 (d.n.); *Porotheleum* (Fr. per Fr.) Fr. 1825: Fr. 1828 & 1832, not *Porothelium* Eschw. (Lichenes) [1951 (Re 1): 217]; lectotype, *Boletus fimbriatus* (Pers.) Pers. (O).—Often referred to the Polyporaceae and even in recent times included in *Poria*. European spp. referred to *Porotheleum* are not listed except when they actually belong to the European ‘polypores’.
**proliferus*, *Polystictus*, Lloyd 1908 (LMW 3, P.I.): 8 f. 202 (U.S.A., Ohio) (as a “form” of *P. perennis*: n.v.p.).—Fide Overh. 1953: 387 = *Polyporus [Coltricia] perennis*.
**proteiporus*, *Polyporus*, Cooke 1883 (G 12): 15 (Australia, Queensland). —This has been referred to *Polyporus rufescens* [= *Abortiporus biennis*] by Lloyd 1912 (LMW 3, S.P.): 162 and to *Polyporus/Heteroporus [Abortiporus] biennis* by G. Cunn. 1965: 82, 83. — Cf. (2).

- proteus*, *Boletus*, Bolt. 1788: 66 pl. 66 (England) (d.n.).—Nomen dubium. Referred by Fr. 1821: 381 to *Polyporus vulgaris* Fr. [sensu stricto = *Poria lenis*] and by Pers. 1825: 100 to *Polyporus* [*Perenniporia*] *medulla-panis*.
- **proteus*, *Polyporus*, Berk. 1843 (LJB 2): 514 ("414") (South Africa), not ~ Kalchbr. apud Cooke 1882; *Trametes* Fr. 1848, G. Cunn. 1949 misapplied; *Polystictus* Cooke 1886; *Microporus* O.K. 1898; *Osmoporus* G. Cunn. 1965, misapplied.—Referred by Bres. 1926: 79 and in earlier publications to *Trametes hispida* [= *Funalia gallica*] sensu lato. — Misapplied by Lloyd; also by G. Cunn. 1965: 249, cf. D. Reid 1967 (TBS 50): 165. — Cf. (36).
- provectus*, *Polyporus*, Chev. 1837: No. 40 var. *e plate f 2* (as a var. of *P. [Albatrellus] cristatus*: n.v.p.) (France).
- **proxima*, *Lenzites*, Berk. 1876 (G 4): 162 (U.S.A., New York); *Cellularia* O.K. 1898.—Referred to *Daedalea* [*Daedaleopsis*] *confragosa* (var.) by Peck 1878 (RNS 30): 74. — Cf. (31).
- prunastri*, *Polyporus*, (Pers. ex S. F. Gray) Bret. & Niel 1894 (BRo III 29): 135 ("Alb. et Schw."); syn.: n.v.p.; *Fomes* Lloyd 1908 (syn.: n.v.p.); [= *Boletus fomentarius* var. "B. prunastri" Pers. 1801: 538 (Germany)]; *Boletus fomentarius* var. *prunastri* (Pers.) ex A. & S. 1805 (d.n.); *Boletus pomaceus* var. Pers. ex S. F. Gray 1821.—Fide Pers. 1825: 85 = *Polyporus* [*Phellinus*] *pomaceus* (var.).
- pruni*, *Polyporus*, Bertol. 1878 (NGi 10): 383 (Italy) (nom. prov. & subnudum), not ~ Wittr. (n.v.p.).—Fide Sacc. 1916: 999 = *Fomes fulvus* [sensu Sacc. = *Phellinus pomaceus*].
- pruni*, *Polyporus*, Wittr. in herb., not ~ Bertol. 1878 (n.v.p.).—Fide Nannf. 1967 (WPb 6): 131 = *Phellinus pomaceus*.
- **prunicola*, *Fomitiporia*, Murrill 1907 (U.S.A., Maine); *Poria* Sacc. & Trott. 1912; *Fuscoporia* Aosh. 1950.—Referred to *Poria* [*Phellinus*] *laevigata*, which was simultaneously considered to be resupinate *Fomes* [*Phellinus*] *igniarius*, by Lowe 1949 (Ll 11): 166, 1966: 156, but cf. (82). Niemelä 1972 (Abf 9): 57 considers it a distinct sp. — Descr.: Overh. 1931 (M 23): 118 pl. 12 fs. 2, 6, pl. 13 f. 8; 1942: 62; Lowe 1946: 81 (*Poria*); Aosh. 1950 (RFJ 46): 160 tpl. 1 f. 3 (*Fuscoporia*); D. Baxt. 1952 (PMi 37): 98 pl. 7 f. 1 (*Poria laevigata* f.); Niemelä l.c. (*Fomitiporia*). *pseudoacaciae*, *Polyporus*, Kalchbr. in manuser.—Fide Igmády 1965 (EFE): 207 = *Gloecoporus* [*Bjerkandera*] *fumosus*.
- pseudoboletus*, *Hydnus*, DC. 1815: 37 (Switzerland) per Fr. 1821; *Xylodon* O.K. 1898.—Nomen dubium. Referred by Pers. 1825: 77 to *Polyporus dolosus* [= *Hirschioporus abietinus*] and by Fr. 1828 E. 1: 147 to *Irpex deformis* [= *Schizopora paradoxa*]. If the substratum ("les bois de chêne dénudés d'écorce") was correctly identified the first suggestion is not tenable; the second is the more likely but far from certain.
- **pseudolacteus*, *Tyromyces*, Murrill 1940 (BTC 67): 65 (U.S.A., Florida); *Polyporus* Murrill 1940 (nom. altern.).—According to Lowe apud

- Overh. 1953: 428, "appears to agree with *Polyporus [Tyromyces] fumidiceps.*"
- pseudo-osseus*, *Polyporus*, J. Schroet. 1893 (JsC 70, Naturw. Abth.): 80 (former Prussian Silesia).—Nomen dubium.
- Pseudopelloporus* Lázaro 1916 (nom. nud. & error: n.v.p.) [1960 (Pe 1): 224, in obs.] \equiv *Heteroporus* Lázaro = *Abortiporus*.
- pulchellus*, *Polyporus*, Sacc. 1873 (ASv 2): 98/50 pl. 7 fs. 11–15 (Italy), not \sim Schw. 1832; *Polystictus* Sacc. 1888; *Microporus* O.K. 1898.—Nomen dubium; even Sacc. 1916: 1021 confessed, "rimane quindi un po'dubbia." — Referred by Lloyd 1915 (LMW 4, Ap.) 384 to *Polyporus [Tyromyces] henningsii* ("picture is surely same thing"); this is contradicted by the original descr., cf. "pileo . . . fusco-zonato; . . . sporis minimis rotundis . . . , circ. 3 μ diam."
- **pulcher*, *Polyporus*, Speg. 1880 (ASa 10): 129 ("pucher") (Argentina), not \sim Fr. 1830; *Trametes* Speg. 1899; \equiv *Polystictus celottianus* Sacc. & Mane. apud Sacc. 1888; *Microporus* O.K. 1898; *Polyporus* Speg. 1899 (syn.: n.v.p.).—Fide Bres. 1916 (Am 14): 223 = *Trametes hispida* [in part, = *Funalia gallica*]. — Cf. (36).
- pulchrum*, *Xylomyzon*, Pers. 1825: 32 pl. 14 f. 1 (Switzerland); *Merulius* Duby 1830.—Fide Romell 1911 (ABS 11³): 30 and Lundell 1941 (LNF 21–22): 3 No. 1004 = *Polyporus haematodes* Rostk. [sensu Romell = *Merulius taxicola* (**O**), fide Donk 1967 (Pe. 5): 104].
- pulvinata*, *Poria*, Scop. 1772 P.s.: 106 pl. 28 f. 1 (Hungary, now Czechoslovakia) (d.n.); *Boletus* Humb. 1793 (d.n.); Fr. 1821 (incidental mention: n.v.p.); *Polyporus* (Scop.) per Steud. 1824; \equiv *Polyporus lycoperdifloris* Pers. 1825.—Nomen dubium. Found in a mine and was very likely a monstrous growth form of some polypore.
- pulvinato-griseus*, *Polyporus*, Seer. 1833 M. 3: 114 (Switzerland) (as a sp. of *Boletus*, nom. nud.: n.v.p.).—Nomen dubium.
- punctatus*, *Boletus*, With. 1776; [\equiv *Fungus arboreus Lobis rubellis*, *diversimodè figuratis & punctatis* Ray 1696: 20, 1724: 23 (England)].—Nomen dubium. This may not even be a polypore.
- **punicus*, *Polyporus*, Kalchbr. 1882 (Rm 4): 96 pl. 29 f. 4 ("punicus") ("Ins. Ocean. pacifici"); *Polystictus* Sacc. 1888; *Microporus* O.K. 1898.—Fide Bres. 1890 (BmF 6): xliv = *Polystictus [Pycnoporus] sanguineus* (q.v.). Referred by G. Cunn. 1965: 169 to *Trametes [Pycnoporus] cinnabarina* sensu lato, but cf. (112). — To be compared with *Trametes [Pycnoporus] coccinea* Fr. 1851 (extra-European) (**O**).
- purpurascens*, *Boletus*, DC. 1815: 41 (France) (d.n.) per Steud. 1824, not \sim Pers. 1796 (d.n.), not \sim Hook. 1822, not \sim Rostk. 1844; *Polyporus* Pers. 1825, not \sim (Hook.) Fr. 1838, not \sim Stahlshmidt 1877.—Fide Fr. 1828 E. 1: 58 = *Merulius corium* (**O**). The monotype was found by de Candolle himself. Fries's identification is apparently based on a specimen sent from France by Guépin; it is supported by the original descr.
- purpurascens*, *Trametes*, B. & Br. 1879 (AM V 3): 210 (England).—Cf.

Bres. 1916 (Am 14): 240, "Vix dubie abortus speciei jam notae, ideoque species delenda."

**purpurea*, *Trametes*, Cooke 1882 (G 10): 121 (Japan).—Referred to *Lenzites [Daedaleopsis] tricolor* ("f. tramctoidea") by Bres. 1916 (Am 14): 229. — Cf. (31).

purpureo-rufus, *Polyporus*, Post in herb. (Sweden).—Fide Romell 1926 (SbT 20): 15 = *Polyporus [Ceriporia] purpureus*.

pusillus, *Trametes*, Lloyd 1918 (LMW 5): 774 f. 1165 (U.S.A., Minnesota), not ~ Ell. & Gall., Lloyd 1915 (n.v.p.).—Overh. 1953: 354, 355 referred this to *Polyporus [Coriolus] velutinus*, which, in his interpretation, might be *Coriolus zonatus*.

queletii, *Daedalea*, S. Schulz. 1885 (H 24): 145 (Yugoslavia, Slavonia); *Striglia* O.K. 1891.—Nomen dubium.

queletii, *Lenzites*, S. Schulz. 1885 (H 24): 142 (Yugoslavia, Slavonia).—Nomen dubium. If this is *Lenzites warnieri* then the descr. contains several errors.

quericina, *Ungularia*, Lázaro 1916 (RMa 14): 674 / 1917: 113 (Spain); *Polyporus* Sacc. & Trott. apud Trott. 1925, not ~ (Schrad.) per Fr. 1838.—Nomen dubium. Cf. *Fomes fomentarius* or *Phellinus* sp.

querneus, *Polyporus*, Berk. 1861 (GCh): 121.—Berk. mentioned this name rather casually in a comparison with *Fistulina hepatica*. This may be taken as a lapsus calami for *Polyporus 'quercinus'* [= *Buglossoporus pulvinus*].

radians, *Polyporus*, Lloyd 1923 (LMW 7): 1186 (nom. nud.: n.v.p.).—This is apparently an error for *Polyporus [Inonotus] radiatus*. According to G. Cunn. 1965: 278 the specimens involved (New Zealand, leg. G. Cunn.) are *Inonotus nothofagi* G. Cunn. (extra-European).

**radiata*, *Lenzites*, (Peck) Lloyd 1924 (as a form of *Lenzites betulina*: n.v.p.); *Lenzites betulina* var. *radiata* Peck 1902 (BNS 54): 965 (U.S.A., New York).—Fide Lowe 1942: 97 = *Lenzites betulina*.

radula, *Poria*, Romell 1926 (SbT 20): 16 ["Bres. (non Pers.)"] (nom. prov.: n.v.p.), not ~ (Pers. per Fr.) Cooke 1886; = *Poria eupora* var. *subfimbriata* Romell, l.c. (Sweden); = either *Chaetoporus separabilimus* or *C. nitidus*. — Romell did not include the 'type' of *Poria radula* sensu Bres., cf. Donk 1967 (Pe 5): 105–106.

ramealis, *Polyporus*, S. Schulz. 1866: 41 (Yugoslavia, Slavonia) (nom. nud.: n.v.p.).—Nomen dubium.

**ramosus*, [*Polyporus*], Schw., "Published ?".—Fide Lloyd 1912 (LMW 3, S.P.): 157 = *Polyporus [Grifola] frondosus*.

rangiferinus, *Polyporus*, Pers. 1825: 114; [= *Boletus medulla-panis* Jacq. sensu Sow. 1801: pl. 326 (England)].—Nomen dubium, cf. Donk 1967 (Pe 5): 93. Referred by Fr. 1828 E. 1: 122 to *Polyporus [Poria] vaillantii* ("optime"). *Serpula* sp.?

**ravenelii*, *Merulius*, Berk. 1871 (G 1): 69 (U.S.A., South Carolina).—Fide Lowe 1966: 35 = *Poria [Merulius] taxicola* (O).

- **repsoldii*, *Polyporus*, A. Möll. 1897 (BCb 72): 232 (Brazil), *Spongiosus* Torrend 1924 ("Repsodi").—Lloyd 1912 (LMW 3, S.P.): 159 compared this with *Polyporus [Phaeolus] schweinitzii* and J. Rick 1960 (Ih 7): 219 ("P. Henn.") reduced it to a var. of that sp.
- resinosus*, *Boletus*, Rubel 1779 (MaJ 1): 180 (presumably Austria) (d.n.).—Nomen dubium. An inclusively conceived and insufficiently described sp. The citation of Schaeff. *pl. 106* [= *Gloeophyllum odoratum*] and *pl. 136* [= *Hapalopilus rutilans*] indicates only some of the elements included.
- resupinatus*, *Boletus*, Bolt. 1791: 165 *pl. 165* (England) (d.n.), not ~ Sw. 1788 (d.n.), not ~ Sow. 1815 (d.n.); *Fomes* (Bolt.) per Mass. 1892; ≡ *Boletus spongiosus* Pers. 1801 (d.n.), not ~ Lightf. 1778 (d.n.); *Polyporus* (Pers.) per Fr. 1821; *Boletus* Hook. 1821; *Poria* S. F. Gray 1821; *Fomes* Cooke 1886; *Physisporus* Cost. & Duf. 1895; *Scindalma* O.K. 1898.—Nomen dubium. This has been reduced to *Polyporus nidulans* [= *Hapalopilus rutilans*] by Fr. 1838: 455 (as a subsp.) & cf. (108). — Misspellings: *Boletus "reticulatus"*, Hartig 1833: 43 (syn.); *Poria "spongia* Quél.", D. Baxt. 1950 (PMi 34): 43. — Sensu Quél. 1892 (*Poria spongiosa*) → *Poria expansa*; sensu Romell (*Polyporus spongiosus*) ~ *Phellinus nigrolimitatus*.
- resupinatus*, *Boletus*, Sow. 1815: *pl. 424* (England) (d.n.), not ~ Sw. 1788 (d.n.), not ~ Bolt. 1791 (d.n.); ≡ *Daedalea vermicularis* Pers. 1825; *Striglia* O.K. 1891.—Nomen dubium. Referred by Fr. 1830 (Li 5): 701 to *Daedalea latissima*, which is referred to *Cerrena unicolor* (forma) by Bourd. & G. 1928: 564. As to Sowerby's fungus, from the plate I do not venture to suggest its identity.
- resupinatus pseudo-platani*, *Polyporus*, Seer. 1833 M. 3: 147 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.).—Nomen dubium.
- resupinus*, *Agaricus*, Paul. 1812–35: *pl. 2 f. 5* ≡ (by lecto-typification) *Agaricus applicatus* Batsch 1786: 171 *pl. 24 f. 125* (d.n.); *Agarico-suber* Paul. 1793; ≡ *Resupinus applicatus* (Batsch per Fr.) S. F. Gray (Agaricales). — Paulet confused this with *Gloeophyllum sepiarium*. Cf. Donk 1971 (PNA 74): 6.
- **reticulata*, *Auricularia*, Fr. 1838: 555 (Brazil); *Gloeoporus* Fr. 1848, Graff 1922.—Fide Bres. 1896 (H 35): 284 = *Gloeoporus conchoides*, but cf. (51).
- reticulata sebacea*, *Poria*, Seer. → *Polyporus sebaceus* Fr. (O).
- Retiporus* Endl. 1836 (syn.: n.v.p.) [1960 (Pe 1): 277]; [= *Boletus "sub-ordo"* *Retiporei* Batsch 1783: 107 (inadmissible terms denoting rank)]; lectotype, *Boletus officinalis* Batsch [= *Agaricum officinale*]; ≡ *Dictyoporus* Clem. 1902 (nom. nud.: n.v.p.).
- **retiporus*, *Polyporus*, Cooke 1883 (G 12): 15 (Australia, Queensland).—Lloyd 1912 (LMW 3, S.P.): 154 thought that this "will prove to be only a form" of *Polyporus [Laetiporus] sulphureus*. Fide Bres. 1916 (Am 14): 227 = *Polyporus [Bondarzewia] berkeleyi* Fr., an extra-European species.

- retiporus*, *Polyporus*, Opiz in herb., not ~ Cooke 1883.—Fide Pilát 1937 (ACE 3): 88 = *Polyporellus* [*Polyporus*] *squamulosus* ("Fungus juvenilis").
- **rhaponticus*, *Fomes*, Lloyd 1913 (LMW 4, L. 44): 11, 1915 (LMW 4, F.): 258 (Japan).—Lowe 1957 F.: 55 mentioned this as a probable syn. of *Fomes* [*Phellinus*] *robustus*. S. Ito 1955: 360 took it to be a nomen dubium. The original descr. disagrees with Lowe's suggestion.
- **richardsonii*, *Irpea*, [Kl. ?] in "Hook. Herb." ("North America", Canada).—Fide Berk. 1839 (AM 3): 395 = *Irpea* [*Hirschioporus*] *fuscoviolaceus*.
- **richardsonii*, *Polyporus*, B. & C. 1856 (JAP II 3): 224 (boreal North America).—Needs re-examination of type. Murrill 1907 (NAF 9): 28 thought, "Apparently near *C[oriolus] pubescens*", a suggestion hardly supported by the original description, which, however, is very poor.
- **rigidus*, *Polyporus*, Lév. 1844 (ASn III 2): 189 (Indonesia, Java), not ~ Berk. in Ravenel 1852 (nom. nud.), not ~ Lloyd 1924 (n.v.p.); *Polystictus* Cooke 1886, not ~ (B. & Mont.) Cooke 1886, not ~ Lloyd 1916; *Microporus* O.K. 1898; *Phaeolus* Pat. 1915, misapplied; *Funalia* House 1918; *Trametes* C. & D. Over. 1922.—Sensu Overh. 1953: 308 a North American sp. of *Rigidoporus* for which he listed *Polyporus* [*Rigidoporus*] *undatus* Pers. 1825 and *P. broomei* Rab. [= *Rigidoporus undatus*] as syns., both based on specimens of a European sp. I cannot agree with these identifications and consider Overholts's sp. to be unreported for Europe. — The application of the name *Polyporus rigidus* by Overh. seems to have been induced by determinations by Lloyd 1915 (LMW 4, Ap.): 337 of certain collections found in the U.S.A. The true *P. rigidus* is apparently a different sp. and has been listed as a syn. of another extra-European sp., viz. *Rigidoporus zonalis* (O) by Pegl. & Wat. 1968 (CDp): no. 200. Bres. 1916 (Am 14): 227 identified *P. rigidus* with *P. rugulosus* Lév., which was listed as another syn. of *Rigidoporus zonalis* by Pegl. & Wat., i.e. Another interpretation of *P. rigidus* is by Pat. 1915 (PJS 10): 92 (as *Phaeolus*) = "*Polyporus*" *durus* Jungh., also extra-European.
- rimosus*, *Polyporus*, Berk. → *Fomes scaber* (Berk.) Lloyd (O).
- **robinophilus*, *Trametes*, Murrill 1907 (NAF 9): 42 (U.S.A., Virginia); *Polyporus* Lloyd 1912, Overh. 1914; *Leptoporus* Pilát 1937.—Reported from Great Britain by Rea 1932 (TBS 17): 47 (no material in K and BM); and from Romania by Eliade 1965: 215 without descr. or comment. — Descr.: Lloyd 1912 (LMW 4, L. 42): 12 (*Polyporus*); 1915 (LMW 4, Ap.): 314 f. 653 *Trametes*; Overh. 1953: 314 pl. 12 fs. 68, 69, pl. 95 f. 544, pl. 131 fig. (*Polyporus*). — Special literature: Kauffman & Kerber, 1922.
- **robinsoniae*, *Pyropolyporus*, Murrill 1908 (NAF 9): 108 (Jamaica); *Fomes* Sacc. & Trott. 1912.—This was referred to *Fomes* [*Phellinus*] *robustus* by D. Baxt. 1952 (PMi 37): 104 ("ex Bres."), but Lowe 1954 (M 46): 494 identified it with *Fomes zealandicus* (Cooke) Cooke [= *Phellinus laurencii* (Berk.) Aosh.] (extra-European).

- roburneus*, *Polyporus*, Fr. 1838; *Fomes* Fr. 1849 (nom. nud.: n.v.p.), Gillet 1877; *Placodes* Quél. 1886; *Scindalma* O.K. 1898; *Ungulina* Pat. 1900; [= *Polyporus annosus* Fr. sensu Fr. 1828 E. 1: 106 (Sweden)]. —Nomen dubium & ambiguum, cf. (48).
- rosae*, *Polyporus*, Velen. 1925 (MP 2): 98 (as a "subspecies" of *P. evonymi*: n.v.p.) (Czechoslovakia).—Fide Pilát 1942 (ACE 3): 528 = *Phellinus ribis* (forma). — *Polyporus ribis* var. *rosae* Velen. 1922: 676, typonym?
- rosmarinus*, *Polyporus*, Schwalb 1891: 166 (Austria?).—Nomen dubium.
- rotundata*, *Poria*, Roussel 1806: 72 (France) (d.n.).—Nomen dubium.
- rotundatus*, *Polyporus*, Lindblad apud Fr. 1874: 554 (Sweden) (nom. prov.: n.v.p.).—Nomen dubium. According to Romell 1909 (M 1): 266 there is no type. He suspected that *P. rotundatus* was *Polyporus [Fomitopsis] pinicola*. He also remarked that, "according to a note, Dr. Lindblad found his fungus 'in cortice vetustiori *Betulae*', while Fries wrote 'ad truncos *Pini*.'"
- ruber*, *Agaricus*, Lam. → *Boletus sanguineus* L. (0).
- ruber*, *Boletus*, Scop. 1772 P.s.: 107 pl. 30 f. 1 (Hungary, now Czechoslovakia) (d.n.), not ~ (Lam). Fr. 1821 (n.v.p.); *Polyporus* (Scop.) per Pers. 1825.—Nomen dubium. Found in a mine; may be an abnormal growth.
- rubescens*, *Boletus*, Gaterau 1789: 190 (France) (d.n.), not ~ Trog. 1839. —Nomen dubium.
- **rubescens*, *Poria*, Petch 1922 (APe 7): 286 (Ceylon).—Referred by Lowe 1966: 31, 32 to *Poria [Ceriporia] rhodella*, which, sensu Lowe, is a broadly conceived sp. (22).
- rubiginosus*, *Boletus*, Retz. 1769 (SVH 30): 253 (Sweden) (d.n.) per Steud. 1824: 81, not ~ Schrad. 1794 (d.n.), not ~ Fr. 1874 (Boletaceae). —Nomen dubium. Sensu Fr. 1818 O. 2: 246 = *Boletus rubiginosus* Fr. 1874: 521 (Boletaceae), not ~ Retz. Later Fr. 1832^{Ind.}: 62 thought of "*Polyp. badius*?" This is difficult to accept; Retzius's sp. was apparently a fleshy bolete, otherwise he would not have cited as a syn. "*Suillus esculentus* [!] . . . Mich. 127."
- rubiginosus*, *Polyporus*, Wallr. 1833: 587 (Germany), not ~ Fr. 1838; not ~ Berk. 1839.—Nomen dubium. This taxon was introduced for a combination of various setae-bearing spp., representing a sp. described in the specific descr. and various others, previously published, appended as syns. and vars. From the descr. I am unable to suggest the identity of the main sp.
- **rubricus*, *Polyporus*, Berk. 1851 (HJB 3): 81 (India); *Polyporellus* P. Karst. 1879.—Fide Bres. 1912 (H 53): 52 = *Polyporus [Laetiporus] miniatus* (0). Referred by Lloyd 1912 (LMW 3, S.P.): 157 to *Polyporus [Laetiporus] sulphureus*.
- rubripes*, *Polyporus*, Rostk. 1848 (StP Fs. 17–28): 31 pl. 16 (Germany/Poland); *Leucoporus* Quél. 1886.—Nomen dubium. Killerm. 1927 (ZP 6): 135 referred this to *Polyporus arcularius*; Bourd. & G. 1925

(BmF 41): 113 reduced it to a form of *P. brumalis* [sensu Bres. = *P. ciliatus*, forma], but they apparently described something different. Another suggestion, made here, is *P. floccipes*: cf. "am Rande mit weissgelbigen Stacheln besetzt. Die Poren sind . . . gross . . ."

rubromaculatus, *Polyporus*, Britz. 1891 H.S. 8: 13 pl. 624 f. 118 (Germany).

—This has been referred to *Polyporus [Tyromyces] fragilis* by Killerm. 1922 (Dba 15): 70, 73 and Ade 1923 (ZP 2): 42, but the protologue does not agree well: fruitbody, "weisslich, rötlich, rotfleckig. Fl[eisch] . . . wässrig, fast krokhart . . . Sp[oren] bald gerade, bald wenig gebogen . . ." As drawn, the spores appear rather very narrowly spindle-shaped. I do not recognize *Tyromyces mollis* in the figures. *rufa*, *Daedalea*, Weinm. 1836: 314 (syn.: n.v.p.).—A herbarium name ("an. 1830. in Sched. adnotavi") for the species actually published by Weinm. 1836: 313 as *Polyporus labyrinthicus* Fr. [sensu Weinm.] → *Polyporus weinmannii* Fr. [= *Tyromyces fragilis*].

rufescens, *Bulliardia*, Lázaro 1916 (RMa 14): 844 / 1917: 156 (Spain); *Daedalea* Sacc. & Trott. apud Trott. 1925, not ~ (Pers. per Fr.) Secr. 1833.—Nomen dubium.

**rufescens*, *Ptychogaster*, Lloyd 1923 (LMW 7): 1195 pl. 241 f. 2426 (South Australia).—Lloyd remarked: "It is one of those abnormal derivates from a *Polyporus*, probably *Polyporus rufescens* [= *Abortiporus biennis*]."
— Cf. (2).

ruficolor, *Polyporus*, E. Krause 1928 B.r.: 53 (Germany).—Nomen dubium. The original descr. is insufficient for recognition, although *Inodermus radiatus* comes to mind. The author cited Schaeff. pl. 136 [= *Hapalopilus rutilans*] and Bolt. pl. 81 [= *Coriolus versicolor*]; later E. Krause 1929 B.r.: 79 identified the sp. with "*Bol. radiatus* Sow. 196 . . . (Nicht *Pol. radiatus* Fr.!)."'

**rufitinctus*, *Poria*, (B. & C.) ex Cooke 1886 (G 15): 25 (Cuba); [*Polyporus*] B. & C. in herb.; *Mucronoporus* Ell. & Macbr. 1896; *Phellinus* Pat. 1900; *Fuscoporia* Murrill 1907; *Fomes* J. Rick 1907; *Trametes* Bres. 1920, misapplied.—Nomen dubium, fide Lowe 1966: 165. Previously Lowe 1954 (PMi 39): 34 referred this doubtfully to *Poria castletonensis* (Murrill) Sacc. & Trott. = *Poria [Phellinus] nicaraguensis* (Murrill) Sacc. & Trott., an extra-European sp. — Sensu Bres. = *Phellinus torulosus*, fide Overh., but Overholts's conception of this sp. is doubtful and apparently erroneous.

**rufo-rugosus*, *Polyporus*, Lloyd 1924 (LMW 7): 1331, 1925 (LMW 7): pl. 318 f. 3058 (Australia, Tasmania).—G. Cunn. 1965: 167, 168 referred this to *Trametes [Coriolus] zonatus*. His interpretation of the latter sp. needs confirmation.

rufo-velutinus, *Agaricus*, DC. 1805: 134 (France) (d.n.) per Mérat 1821; *Daedalea* Duby 1830.—Nomen dubium. Fr. 1821: 340 wrote, "Cf. *Daed. saep.*" [*Gloeophyllum sepiarium*].

rufus, *Boletus*, Schrad. apud J. F. Gmel. 1792: 1435 & Schrad. 1794:

172 (Germany) (d.n.), not ~ Schaeff. 1774 (d.n.) per Krombh. 1821; *Polyporus* (Schrad.) per Fr. 1821; *Physisporus* Gillet 1877; *Poria* Cooke 1886, Quél. 1886; *Merulius* Sacc. & Lind. 1897 [“(Pers.) Karst.”]. —Nomen dubium fide Lundell 1941 (LNF 21–22): 3 No. 1004, in obs., and Donk 1967 (Pe 5): 108. —Sensu Fr. 1874, Romell = *Merulius taxicola* (**O**).

rugosa*, *Gemmularia*, Rafin. 1819 (JPC 89): 106, 1820 (JBD 1): 243 (nom. anam.) (d.n.) (U.S.A.) per Steud. 1824; *Tucahus* Rafin. 1830, G. F. Web. 1929 (“*Tuckhaus*”; syn.: n.v.p.).—This is now held to be the same as *Pachyma cocos* (O**), see G. F. Web. 1929 (M 21): 122 and Donk 1962 (Ta 11): 101.

**rugosa*, *Trametes*, B. & Br. 1873 (JLS 14): 55 (Ceylon).—Nomen dubium. Lloyd apud Petch 1916 (APe 16): 109 referred the portion of the type collection in K to *Trametes* [*Truncospora*] *ochroleuca*; Petch, i.e., thought that the portion at Peradeniya “appears to be nearer *Hexagona durissima* [B. & Br.; extra-European], but they are scarcely identifiable.” Bres. 1916 (Am 14): 240 wrote about *T. rugosa*: “*Trameti Moritzianae* Lév. valde affinis et tantum colore saturatiori distincta. Sterilis inventa, at mihi species valde dubia.”

Rugosaria* Rafin. → *Gemmularia* Rafin. (O**).

rugulosus, *Polyporus*, Lasch in Rab. 1859 F.e.: No. 16, not ~ Lév. 1844. —Wint. 1884 (RKF 1): 416 referred it to *Polyporus* [*Coriolus*] *velutinus*. I saw three copies of the type distribution with strongly insect-damaged material which I would refer to *Coriolus zonatus*. The distributed material may be mixed, cf. “Ad trunc. *Carpini* et *Betulae* . . .”

rupiforme, *Agarico-suber*, Paul. 1793 T. 2: 76 [pl. 2 f. 1] (descr.), Ind. (France) (d.n.).—Nomen dubium. Paul. 1812–35: pl. 2 f. 1 later called this a variety of *Agaricus* [*Daedalea*] *quercinus*. The figure suggests *Lenzites betulina* but there is scarcely any indication of zonation of the surface of the cap and Paul. explicitly stated, “la surface supérieure n'est point zonée ou à bandes”.

rutilenis, *Dendrosarcos*, Paul. → *Agarico-carnis malum* Paul. (**O**).

sabinae, *Polyporus*, (Rox. Clem.) Colm. 1867: 23 (nom. nud.: n.v.p.); *Boletus* Rox. Clem. 1864: 64 (Spain) (nom. nud.: n.v.p.).—Nomen dubium.

saccharinus, *Polyporus*, B. & C. in herb. (type locality?).—Listed by Cooke 1885 (G 13): 85 as a syn. of *Polyporus* [*Tyromyces*] *lacteus*; this means next to nothing.

**saharanpurensis*, *Polyporus*, P. Henn. 1901 (H 40): 325 (India).—Lloyd 1912 (LMW 3, S.P.): 162 remarked, “*Sahranpurennis* [!] . . . from the description seems to be [*Phaeolus*] *Schweinitzii*”.

**saitoi*, *Polyporus*, Lloyd 1924 (LMW 7): 1269 pl. 282 f. 2770 (Japan), not ~ Lloyd 1925 (n.v.p.).—Lloyd considered this “close to *Polyporus brumalis*”; S. Ito 1955: 321 listed it with doubt as a syn. of *P. picipes* [= *P. badius*].

salebrosus, *Polyporus*, Lasch in Rab. 1852 Kl.: No. 1606 (Germany), not ~ Lloyd 1912.—Nomen dubium. Pilát 1942 (ACE 3): 557, 558 listed this name (“teste Rechinger”) as a syn. of *Inonotus radiatus* var. *nodosus* [= *I. nodulosus*] and Bond. 1953: 327 transferred it as a syn. (still with the remark “teste Rechinger”) to *Inonotus polymorphus* [sensu Bourd. & L. Maire] (57). I have been unable to make a determination on the basis of the poor material of two copies of the type-distribution (L); no tramal setae could be located so that I cannot accept the name *P. salebrosus* as basionym for the correct name of *Inonotus polymorphus* sensu Bourd. & L. Maire.

salicinus fumidus, *Polyporus*, Seer. 1833 M. 3: 107 (as a sp. of *Boletus* & double epithet & nom. nud.: n.v.p.) ≡ *Boletus salicinus* Bull. [= *Bjerkandera fumosa*].

**salleana*, *Poria*, (Berk.) ex Cooke 1886 (G 15): 25 (Mexico); *Polyporus* Berk. in herb.—Lowe 1966: 87 writes, “similar to or the same as *Polyporus [Gloeoporus] dichrous*”. — Descr.: Lowe 1963 (M 55): 468. — Cf. (51).

saloensis, *Poria*, (P. Karst.) Bourd. & G. 1925 (syn.: n.v.p.); *Physisporus aurantiacus* var. P. Karst. 1887 (Rm 9): 10 (“*taloensis*”), 1887 (Mfe 14): 81 (Finland).—Fide Bres. 1903 (Am 1): 77 = *Poria nitida* [sensu Bres. 1903], fide Lowe 1961 (PMi 46): 206 = *Poria salmonicolor*.

**salpincta*, *Polyporus*, Cooke 1880 (New Zealand); *Polystictus* Cooke 1886; *Microporus* O.K. 1898; *Coltricia* G. Cunn. 1948.—Lloyd 1912 (LMW 3, S.P.): 160 remarked about this, “probably an abnormal [*Coltricia*] *oblectans*”; this explains why Pilát 1942 (ACE 3): 580, 582 listed it as a syn. of *Polystictus [Coltricia] perennis* f. *cinnamomeus* (Jacq. per S.F. Gray) Pilát. Treated as a distinct sp. by G. Cunn. — Descr.: G. Cunn. 1965: 194 pl. 4 f. d (*Coltricia*).

sanguineus, *Boletus*, Fr. 1821: 372 (incidental mention: n.v.p.), not ~ L. 1759 (d.n.), not ~ With. 1792 (d.n.) per Purt. 1821 (Boletales); not ~ Pers. 1801 ex Seer. 1833 (Boletales); [= *Boletus sanguineus* L. sensu Vill. 1789: 1041, excl. of type, (France)]; = *Fistulina hepatica*.

**sanguineus*, *Boletus*, L. 1759: 1350 (Surinam) (d.n.) (112), not ~ With. 1792 (d.n.) per Purt. 1821 (Boletales), not ~ Pers. 1801 ex Seer. 1833 (Boletales); *Agarico-suber* Paul. 1793 (d.n.); *Xylometron* Paul. 1812–35 (generic name n.v.p.); *Polyporus* G. Meyer 1818 (d.n.); *Polyporus* (L.) per Fr. 1821; *Boletus* Hook. 1822, not ~ Fr. 1821 (n.v.p.), not ~ With. per Purt. 1821, not ~ Pers. per Seer. 1833 (Boletales), not ~ With. 1792 (d.n.) per Fr. 1835 (Boletales); *Polystictus* Fr. 1851; *Trametes* Mart. 1853, Imaz. 1943, not ~ (Kl.) Pat. 1897, not ~ Lloyd 1924; *Microporus* Pat. 1897 (generic name n.v.p.), O.K. 1898; *Pycnoporus* Murrill 1904; *Petaloides* Torrend 1924; *Coriolus* G. Cunn. 1948 (nom. prov.: n.v.p.), 1949, 1950; = *Agaricus ruber* Lam. 1783 (d.n.), not ~ Scop. 1772 (d.n.), not ~ Schaeff. 1774 (d.n.) per Krombh. 1821, not ~ Pers. 1801; *Boletus* Fr. 1821 (syn.: n.v.p.).

—This has been reduced to *Trametes [Pycnoporus] cinnabarina* by various authors, usually as a form or variety. It is now more often considered distinct from *Pycnoporus cinnabarina*; cf. Nobles & Frew 1962 (CJB 40): 1010 /s. 78–98, pl. 2 /s. 25–27 (*Pycnoporus*). It is as yet not certain that it occurs in Europe. — Synonyms of this sp. are not mentioned in this list. — Sensu Plan., Vill. = *Fistulina hepatica*; sensu Liljebl. → *Fomitopsis pinicola*.

"Sarrafini", *Polyporus*.—An error in Lind. & Syd. 1917 T. 5: 190 for *P. 'sarazinii'* S. Schulz.

saxicola = *taxicola*

**scaber*, *Fomes* (Berk.) Lloyd 1915; *Polyporus igniarius* var. Berk. 1839 (AM 3): 324 (Van Diemen's Land = Australia, Tasmania); ≡ *Polyporus rimosus* Berk. 1845; *Fomes* Cooke 1885; *Scindalma* O.K. 1898; *Xanthochrous* Pat. 1900; *Phellinus* Pilát 1940, misapplied, Bond. & S. 1941, G. Cunn. 1965; *Pyropolyporus* Teng 1964.—The sp. from Europe and North America that was identified with *Polyporus rimosus* is a different fungus, → *Phellinus robinae* (88). In the sense of its type it is extra-European; cf. Lowe 1957 F.: 22. No taxonomic syns. included in this list. *Scalaria* Lázaro 1916 [1960 (Pe 1): 278]; monotype, *Scalaria fusca* Lázaro, a nomen dubium. It is just possible that part of the sp. (on almonds, not represented by the theoretical type) is *Phellinus pomaceus*. Cf. Trott. 1925 (SF 23): 397, "Hoc nov. gen. lazaroanum *Scalaria* ... abnormitas tantum sistit."

scalaris, *Boletus*, Schrank 1789: 617 (Germany) (d.n.).—Nomen dubium.

**schini*, *Inonotus*, J. G. Brown 1922 (Sci II 55): 547 (U.S.A., Arizona); *Polyporus* Pilát 1942 ("Overholts"; syn.: n.v.p.).—Pegl. 1964 (TBS 47): 185 referred this to *Inonotus cuticularis* as a thick form with rare setae. Previously Long 1945 (Ll 8): 235 had listed it as a syn. of *Polyporus [Inonotus] farlowii* (extra-European) and Overh. 1953: 425, as a syn. of *Polyporus [Inonotus] munzii* (O), a later name than *P. farlowii*. — Descr.: J. G. Brown 1930. — V.s.: "schinus".

schinus = *schini*.

schönbrunnensis, *Polyporus*, Kalchbr. 1868 in herb. (Austria).—Fide Fr. apud Kalchbr. 1868 (VW 18): 431 = *Polyporus cyphelloides* Fr. apud Kalchbr. [= *Flaviporus brownii*] "nimis affinis".

schulzeri, *Daedalea*, Poetsch 1879 (ÖbZ 29): 289 (Austria); *Striglia* O.K. 1891.—Nomen dubium. Collections referred here to were included by Bres. apud Sacc. 1896 (Mal 10): 262 and Bres. 1897 (AAR III 3): 90 in *Trametes populinus* Bres. apud Sacc. [= "Trametes" *cervina*]. — Sensu Velen. 1922: 689 = *Gloeoporus [Bjerkandera] fumosus*, fide Pilát 1937 (ACE 3): 162.

schulzmorlinii, *Sistotrema*, Spreng. 1806: 377 (Germany) (d.n.) per Steud. 1824.—Nomen dubium.

"*schwartzii* J[oachim]", *Polyporus*, Badet 1934: 145 = (error for) *Polyporus [Phaeolus] schweinitzii*.

- **sciurinus*, *Polyporus*, Kalchbr. apud Thüm. 1882 (BSM 56²): 117 (U.S.S.R., Russia, Siberia); *Bjerkandera* P. Karst. 1882; *Polystictus* Cooke 1886; *Microporus* O.K. 1898.—Fide Bres. 1890 (BmF 6): xlvi = *Trametes hispida* [sensu Bres.]. — “... substantia pilei pallide ligneis ... fere alba vetat ...” *Funalia trogii?*
- scopolii*, *Polyporus*, Pers. 1825 → *Poria membranacea* Scop. (0).
- scoriatus*, *Polyporus*, Pers. in herb.—Fide Lloyd 1910 (LMW 3): 469 = *Fomes evonymi* [= *Phellinus ribis*].
- scrubiculatus*, *Polyporus*, (P. Karst.) Lloyd 1915 (LMW 4, Ap.): 385 (incidental mention: n.v.p.); *Inonotus radiatus* var. P. Karst. 1882 (BFi 37): 238, 1882 (Mfe 9): 50 (Finland); *Polystictus* Pilát 1942 (syn.: n.v.p.)—Fide Lowe 1956 (M 48): 107 = *Polyporus [Inonotus] radiatus*.
- **scutellatus*, *Polyporus*, Schw. 1832: 157 (U.S.A., Pennsylvania), not ~ I. Boršč. 1856; *Fomes* Cooke 1885; *Trametes* Morg. 1886, misapplied, G. Cunn. 1965; *Scindalma* O.K. 1898; *Ungulina* Pilát 1934; *Fomitopsis* Bond. & S. 1941, G. Cunn. 1948.—Reported for Portugal by Bres. 1902 (AAR III 8): 129 and Torrend 1902 (Bro 1): 133; later Torrend 1913 (Bro 11): 67, 68 referred his material to *Trametes [Truncospora] ohiensis* (0). — Apparently not yet reported for Europe where it may be expected perhaps in the north-east of the continent. — Descr.: Overh. 1953: 51 pl. 61 fs. 364, 365, pl. 126 fig.; Lowe 1957 F.: 78 f. 59 (*Fomes*).
- sebaceus*, *Boletus*, Leyss. 1783: 300 (Germany) (d.n.); *Polyporus* (Leyss.) per Lloyd 1922, presumably misapplied, not ~ Fr. 1838.—Nomen dubium. The specific phrase runs: “sebaceus acaulis vndulatus late expansus ex albido spadiceus.” Cited syn.: “*Agaricum sebaceum vndulatum ex albo spadiceus*. Hall. helv. 2250.” Pers. 1801: 543 regarded *B. sebaceus* Leyss. as a var. of *Boletus [Tyromyces] destructor* (128). — Sensu Lloyd 1922 (LMW 7): 1163 (*Polyporus*) = ?
- sebaceus*, *Polyporus*, Fr. 1838, not ~ (Leyss.) per Lloyd 1922; ≡ *Poria reticulata sebacea* Secri. 1833 M. 3: 175 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.).—Nomen dubium. Fr. 1874: 580 thought that this was the “primordia” of myxomycetes; this seems incorrect.
- sebaceus abietis*, *Polyporus*, Secri. 1833 M. 3: 170 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.)—Nomen dubium.
- **secernibilis*, *Polyporus*, Berk. 1847 (LJB 6): 500 (Ceylon).—Sensu Lloyd 1913 (LMW 4, L. 45): 4 & 1915 (LMW 4, Ap.): 329 = “an Eastern form” of *Polyporus [Bjerkandera] adustus*; but cf. Petch 1916 (APe 6): 94, 119. — Referred to *Gloeoporus crispus* by G. Cunn. 1965: 113, 114, whose interpretation of *Boletus crispus* Pers. [= *Bjerkandera adusta*] is not altogether clear to me.
- secretanii*, *Scindalma*, O.K. → *Boletus variegatus* Sow. (0).
- semicircularis*, *Boletus*, With. 1776 (d.n.); [= *Fungus arboreus porosus minor absque pediculo*, *semicircularis* Ray 1696: 336 & 1724: 24 (England)].—Nomen dubium.

- semipetiolatus*, *Boletus*, Gaterau 1789: 191 (France) (d.n.).—Nomen dubium. Descr.: “Chapeau en demi-cercle, bai fauve ou lisse, pores petits, d'un jaune blanchâtre; pédicule court et mammelonné. / Sur les trones de Chêne.”
- **semisanguineus*, *Polystictus*, Lloyd 1912 (LMW 4, L. 39): 8 (Singapore).—Reduced to *Trametes [Pycnoporus] cinnabarinus* sensu lato by G. Cunn. 1965: 169, but cf. (112). Nobles & Frew 1962 (CJB 40): 1006 referred it, with doubt, to *Pycnoporus coccineus* (extra-European) (O).
- senescens*, *Agaricus*, Willd. in herb.—Fide Fr. 1830 (Li 5): 513 and 1838: 407 = *Daedalea/Lenzites [Gloeophyllum] abietina*. Fries thought the name had been published by Willd. (“Ber. p. 376”), but Willd. did not publish it. On the page cited *A. antiquus* is described, its descr. points to *Gloeophyllum sepiarium*; the syn. cited by Willd. represents *Daedalea quercina*.
- separabilis*, *Polyporus*, Velen. “in herb.” (Czechoslovakia).—Listed by Pilát 1937 (ACE 3): 176 as a syn. of *Leptoporus [Tyromyces] fragilis*, but according to Kotl. & P. 1964 (ČM 18): 267, 215 = *Tyromyces gloeocystidiatus* [= *T. leucomallelus*].
- septicus*, *Polyporus*, Anon. 1876 (BbF 23): 336 (nom. nud.) ≡ (presumably an error for) *Polyporus [Tyromyces] stipticus*.
- serpens*, *Daedalea*, (Tode per Fr.) E. Krause 1928 (“*Daedaleus*”); *Merulius* Tode 1783 (AhG 1): 355 (Germany) per Fr. 1821; *Xylomyzon* Pers. 1825; *Serpula* P. Karst. 1889; *Byssomerulius* Parm. 1967.—Variously interpreted; the currently accepted interpretation, as *Merulius serpens*, is that of Romell 1911 (‘Corticiaceae’).
- Serpula* (Pers.) per S. F. Gray 1821, P. Karst. 1884; *Merulius* sect. Pers. 1801: 496 (d.n.); ≡ *Xylophagus* Link 1809 per Murrill 1903 [1958 (Fu 28): 14]; ≡ *Xylomyzon* Pers. 1818 (nom. nud.) ex Pers. 1825 [1958 (Fu 28): 14]; lectotype, *Merulius destruens* Pers. = *Serpula lacrimans* (O).—For a long time this genus (Coniophoraceae) was included in the Polyporaceae.
- serpula*, *Bjerkandera*, P. Karst. 1887 (Mfe 14): 79 (Finland); *Polyporus* Sacc. 1888.—Fide Lowe 1956 (M 48): 103, cf. *Coriolus* sp., indet.
- sesia*, *Daedalea*, (Scop.) per Pers. 1828; *Merulius* Scop. 1772 P.s.: 101 pl. 18 f. 1 (Hungary, now Czechoslovakia) (d.n.).—Nomen dubium. Found in a mine: apparently an abnormal growth. The specific epithet is explained by Scop. thus: “*Agaricus de St. Clou*. Vaillant. Paris. p. 3. Tab. 1 Fig. 1. 2. 3. huic proximus, quem Cl. Adansonius *Sesiam* vocavit.” This *Agaricus de St. Clou* has been generally identified with *Gloeophyllum sepiarium*: it is certainly different from *Merulius sesia*, the diagnosis of which contains as sole colour indication “albus”.
- sessilis*, *Polyporus*, Graff 1936 (M 28): 155, 159 (syn.: n.v.p.); [= *Polyporus sessilis, convexo planus, poris amplissimis albidis*] Haller 1768 H. 3: 140 no. 2278 (Switzerland).—Haller cited Schaeff. pls. 101, 102, *Boletus juglandis* Schaeff. [= *Polyporus squamosus*] for his sp. and his

descr. suggest the same sp. Graff cited '*Polyporus sessilis*' as a syn. of *P. squamosus*.

**setulosus*, *Fomes*, Lloyd 1915 (LMW 4, F.) 243; *Phellinus* Imaz. 1943; \equiv *Fomes robustus* var. *setelatus* Lloyd 1912 (LMW 4, L. 42): 11 (Ceylon).

—Some authors erroneously referred this to *Phellinus robustus*. Often misapplied. — Descr.: Lowe 1957 F.: 60 f. 44 (*Fomes*).

setulosus, *Polyporus*, Killerm. 1940 (DrG 21): 71 *tpl.* 31 *f.* 34 (Germany) (lacking Latin descr.: n.v.p.).—Insufficiently described. Apparently belonging to the *Polyporus brumalis* group.

**shiraianus*, *Polyporus*, P. Henn. 1900 (BJ 28): 269 (Japan).—Bres. identified this with *Favolus europaeus* [= *Polyporus mori*], but it may appear to belong to *Favolus* [*Polyporus*] *canadensis* Kl. (O) if the two should appear to be different species. — Cf. (98).

**shiraianus*, *Polyporus*, P. Henn. in herb. (Japan), not \sim P. Henn. 1900 (BJ 28): 269 (O).—Fide Murrill 1907 (NAF 9): 70 = *Pycnoporellus fibrillosus* [= *P. fulgens*]; but cf. Lloyd 1922 (LMW 7): 1108, in obs. Murrill thought he had studied the type of the published homonym, rather than that of the herbarium name. The former is *Favolus europaeus* [= *Polyporus mori*], fide Bres. 1916 (Am 14): 227, or a closely related sp.

**sibiricus*, *Lenzites*, P. Karst. 1904 (ÖFF 46^{II}): 3 (U.S.S.R., Baikal region).—According to Lowe 1956 (M 48): 109 a poorly developed, reddish form of *Daedalea* [*Daedaleopsis*] *confragosa*. — Cf. (31).

**sibiricus*, *Polyporus*, [Murašk.] in herb. (U.S.S.R., Russia, Siberia).—Fide Pilát 1934 (BmF 49): 265 = *Trametes* [*Dichomitus*] *squalens*.

**simulans*, *Polyporus*, B. & C. ex Sacc. 1888 (SF 6): 117 ("Cuba", but cf. Lloyd 1915 (LMW 4, Ap.): 386, probably from Ceylon)], not \sim Błoński 1889, not \sim Wakef. ex Lloyd 1924; *Polyporus* B. & C. in herb., Cooke 1885 (nom. nud.: n.v.p.); *Trametes* Killerm. 1928 ("Bres."); *Polystictus* Pilát 1937 (syn.: n.v.p.; "simulans"); \equiv *Bjerkandera sub-simulans* Murrill 1907.—Recorded by Maire, Dumée, & Lutz 1903 (BbF 48): cxxviii from Corsica as "*Phaeolus simulans* (Berk. et Curt.) Pat.", certainly in error. It may be that these authors had *Phaeolus nidulans* ("Pers." [= Fr.]) Pat. [= *Hapalopilus rutilans*] in mind rather than *Bjerkandera simulans* P. Karst. [= *Tyromyces lacteus*?]. The identity of *Polyporus simulans* B. & C. is still a puzzle. Lloyd, i.e., referred it to *Polyporus* [*Bjerkandera*] *fumosus* and Pilát 1937 (ACE 3): 158 listed it as a syn. of this species. Bres. 1926: 27 rejected this identification and stated that it was a species of "*Trametes*" (with descr.).

**sinensis*, *Lenzites*, Cooke 1889 (G 17): 75 (China); *Cellularia* O.K. 1898. —Referred to *Lenzites* [*Daedaleopsis*] *tricolor* by Bres. 1916 (Am 14): 221 ("chinensis").

sinuatum, *Gymnoderma*, Humb. 1793: 109 (nom. anam.?) (d.n.) per Steud. 1824.—The genus *Gymnoderma* (O) was introduced to accommodate this

fungus; it has been listed as belonging to the 'Thelephoraceae', but Donk 1957 (Ta 6): 72 suggested that this might be an abnormal and/or sterile growth form of some polypore; it was found growing in a mine. *sinuosa*, *Trametes*, "Bres.", an error of Lind 1913: 393 (as syn.) for *T. subsinuosa* Bres. [= *Antrodia ramentacea*].

skeptonymus, *Agaricus*, E. Krause 1932 B.r.: 142; [= *Polyporus vegetus* Fr. sensu E. Krause 1931 B.r.: 122 (Germany)].—Apparently a sp. of *Ganoderma*, but the descr. is too incomplete to guess which one. — The following combines all descriptive matter furnished by the author: Mit dickem Wesen; mit harziger Kruste; heurige Zuwachszone weiss, bald dunkelnd; Röhren kurz, erst weiss, aber bald dunkelbraun; Sporen rostfarben, $9-10 \times 8-9 \mu$. Buche. Cf. Donk 1969 (PNA 72): 281.

sorbicola, *Polyporus*, Fr. 1874: 570 (U.S.S.R., European Russia); *Poria* P. Karst. 1882.—Fide Bres. 1897 (AAR III 3): 80 = *Poria* [*Merulius*] *taxicola* (**O**). The descr. agrees with this identification; apparently the substratum was incorrectly identified.

sordentulus = *sordulentus*

**sordulentus*, *Polyporus*, Mont. 1852: 357 (Chile).—Referred to *Polyporus* [*Laetiporus*] *sulphureus* by Lloyd 1912 (LMW 3, S.P.): 154 (forma), but later he seems to have accepted the name [Lloyd 1918 (LMW 5, L. 67): 4, as "sordentulus"] when naming specimens (no author, no notes or descr.). Sing. 1962: 300 & 1969 M.a.: 382 transferred the species to *Grifola*, which indicates that it does not belong to *Laetiporus*.

**sororius*, *Polyporus*, (P. Karst.) Sacc. & Trott. 1912; *Polyporellus caudicinus* subsp. *P. sororius* P. Karst. 1906 (Ttk 8¹): 61 [repr. 1912 (SF 21): 267] (U.S.S.R., Russia, 'Transbaikal').—Nomen dubium. Undoubtedly belonging to the group of *Polyporus squamosus* (which species P. Karst. at that time called *Polyporellus caudicinus*) but it is difficult to make a more precise suggestion from the descr.

sowerbeii. — *Daedalea biennis* "β. *D. sowerbeii*" Fr. 1821: 332 (published as an infraspecific taxon: n.v.p.); [= *Boletus biennis* Bull. sensu Sow. 1799: pl. 191 (England)]. — This is *Abortiporus biennis*. According to Pilát 1937 (ACE 3): 116 a specimen cited by him as "*Daedalea Sowerbii* ex herb Berkeley in h. Corda, h. N.M.P." is also *Heteroporus* [*Abortiporus*] *biennis*.

spadiceus, *Polyporus*, Fr. "in litt." apud Kalchbr. 1868 (Mtk 5): 263 pl. 4 f. 1 [repr. 1869 (H 8): 117] (Hungary, now Czechoslovakia), not ~ Jungh. 1838, not ~ Berk. 1839, not ~ Bres. 1915.—Nomen dubium. A resupinate brown-coloured species of *Poria* sensu lato; it was dropped from literature apparently because Fr. did not mention it in his own publications.

spathulatum, *Hydnus*, Schrad. 1794: 178 pl. 4 f. 3 (Germany) (d.n.); *Sistotrema* Pers. 1801 (d.n.); *Hydnus* Schrad. per Fr. 1821, not ~ Schw. 1822; *Sistotrema* Pers. 1825; *Irpea* Fr. 1828; *Xylodon* P. Karst. 1882; *Radulum* Bres. 1903; *Odontia* Litsch. 1939, not ~ (Schw.: Fr.)

Rea 1922; *Hyphodontia* Parm. 1968.—In my opinion a nomen dubium. The name was revived by Bres. 1903 (Am 1): 89 (as *Radulum*) but was too briefly annotated to determine what he was naming. The now accepted conception was published by L. W. Mill. 1934 (M 26): 25 pl. 2 f. 3 ("*Radulum?*") who also stated that it was considered to be a form of *Odontia arguta* (Fr.) P. Karst. by Miss E. M. Wakefield. Pilát 1941 (ACE 3): 273, 276 referred the sp. to *Trametes* [*Hirschioporus*] *abietinus* var. "*Xylodon candidum*" [= *Sistotrema candidum* = *Hirschioporus fuscoviolaceus*].

spathulatum.—"*Sistotrema spathulatum* Schw."—According to Overh. 1953: 331 the "types" of this name are *Polyporus tulipiferae* [= *Irpex lacteus*]. It is not clear which name Overh. had in mind for there is no *Sistotrema spathulatum* "Schw." There exist (i) a *Hydnnum spathulatum* Schw. 1822: 104; Fr. 1828 E. 1: 139, which Fr. 1838: 517 listed as "*Systotr.* Schwein! Car. n. 993" as (syn.), evidently by error; and (ii) a *Hydnnum spatulatum* [!] Schrad. 1794 (d.n.) per Fr. 1821, which was reported from South Carolina as *Sistotrema spathulatum* (Schrad.) Pers. 1801: 553 by Schw. 1822: 102 without descr.

spathulatus, *Polyporus*, Fr. ("in litt.") apud Weinm. 1826 (SPR 2): 101 (nom. nud.) ≡ *Polyporus* [*Climacocystis*] *borealis* var. *spatulatus* (Fr.) ex Fr. 1828 E. 1: 85 (U.S.S.R., European Russia).

spiraeformis, *Polyporus*, Seer. 1833 M. 3: 103 (Switzerland) (as a sp. of *Boletus* & nom. nud.: n.v.p.).—Nomen dubium.

splendens, *Polyporus*, E. Krause 1931 B.r.: 121 (syn.: n.v.p.).—Presumably an error for *P.* [*Spongipellis*] 'spumeus'.

Spongoides Lázaro 1916 [1960 (Pe 1): 283]; monotype, *Boletus cryptarum* Bull. [sensu Lázaro].—It looks as though at least a good portion of Lázaro's descr. of the type species is derived from *Poria expansa* growing in the dark, especially in mines and the generic name should be kept in mind in case *P. expansa* is placed in a genus of its own (107).

spongiosum, *Sistotrema*, Schw. 1822: 101 (U.S.A., North Carolina); *Hydnnum* Spreng. 1827; ≡ *Polyporus labyrinthicus* Fr. 1828; E. 1: 83; *Spongipellis* Pat. 1900.—A somewhat doubtful species not mentioned by Overh. 1953. It was referred together with *Polyporus obtusus* (**O**) to *Spongipellis unicolor* (Schw.) Murrill 1907 (NAF 9): 37; if this is in order then the correct name for the species is *Spongipellis labyrinthicus* (Fr.) Pat. — Mentioned in this list because *Polyporus labyrinthicus* was recorded for Europe by Weinm. 1836: 313; his fungus was renamed *Polyporus weinmannii* Fr. [= *Tyromyces fragilis*].

spongiosus, *Boletus*, Pers. → *B. resupinatus* Bolt. (**O**).

spuma, *Poria*, Hoffm. 1797–1811 V.s.: 21 pl. 13 f. 2 (Germany) (d.n.).

—Nomen dubium. Found in a mine: apparently an abnormal growth.

squalens, *Poria*, Lloyd 1908 (LMW 2, L. 24): 2 ("Russia"), not ~ (P. Karst.) Lowe 1956.—Nomen dubium (subnudum).

squamatus, *Polyporus*, Lloyd 1911 (LMW 3, O.): 84 f. 505 (Hungary), not ~ Schwallb 1891; *Polyporellus* Pilát 1936, in part.—The type no longer exists. However, I have little doubt that the species was based on *Strobilomyces floccopus* (Vahl per Fr.) P. Karst. (Boletales). — Pilát 1934 (ČeH 14): 103 and 1935 (ČeH 15): 54 ("Kalchbr.") referred this taxon as a form to *Polyporellus [Polyporus] squamosus*. Soon afterwards Pilát 1936 (ACE 3): 94 accepted Lloyd's sp. and referred *Polyporus boucheanus* sensu Velen. 1922: 665 to it. Fide Pouz. 1966 (Fgp 1): 360 Velenovský's material represents poorly dried fruitbodies of a sp. of *Albatrellus*, viz. *A. ovinus* or *A. similis*.

squamosum, *Agaricum*, Graff 1936 (M 28): 154, 159 (syn.: n.v.p.); [= *Agaricum squamosum Ilicibus . . . innascens . . .* Mich. 1729: 118 (Italy)]. —Listed by Graff as a syn. of *Polyporus squamosus*. This is not acceptable; it has little in common with this sp. — Micheli used 'squamosus' for 'imbricate' in connection with caps.

**squamulosus*, *Polyporus*, Bres. 1890 (BmF 6): xxxix pl. 5 f. 1 (San Thomé), not ~ P. Henn. 1895.—Lloyd 1915 (LMW 4, Ap.): 386 referred this to *Polyporus [Tyromyces] tephroleucus*; he thought that Bres. had described the spores wrong.

**squarrosum*, *Fomes*, Lloyd 1914 (LMW 4, L. 53): 10 and 1915 (LMW 4, F.): 247 f. 590 (Australia, Victoria).—This has been taken as a form of *Fomes [Phellinus] robustus* by J. Rick 1960 (Ih 7): 208; G. Cunn. 1965: 227 included it as a mere syn. in that sp. This disposition is very doubtful. Lloyd 1916 (LMW 5, L. 62): 5 at first referred *F. squarrosum* to *Fomes robinsoniae* Murrill, which according to Lowe 1957 F.: 59 = *Fomes [Phellinus] zealandicus* (Cooke) Cooke [= *Phellinus laurencii* (Berk.) Aosh.] (extra-European); later Lloyd 1918 (LMW 5, L. 67): 14 made it a syn. of *Fomes [Phellinus] setulosus* Lloyd (extra-European) (O).

stalachte & *stalachites* = *stalactites*

stalactites, *Poria*, Hoffm. 1797–1811 V.s.: 11 pl. 7 (Germany) (d.n.); Fr. 1828 E. 1: 105 ("stalache") & 1832^{Ind.}: 150 ("stalachites") (syn.); *Polyporus* (Hoffm.) per Pers. 1825.—Nomen dubium. Found in mines. Fr. 1828 E. 1: 105 referred this to *Polyporus [Fomitopsis] roseus* as a monstrosity, but I cannot follow him in this.

starbaeckii, *Poria*, P. Karst. in herb.—Listed by Egeland 1912 (NMN 49): 370 as a syn. of *Poria [Ceriporia?] rhodella* Fr. (22). Referred by Bourd. & G. 1928: 669 to *Polyporus [Poria] resinaceus*. Cf. also Lowe 1956 (M 48): 121.

stereoides, *Polyporus*, Fr. 1818 O. 2: 258 (Sweden) (d.n.) per Fr. 1821; *Bjerkandera* P. Karst. 1882; *Polystictus* Cooke 1886, not ~ (Berk.) ex Sacc. 1888, not ~ Lloyd 1918 (n.v.p.); *Coriolus* Quél. 1886; *Trametes* Bres. 1897; *Microporus* O.K. 1898; *Antrodia* Bond. & S. 1941, Bond. 1953. *Datronia* Ryvarden 1967 (incomplete ref.: n.v.p.; "steroides"), 1968.—Nomen dubium, fide Donk 1966 (Pe 4): 338, 1971 (PNA 74): 5.

— Sensu Fr. 1884 → *Datronia mollis*; sensu Romell, Ryv. → *Datronia epilobii*.

stictis.—“*Poria stictis* Fries”: Opiz 1856 (Lo 6): 211.—Apparently an error. *stillativus*, *Polyporus*, Britz. 1893 (BCb 54): 103 [*pl. 628 f. 126*] (Germany).

— Nomen dubium. Lloyd 1915 (LMW 4, Ap.): 386 thought of *Polyporus fulvus* [= *Ischnoderma benzoinum*] and Killerm. 1922 (Dba 15): 73 of *Polyporus squamosus*. To me both identifications are unacceptable. It is possible that the spores (spindle-shaped, 10–12 × 2–3 μ) belong to a contamination growing on a rotting fruitbody.

stipitatus.—“[*Boletus*] *stipitatus* Sow.”, Fr. 1832^{Ind.}: 63 (error, syn.: n.v.p.) ≡ *Boletus spumeus* Sow. *pl. 211*, the plate depicting a stipitate fruitbody, cf. Fr. 1821: 358.

stratosus, *Agaricus*, Fr. 1821 → *Polyporus gelsorum* Fr. (**0**).

striatulus*, *Favolus*, Ell. & Ev. 1897 (AN 31): 339 (U.S.A., Delaware); *Hexagonia* Murrill 1907.—This has been referred to *Favolus* [*Polyporus*] *canadensis* (0**) by Overh. 1914 (AMo 1): 148, 149, a taxon that in its turn has been included in *Polyporus mori*, but cf. (98).

striatus, *Agaricus*, Sw. 1788: 148 (Jamaica) (d.n.); *Daedalea striata* (Sw.) per Fr. 1821; *Lenzites* Fr. 1838; *Cellularia* O.K. 1898; *Sesia* Murrill 1904; *Gloeophyllum* Murrill 1905.—This sp. of *Gloeophyllum* was reduced to the synonymy of *G. trabeum* by G. Cunn. 1965: 253, an unacceptable identification. As a result the tropical *Lenzites striata* has been reported from Europe, for instance by Eusebio 1971 (PJS 98): 179. — Deser.: Overh. 1953: 113 *pl. 93 fs. 526, 527, pl. 94 fs. 539, 540, pl. 127 fig. (Lenzites)*.

striatus, *Boletus*, Humb. 1793: 102 *pl. 4 f. 19* (Germany) (d.n.) per Steud.

1824, not ~ Hook. 1822; *Polyporus* Pers. 1825.—Nomen dubium.

strigosus, *Boletus*, K. F. Schultz 1806: 488 (Germany, now Poland) (d.n.); *Polyporus* (K. F. Schultz) per Pers. 1825.—Nomen dubium. Perhaps misled by the substratum, Fr. 1821: 375 at first referred this to *Polyporus [Phellinus] ignarius*, in which he also included *Phellinus pomaceus*. However, Pers. 1825: 57 pointed out that this identification was untenable, and Fr. 1874: 559 changed his mind and wrote “*forte P. vulpinus*”. This too is not readily acceptable because the fruitbody was stated to be thin. I would have suggested *Coriolus hirsutus* had Schultz not described the underside as ‘*cervinus*, nec *albus*’: he compared his sp. with *C. versicolor*.

strobiliformis, *Polyporus*, (Dicks.) per Steud. 1824, Loud. 1829, or (Dicks. per Pollini) Steud.; *Boletus* Dicks. 1785 (d.n.) (England), not ~ Vill. 1789 (d.n. & syn.); = *Strobilomyces floccopus* (Vahl per Fr.) P. Karst. (Boletales).

Strongylium Ditm. apud Link 1809 (NJB 3^{1, 2}): 16; Ditm. 1809 (NJB 3^{3, 4}): 55; monotype, *Trichoderma fuliginoides* Pers. [sensu Ditm., Link].—The type appears to belong to *Reticularia lycoperdon* Bull., (Myxomycetes); cf. Donk 1972 (PNA 75): 170.

- **stuppea*, *Trametes*, Berk. 1841 (AM 7): 453 (Canada, British Columbia); *Polystictus* Cooke 1886; *Microporus* O.K. 1898; *Funalia* Murrill 1905.—Murrill 1905 (BTC 32): 356 listed *Trametes peckii* (O.) as a syn. — For a picture of the type, see Lloyd 1910 (LMW 3, M.): f. 355 (*Polystictus*). — Cf. (36).
- **subbadia*, *Poria*, Murrill 1921 (M 13): 93 (U.S.A., Alabama).—Fide Lowe 1947 (Ll 10): 57 = *Poria* [*Ceriporia*] *viridans* (sterile).
- **subchartaceus*, *Coriolus*, Murrill 1907 (NAF 9): 24 (U.S.A., Colorado); *Polystictus* Sacc. & Trott. 1912; *Polyporus* Overh. 1915; *Hirschioporus* Bond. & S. 1941.—Regarded as a syn. of *Polystictus* [*Hirschioporus*] *pargamenus* by some authors, for instance, Lloyd 1922 (LMW 7): 1121. In my opinion a distinct species, not reported for Europe.
- **subchioneus*, *Tyromyces*, Murrill 1908 (BTC 35): 406 (Philippine Is.); *Polyporus* Sacc. & Trott. 1912; *Fomes* Graff 1914.—Lloyd 1915 (LMW 4, Ap.): 386 wrote, "I should refer it to *Polyporus* [*Tyromyces*] *caesius*."
- **subcordatum*, *Gloeophyllum*, Murrill "msn." (U.S.A., New York).—Fide K. Fid. 1962 (Ri 1): 129 (syn.: n.v.p.) = *Osmoporus odoratus* subsp. *americanus* (Overh.) K. Fid. [= *Gloeophyllum protractum*?].
- **subectypus*, *Coriolus*, Murrill 1907 (NAF 9): 22 (U.S.A., Florida); *Polystictus* Sacc. & Trott. 1912; *Polyporus* Overh. 1953.—Referred by Bres. 1926: 80 to "Fomes" [*Coriolus*] *velutinus*. ('Fomes' is due to a typographical error.) Overh. 1953: 371 (which see for descr.) treated the sp. as distinct, calling it *Polyporus ectypus* (Murr.) "Bres."; 'Bres.' is an error because at the place cited Bresadola referred the sp. to *Polyporus velutinus*.
- suberosa*, *Trametes*, Quél. 1873 (MMb II 5): 356 ["(Sow.?) Q. n.s."] (France).—Nomen dubium. Insufficiently described; probably either *Fomitopsis cytisina* or *Oxyporus ulmarius*. 'Sow.' of Quélet's authors' citation refers to *Boletus suberosus* L. sensu Sow. 1800: pl. 288 ≡ *Polyporus gibbosus* Pers. [= *Fomitopsis cytisina*].
- suberoso-tomentosum*, *Agarico-igniarium*, Paul. 1793 T. 2: 93 (descr.), Ind. (name) (d.n.) & Paul. 1812-35: pl. 9 fs. 1-3 as *Pyreium fomentarium*.—Nomen dubium. Referred to *Polyporus* [*Fomes*] *fomentarius* by Lév. 1855: 6; *Boletus fomentarius* L. was one of the spp. that Paul. cited as a syn.
- suberosus*, *Boletus*, L. 1753: 1176 (Sweden) (d.n.); *Agaricus* Lam. 1783 (d.n.); *Boletus* L. per Purt. 1821, not ~ Bull. per St-Am. 1821; *Agaricus* Boisd. 1828 (nom. nud. & error: n.v.p.), Dubois 1833; *Polyporus* Wettst. 1885, not ~ Fr. 1821, not ~ (Bull. per St-Am.) Chev. 1826; *Piptoporus* Murrill 1903; *Fomes* Big. & Guill. 1913 ("Sow."); syn.: n.v.p.).—Nomen dubium. Fide Fr. 1821: 338 ("ob poros") & 1832^{Ind.}: 63 (L. "suec. ed. 1") = *Daedalea* [*Trametes*] *gibbosa*; & fide Fr. 1821: 358 (sensu Wulf.) & 1832^{Ind.}: 63 (L. "suec. ed. 2. Wulf.") → *Polyporus* [*Piptoporus*] *betulinus*. — Sensu Bolt. → *Trametes suaveolens*; sensu Sow. → *Polyporus gibbosus* [= *Fomitopsis cytisina*]; sensu Wahl. →

- Polyporus suberosus* Fr. 1821, not ~ L., → *Boletus pulvinatus* Wahl.
 = *Polyporus [Spongipellis] spumeus*, fide Fr. 1828 E. 1: 84.
- **subferruginea*, *Lenzites*, Berk. 1854 (HJB 6): 134 (India); *Cellularia* O.K. 1898; *Gloeophyllum* Bond. & S. 1941, Bond. 1953 (incomplete ref.: n.v.p.); *Daedalea* G. Cunn. 1950.—When Lloyd 1922 (LMW 7): 1165 referred *Lenzites cinnamomea* [= *L. betulina*] to *Lenzites [Gloeophyllum] subferruginea*, indirectly he recorded the latter species from Sweden.
- subfuscoclavatus*, *Polyporus*, Rostk. 1848 (StP Fs. 27–28): 21 pl. II (Germany/Poland); *Physisporus* P. Karst. 1882 ("Chev."); *Poria* Cooke 1886, Quél. 1886.—Nomen dubium. Variously interpreted. Sensu autt. nonn. in herb. → *Poria cinerascens* = *P. lindbladii*; and cf. Bourd. & G. 1928: 691 for other interpretations, e.g. of Bres. 1897 (AAR III 3): 82 (*Poria*).
- subganodermica*, *Ungularia*, Lázaro 1916 (RMa 14): 674 / 1917: 113 (Spain); *Polyporus* Sacc. & Trott. apud Trott. 1925.—Nomen dubium. Cf. Bres. apud Trott. 1925 (SF 23): 369, "potius *Fomes roburneus* [(48)] habenda". *Ganoderma* sp.?
- subintegra*, *Lenzites*, S. Schulz. 1866: 43 (Yugoslavia, Slavonia) (nom. nud.; n.v.p.).—Nomen dubium. The author cited as a syn. "*Agaricus [Daedaleopsis] tricolor* Bull. Tab. 541?"
- **sublaevigata*, *Poria*, Clel. & Rodw. 1929 (PTa 1928): 39 (Australia, New South Wales).—Referred by G. Cunn. 1965: 215 to *Fuscoporia [Phellinus] punctata*. The original descr. (apparently abundant setae present!) does not support this identification.
- **subliberatus*, *Polyporus*, B. & C. 1868 (JLS 10): 318 (Cuba); *Poria* Cooke 1886.—Referred by Murrill 1921 (M 13): 87 to *Poria [Rigidoporus] undata*, but Lowe 1959 (Ll 21): 111 stated that the type is sterile and afterwards, 1963 (M 55): 479, that it "appears to belong to the *Polyporus [Rigidoporus] lignosus* Klotzsch complex."
- sublobatus*, *Polyporus*, Opiz 1852: 137 (nom. nud.; n.v.p.) (Czechoslovakia).—Fide Pilát 1937 (ACE 3): 99 = *Polyporellus picipes* [= *Polyporus badius*]. Opiz cited "*Boletus badius* P. ?" as a syn.
- submembranaceus*, *Polyporus*, Saut. 1876 (H 15): 153 (Austria).—Nomen dubium.
- submersus*, *Irpex*, Killerm. 1940 (DrG 21): 67, 68 (Germany).—Nomen dubium. "An Röhricht in 1 m Tiefe."
- submulinus*, *Polyporellus*, P. Karst. 1881 (nom. nud.; n.v.p.); *Polyporellus lepidus* var. *submulinus* P. Karst. 1882 (BFi 37): 28 (Finland).—Cf. *Polyporus lepidus* Fr. = *P. ciliatus* (forma).
- **subodoratus*, *Lenzites*, Murrill "msn" (U.S.A., New York).—Fide K. Fid. 1962 (Ri 1): 129 (syn.; n.v.p.) = *Osmoporus odoratus* subsp. *americanus* (Overh.) K. Fid. [= *Gloeophyllum protractum*?].
- subpalmatus*, *Polystictus*, Sacc. → *Polyporus palmatus* Saut. (O).
- subpapillosa*, *Boletus*, Reb. 1804: 376 (Germany) (d.n.) per Steud. 1824.

—Nomen dubium. The description somehow suggests *Stromatoscypha fimbriatum* (**O**), but the subiculum is perhaps inconsistent with this guess: "Substantia . . . coriaceo suberosa 2 lin. fere crassa."

**subradula*, *Coriolus*, Pilát 1936 (BmF 51): 366 pl. 7 f. 3; *Polystictus* Killerm. 1943; ≡ (by lectotypification) *Coriolus pallescens* f. *resupinatus* Pilát 1932 (U.S.S.R., Russia, Siberia; Zilling 233).—The type collection was determined by Litsch. as *Coriolus pallescens* [= "*Trametes*" *semisupinus*] but later Pilát decided that it was a different sp.

subroseus, *Polyporus*, Berk.—A name listed without ref. or descr. from Portugal by Henrig. 1881: 58. This may be a herbarium name: in the introduction to the paper it is stated, "Fungos fere omnes Cl. Berkeley . . . praecipue ex imaginibus a me depinctis determinavit." I could trace no further information supplied by Portuguese mycologists.

**subrubescens*, *Scutiger*, Murrill 1940 (BTC 67): 277 (U.S.A., Florida); *Polyporus* Murrill 1948 (nom. altern.).—Lowe apud Overh. 1953: 428 wrote that "the type material of this species does not appear to differ from *Polyporus [Albatrellus] confluens*." The original description does not readily suggest this identity.

subsimulans, *Bjerkandera*, Murrill → *Polyporus simulans* B. & C. ex Sacc. (**O**).

subspadiceus, *Polyporus*, Fr. 1818 O. 2: 263 (Sweden) (d.n.) per Fr. 1821; *Physisporus* Gillet 1877; *Poria* P. Karst. 1882.—Nomen dubium. The descr. suggests resupinate *Bjerkandera* cf. *adusta*.

subsuberosus, *Polyporus*, S. Schulz. 1866: 42 (Yugoslavia, Slavonia) (nom. nud.: n.v.p.).—Nomen dubium.

**subsulphureus*, *Polyporus*, P. Henn. 1895 (BJ 22): 89 (incidental mention: n.v.p.), a name mentioned in connection with a collection of *P. sulphureus* f. *substipitatus* P. Henn. (Cameroons). Perhaps a tropical sp. of *Laetiporus*.

subterraneus, *Boletus*, Scop. 1772 P.s.: 107 pl. 30 f. 1 (Hungary, now Czechoslovakia) (d.n.); ≡ *Polyporus ruber* Pers. 1825.—Nomen dubium. Found in a mine: apparently an abnormal condition.

subtomentosus, *Boletus*, L. 1753: 1178 (Sweden) (d.n.) per Fr. 1821; &c. (Boletales).—Sensu Bolt. → *Coltricia perennis*.

subtus-alba, *Daedalea*, Secr. 1833 M. 2: 487 ("*subtus alba*") (nom. nud.: n.v.p.) (Switzerland) = *Lenzites betulina*.

**subvaporaria*, *Poria*, Cooke "in herb. Kew" (Australia, Queensland).—Fide G. Cunn. 1965: 63, 64 = *Poria versipora* [= *Schizopora paradox*].

**sulphurea*, *Poria*, Killerm. "n. sp. . . . in scheda" (U.S.S.R., Russia, Siberia), not ~ Petch 1922.—Fide Pilát 1932 (BmF 48): 44 = *Poria calcea* var. *xantha* (Fr. per Fr.) Bourd. & G. [= *Poria xantha*]. Afterwards referred to as *Poria selecta* "var. *sulphurea* Romell?" by Killerm. 1943 (Am 41): 251.

sulphureo-flavida, "determined by Prof. Maire" apud Lloyd 1910 (LMW 3,

L. 28): 1 (France) (nom. nud.: n.v.p.).—Nomen dubium. Error for *Poria 'subfusco-flavida'* (**O**)?

sulphureum, *Sporotrichum*, Grev. 1822 (MWS 4): 69 *pl.* 5 *f.* 3 (Scotland).

—Jaap 1922 (VBr 64): 45, under *Poria [Inonotus] obliqua*, stated, "In Gesellschaft wächst *Sporotrichum sulphureum* Grev., wohl als Konidienform hierzu gehörend." This shows that Jaap found the abundant spore deposit of the polypore; his suggestion that it would be *Sporotrichum sulphureum* is certainly untenable. The 'type' habitat of that species is, "in stercore et in cellariis, toto anno."

sulphureus, *Polyporus*, Chev. 1837: no. 40 var. γ *plate f.* 2 (as a var. of *P. [Albatrellus] cristatus*: n.v.p.) (France), not \sim (Bull.) per Fr. 1821.

**tabacinum*, *Irpea*, B. & C. apud Fr. 1851 (NAu III 1): 106/90, apud Berk. 1873 (G. 1): 102 (U.S.A., South Carolina); *Xylodon* O.K. 1898; *Trametes* Pat. 1900; *Cerrenella* Murrill 1905.—An extra-European sp. (Hymenochaetaceae). Erroneously referred as a var. to *Trametes [Hirschioporus] abietina* by Pilát 1941 (ACE 3): 273, 275.

tabacinus, *Polyporus*, Fr. "in litt." apud Weinm. 1826 (SPR 2): 103 (U.S.S.R., European Russia) (nom. nud.), not \sim Mont. 1835.—Nomen dubium.

taloisensis = *saloisensis*

**tanakae*, *Irpiciporus*, Murrill 1909 (M 1): 166 (Japan); *Irpea* Sacc. & Trott. 1912; *Daedalea* Aosh. 1967.—Referred to *Trametes [Antrodia] albida* by Imaz. 1939 (JJB 15): 302, but Aosh. 1967 (TmJ 8): 3 maintains it as a distinct sp. of *Daedalea* emend. Aosh. [in part = *Antrodia*].

taurinus, *Polyporus*, Pers. 1825: 37 (Italy).—The descr. suggests a sp. of Boletales. Referred by Fr. 1874: 525 to *Polyporus viscosus* Pers. (**O**).

taxicola, *Merulius*, Pers. 1825: 32 *pl.* 14 *fs.* 4, 5 (Switzerland); *Poria* Bres. 1897; *Merulioporia* Bond. & S. 1941 (generic name n.v.p.), 1943; *Meruliopsis* Bond. apud Parm. 1959, Bond. 1961; *Ceriporia* E. Komar. 1964 (incomplete ref.: n.v.p.); = *Merulius taxicola* (Pers.) Duby 1830 ('Corticiaceae'). — V.s.: *Poria "saxicola"*, Torrend 1913 (Bro 11): 67.

tenerrimus, *Polyporus*, Saut. 1878 (Msa 18): 180 (Austria), not \sim B. & Rav. apud Berk. 1872.—Nomen dubium.

tenuiparietale, *Aporpium*, Bond. apud Bond. & S. 1941 (nom. nud.: n.v.p.); *Polyporus* Bond. & S. 1943 (SB¹): 30 (lacking Latin descr.: n.v.p.).

—Fide Bond. 1953: 162 = *Aporpium* ["*Trametes*"] *semisupinum*. The descr. of 1943 runs (translated), 'not always resupinate'.

tenuis*, *Lenzites*, Lév. 1846 (ASn III 5): 122 (Guadeloupe), not \sim (Berk.) Pat. 1914; *Cellularia* O.K. 1898.—Specimens so named by Lloyd 1917 (LMW 5): 709 from Japan (with *Lenzites earlei* Murrill as syn.) led to this sp. being referred by Hemmi apud Hemmi & Ikeya 1939 (ApJ 9): 14 to *Lenzites [Trametes] gibbosa*. I doubt the correctness of Lloyd's determination. The original fungus was referred to *Daedalea elegans* Spreng. ex Fr. [= "*Trametes*" *palisotii* (O**)] by O. & K. Fid. 1966 (M 58): 868.

- tephrodes*, *Poria*, Fr. in herb. (Norway).—Fide Egeland 1912 (NMN 49): 368, 1914 (NMN 52): 153 = *Poria cinerascens*.
- **terebrans*, *Polyporus*, B. & C. 1868 (JLS 10): 306 (Cuba); *Bjerkandera* Murrill 1907.—Referred by Lloyd 1915 (LMW 4, Ap.): 387, with some reservation, to *Polyporus* [*Bjerkandera*] *fumosus*.
- terrestris*, *Boletus*, Sow. 1803: pl. 387 f. 5 (England) (d.n.), not ~ (Pers.) DC. 1815 (d.n.); = *Polyporus insularis* Pers. 1825, Fr. 1832 ("*infularis*"; syn.: n.v.p.), not ~ (Har. & Pat.) Lloyd 1912.—Nomen dubium. Referred, with doubt, to *Polyporus* [*Poria*] *bombycinus* by Fr. 1832^{Ind.}: 63, 146.
- terrestris luteus*, *Polyporus*, Secr. 1833 M. 3: 173 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.).—Nomen dubium. Secr. thought of *Poria terrestris* Pers., but concluded that "ma plante n'a guère de rapport avec celles des auteurs cités. . . ."
- tessulatus*, *Polyporus*, Fr. → *Boletus hirsutus* Batsch (O).
- **testaceo-fuscus*, *Fomes*, Bres. 1912 (Am 10): 498 (Indonesia, Java).—Mentioned by Lowe 1957 F.: 55 as a probable syn. of *Fomes* [*Phellinus*] *robustus*, but the original descr. does not support this suggestion.
- **texanus*, *Inonotus*, Murrill 1904 (BTC 31): 597 (U.S.A., Texas); *Polyporus* Sacc. & Trott. 1912.—Referred by Lloyd 1915 (LMW 4, Ap.): 387 to *Polyporus* [*Inonotus*] *corruscans* [sensu Lloyd], but other authors maintain the species as distinct from the *I. rheades* complex (no granular basal core in the fruitbody). — Deser.: Schrenk 1914 (AMo 1): 247 pls. 6, 7; Overh. 1953: 416 pl. 132 fig. (*Polyporus*); Pegl. 1964 (TBS 47): 188 (*Inonotus*).
- **texanus*, *Pyropolyporus*, Murrill 1908 (NAF 9): 104 (U.S.A., Texas); *Fomes* Hedgec. & Long 1912, Sacc. & Trott. 1912; *Phellinus* A. Ames 1913.—Referred by Lowe 1954 (M 46): 496, 1957 F.: 55 to *Fomes* [*Phellinus*] *robustus* in a broad sense. Growing on *Juniperus*, hence perhaps rather *Phellinus hartigii*. — Descr.: Hedgec. & Long 1912 (M 4): 112 pl. 64 fs. 2, 3, pl. 65 fs. 1, 4, 7; Lloyd 1915 (LMW 4, F.): 242; Overh. 1953: 89 pl. 62 fs. 369, 370, pl. 127 fig. (*Fomes*).
- **thelephoroides*, *Boletus*, Hook. 1822: 10 (Peru); *Polyporus* Fr. 1838; *Polystictus* Cooke 1886; *Microporus* O.K. 1898; *Gloeoporus* Bres. apud Speg. 1919, G. Cunn. 1965 misapplied?—At first referred by Bres. 1912 (H 53): 74 to *Gloeoporus dichrous*, but afterwards referred by Bres. 1916 (Am 14): 227 and Lloyd 1915 (LMW 4, Ap.): 331 to *Polyporus*/*Gloeoporus conchoides*. — Cf. (51).
- **thunbergii*, *Daedalea*, Fr. 1821: 335; *Lenzites* Fr. 1838; *Lentinus* Sacc. 1891; = *Boletus agaricoides* Thunb. 1784: 347 & apud Murr. 1784: 977 (Japan) (d.n.).—This is now referred to *Daedalea* ["*Trametes*"] *palisoti* Fr. (O). Referred to *Lenzites betulina* by S. Ito 1955: 246, which seems incorrect in view of the descr. of the surface of the cap as 'laevis'. — *Lenzites thunbergii* was recorded for Switzerland by Otth 1871 (MiB 1870): 93 as growing next to *Trametes trabea* Otth [= *Gloeoporus*]

phyllum trabeum (Pers. per Fr.) Murrill] and "die sich von der *Trametes*, innen und aussen, absolut durch nichts unterschied, als durch das volkommen und rein lamellöse Hymenium."

tiliophila, *Tyromyces*, Murrill 1907 (NAF 9): 33 (Canada, Ontario); *Polyporus* Sacc. & Trott. 1912.—This was referred by Overh. 1953: 286, 287 to *Polyporus* [*Tyromyces*] *guttulatus*, but Lowe in litt. believes this to be extremely doubtful. It is not bitter in taste, has spots only at the extreme base of the fruitbody, and grows on hardwoods.

**tinctorius*, *Polyporus*, Quél. apud Malinvaud 1881 (BbF 28): 216 (Algeria); *Placodes* Quél. 1888; *Xanthochrous* Pat. 1897; *Polystictus* Big. & Guill. 1913; *Inonotus* Maire apud Maire & Wern. 1938.—Pegl. 1964 (TBS 47): 184 (apparently type not examined) referred this to *Inonotus hispidus*. — Descr.: Quél. 1888: 399 (*Placodes*); Pat. 1897 (BmF 13): 20, setae said to be lacking (*Xanthochrous*); Lloyd 1915 (LMW 4, Ap.): 365 (*Polyporus*). — Cf. Hazslinszky 1870 in connection with *Polyporus* [*Inonotus*] *hispidus*.

**tisdalei*, *Scutiger*, Murrill 1943 (LJ 6): 227 (U.S.A., Florida); *Polyporus* Murrill 1943 (nom. altern.).—Lowe apud Overh. 1953: 429 thought this to be "a noncystidiate condition of *Polyporus* [*Abortiporus*] *biennis*". Dr. Murrill does not agree, maintaining that it is a distinct species." Fid. 1969 (Ri 4): 154 did not agree either, but offered no alternative solution.

**tokyoensis*, *Polyporus*, Lloyd 1915 (LMW 4, Ap.): 302 f. 639 (Japan); Trott. 1925 ("*tokyvensis*").—Referred to *Tyromyces caesius* (with a question mark) by S. Ito 1955: 278; and to *Tyromyces mollis* by G. Cunn. 1965: 129.

tomentosum, *Hydnus*, L. 1753: 1178 (Sweden) (d.n.), not ~ Schrad. 1784 (d.n.); *Hydnus* L. per Fr. 1821; &c.; sensu Pers. 1800: 53 & Fr. 1821 = *Phellodon tomentosum* (L. per Fr.) Banker 1906 (Bankeraceae). — Sensu Oed. → *Coriolus versicolor*.

Tortula Hedw. per Hedw. (Musci frondosi).—Through a complicated error this generic name was brought into connection with a polypore by Pfeiffer 1874 [1960 (Pe 1): 287].

**tortuosa*, *Daedalea*, Crag. 1884 (BWb 1): 26 [repr. 1884 (JM 1): 28] (U.S.A., Kansas).—Nomen dubium. Referred, with doubt, to *Cerrena unicolor* by Murrill 1908 (NAF 9): 124, but the original descr. hardly supports this guess.

torulosa, *Daedalea*, Pers. 1828, epithet preceded by an asterisk: [= *Daedalea gibbosa* (Pers.) Pers. sensu Tratt. 1806: 150 pl. 15 f. 30 (Austria)].—Nomen dubium. The surface of the cap is said to be without zones ("Binden"), which may have been the reason why Persoon did not recognize *Trametes gibbosa* in it. Nevertheless the pores suggest this species.

**torulosoides*, *Fomes*, Lloyd "in litt." (Brazil).—Listed by Torrend 1940: 328 as a form of *Fomes* [*Phellinus*] *torulosus*.

trabens = *trabeus* (*Polyporus*)

trabeus, *Ceriomyces*, J. Schroet.—Fide Mez 1908: 249 = *Polyporus* [*Antrodia*]

serialis Fr. — I have been unable to trace the place of publication of this name.

trabeus, *Polyporus*, Rostk. 1830 (StP 4): 59 *pl.* 28; Fr. 1832 (Germany/Poland); *Postia* P. Karst. 1881; *Bjerkandera* P. Karst. 1881; *Leptoporus* Quél. 1886; *Polystictus* Big. & Guill. 1913; *Tyromyces* Parm. 1959, misapplied; *Chaetoporellus* M. P. Christ. 1960, misapplied.—Nomen dubium & ambiguum. Variously interpreted. Romell 1926 (SbT 20): 7 suggested that the original plate might represent *Trametes* [*Dichomitus*] *squalens*, but he did so without conviction. — Sensu Bres. → *Tyromyces leucomallelus*; sensu Lloyd, at least in part → *Tyromyces chioneus*; sensu Fr. = ?, perhaps a mixture, perhaps including *Polyporus albidus* [= *Tyromyces stipticus*], cf. Romell, op. cit., pp. 3, 5; sensu Lowe 1934, in part, → *Tyromyces lowei*. — V.s.: “*trabens*”.

trametea, *Lenzites*, Barbier in herb., (“Quélet”); ≡ *Lenzites tricolor* var. *trametea* Quél. 1888: 368 (France).—The specific combination was cited by Lloyd 1912 (4, L. 42): 2 as a syn. (n.v.p.) of *Daedalea* [*Daedaleopsis*] *confragosa* (*forma*).

**trametes*, *Daedalea*, Speg. 1880 (ASa 9): 166 (Argentina); *Striglia* O.K. 1891; ≡ *Trametes daedalea* Speg. 1899.—Referred to *Trametes* [*Funalia*] *trogii* by Bres. 1916 (Am 14): 229. — Cf. (36).

tremellosa, *Daedalea*, (Sehrad. per Fr.) E. Krause 1928 (“*Daedaleus*”); *Merulius* Schrad. 1794: 139 (Germany) (d.n.) per Fr. 1821; *Xylomyzon* Pers. 1822; *Thelephora* L. March. 1828.—*Merulius tremellosus* Schrad. per Fr. is the type of *Merulius* Fr., a genus now excluded from the polypores (‘Corticiaceae’).

tremulae, *Polyporus*, Wittr. in herb.—Fide Nannf. 1967 (WPb 6): 131 = *Phellinus tremulae*.

**tricolor*, *Trametes*, Lloyd 1920 (LMW 6): 998 *pl.* 163 f 1807 (Japan) (“For me a trametoid form of *Lenzites tricolor*”: n.v.p.).—Fide Imaz. = *Daedaleopsis conchiformis* Imaz. 1943 (BTS 6): 77. — Cf. (31).

trilobatus, *Boletus*, With. 1776; [≡ *Fungus albus minimus trilobatis, sine pediculo, foliis quercinis adnascens* Ray 1696: 18; 1724: 22 (England)].—Nomen dubium. It is not even certain that this fungus had pores, as was accepted when it was placed in *Boletus* [sensu lato].

**trizonatus*, *Polyporus*, Cooke 1883 (G 12): 17 (Australia, Victoria); *Polystictus* Cooke 1886; *Microporus* O.K. 1898.—Bres. 1926: 80 referred this to *Polyporus* [*Coriolus*] *velutinus*; G. Cunn. 1949 (BPZ 75): 3, 1950 (PNW 25): 245, 248, and 1965: 155, to *Coriolus versicolor*, *C. zonatus*, and *Microporus flabelliformis* (Kl.) O.K. respectively.

truncata, *Labirinthia*, S. Schulz. “Mpt. p. 712, 1869” (n.v.p.).—Fide Igmandy 1968 (Aph 3): 354 = *Phaeolus schweinitzii*.

truncigenus, *Boletus*, (Fr.) Mussat 1901 (SF 15): 68 (syn.: n.v.p.).—An error for *Polyporus intybaceus* [var.] “B.” *truncigenus* Fr. 1838: 446, 1874: 539, Sacc. 1888 (SF 6): 96, the ‘B.’ having been taken for the abbreviation of ‘*Boletus*’.

- **tsuginae*, *Fomitiporia*, Murrill 1907 (NAF 9): 9 (U.S.A., New Hampshire); *Poria* Sacc. & Trott. 1912.—This has been reduced to *Polyporus/Fomes [Phellinus] robustus* as a resupinate condition by Bres. 1926: 81, Overh. 1953: 87, and Lowe 1949 (Ll 11): 168, 1957 F.: 56; or to *Fomes [Phellinus] hartigii* by Englerth 1942 (BFY 50): 17. This needs confirmation. No setae have been reported. — Descr.: Overh. 1931 (M 23): 121 *pl. 12 f. 4, pl. 14 fs. 14, 16*; Lowe 1946: 77 (*Poria*).
tuber, *Physisporus*, P. Karst. 1885 (H 24): 72 (Finland).—Nomen dubium. Cf. Lowe 1956 (M 48): 115.
Tuberaster W. Cooke 1953 ("Bocccone") (incidental mention: n.v.p.) [1960 (Pe 1): 290] is not a generic name, as treated by Cooke, but the first word of a non-Linnaean name, *Tuberaster Fungos ferens* Bocccone, which is a syn. of *Polyporus tuberaster*.
tuberculosa, *Poria*, Pers. 1795 (ABU 15): 14 / 1796 O. 1: 14 (Germany) (d.n.); *Boletus* Pers. 1801 (d.n.), not ~ Baumg. 1790 (d.n.), not ~ J. F. Gmel. 1792 (d.n.); *Polyporus* (Pers.) per Pers. 1825, not ~ Fr. 1821; *Boletus* L. Morel 1865, misapplied (sensu D.C.); *Poria* Cooke 1886. — Nomen dubium. No type in herb. Pers. Found in a mine; apparently an abnormal growth. — Sensu DC. → *Pachykytospora tuberculosa*.
Tucahus Rafin. → *Gemmularia* Rafin. (O).
**tucumanensis*, *Polyporus*, Speg. 1898 (ABA 6): 162 (Argentina).—Referred to *Polyporus similis* Berk. (extra-European) (90) by Bres. 1916 (Am 14): 227 and to *Leucoporus [Polyporus] brumalis* var. *vernalis* "Quél." by Speg. 1925 (BCó 28): 367.
**tucumanensis*, *Trametes*, Speg. 1898 (ABA 6): 174 (Argentina).—Fide Bres. 1916 (Am 14): 229 = *Trametes [Funalia] trogii*. — Cf. (36).
**tunetanus*, *Melanopus*, Pat. 1902 (BmF 18): 50 (Tunisia); *Polyporus* Sacc. & D. Sacc. 1905 (SF 17): 106.—Reported from Spain by Codina Viñas 1925, but his descr. and the original show considerable differences, and I assume that the determination (by Hariot) is incorrect.
tunicatus, *Boletus*, Schum. 1803: 391 (Denmark) (d.n.).—Nomen dubium. Referred by Fr. 1821: 381 to *Polyporus vulgaris* [sensu typi = *Poria lenis*]; and by Seer. 1833 M. 3: 164 to *Polyporus fimbriatus supinus* [= *Stromatoscypha fimbriatum* (O)].
**turbinatus*, *Cyclomyces*, Berk. 1854 (HJB 6): 166 (India); *Xanthochrous* Pat. 1900; *Cycloporus* Bond. & S. 1941.—Referred to *Cyclomyces greenei* [= *Polyporus [Coltricia] montagnei* var. *greenei* (Berk.) R. L. Gilb.] by Lloyd 1917 (LMW 4): 633.
"typha (tubulosus)", *Polyporus*, Seer. 1833 M. 3: 64 (Switzerland) (as a sp. of *Boletus*: n.v.p.).—Nomen dubium. Apparently belonging to *Polyporus* subgen. *Melanopus* (Pat.) Maubl.
typha porosus, *Polyporus*, Seer. 1833 M. 3: 65 (Switzerland) (as a sp. of *Boletus* & double epithet & nom. nud.: n.v.p.).—Nomen dubium. Rather (var. A) a sp. of *Polyporus* subgen. *Melanopus* (Pat.) Maubl.; Seer. himself thought of *Boletus elegans* Bull. [= *Polyporus varius*].

- ulicis*, *Xanthochrous*, "Quél." apud Pat. 1900: 101 (nom. nud.: n.v.p.);
 ≡ *Polyporus ulicis* Boud. [= *Phellinus ribis*]?
- ulmarius*, *Boletus*, Gaterau 1789: 190 (France) (d.n.).—Nomen dubium.
 If the stalks had not been described as "blanchâtres et écailleux" the brief descr. almost suggests *Polyporus squamosus*.
- ulmarius*, *Polyporus*, S. Schulz. 1866: 41 (Yugoslavia, Slavonia) (nom. nud.: n.v.p.), not ~ (Sow.) per Fr. 1821.—Nomen dubium.
- umbilicatus*, *Boletus*, Schrank 1789: 621 (Germany) (d.n.), not ~ Scop. 1772 (d.n.).—Nomen dubium. Referred by Fr. 1821: 348 to *Polyporus brumalis* [sensu lato], but the original descr. is too brief to make this identification convincing.
- umbilicatus*, *Boletus*, Scop. 1772: 466 (Yugoslavia, Carniola) (d.n.), Fr. 1832^{Ind.}: 64 ("umbilicus"; syn.), not ~ Schrank 1789 (d.n.): *Boletus* (Scop.) per Spreng. 1827; *Polyporellus* P. Karst. 1889; *Polyborus* Romell 1898, not ~ Paul. 1812–35 (d.n. ?), not ~ Jungh. 1838, not ~ Berk. 1851.—Nomen dubium. Referred by Fr. 1821: 348 to *Polyborus melanopus* var. *cyathoides* [= *P. melanopus*], but this is not supported by Scopoli's descr., fide Donk 1968 (Pe 5): 258.
- **umbilicatus*, *Polyborus*, Jungh. 1838: 72 (Indonesia), not ~ Paul. 1812–35 (d.n.?), not ~ Berk. 1851.—To be kept in mind in connection with *Polyborus alveolarius* (Bosc) per Fr., cf. Donk 1969 (Pe 5): 238. Reduced to a very inclusive *Polyborus arcularius* by Lloyd 1912 (LMW 3, S.P.): 179.
- umbilicatus*, *Polyborus*, Paul. → *Fungus polyborus perennis* Paul. (O).
umbilicus = *Boletus umbilicatus* Scop.
- **umbrinus*, *Daedalea*, Lloyd 1914 (LMW 4, L. 53): 10 (Brazil) (as a var. of *Daedalea quercina*: n.v.p.).—The correct status of this taxon needs further study.
- underwoodii*, *Polyborus*, Murrill apud Peck, see *Polyborus admirabilis* Peck (O).
- **ungulaeformis*, *Lenzites*, B. & C. 1849 (HJB 1): 101 (U.S.A., North Carolina); *Cellularia* O.K. 1898.—Nomen dubium. At first referred by Murrill 1905 (BTC 32): 86, 87, to *Agaricus [Daedaleopsis] confragosa* (31); later Murrill 1908 (NAF 9): 127 listed it as a syn. of *Lenzites betulina*. — For a picture of the type, see Lloyd 1918 (LMW 5): f. 1265 on p. 811.
- ungulatus*, *Fomes*, Lázaro 1916 (RMA 14): 663 & 1917 (RMa 15): pl. 10 f. 24 / 1917: 102 pl. 10 f 24 (Spain), not ~ (Schaeff. per St-Am.) Sacc. 1888.—Nomen dubium. Cf. Bres. apud Trott. 1925 (SF 23): 396, "Ver-similiter est *Fomes* [*Phellinus*] *igniarius* minor." The descr. is incomplete but as the fungus occurred on *Salix* it suggests this sp.
- Ungulina* Kotl. & P. 1957 (lacking Latin descr.: n.v.p.), not ~ Pat. 1900 [repr. 1960 (Pe 1): 292, in obs.]; [= *Ungulina* Pat. sensu Kotl. & P. 1957 (CM 11): 168, excl. of type]; holotype, *Polyborus [Truncospora] ochroleucus* Berk.

- **unicolor*, *Boletus*, Schw. 1822: 97 (U.S.A., North Carolina); *Polyporus* Fr. 1838; *Trametes* Murrill 1906; *Spongipellis* Murrill 1907.—This was identified by Murrill 1907 (NAF 9): 37 with *Polyporus [Spongipellis] obtusus* (O), a North American species. The reason for including the present entry is that Murrill, i.e., referred *Polyporus [Spongipellis] schulzeri* Fr. here; see Donk 1972 (PNA 75): 175. See also Lloyd 1915 (LMW 4, Ap.): 324.
- **unicolor*, *Irpex*, Lloyd 1920 (LMW 6): 921 *pl. 145 fs. 1649, 1950* (Japan) (as a form of *Daedalea [Cerrena] unicolor*: n.v.p.).—Fide S. Ito 1955: 265 = *Cerrena unicolor*.
- **usambarensis*, *Poria*, P. Henn. 1905 (BJ 38): 108 (Tanganyika).—Bres. 1916 (Am 14): 229 referred this to *Poria [Phellinus] ferruginosa*, but Lowe 1963 (M 33): 472 thought it was a distinct sp.; later Lowe 1966: 150 remarked that it may be the same as *Poria [Phellinus] ferrea*.
- ustalis*, *Polyporus*, Velen. 1922: 671 [see Pilát 1948: 255 for Latin translation] (Czechoslovakia).—Needs typification. Cf. *Polyporus lepideus* = *P. ciliatus* (forma).
- vaporaria*, *Poria*, Pers. 1794 (ABU 11): 30 (Germany) (d.n.); *Boletus* Pers. 1801 (d.n.); *Polyporus* Fr. 1818 (d.n.), misapplied; *Polyporus* (Pers.) per Fr. 1821, misapplied; *Boletus* Spreng. 1827; *Physisporus* Gillet 1878, misapplied; *Poria* Cooke 1886, Quél. 1886 misapplied; *Trametes* Pat., fide R. Heim 1934. *Coriolus* Bond. & S. 1941; *Tyromyces* M. P. Christ. 1960, misapplied.—Nomen dubium. Cf. Bres. 1897 (AAR III 3): 88, “vix dubia cum *Poria vaillantii* Dec. identica est”, but the original descr. and type prevent acceptance of this identification, fide Donk 1967 (Pe 5): 117. — Sensu Fr. → *Antrodia sinuosa*; sensu R. Hartig 1878 → *Antrodia serialis*; sensu P. Henn. → *Polyporus [Tyromyces] henningsii*; sensu Mez → *Polyporus [Tyromyces] fodinarum*; sensu Berk. → *Schizopora paradoxa*; “sensu Liese”, &c. → *Poria placenta*. See also *Poria vaporaria* Bres. [= *Antrodia sinuosa*].
- variegata*, *Daedalea*, P. Karst. 1911 (Ttk 121, 2): 111 (U.S.S.R., ‘Transbaikal’), not ~ Fr. per Fr. 1821.—Considered to be a form of *Daedalea [Daedaleopsis] confragosa* by Lowe 1956 (M 48): 105. — Cf. (31).
- variegatus*, *Boletus*, Schaeff. 1774: 90 [*pl. 263*] (Germany) (d.n.), not ~ Sow. 1802 (d.n.), not ~ Sw. 1810 (d.n.) per Fr. 1821; *Scindalma* (Schaeff.) per O.K. 1898.—Nomen dubium. Referred by Fr. 1821: 353 to *Polyporus [Ganoderma] lucidus*. — Sensu Fr. (syn.), O.K. → *Ganoderma lucidum*.
- variegatus*, *Boletus*, Sow. 1802: *pl. 368* (England) (d.n.), not ~ Schaeff. 1774 (d.n.), not ~ Sw. 1810 (d.n.) per Fr. 1821; *Polyporus* (Sow.) per Loud. 1829, not ~ Endl. 1830; *Fomes* Cooke 1885; *Placodes* Quél. 1886; *Agaricus* E. Krause 1934; = *Scindalma secretanii* O.K. 1898.—Nomen dubium. Sow. cited as syn. *Boletus versicolor* Schaeff. [= *Hapalopilus rutilans*] which does not agree. Fr. 1821: 352 referred it to *Polyporus varius* but evidently incorrectly so. Redescribed by Secri. 1833 M. 3: 99 (“*Polyporus*”, but as a sp. of *Boletus*: n.v.p.), which induced Fr. 1838:

470 to accept the sp. I am at a loss as to the identity of Sowerby's fungus; Secretan's description suggests *Inodermus nodulosus*.

**variiiformis*, *Polyporus*, Peck 1889 (RNS 42): 122 (U.S.A., New York); *Polydictus* Sacc. 1891; *Microporus* O.K. 1898; *Coriolus* Pat. 1900; *Trametes* Peck 1899; *Coriolellus* Sarkar 1959; *Antrodia* Donk 1966.—Referred by Murrill 1907 (NAF 9): 29 to *Coriolellus* [*Antrodia*] *serialis*. Currently considered to be a distinct species; not yet reported from Europe. — Descr.: Overh. 1953: 140 *pl.* 88 *fs.* 504, 505, *pl.* 125 *fig.* (*Trametes*); Sarkar 1959 (CJB 37): 1262 *fs.* 58–71, *pl.* 1 *f.* 8 (*Coriolellus*). *vavraeanus*, *Polyporus*, Opiz 1852: 136 (Czechoslovakia) (nom. nud.: n.v.p.).—Nomen dubium.

vegetus, *Polyporus*, Fr. 1838 (Sweden); *Fomes* Fr. 1849 (nom. altern.); *Placodes* Quél. 1886; *Phaeoporus* J. Schroet. 1888; *Ganoderma* Pat. apud Rolland 1890, Bres. 1897 & 1912; *Scindalma* O.K. 1898; *Friesia* Lázaro 1916.—Variously interpreted. Now usually referred to *Ganoderma appplanatum*, but the original descr. does not really support this. Fr. himself (1838: 464) compared it with his conception of *Polyporus australis*, which is problematic. Cf. Donk 1969 (PNA 72): 280, note. — Descr.: Fr. 1838: 464; 1884 I. 2: 82 *pl.* 183 *f.* 3. — Sensu Rick. → *Ganoderma pfeifferi* (a possibility); sensu Velen. → *Phellinus torulosus*.

**vellereus*, *Polyporus*, Berk. 1842 (LJB 1): 455 (New Zealand); *Polydictus* Fr. 1851; *Hansenia* P. Karst. 1879; *Microporus* O.K. 1898; *Coriolus* Pat. 1923, or perhaps earlier.—Referred to *Polydictus fibula* [sensu Fr. = *Coriolus hirsutus*] by Bres. 1912 (Am 10): 504 and to *Trametes* [*Coriolus*] *hirsuta* by G. Cunn. 1965: 172. — Descr.: Lloyd 1921 (LMW 6): 1033 *pl.* 172 *f.* 1877 (*Polydictus*).

**veluta*, *Hydnus*, Schw. in herb. (U.S.A.).—Fide Schw. 1832: 164 = *Irpea* [*Hirschioporus*] *fuscoviolaceus*.

velutina, *Bulliardia*, Lázaro 1916 (RMa 14): 841 / 1917: 153 (Spain); *Daedalea* Sacc. & Trott. apud Trott. 1925, not ~ Ces. 1879.—Nomen dubium. Bres. apud Trott. 1925 (SF 23): 450 suggested, "est verisimiliter *Polyporus* [*Coriolus*] *velutinus* hymenio lacerato." In view of the substratum ("en la base de los troncos de pino") and some notes by Bourd. & G. 1928: 561 in connection with *Inodermus maritimus* Quél. ("... une forme de *Tr[ametes] Trogii*, blanchâtre finement vêtue, sans soies rigides, récoltée sur pin . . .") I would make another suggestion, viz. *Funalia trogii*, but without conviction.

velutina, *Daedalea*, Ces. 1879: 7 ("*vetulina*") (Ceylon), not ~ (Lázaro) Sacc. & Trott. apud Trott. 1925; *Striglia* O.K. 1891; *Lenzites* Bres. 1916 (syn.: n.v.p.).—Patch 1916 (APe 6): 111 suggested that this was *Lenzites betulina*; and Lloyd 1923 (LMW 7): 1205 referred it to that sp. (form '*L. berkeleyi*'), but Bres. 1916 (Am 14): 221, 230 considered it to be a syn. of *Lenzites junghuhnii* Lév. (O).

velutinum.—" [*Hydnus*] *velutinum*. Fl.d. †", Steud. 1824: 205, not ~ Fr. 1821.—This name is a puzzle. I have thought of accepting it as a

substitute name for *Hydnus tomentosum* L. sensu Oed. 1770 (Fd 3 / Fasc. 9); 7 pl. 534 f. 3, of which Fr. 1821: 406 suggested "potissimum *Polyp. [Bjerkandera] adustus.*" I would refer the figure to *Coriolus versicolor*.

venetus, *Polyporus*, Sacc. 1873 (ASv 2): 100/52 pl. 7 fs. 4-6 (Italy); *Poly-stictus* Cooke 1886.—Nomen dubium. Perhaps abnormal fruitbodies: found in a wine-cellars. Pilát 1937 (ACE 3): 124, 125 referred it to *Piptoporus quercinus* [= *Buglossoporus pulvinus*] as a monstrous form, but this is contradicted by the descr.

venosus, *Boletus*, Humb. 1792 (ABU 3): 57 (Germany) (d.n.) per Steud. 1824; *Polyporus* Pers. 1825.—Nomen dubium.

vermicularis, *Daedalea*, Pers. → *Boletus resupinatus* Sow. (O).

vernus, *Polyporus*, S. Schulz. 1870 (VW 20): 177 (Hungary, now Czechoslovakia) (nom. nud.: n.v.p.).—Apparently a sp. of *Polyporus* subgen. *Leucoporus* (Quél.) Maubl.: the author appended a var., " β . *fascicularis* Schrad." = *Boletus fasciculatus* Schrad. [= *Polyporus brumalis*].

veronensis, *Boletus*, Spreng. → *Polyporus castaneus* Fr. (O).

versicolor fusco-purpureus, *Polyporus*, Seer. 1833 M. 3: 149 (Switzerland) (as a sp. of *Boletus* & double epithet & nom. nud.: n.v.p.) = *Coriolus versicolor*.

versicolor impolitus, *Polyporus*, Seer. 1833 M. 3: 144 (Switzerland) (as a sp. of *Boletus* & double epithet & nom. nud.: n.v.p.).—*Coriolus versicolor?*

versicolor iris, *Polyporus*, Seer. 1833 M. 3: 138 (Switzerland) (as a sp. of *Boletus* & double epithet & nom. nud.: n.v.p.).—Var. A = *Polyporus* [*Coriolus*] *versicolor*.

versicolor olivascens, *Polyporus*, Seer. 1833 M. 3: 141 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.).—Nomen dubium. Perhaps a form of *Coriolus versicolor*.

versicolor pseudo-platani, *Polyporus*, Seer. 1833 M. 3: 148 (Switzerland) (as a sp. of *Boletus* & double epithet & nom. nud.: n.v.p.): = *Coriolus versicolor*.

versicolor psittacinus, *Polyporus*, Seer. 1833 M. 3: 143 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.).—*Coriolus versicolor?*

versicolor quercinus, *Polyporus*, Seer. 1833 M. 3: 145 (as a sp. of *Boletus* & double epithet & nom. nud.: n.v.p.).—*Coriolus versicolor?*

versicolor ramorum, *Polyporus*, Seer. 1833 M. 3: 147 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.); = *Coriolus versicolor*.

versicolor salicinus, *Polyporus*, Seer. 1833 M. 3: 142 (Switzerland) (as a sp. of *Boletus* & double epithet & nom. nud.: n.v.p.).—Nomen dubium.

versipellis, *Polyporus*, Pers. 1825: 96 (Italy).—Nomen dubium. I could not locate the type specimen; descr. too incomplete for certain identification.

versiporus, *Polyporus*, Lloyd = *versisporus*.

**versisporus*, *Polyporus*, Lloyd 1915 (LMW 4, Ap.): 312 (Japan), 1915 (LMW 4, L. 60): 8 ("versiporus"); Yas. 1817 (BMT 31): 52 (nom. nud.).

- This was listed as a syn. of *Heterobasidion [Truncospora] ochroleucum* by G. Cunn. 1965: 145, but Japanese authors now refer it to *Laetiporus versisporus* (Lloyd) Imaz. (extra-European), basionym, *Calvatia versispora* Lloyd, cf. S. Ito 1955: 275.
- veselskyi*, *Polyporus*, Opiz in herb.—Fide Pilát 1942 (ACE 3): 623 = *Trametes suaveolens*.
- “*vetusta*, *Daedalea*, Ell. & Harkn. “manuscript name”.—Fide Murrill 1905 (BTC 32): 368 = *Porodaedalea pini* (Thore per Pers.) Murrill [= *Phellinus pini* (Brot. per Fr.) A. Ames]. — Cf. (84).
- **victoriensis*, *Polyporus*, Lloyd 1921 (LMW 6): 1095 (Australia, Victoria); *Inonotus* Pegl. 1964.—Referred to *Inonotus rheades* by G. Cunn. 1965: 210, but this is not acceptable. — Descr.: Pegl. 1964 (TBS 47): 180 *fs. 1: 18, 2: 31 (Inonotus)*.
- villosus*, *Boletus*, With. 1776: 768 (England) (d.n.), not ~ Huds. 1778 (d.n.), not ~ Sw. 1788 (d.n.); [= *Agaricus villoso-porosus, substantiae coriaceae* Dill. 1719: 193 sensu Ray 1724: 24; = *Fungus arboreus variegato illo Cerasorum, &c. C.B. similis, sed hirsutior, foraminulis etiam majoribus* Ray 1696: 336 (England)].—Nomen dubium.
- **vinaceo-rosea*, *Poria*, Rodw. & Clel. 1929 (PTa 1928): 78 (Australia, Queensland).—Referred by Lowe 1962 (PMi 47): 185 to *Poria [Ceriporia] rhodella*, which, sensu Lowe, is a broadly conceived sp. (22).
- vinosus*, *Boletus*, Thore 1803: 488 (France) (d.n.).—Nomen dubium.
- vinosus juglandis*, *Polyporus*, Secr. 1833 M. 3: 90 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.).—Nomen dubium.
- violaceus*, *Polyporus*, Fr. 1818 O. 2: 263 (d.n.) per Fr. 1821: 379, misapplied?, not ~ (C. E. Mart.) C. E. Mart. 1904; *Boletus* Lenz 1840; *Physisporus* Gillet 1877; *Poria* Cooke 1886, Quél. 1886; *Caloporia* P. Karst. 1893, misapplied; *Merulius* Pat. 1900; *Meruliporia* Bond. 1953; *Meruliopsis* Bond. apud Parm. 1959, Bond. 1961; = *Boletus nitidus* var. *violascens* A. & S. 1805 (Germany) (d.n.); *Polyporus* Secr. 1833 (as a sp. of *Boletus*: n.v.p.); *Polyporus* (A. & S.) per J. Schroet. 1888.—Nomen dubium (sensu originario A. & S.). — Sensu Fr. 1818 = ?; sensu Quél., P. Karst., &c. = *Poria [Merulius] taxicola* (O), fide Bourd. & L. Maire 1920 (BmF 36): 84, & Donk 1962 (Pe 2): 230, &c.; sensu Bres. 1903 (Am 1): 76, a distinct sp. of *Poria* or *Ceriporia*?
- violascens*, *Hypodrys*, (Pers.) Streinz 1861 (syn.: n.v.p.); = *Hypodrys hepaticus* var. *violascens* Pers. 1825; [= *Fistulina buglossoides* Bull. sensu St-Am. 1821: 546 (France)]; = *Fistulina hepatica*.
- viridis hirtus*, *Polyporus*, Secr. 1833 M. 3: 131 (Switzerland) (as a sp. of *Boletus* & double epithet: n.v.p.).—Nomen dubium.
- **viridiuscula*, *Poria*, D. Baxt. 1947 (PMi 31): 128 *pls. 4, 5* (U.S.A., Georgia). —At first Lowe 1959 (Li 21): 107 referred this, with doubt, to *Poria [Gloeodoporus] pannocincta*, apparently without having seen the type (which for some time was not available), later Lowe 1966: 135 made it a syn. of *Polyporus [Gloeoporus] dichrous*. — Cf. (51).

- viridi-zonatus*, *Polyporus*, Seer. 1833 M. 3: 135 (Switzerland) (as a sp. of *Boletus*: n.v.p.).—Nomen dubium. *Coriolus* sp.?
- viscosus*, *Polyporus*, Pers. 1825: 41 (France): Fr. 1828; *Caloporus* Quél. 1886; *Heteroporus* Lázaro 1916.—Fide Bres. 1920 (Am 18): 68 = *Boletus bovinus* L. per Fr. (Boletaceae).
- voluta*, *Polyporus*, Pers. → *Poria difformis* Scop. (O).
- Vonkhout* Endl. 1836 (syn.: n.v.p.), Pfeiff. 1874 (syn.: n.v.p.; “*Vonckhout*”).—The ‘generic’ name *Vonkhout* has been cited as a syn. of *Daedalea*, but van Sterbeeck’s typical species is presumably *Fomes fomentarius*, cf. Donk 1960 (Pe 1): 293.
- **vorax*, *Daedalea*, Harkn. 1879 (PrP 17): 49 (U.S.A., California) (nomen subnudum).—This was referred to *Porodaedalea pini* (Thore per Pers.) Murrill [= *Phellinus pini* (Brot. per Fr.) A. Ames] by Murrill 1905 (BTC 32): 368 and to *Trametes [Phellinus] pini* (Brot. per Fr.) Fr. by Haddow 1938 (BTS 22): 185. — Cf. also Haddow, op. cit., p. 190. — Cf. (84).
- vukasovićiana*, *Lenzites*, S. Schulz. 1887 (H 26): 192 (Yugoslavia, Slavonia).—Nomen dubium. *Lenzites betulina* (forma)?
- **whelstonei*, *Favolus*, Lloyd ex Trott. 1925; Lloyd 1916 (LMW 5): 615 f. 870 (U.S.A., Minnesota) (referred to *Favolus europaeus* as “a sport”; n.v.p.).—Fide Overh. 1953: 157 = *Favolus [Polyporus] europaeus* [= *Polyporus mori*], but cf. (98). Published in the best of the Lloydian tradition with an extremely poor protologue and a single miserable specimen as the type that should never have been named. A re-examination of the type is suggested.
- wirtgenii*, *Polyporus*, Fr. 1838: 483; *Poria* Cooke 1886, Quél. 1886; [= *Polyporus bombycinus* Fr. sensu Wirtg. 1835 (Fl 18): 324 (Germany)].—Nomen dubium.
- wranyi*, *Polyporus*, Opiz. “in herb.” (presumably Czechoslovakia).—Fide Pilát 1941 (ACE 3): 451 = *Poria vaillantii*.
- xoilopus*, *Polyporus*, Rostk. 1828 (StP 4): 23 pl. 10: Fr. 1832 (Germany/Poland); *Pelloporus* Quél. 1886; *Caloporus* Pilát 1931.—Nomen dubium. This is most likely a sp. of *Boletus* sensu lato. At first Killerm. 1922 (Dba 15): 62 thought of young fruitbodies of *Boletus [Gyroporus] castaneus* Bull. per Fr., but later he believed he had found the real fungus: Killerm. 1929 (H 67): 125 f. A, 1928 (Dba 17): 73 pl. 11 f. 3, Bres. 1931 (BIM 20): pl. 961 f. 2 (*Polyporus*). These descriptions also suggest some sp. of Boletales. — V.s.: “*xylopus*”.
- Xylodon* (Pers.) ex S. F. Gray 1821 [1956 (Ta 5): 113, 1963 (Ta 12): 156]; *Sistotrema* sect. “**** . . . (*Xylodon*)” Pers. 1801: 552; lectotype, *Sistotrema quercinum* (Pers.) Pers.—To me a nomen dubium because of the uncertain identity of the type species, which may not be a ‘polypore’. — *Xylodon* “Ehrenb.” ex P. Karst. 1881 (Afe 2¹): 31 is a monadelphous homonym of which *Irpex [Schizopora] paradoxus* has been regarded as type species: this makes it a typonym of *Schizopora*. O.K. 1898: 540 implicitly took

Xylodon candidum Ehrenb. [= *Hirschioporus fuscoviolaceum*] as type species and regarded *Xylodon* "Ehrenb." as the correct name for *Irpex* Fr. If validly published as distinct names from *Xylodon* (Pers.) ex S. F. Gray, than both *Xylodon* 'P. Karst.' and *Xylodon* 'O.K.' are impriorable as later homonyms.

Xylomyzon Pers. → *Serpula* (Pers.) per S. F. Gray (**O**).

Xylophagus Link per Murrill → *Serpula* (Pers.) S. F. Gray (**O**).

Xylopilus P. Karst. 1882 [1960 (Pe 1): 295]; monotype, *Polyporus crassus* Fr. (**O**).—Nomen dubium.

xylopus = *xoilopus*

xylostromeus, *Polyporus*, Pers. 1825: 112 (Europe).—Nomen dubium.

Referred by Fr. 1838: 485 ("Pers. . . n. . . 159") to *Polyporus vitreus* ("mycelium sterile") and 1874: 577 to the same sp. ("fungus siccus"). Fries's interpretation of *Polyporus* [*Rigidoporus*] *vitreus* in his later publications is discussed by Donk 1967 (Pe 5): 122.

**yamanoi*, *Cryptoderma*, Imaz. 1951 (FPJ 4): 176 (Japan).—Apparently a superfluous name introduced for the combination of *Daedalea jezoensis* Yamano and *Trametes picei* Yamano. It has been referred to *Fomes* [*Phellinus*] *pini* by Lowe 1954 (M 46): 49, 1957 F.: 47. — Cf. (84). — Descr.: Imaz., l.c.; S. Ito 1955: 367 f. 262; Imaz. & Hongo 1957 C.J. [1]: 144 pl. 67 fs. 397, 398. — If considered a distinct sp., the correct basionym appears to be *Daedalea jezoensis*; the simultaneously published name *Trametes picei* was reduced to the synonymy of the former by Tochinai & Kamei 1933 (ApJ 2): 573 (n.v.).

**yasudai*, *Fomes*, Lloyd 1915 (LMW 4, F.): 272 f. 606 (Japan).—According to Lowe 1957 F.: 55 a "probable synonym" of *Fomes* [*Phellinus*] *robustus*. Listed, with doubt, as a syn. of *Phellinus hartigii* by S. Ito 1955: 373.

yezoense = *jezoensis*

**yoshinagae*, *Lenzites*, Lloyd 1922 (LMW 7): 1108 pl. 189 f. 2042 (Japan).

—Imaz. 1939 (JJB 15): 302 referred this to *Trametes* [*Antrodia*] *albida*, but Aosh. 1967 (TmJ 8): 3 considered it to be synonymous with *Daedalea* [*Antrodia*] *tanakae*.

zollingeri Lév. → *Polyporus zollingerianus* Lév.

**zollingerianus*, *Polyporus*, Lév. 1846 (ASn III 5): 131 (Indonesia, Java); *Trametes* Sacc. 1888; = *Polyporus zollingeri* Lév. 1846 M.: 120 (nom. nud.: n.v.p.), not ~ Sacc. 1891.—At first referred to *Trametes lutescens* f. *umbrina* [= *Funalia gallica*] by Bres. 1897 (AAR III 3): 90 and to *Trametes favus* [sensu Bres. in part = *Funalia gallica*] but later identified with *Polyporus* [*Hirschioporus*] *versatilis* (Berk.) Romell by Bres. 1916 (Am 14): 229, and by Lloyd 1917 (LMW 5): 784 as *Polystictus* [*Hirschioporus*] *versatilis* (Berk.) Fr. (extra-European). Referred to 'Trametes cristata' Cooke by Pat. 1928 (ACe 1): 11.

**zonalis*, *Polyporus*, (Kön.) ex Berk. 1843 (AM 10): 375 pl. 10 f. 5 (Ceylon); *Boletus* Kön. in herb.; *Hansenia* P. Karst. 1879; *Leptoporus* Pat. 1900; *Fomitopsis* Imaz. 1943; *Fomes* Teng 1964; = *Rigidoporus zonalis* (Kön.

ex Berk.) Imaz. 1952.—Recorded for Europe, Portugal, by Alm. & Câm. 1909 (BSb 24): 152 without any description or comment: "In ligno emortuo *Populi* sp., pr. Coimbra, Bemcanta, leg. Octavio Vecchi, junio, 1903." Since it is doubtful that the determination is correct, the species and its numerous synonyms are neither entered on the Check list proper nor taken further into account on this list. — Recently Al. David 1972 (BmF 87): 417 remarked that *Rigidoporus moeszii* is "identique ou peu différent de *Polyporus* [*Rigidoporus*] *zonalis* Berk." No supplementary information was presented.

**zonata*, *Daedalea*, Schw. 1822: 94 (U.S.A., North Carolina): *Striglia* O.K. 1891.—Referred to *Agaricus* [*Daedaleopsis*] *confragosus* by Murrill 1905 (BTC 32): 86; according to Lloyd 1913 (LMW 4, L. 50): 11, this is the thin, zonate, lenzitoid, southern form of *Daedalea* [*Daedaleopsis*] *confragosa* in the U.S.A. — This species was recorded for Europe by Trog 1850 (MiB): 53 (no descr.) and Saut. 1878 (Msa 18): 149 (no descr.). — Cf. (31).

zonatus, *Polyporus*, Velen. → *Polyporus circulatus* Velen. (O).

zonatus coryli, *Polyporus*, Seer. 1833 M. 3: 134 (Switzerland) as a sp. of *Boletus* & double epithet & nom. nud.: n.v.p.).—Nomen dubium.

ABBREVIATIONS OF AUTHORS' NAMES

In deciding on abbreviations all groups of plants have been taken into account. This will explain my preference for instance for 'P. Karst.' (= P. A. Karsten, 1834–1917), not 'Karst.' (= G. K. W. H. Karsten, 1817–1908), who started publishing at an earlier date; and for 'Murrill', to avoid confusion with 'Murr.' (= J. A. Murray, 1740–1791).

A few wittingly irregular abbreviations are included as exceptions. These are 'Bond'. (not O. N. Bondarenko), 'J. B. Ell.' (instead of J. B. Ellis), 'Lloyd' (instead of 'C. Lloyd' = C. G. Lloyd), and 'Lowe' (instead of 'J. L. Lowe').

 Gouan—A. Gouan
 Govi—G. Govi
 Graff—P. W. Graff
 Gramb.—E. Gramberg
 S. F. Gray
 Grev.—R. K. Greville
 Grög.—F. Gröger
 Güssow—H. T. Güssow

- Guillaud & al.—J. A. Guillaud, L.
 Forquignon, & N. Merlet
 Guillemot—J. Guillemot
 Gunn.—J. E. Gunnerus
 Haddow—W. R. Haddow
 Haglund—Erik E. Haglund
 Haller—A. von Haller
 L. Hansen—L[ise] Hansen
 Hara—K. Hara
 Haracs—L. Haraesi
 Hard—M. E. Hard
 Hariot—P. A. Hariot
 Har. & Karst.—Hariot & P. A. Karsten
 Har. & Pat.—Hariot & N. T. Patouillard
 Harkn.—H. W. Harkness
 Hartig—T. Hartig
 R. Hartig—H. J. A. R. Hartig
 Harz—C. O. Harz
 Harzer—C. A. F. Harzer
 Hazsl.—F. A. Hazlinszky
 Hedgec. & Long—G. G. Hedgecock &
 W. H. Long
 R. Heim
 Hemmi—T. Hemmi
 Hemmi & Ikeya—Hemmi & J. Ikeya
 Hendr.—F. L. Hendrickx
 B. Henn.—B. Hennig
 P. Henn.—P. C. Hennings
 Henriq.—J. A. Henriques
 Heufl.—L. J. von Heufler, later L. von
 Hohenbühel, genannt Heufler zu
 Rasen und Perdonegg
 Hill—J. Hill
 Höhn.—F. X. R. von Höhnel
 Hoffm.—G. F. Hoffmann
 Holm → Holmskj.
 Holmskj.—T. Holmskjold
 Holterm.—C. Holtermann
 Hook.—W. J. Hooker
 Hook. f.—J. D. Hooker
 Hornem.—J. W. Hornemann
 House—H. D. House
 Houtt.—M. Houttuyn
 Hruby—J. Hruby
 H. Huber
 Hubert—E. E. Hubert
 Huds.—W. Hudson
 S. Hugh.—S. J. Hughes
 Humb.—F. H. A. von Humboldt
 Humphr. & Leus—C. J. Humphrey &
 S. Leus[-Palo]
 Humphr. & Sigg.—C. J. Humphrey &
 P. V. Siggers
- Hussey—A. M. Hussey
 Igmándy—Z. Igmándy
 Imaz.—R. Imazeki
 Imaz. & Aosh.—Imaz. & K. Aoshima
 Imaz. & Hongo—Imaz. & T. Hongo
 Imaz. & Toki—Imaz. & S. Toki
 Imbach—E. J. Imbach
 Ingold—C. T. Ingold
 Inz.—G. Inzenga
 Istv.—G. Istvánffy de Csík-Madéfalvi
 (formerly, J. Schaarschmidt)
 S. Ito
 Jaap—O. Jaap
 Jač.—A. A. Jačevskij [A. L. von/de
 Jaczewski]
 Jacq.—N. J. von Jacquin
 H. Jahn
 Jel. & Tort.—M. B. Jelić & M. Tortić
 Joach. & Dumée—L. Joachim & P.
 Dumée
 Juel—H. O. Juel
 Jullien
 Jungh.—F. F. W. Junghuhn
 Juss.—A. L. de Jussieu
 Jørst.—I. Jørstad
 Jørst. & Juul—Jørst. & J. G. Juul
 O.K.—C. E. O. Kuntze
 Kalchbr.—K. Kalchbrenner
 Kalchbr. & Cooke—Kalchbr. & M. C.
 Cooke
 Kallenb.—F. J. Kallenbach
 P. Karst.—P. A. Karsten
 Kartav.—N. T. Kartavenko, [N. T.
 Stepanova-Kartavenko]
 C. H. Kauffm.—C. H. Kauffman
 Kavina—K. Kavina
 Kawam.—S. Kawamura
 Keissl.—K. von Keissler
 Kickx f.—J. J. Kickx (1803–64)
 Killerm.—S. Killermann
 L. Kirchn.—L. A. Kirchner
 W. Kirschst.—W. Kirschstein
 Kl.—J. F. Klotzsch
 Y. Kobay.—Y. Kobayashi
 Kögl—F. Kögl
 Kön.—J. G. König [König]
 E. Komar.—E. P. Komarova
 Konr.—P. Konrad
 Konr. & M.—Konr. & A. Maublanc
 Kotl.—F. Kotlaba
 Kotl. & P.—Kotl. & Z. Pouzar
 E. Krause—E. H. L. Krause
 Kravc.—B. I. Kravcev
 Kreisel—H. Kreisel

- Kreis. & Jahn—H. Kreisel & H. Jahn
 Krombh.—J. V. von Krombholz
 Kühner—R. Kühner
 Kumm.—P. Kummer
 O. Kuntze → O.K.
 Kunze—G. Kunze
 L.—C. Linnaeus
 Lam.—J. B. A. P. M. de Lamarck
 Lapl.—M. C. de Laplanche
 Lasch—W. G. Lasch
 Laterr.—J. F. Laterrade
 Latourr.—M. A. L. C. de Fleurieu de Latourrette
 Laubert—R. Laubert
 Lázaro—B. Lázaro é Ibiza
 Lea—T. G. Lea
 Lek—H. A. A. van der Lek
 Lenz—H. O. Lenz
 Letell.—J. B. L. Letellier
 Lév.—J. H. Léveillé
 Leyss.—F. W. von Leysser
 Lib.—M. A. Libert
 Liboš.—J. JA. Libošic [J. Liboschitz]
 Lightf.—J. Lightfoot
 Liljebl.—S. Liljeblad
 Lind—J[ens] Lind
 Lind. & Syd.—G. Lindau & P. Sydow
 Lindblad—M. A. Lindblad
 Lindr.—J. J. Lindroth
 Linhart—G. Linhart
 Link—J. H. F. Link
 Litsch.—V. Litschauer
 Litsch. & Lohw.—Litsch. & H. Lohwag
 Ljub.—L. V. Ljubariskij
 Lloyd—C. G. Lloyd
 Lohw.—H. Lohwag
 Lohw. & Follner—Lohw. & L. Follner
 K. Lohw.—K. Lohwag
 Lombard—F. F. Lombard
 Lomb. & Gilb.—Lombard & R. L. Gilbertson
 Long—W. H. Long
 Long & Baxt.—Long & D. V. Baxter
 Loud.—J. C. Loudon
 Lour.—J. de Loureiro
 Lowe—J. L. Lowe
 Lowe & Gilb.—Lowe & R. L. Gilbertson
 Lowe & Lund.—Lowe & S. Lundell
 Luc. & Gillot—L. Lucand & F. X. Gillot
 Lübstorf—W. Lübstorf
 F. Ludw.—F. Ludwig
 Lumn.—S. Lumnitzer
 Lundell—S. Lundell
 Lund. & Pil.—Lundell & A. Pilát
 Maas G.—R. A. Maas Geesteranus
 Macbr.—T. H. Macbride (1848–1934)
 Macrae & Aosh.—R. Macrae & K. Aoshima
 P. Magn.—P. W. Magnus
 Maheu—J. Maheu
 Maire—R. C. J. E. Maire
 Maire & Pol.—Maire & J. Politis
 Maire & Wern.—Maire & R. G. Werner
 L. Maire
 Mal. & Bert.—Malenç. & R. Bertault
 Malenç.—J. L. G. Malençon
 Malinvaud—E. Malinvaud
 Malkovský—K. M. Malkovský
 Manc. & Sacc.—V. Mancini & P. A. Saccardo
 Mang. & Pat.—L. A. Mangin & N. T. Patouillard
 Mang. & Viala—L. Mangin & P. Viala
 Maratti—G. F. Maratti
 March. & Court.—L. Marchand & R. Courtois
 L. March.—L. Marchand (fl. 1826–30)
 Marcucci—M. Marcucci
 Mart.—K. F. P. von Martius
 C. E. Mart.—C. E. Martin
 Martelli—U. Martelli
 T. Martius
 Mass.—G. E. Massee
 Mattioli—P. A. Mattioli (Lat., Matthiolus)
 Mattiolo—O. Mattiolo
 MaUBL.—A. Maublanc
 Mauri—E. Mauri
 May—K. May
 McCallum—A. W. McCallum
 McGinty = Lloyd
 McIlv.—C. McIlvaine
 McKay—H. H. McKay
 Mérat—F. V. Mérat [de Vaumartoise]
 G. Meyer—G. F. W. Meyer
 Mez—C. Mez
 Mich.—P. A. Micheli
 Michael—E. Michael
 L. W. Mill.—L. W. Miller
 A. Möll.—F. A. G. J. Möller
 Moesz—G. von Moesz / Moesz G.
 Mont.—J. P. F. C. Montagne
 Mont. & Dur.—Mont. & M. C. Durieu de Maisonneuve
 L. Morel—L. F. Morel
 Morg.—A. P. Morgan

- Moritzi—A. Moritzi
 Moug.—J. B. Mougeot
 Moug. & Nestl.—Moug. & C. G. Nestler
 Moug. & Ferry—J. A. [= Antoine] Moug. & R. Ferry
 Moug. & Lév.—Moug. & J. H. Léveillé
 Mounce & Macrae—I. Mounce & R. Macrae
 O. F. Müll.—O. F. Müller
 Müll. & Jahn—G. Müller & H. Jahn
 Murašk.—K. E. Muraškinskij
 Murr.—J. A. Murray
 Murrill—W. A. Murrill
 Mussat—E. Mussat
 Nannf.—J. A. Nannfeldt
 Nannf. & Du R.—Nannf. & G. E. Du Rietz
 Nath.-W.—T. Nathorst-Windahl
 Nees—C. G. D. Nees von Esenbeck
 C. & T. Nees—Nees & T. F. L. Nees von Esenbeck
 Nentien
 Neuman—J. J. Neuman
 Niemelä—T. Niemelä
 Nikol.—T. L. Nikolajeva
 Nobles—M. K. Nobles
 Nobles & Frew—Nobles & B. P. Frew
 Nocca & Balb.—D. Nocea & C. B. Balbis
 Nohara—S. Nohara
 Nyl. & Sæl.—W. Nylander & T. Sælan
 Oed.—G. C. Oeder
 Oehm—G. Oehm
 A. J. Olson
 O.K.—C. E. O. Kunze
 Opiz—F. M. Opiz (usually listed as P. M. Opiz)
 Orl.—A. Orlicz
 Otth—G. H. Otth
 Otto—J. G. Otto
 Oud.—C. A. J. A. Oudemans
 Over.—C. van Overeem
 C. & D. Over.—Over. & D. van Overeem-de Haas
 Over. & Steinm.—Over. & A. Steinmann
 Over. & Weese—Over. & J. Weese
 Overh.—L. O. Overholts
 Overh. & Engl.—Overh. & G. H. Englerth
 Overh. & L.—Overh. & J. L. Lowe
 Panizzi—F. Panizzi
 Paravicini—E. Paravicini
 Park.-Rh.—A. F. Parker-Rhodes
 Parm.—E. Parmasto
 Passerini—G. Passerini
 Pat.—N. T. Patouillard
 Pat. & Gaill.—Pat. & A. Gaillard
 Pat. & Har.—Pat. & P. A. Hariot
 Pat. & Lag.—Pat. & N. G. Lagerheim
 Paul.—J. J. Paulet
 Payer—J. B. Payer
 P. Beauv.—A. M. F. J. Palisot de Beauvois
 A. Pears.—A. A. Pearson
 Peck—C. H. Peck
 Pegl.—D. N. Pegler
 Pegl. & Gibbs.—Pegl. & J. A. S. Gibson
 Pegl. & Young—Pegl. & T. W. K. Young
 Pegl. & Wat.—Pegl. & J. M. Waterston
 Pers.—C. H. Persoon
 Petch—T. Petch
 Pfeiff.—L. Pfeiffer
 Pilát—A. Pilát
 Pil. & Lindtn.—Pilát & V. Lindtner
 Pinto-L.—J. Pinto-Lopes
 Plan.—J. J. Planer
 Plowr.—C. B. Plowright
 Poelt & Jahn—J. Poelt & H. Jahn
 Poelt & Oberw.—J. Poelt & F. Oberwinkler
 Poetsch—J. S. Poetsch
 Poir.—J. L. M. Poirier
 Pollini—C. Pollini
 Poll. & Kauffm.—J. B. Pollock & C. H. Kauffman
 Post—H. A. von Post
 Pouz.—Z. Pouzar
 Povah—A. H. W. Povah
 Preuss—C. G. T. Preuss
 Prilleux—E. E. Prilleux
 Purt.—T. Purton
 Quél.—L. Quélet
 Quél. & Schulz.—Quél. & S. Schulzer von Müggenburg
 Rab.—G. L. Rabenhorst
 Radde & Walt.—G. F. R. Radde & A. Walter
 Raddi—G. Raddi
 Rafin.—C. S. Rafinesque [Schmaltz]
 Ravenel—H. W. Ravenel
 Ray—J. Ray
 Razzore—A. Razzore
 G. F. Re
 Rea—C. Rea
 Reb.—J. F. Rebentisch
 Reichenb.—H. G. L. Reichenbach

BIBLIOGRAPHY OF SPECIAL LITERATURE

The bibliography includes, *inter alia*, the titles of the 'special literature' cited on the preceding pages. The enumeration is the result of a sharp selection. With a very few exceptions the titles refer to publications that deal exclusively with separate European species or with groups of them, like genera, but then only if these treatments of genera or larger groups are not based more or less exclusively on non-European material. For instance, a monographic treatment of the Japanese species of *Griphula* will not be found listed; the same applies to Cunningham's 'Polyporaceae of New Zealand.' Publications with a wider scope than the 'polypores' also failed to qualify for admission. For instance, the section of "Die natürlichen Pflanzenfamilien" written by Killermann and containing besides the treating not only the 'Polyporaceae' but also various other groups is not included. A few exceptions were made, for instance for some works by Bourdot & Galzin, Overholts, and Lowe. Because it has been rigorously adapted to the limited scope of the present work the list is therefore far from world-wide.

The number of titles of special literature related to certain species has been strongly reduced in order to cut down the length of the bibliography. These species are *Fomes fomentarius*, *Heterobasidion annosum*, *Phaeolus schweinitzii*, *Phellinus igniarius*, and *Phellinus tremulae*.

It will be observed that many titles are replaced by mention of the language in which they are written, for instance, "[Russian title]." This is done for languages using many diacritical marks or an alphabet other than the 'Latin' (English) one, or where the title is written in national writing-symbols like Japanese. In these cases a second title is given in full, consisting of an English, French, or German translation, preferably one to be found in the paper itself or in the serial in which it was published. If such a translated title is copied from another source it appears in brackets (); if it is a translation for which I feel personally responsible it appears in square brackets [].

INDEX

The index contains (1) the accepted generic names of the "Check list" proper and their synonyms, (2) the accepted specific (and infraspecific) epithets of the same list and their binomial synonyms, (3) the generic names treated in the "Notes". Misapplied names are not considered. The "List of omitted names" has not been integrated into the index. To facilitate searching, the specific and infraspecific epithets are followed by their first author, without the use of brackets. To save space, however, the generic names are left out.
