

THE PARASITIC FUNGI OF OHIO PLANTS

DISSERTATION

Presented in Partial Fulfillment of the Requirements
for the Degree Doctor of Philosophy in the
Graduate School of The Ohio State
University

By

C LAYTON WAYNE ELLETT, B.S., M.Sc.

The Ohio State University

1955

Approved by:

W.G. Stover
Co-Adviser

C.C. Allason
Co-Adviser
Department of Botany
and Plant Pathology

ACKNOWLEDGEMENTS

The writer sincerely thanks Dr. C. C. Allison and Dr. W. G. Stover for their counsel and encouragement throughout his years of graduate education.

The writer is also indebted to Dr. H. C. Young of the Department of Botany and Plant Pathology, Ohio Agricultural Experiment Station, and Dr. G. T. Jones, Department of Botany, Oberlin College, for permission to study the herbarium specimens at their respective institutions.

The writer thanks his wife for her help in the preparation of the manuscript and for her encouragement during the course of the investigations.

INTRODUCTION

"If there be in the land famine,
if there be pestilence, blasting, mildew,
locust -----" I Kings 8:37

Fungi have been present upon the earth for a long time, much longer than seed plants. Seward (36) states: "We can safely say that bacteria and many other fungi are entitled to be included among the most ancient members of the plant kingdom."

The number of known species of fungi is reported from 34,000 to as high as 100,000 (5, 28). The number varies depending upon the authors' concept of a species and according to their estimate of the number of synonyms. The number of known species of Spermatophyta is estimated to be from 160,000 to 200,000. There is ample evidence that the total number of species of fungi upon the earth is equal to or greater than the total number of kinds of seed plants (4, 5, 28). Fries, in 1825, is reported to have written (28), "Many botanists, looking at fungi from a distance, deem them a small province of the vegetable kingdom, although it is really the greatest, being analogous to that of insects among animals."

For Ohio, about 2500 native and naturalized vascular plants have been listed¹. The only comprehensive compilation of the fungus flora of Ohio was published in 1893 (26). This included about 1000 species. The first list of fungi from Ohio, published in 1849 included 319 species, of which about 20 would be considered parasitic (27).

¹ Information supplied by Clara G. Weishaupt, Curator of Herbarium of Vascular Plants, The Ohio State University.

Since this first report, many additional parasitic fungi have been reported. Today, the vascular flora of Ohio is considered to be well known, but our knowledge of the fungus flora of the state is far from complete.

The plant pathologist has a need for more exact information regarding the distribution of the parasitic fungi. Such information would enable him to identify plant diseases more readily and to plan research projects and control programs.

Plant science as a whole, is certain to profit from a more precise knowledge of the geographical distribution, ecology, and habitats of the fungi. Students are aided by having in convenient form, a list of the parasitic fungi that might be present in the area.

Aside from the practical value of a consideration of the fungi, they may be studied as a hobby as suggested by Cooke who is quoted by Rolfe (31) as writing:

"Let me assure the student that all times, seasons, and localities will afford him some species for examination; and whether he has felt interested in them before, or now, for the first time, adopts these interesting plants as objects worthy of his special regard, I would commend them to his patient and persevering attention, in the assurance that this pursuit will 'lead from joy to joy.'"

HISTORICAL SKETCH

The first published record of the fungus flora of Ohio appeared in 1849 in a "Catalogue of Plants, Native and Naturalized, Collected in the Vicinity of Cincinnati, Ohio, During the Years 1834-1844." The 1,050 plants in this list were collected by Thomas G. Lea. Included were 319 fungi of which, today, 20 to 30 would be recognized as plant parasites. However, at that time, fungi were not generally recognized as causing plant disease. The fungi in Lea's list were identified by the Reverend M. J. Berkeley, well known British mycologist of the 19th century. In 1878, A. P. Morgan's "Flora of the Miami Valley" was published (29). This included a list of fungi but no parasitic species. Beginning in the late 1880's, several persons became active as collectors of parasitic fungi and in some instances, studied the fungi as incitants of disease. Frederica Detmers was appointed assistant botanist at the Ohio Agricultural Experiment Station in 1889 and between 1891 and 1893, she reported on many diseases of fruit and vegetable crops and prepared two lists of the rust fungi of the state (15, 16). In 1894, A. D. Selby became botanist at the Ohio Agricultural Experiment Station, now at Wooster, and contributed greatly to our knowledge of plant pathology. Even before his appointment to the Station staff, Selby had prepared a list of Ohio Erysipheae (33). One of his more important publications, and one of the first of its kind in the United States, was a handbook of plant diseases prepared in 1900 (34) and revised in 1910 (35).

W. A. Kellerman was elected chairman of the newly organized department of botany at The Ohio State University in 1891. From that time until his death in 1908, he collected extensively, adding many species of parasitic fungi to the herbarium at the University. In 1892, he organized the first course to be offered in plant pathology at The Ohio State University. In 1893, Kellerman and Werner (26) prepared the Botany section of Volume 7 of the "Report of the Geological Survey of Ohio." Included was the most complete list of the fungus flora of Ohio published. The compilation included about 1000 species of which about 250 were parasitic. At intervals, from 1901 to 1905, Kellerman published and issued the "Ohio Fungi Exsiccati." This was issued in ten fascicles and included descriptions of 200 species of fungi, most of which were plant parasites.

Table 1.--Principal Collectors of Parasitic Fungi in Ohio, 1890-1910.

Collector	Location	Approximate Date
W. H. Aiken	Cincinnati	1897-1910
E. E. Bogue	Ashtabula County	1890's
Thomas Bonser	Wyandot County	Early 1900's
Edo Claassen (9,10,11,12,13,14)	Cuyahoga County	1895-1924
Moses Craig	Columbus	1888-1892
Freda Detmers (15,16)	Columbus, Wooster	1890's
W. A. Kellerman (21,22,23,24,25,26)	Columbus	1880-1907
Rev. F. D. Kelsey	Oberlin, Toledo	1890's
L. C. Riddle	Columbus	1895-1905
A. D. Selby (33,34,35)	Columbus, Wooster	1890-1923
F. L. Stevens (37,38,39,40)	Columbus	1895-1898
C. M. Weed	Columbus	1888-1891
W. C. Werner (26)	Columbus, Painesville	1890's
E. M. Wilcox	Columbus	1890's

Many collections of plant disease fungi were added to the herbaria in the state from 1890 to 1910. Some of the contributors identified their collections and published lists while others deposited their specimens, identified or not, in the herbaria at The Ohio State University, the Ohio Experiment Station, Oberlin College, or elsewhere. Some of these are still not identified, but many were checked by Selby or Kellerman and in more recent years, by A. L. Pierstorff, W. G. Stover, B. H. Davis, C. W. Ellett and others. A list of the major contributors of the period is presented in Table 1. The number in parentheses after the collector's name refers to the articles, in the literature cited, where their reports of parasitic fungi are to be found.

METHODS

This list of fungi which are pathogenic on plants in Ohio was prepared from: (1) specimens in herbaria, (2) published records, (3) collections and observations of the writer, and (4) unpublished reports solicited by the writer.

The collections in the herbaria at The Ohio State University, the Ohio Agricultural Experiment Station, and Oberlin College, were studied. These collections date from about 1888. Some unidentified collections were determined. Some determinations were incorrect and these were corrected where possible. The nomenclature of host and parasite was brought up to date.

The writer has collected and identified or observed and identified parasitic fungi from all counties in the state. This has usually involved microscopic examination and, often, isolation and

inoculation techniques.

Unpublished reports were used in only a few instances.

Credit is given to the author of these reports.

LIST OF OHIO FUNGI PARASITIC ON PLANTS

The fungi are arranged alphabetically under the order to which they are referred. The systematic arrangement of the orders within the classes of fungi is that of Ainsworth and Bisby (1). With but few exceptions the placement of the genera in the orders follows Ainsworth and Bisby.

The names of both the imperfect and perfect stages of the Ascomycetes are commonly listed, but the hosts are recorded under the name of the stage which is usually associated with the parasitic phase. Usually this is the imperfect stage.

The term fungus has been used by plant scientists in a general way to include all plants which have no stems, roots, leaves or chlorophyll (2, 32). Therefore, as certain species of bacteria are important plant parasites, they are included in this dissertation. The genera of bacteria are those recognized by Elliott (19). The genus Streptomyces which is included here with the bacteria is sometimes classified with the Fungi Imperfeci.

The systematic arrangement of the genera found in Ohio with the number of Ohio species in each genus follows:

SCHIZOMYCETES	ASCOMYCETES
Eubacteriales	Taphrinales
<i>Agrobacterium</i> (2)	<i>Taphrina</i> (8)
<i>Bacterium</i> (1)	
<i>Corynebacterium</i> (5)	Myriangiales
<i>Erwinia</i> (6)	
<i>Pseudomonas</i> (24)	<i>Elsinoe</i> (2)
<i>Xanthomonas</i> (11)	
Actinomycetales	Dothideales
<i>Streptomyces</i> (1)	<i>Cymadothea</i> (1)
PHYC OMYCETES	<i>Dibotryon</i> (1)
	<i>Endothella</i> (1)
	<i>Phyllachora</i> (5)
	<i>Scorias</i> (1)
Chytridiales	Hemisphaeriales
<i>Physoderma</i> (1)	<i>Asterina</i> (1)
<i>Synchytrium</i> (2)	
Plasmodiophorales	Erysiphales
<i>Plasmodiophora</i> (1)	<i>Apiosporina</i> (1)
<i>Spongospora</i> (1)	<i>Erysiphe</i> (5)
Saprolegniales	<i>Microsphaera</i> (5)
<i>Aphanomyces</i> (2)	<i>Phyllactinia</i> (2)
Peronosporales	<i>Podosphaera</i> (3)
<i>Albugo</i> (<i>Cystopus</i>) (5)	<i>Sphaerotheca</i> (4)
<i>Bremia</i> (1)	<i>Uncinula</i> (8)
<i>Peronospora</i> (18)	
<i>Phytophthora</i> (7)	
<i>Plasmopara</i> (5)	
<i>Pseudoperonospora</i> (1)	
<i>Pythiogeton</i> (1)	
<i>Pythium</i> (5)	
<i>Sclerospora</i> (1)	
Mucorales	Hypocreales
<i>Choanephora</i> (1)	<i>Balansia</i> (2)
<i>Mucor</i> (1)	<i>Claviceps</i> (2)
<i>Rhizopus</i> (1)	<i>Cordyceps</i> (2)
<i>Spinellus</i> (1)	<i>Epichloe</i> (1)
<i>Sporodinia</i> (<i>Syzygites</i>) (1)	<i>Gibberella</i> (2)
	<i>Hypocrea</i> (1)
	<i>Hypocreopsis</i> (1)
	<i>Hypomyces</i> (3)

Volutella (1)	

The host plants are arranged alphabetically under each fungus species. In the Uredinales, the stage or stages of the rust fungus found on the host is recorded in the conventional way. The basis for including the report of the parasite in Ohio on each host is recorded, in abbreviated form, following the host name. The purport of these abbreviations, where not evident, follows:

- SU - specimen in herbarium at The Ohio State University.
- ES - specimen in herbarium at the Ohio Agricultural Experiment Station.
- OB - specimen in herbarium at Oberlin College.
- PDS Index - refers to the "Index of Plant Diseases in the United States" issued in five parts from 1950 to 1953 by The Plant Disease Survey, Division of Mycology and Disease Survey. United States Department of Agriculture.
- PDR - "The Plant Disease Reporter."
- PDR Su United States Department of Agriculture ent."
- Arthur - "J. C. Arthur's "Manual of the Rusts in the United States and Canada" (1934).
- Chupp - Charles Chupp's "A monograph of the Fungus Genus Cercospora" (1953).
- Fischer - G. W. Fischer's "Manual of the North American Smut Fungi" (1953).
- Alexander - Report of Paul Alexander, Ohio Florists' Association Fellow, Department of Botany and Plant Pathology, The Ohio State University.
- Ellett - Observations and/or collections of the writer but specimens not in the herbarium.
- Sprague - Roderick Sprague's "Diseases of Cereals and Grasses in North America" (1950).

An asterisk before a fungus or host name denotes the first report of the parasite or of the parasite on that host in Ohio.

The nomenclature for the host plants is from "Gray's Manual of Botany," 8th edition, 1950 or from Bailey's, "Manual of Cultivated Plants," revised edition, 1949. With the exception noted below, the nomenclature of the parasites follows that in the "Index of Plant Diseases in the United States," issued in five parts from 1950 to 1953 by the United States Department of Agriculture. The nomenclature of the smut fungi is from Fischer's, "North American Smut Fungi" (20), and that of the rust fungi, Arthur's "Manual of Rusts in the United States and Canada" (3).

DISCUSSION AND SUMMARY

Most agriculturists do not realize that several thousand species of bacteria and fungi are plant pathogens. Further, it is not recognized by most that the annual loss in the United States attributed to plant diseases is around three billion dollars (41). The fungi and bacteria probably account for two-thirds of this loss. A conservative estimate for the annual loss in Ohio is 75,000,000 dollars. This estimate is based on 1950 prices.

Bacterial and/or fungus diseases have been largely responsible for limiting the areas of commercial production of many crops during the last 100 years. Crops in Ohio which have been thus limited include grape, pear, watermelon, and flax. There are many instances of fungus and bacterial diseases being the limiting factor in crop production in one or more areas of the state in a given year. A few examples include potato late blight, tomato late blight, wheat stem rust, barley powdery mildew, corn leaf blight, sweet corn bacterial wilt, sugar beet leaf spot, peach brown rot, apple scab, rose black spot, rose powdery mildew, soybean root rot, cucumber and muskmelon bacterial wilt, alfalfa bacterial wilt, sugar beet root rot, and *Helminthosporium* blight of oats.

Parasitic fungi may be present in an area for many years causing little loss. Then, when new varieties (genotypes) of crop plants are introduced or when cultivation of the crop is intensified, these parasitic fungi may become the limiting factors to successful cultivation of that crop. *Helminthosporium turcicum* Pass., a leaf

parasite of corn, was first reported in Ohio in 1900 (34). From that date until 1939 it was seldom mentioned in reports or discussions of corn pathology. In 1939 the writer reported H. turcicum as a major disease of certain corn hybrids and the factor limiting their cultivation in parts of southern Ohio (17). It is important, then, that plant pathologists, geneticists and agronomists working together in the development and introduction of new crops and crop varieties be cognizant of the pathogens, minor or major, of these crops.

There is evidence (4) that the species of fungi outnumber the species of vascular plants, at least in temperate regions. The smaller the area under consideration the more the species of fungi outnumber those of vascular plants (4, 28). In Britain the number of valid fungus species is estimated to be nearly three times the number of species of vascular plants (5). In Manitoba the number of known species of fungi is about twice the number of vascular plants (6). No estimate of the number of fungus species in Ohio has been made. The reported Ohio species of fungi, saprophytic and parasitic, have not been tabulated since 1893. The writer estimates the known species at 3,000 and suggests that there are 5,000 to 6,000 species, unreported and reported, of fungi in Ohio. Of these, 3,000 are estimated to be pathogens.

In this dissertation 983 species and varieties of parasitic fungi and bacteria are reported on Ohio plants with over 2,100 combinations of host and parasite.

Included among the parasites in Ohio are 49 bacteria, 44 downy mildews, 27 powdery mildews, 47 smuts, 164 rusts, 48 species of

Phyllosticta, 82 species of Cercospora, 95 species of Septoria. The host with the largest number of pathogens is Pyrus malus L. with 30. The fungus with the largest number of suspects is Erysiphe cichoracearum DC. ex Merat. with 51. In this dissertation 43 species of fungi are reported in Ohio for the first time. In addition, 72 fungi are reported for the first time on a particular host.

This list of plant parasitic fungi is incomplete. No parasites of the algae, lichens or liverworts are recorded. Certainly there are many parasites of these plants. It is estimated that there are over 1,000 species of vascular plants in Ohio on which no fungi have been reported. It is not likely that these are free of pathogens.

APPENDIX

Key to the Ohio Genera of Plant Pathogens

of the Fungi Imperfecti.

1 - Conidia and conidiophores borne within a pycnidium
or within locules in a stroma----- SPAEROPSIDALES (p. 144)

1 - Conidia and conidiophores borne in an
acervulus----- MELANCONIALES (p. 147)

1 - Conidia and conidiophores not developing within a
pycnidium or acervulus----- MONILIALES (p. 149)

1 - Conidia not known----- MYCELIA STERILIA

Rhizoctonia

Papulaspora

Sclerotium

SPHAEROPSIDALES

1 - Pycnidium complete and well-developed-----	2
1 - Pycnidium with well-developed base, but the upper part vanishing very early leaving the basal part in the shape of a cup or saucer-----	22
1 - Pycnidium with well-developed top but base poorly formed (dimidiate or shield-shaped), opening by an ostiole or by a longitudinal fissure-----	24
2 - Conidia slender, many times as long as broad (filiform)-	20
2 - Conidia spherical, ellipsoid, or oval; not more than a few times longer than broad-----	3
3 - Conidia hyaline-----	4
3 - Conidia colored-----	17
4 - Conidia one-celled-----	5
4 - Conidia two-celled-----	16
4 - Conidia three- or more-celled-----	STAGONOSPORA
5 - Stroma present-----	13
5 - Stroma lacking-----	6
6 - Pycnidium with appendages (bristles or hairs)--	PYRENOCHAETA
6 - Pycnidium smooth-----	7
7 - Pycnidium in or on the hyphae of powdery mildew fungi-----	CICINNOBOLUS
7 - Pycnidium without a definite ostiole, opening irregularly; spores oblong, ends rounded-----	PLENODOMUS
7 - Pycnidium with an ostiole (not always present in <u>Phomopsis</u>)-	8
8 - Conidia of two kinds; oval on long conidiophores, and slender stylospores usually curved like a hook at one end-----	PHOMOPSIS
8 - Conidia of one kind-----	9

- 9 - Conidiophores branched; conidia very small (3-8 by 1-3 microns)----- DENDROPHOMA
- 9 - Conidiophores simple, or not evident; conidia various, usually larger----- 10
- 10 - Conidia falcate or lunate (not yet reported in Ohio)----- SELENOPHOMA
- 10 - Conidia mostly straight----- 11
- 11 - Conidia more than 15 microns long, usually at least 20 microns----- MACROPHOMA
- 11 - Conidia less than 15 microns long----- 12
- 12 - Pycnidia usually in definitely limited spots on leaves; conidia egg-shaped, cylindric, or nearly spherical----- PHYLLOSTICTA
- 12 - Pycnidia on other parts of host; if on leaves not in definite spots. (Not mycologically distinguishable from Phyllosticta)----- PHOMA
- 13 - Pycnidia mostly occurring singly in the stroma, or often without definite stroma; conidia of two kinds----- PHOMOPSIS
- 13 - Pycnidia or locules several in a stroma, with separate ostioles----- 14
- 14 - Stroma more or less valloid (pycnidia arranged more or less in a circle in the stroma)----- 15
- 14 - Stroma not valloid, but pycnidia in botryose clusters (like grapes) on the stroma, occasionally immersed in a pulvinate stroma; conidia ovate or oblong---- DOTHIORELLA
- 15 - Conidia fusoid or elliptic-fusoid, straight or nearly so----- FUSIGGUM
- 15 - Conidia allantoid, small (3-10 microns)----- CYTOSPORA
- 16 - Conidia with slimy or hair-like appendages at each end; parasitic on sori of Uredinales----- DARLUCA
- 16 - Conidia without appendages; on higher plants---- ASCOCYTA
- 17 - Conidia one-celled----- 18
- 17 - Conidia two-celled----- 19

- 18 - Conidia small----- CONIOTHYRIUM
- 18 - Conidia large (20 or more microns)----- SPHAEROPSIS
(Considered by some to be an immature Diplodia)
- 19 - Pycnidia single, not in a stroma----- DIPLODIA
- 19 - Pycnidia borne in a stroma----- BOTRYODIPLODIA
- 20 - Stroma present; locules one to several and separate;
conidia one to five septate----- DOTHISTROMA
- 20 - Stroma not present----- 21
- 21 - Pycnidia mostly in spots on leaves or herbaceous stems;
ostioles small----- SEPTORIA
- 21 - Pycnidia on leaves; not completely developed, wall very
thin; opening by a wide mouth (similar to Septoria)-- PHLEOSPORA
- 22 - Pycnidium with setae----- AMEROSPORIUM
- 22 - Pycnidium without setae----- 23
- 23 - Pycnidium opening radiately; on Medicago----- SPORONEMA
- 23 - Pycnidium opening irregularly; on Populus----- DOTICHIZA
- 24 - Pycnidium superficial, shield-shaped----- 25
- 24 - Pycnidium irregular in shape, not usually superficial; said
to be the spermagonial phase of certain leaf spot
fungi----- PIGGOTIA
- 25 - Pycnidium gelatinous within----- GLOEODES
- 25 - Pycnidium not gelatinous within----- 26
- 26 - Pycnidium borne on a stalk; our species on
Quercus leaves----- ACTINOPELTE
- 26 - Pycnidium not borne on a stalk; our species
on Pyrus----- LEPTOTHYRIUM

MELANCONIALES

- 1 - Conidia hyaline, filiform, many times as long as broad----- CYLINDROSPORIUM
- 1 - Conidia hyaline, globose, ellipsoid, fusoid, or allantoid; not more than 3 or 4 times longer than broad---- 2
- 1 - Conidia colored----- 9
- 2 - Conidia one-celled----- 3
- 2 - Conidia more than one-celled----- 6
- 3 - Acervuli with bristles or setae----- COLLETOTRICHUM
- 3 - Acervuli without bristles or setae----- 4
- 4 - Acervuli in herbaceous plant parts----- 5
- 4 - Acervuli in woody stems----- MYXOSPORIUM
- 5 - Acervuli immersed and remaining covered by host epidermis for a considerable time----- GLOEOSPORIUM
(This genus and Colletotrichum are similar)
- 5 - Like Gloesporium, but the conidiophores arising from a well-developed base, almost stromatic; perfect stage Elsinoe----- SPHAEOLOMA
- 6 - Acervuli subcuticular, finally erumpent, surrounded by and on radiating dark hyphae----- ACTINONEMA
- 6 - Acervuli not surrounded by or on dark radiating hyphae-- 7
- 7 - Conidia two-celled; acervuli on leaves----- MARSSONINA
- 7 - Conidia two-celled; acervuli on fruits or stems----- SEPTOMYXA
- 7 - Conidia with three or more cells----- 8
- 8 - Conidia with appendages----- ENTOMOSPORIUM
(Often included in the Sphaeropsidales)
- 8 - Conidia without appendages----- SEPTOGLOEUM
- 9 - Conidia one-celled----- MELANCONIUM
- 9 - Conidia with three or more cells----- 10

- 10 - Conidia with filiform appendages----- 11
- 10 - Conidia without appendages, oblong, more or less
clavate, or broadly fusoid----- CORYNEUM
- 11 - A single hyaline setae from the apical cell----- MONCHAETIA
- 11 - Two or more setae from the apical cell; end cells often
hyaline----- PESTALOTIA
- 11 - One appendage at the base----- CRYPTOSTICTIS

MONILIALES

1 - Conidiophores united into a compact column, and or arising from the surface of a more or less rounded mass of hyphae forming a cushion-----	30
1 - Conidiophores free, not as above-----	2
2 - Conidia and conidiophores hyaline or bright colored----	3
2 - Conidia and or conidiophores with dark pigment-----	17
3 - Conidia one-celled, globose to elliptical-----	4
3 - Conidia two-celled, globose to elliptical-----	12
3 - Conidia three- or more-celled-----	14
4 - Conidiophores not conspicuous, short, or if conspicuous then straight and unbranched-----	5
4 - Conidiophores branched-----	9
5 - Conidiophores elongate with swollen apex; conidia forming in chains from the sterigmata on the swollen apex--- ASPERGILLUS	
5 - Conidiophores short, one-celled, clavate, thickly massed, bearing conidia at the tips-----	MICROSTROMA
5 - Conidiophores not as above-----	6
6 - Conidia forming in chains; ovate, powdery in mass----	OIDIUM
6 - Conidia not in chains; borne singly-----	7
7 - Growing on other fungi-----	MYCELIOPHTHORA
7 - Not growing on other fungi-----	8
8 - Conidia forming singly and collecting in droplets of mucilage at the apex of short, pointed conidiophores-----	CEPHALOSPORIUM
8 - Conidia attached at the sides and apex of the conidiophores which emerge in clusters from leaf tissues-----	OVULARIA
9 - Conidiophores verticillately branched-----	10
9 - Conidiophores not verticillately branched-----	11

- 10 - Large rough chlamydospores always present----- *SEPEDONIUM*
- 10 - Chlamydospores not present----- *VERTICILLIUM*
- 11 - Conidiophores repeatedly branched toward the apex
resulting in a compact brush-like appearance----- *PENICILLIUM*
- 11 - Conidiophores irregularly branched, tree like; conidia
developing around the ends of the branches forming
grape-like clusters----- *BOTRYTIS*
- 12 - Conidiophores repeatedly branched; conidia mostly
two-celled, cylindrical----- *CYLINDROCLEDIUM*
- 12 - Conidiophores not branched or only rarely branched--- 13
- 12 - Conidiophores not evident, apical cell of conidium
commonly with a short beak----- *RHYNCHOSPORIUM*
- 13 - Conidiophores arising from the leaf surfaces in clusters;
conidia ovate, single----- *DIDYMARIA*
- 13 - Conidiophores long, septate, not in clusters; conidia
ovate, single, apical cell often larger than the
basal cell----- *TRICHOTHECIUM*
- 14 - Conidia pyriform, single; mostly parasites
of grasses----- *PIRICULARIA*
- 14 - Conidia not pyriform----- 15
- 15 - Conidia elongate, cylindrical----- 16
- 15 - Conidia more or less crescent-shaped----- *FUSARIUM*
- 16 - Conidia borne in chains----- *SEPTOCYLINDRIUM*
- 16 - Conidia single or occasionally in short chains
mostly one to three septate; conidiophores growing
through stomates of leaves, in clusters----- *RAMULARIA*
- 16 - Conidia single, slender, often curved, mostly more
than three septate----- *CERCOSPORELLA*
- 17 - Conidia endogenous----- 18
- 17 - Conidia exogenous----- 19
- 18 - Chlamydospores, dark and multicellular; conidia
hyaline, rod-shaped----- *THIELAVIOPSIS*

- 18 - Chlamydospores absent; conidia hyaline, rod-shaped- CHALARA
- 19 - Conidia one-celled, hyaline----- MONILIOCHAETES
- 19 - Conidia one-celled, dark, globose----- NIGROSPORA
- 19 - Conidia two-celled----- 20
- 19 - Conidia three- or more-celled----- 23
- 20 - Conidiophores wavy----- POLYTHRINCIMUM
- 20 - Conidiophores not wavy----- 21
- 21 - Conidiophores usually branched; conidia in chains,
sometimes three-celled----- CLADOSPORIUM
- 21 - Conidiophores not branched; conidia not in chains----- 22
- 22 - Mycelium subcuticular; conidiophores not in
clusters----- FUSICLADIUM
- 22 - Mycelium subepidermal; conidiophores in
clusters----- SCOLECOTRICHUM
- 23 - Conidia muriform----- 29
- 23 - Conidia not muriform----- 24
- 24 - Conidia filiform, hyaline or dark, single,
multiseptate----- CERCOSPORA
- 24 - Conidia not filiform, dark, multiseptate----- 25
- 25 - Conidiophores very short, not much longer than the
conidia, unbranched, in clusters from leaf stomates;
conidia ovoid to ellipsoid----- STIGMINA
- 25 - Conidiophores usually much longer than the spores----- 26
- 26 - Conidia in whorls from the upper cells of the
unbranched conidiophores----- SPONDYLOCLADIUM
- 26 - Conidia not as above----- 27
- 27 - Conidia smooth----- 28
- 27 - Conidial walls rough (echinulate)----- HETEROSPORIUM
- 28 - Conidia sharply curved, central cell or cells
enlarged; end cells often lighter in color----- CURVULARIA

- 28 - Conidia straight or slightly curved; central cell not enlarged; end cells not of a different color----- *HELMINTHOSPORIUM*
- 29 - Conidia not in chains, rounded at both ends----- *STEMPHYLIUM*
- 29 - Conidia in chains or not, attenuated at the apex----- *ALTERNARIA*
- 30 - Conidiophores united in an erect fascicle (*coremium*), dark, bearing a spherical, terminal mass of one-celled spores embedded in a slime----- *GRAPHIUM*
- 30 - Conidiophores usually short and arising from a cushion-like, mass of fungus tissue (*sporodochium*)----- 31
- 31 - Conidia dark----- 32
- 31 - Conidia hyaline----- 33
- 32 - Conidia ovoid, one-celled; conidiophores repeatedly branched----- *MYROTHECIUM*
- 32 - Conidia globose, one- to several-celled; conidiophores short, radiating from the dark sporodochia----- *EPIC OCCUM*
- 33 - Conidia one-celled----- 34
- 33 - Conidia more than one-celled; conidia more or less crescent-shaped, pointed at the ends; often accompanied by one-celled microconidia; sporodochia often not present----- *FUSARIUM*
- 34 - Parasitic on rust fungi----- *TUBERCULINA*
- 34 - Parasitic on other plants----- 35
- 35 - Sporodochia with prominent setae----- *VOLUTELLA*
- 35 - Sporodochia without setae----- 36
- 36 - Sporodochia white, breaking through epidermis of leaves; conidiophores short, one-celled, clavate, bearing up to six elongate conidia at the tip in basidiospore fashion (sometimes included in the Melanconiales)----- *MICROSTROMA*
- 36 - Sporodochia light in color; conidiophores clavate, usually septate, with a warty tip; conidia often slightly curved, borne at the tip in basidiospore fashion (often included in the Melanconiales)----- *KABATIELLA*

AUTOBIOGRAPHY

I, Clayton Wayne Ellett, was born in Northfield, Ohio, November 12, 1916. I attended the public schools of Hudson, Ohio, graduating in 1934. I obtained the degree of Bachelor of Science from Kent State University in 1938. I received the degree Master of Science from The Ohio State University in 1940. While in residence at The Ohio State University I served as graduate assistant in the Department of Botany and Plant Pathology and as assistant in extension plant pathology. From May, 1944, to August, 1944, I was in the United States Army and from August, 1944, to August, 1946, I was on active duty with the United States Navy. Since 1946, I have been an Instructor in Botany and Plant Pathology at The Ohio State University. From April to September, 1948, I was on leave of absence and employed as a research assistant in the Division of Plant Pathology, University of Minnesota.
