*Cover Caption:* The catalytic subunit of cAMP-dependent protein kinase, shown as a ternary complex with ATP and an inhibitor peptide, serves as a prototype for the entire family of protein kinases that transfer phosphate to Ser, Thr, and Tyr. With the human genome predicted to encode over 2000 protein kinases, this is perhaps the largest gene family. The protein kinase fold, defined by the small and large lobes of cAPK, is conserved throughout the family. A set of conserved residues that contribute mostly to ATP binding and phosphoryl transfer and cluster around the active site cleft are shown as white spheres. Opening and closing of the cleft is an essential feature of catalysis. The essential phosphate in the activation loop, Thr197, is shown as a blue sphere. ### Efficient Analysis of Molecular Interactions using Fluorescence Correlation Microscopy

Presented by: *Winfried Wiegraebe*  
Carl Zeiss, Inc.  
One Zeiss Drive  
Thornwood, NY 10594

Fluorescence Correlation Microscopy is an efficient and fast method to probe molecular interactions in fluids and inside living cells. It is used to determine molecular concentrations,

binding constants, enzymatic kinetics and diffusion constants based on a homogenous assay. Because the method detects single molecule events, a sample volume less than a nanoliter is enough. The interacting molecules diffuse free without the need to interact and react with any surface. In this talk applications and physical fundamentals of Carl Zeiss Fluorescence Correlation Microscope ConfoCor 2 are presented. This instrument is used as a stand alone version to investigate reactions e.g. in microtiter plates or combined with the confocal laser scanning microscope LSM 510 to visualize the point of measurement e.g. inside living cells. The measuring method is called fluorescence correlation spectroscopy and analyses the fluctuation of fluorescence labeled molecules. A wide range of dyes can be used because of the availability of up to five independent laser lines for excitation. Two avalanche photo detectors (APDs) enable the use of two different dyes simultaneously. The software calculates the auto correlation function as well as the cross correlation function. Optimized fit algorithms determine the biophysical and chemical relevant values like number and fraction of particles, diffusion times and triplet fraction. The software allows researches interested in basic research to implement their own evaluation algorithms by providing unprocessed raw data on one hand, on the other hand the fully automated soft- and hardware approach makes the ConfoCor 2 ideal for routine work as well.
