

Problem: Iris Leaf Spot - *Didymellina macrospora*

Plants Affected: Iris

Description: This fungus disease attacks the leaves and occasionally the flower stalks and buds of iris. Look for small (1/8 to 1/4 inches in diameter) spots to appear on the leaves. The borders of these spots are a reddish color and surrounding tissue first appears water-soaked and then yellows with time. Spots enlarge after flowering and may coalesce. The disease tends to be worse in wet weather and may kill individual leaves. Though the disease will not kill the plant directly, repeated attacks can so reduce plant vigor that the iris may die. Spores are passed to nearby plants by wind or splashing water.

Recommendations: Removal and destruction of dead leaves will help control the disease. Spray with chlorothalonil (Bravado Fungicide, Fertilome Broad Spectrum Landscape & Garden Fungicide, Ortho Garden Disease Control, GardenTech Daconil, Bonide Fung-onil) or myclobutanil (Immunox, Monterey Fungi-Max, F-Stop Lawn & Garden Fungicide) starting when leaves appear in the spring. Repeat sprays every seven to 10 days for four to six sprays. Iris leaves are waxy, so be sure to include a spreader-sticker in your spray to ensure good coverage.
