Paper not accessible; a list of Knox county plants in the herbarium of the writer is in the hands of the survey.

#### APPENDIX B.

#### LIST OF CRYPTOGAMS AT PRESENT KNOWN TO INHABIT THE STATE OF INDIANA.

In the following list specimens collected by various persons are duly credited; where no collector is named, the collection was made by the Director of the Survey. The plants collected by Mr. Fisher are in the U. S. Nat. herbarium; a few of these have not been collected by any one else. Unless a special statement is made, all species are represented in the Underwood herbarium; reference is made in brackets for those species not in our possession. A considerable amount of material including some interesting algae has not been fully determined as yet, and some small collections have not been worked over.

*GYROMITRA BRUNNEA* n. sp. A stout, fleshy, stipitate plant, 8-13 cm. high, bearing a broad, much contorted, brown ascoma; stem 2-5 cm. thick, more or less enlarged and spongy-solid at the base, hollow below, rarely slightly fluted, clear white; receptacle 5-12 cm. across in the widest direction, the two diameters usually considerably unequal, irregularly lobed and plicate, in places faintly marked into areas by indistinct anastomosing ridges, closely cohering with the stem in various parts, rich chocolate brown or somewhat lighter if much covered with the leaves among which it grows, whitish underneath; asci 8-spored; spores oval, 28-30 mic. long by about 14 wide, hyaline, somewhat roughened-tuberculate, usually nucleate, the highly refractive nucleus spherical or oval, 11 mic. or if oval 14 by 11 mic. in diameter; paraphyses slender, enlarged at the apex, faintly septate. In rich woods, mostly in beech leaf mould; Putnam county, May 1892, 1893 and 1894, first found by Dr. W. V. Brown. The plant is esculent, tender and possesses a fine flavor. Often as many as 8 or 10 plants would be found in one small area but the plant appears to be local

and never very abundant. Some single plants would weigh nearly half a pound.

**POLYPORUS** (*Poria*) *XANTHOSPORUS* n. sp. A resupinate plant with golden yellow spores, covering large areas of decaying wood; mycelium thin, dirty white, forming an almost imperceptible subiculum; pores at first whitish shallow folds of the subiculum, leaving scarcely any margin not occupied by the various stages of imperfectly formed pores, at length appearing yellowish from the abundant spores, finally yellowish brown or dark russet, slightly angular, small (0.25 mm.), becoming cristate at the mouth, 1 cm. or less long when fully mature, or with occasional longer masses of pores rising above the general surface, 2-2.5 cm. long; spores copious, brilliant golden yellow, oval, smooth, nucleate, 6x4 or 6x5 mic. "Goose pond" nine miles south of Terre Haute, Vigo county, October 1893. Forming large masses in cavities underneath the bark and wood of decaying poplar logs (*Populus heterophylla*?), its brilliant spores forming a dense covering in portions of the cavities not filled with the fungus. The color has persisted without appreciable fading after exposure to the light for nearly seven months.

#### ZOOLOGY.

C. H. EIGENMANN, DIRECTOR.

In connection with the general circular of the Biological Survey of Indiana, the following special circular for the Zoological section was issued:

##### SPECIAL ANNOUNCEMENT OF THE DIVISION OF ZOOLOGY.

The leading aim of this division during the season will be the compilation of a complete bibliography of the vertebrates of Indiana and of as many invertebrates as can be provided for.

At the same time any material showing the distribution of animals in the state is especially desirable. To determine the distribution, complete collections of the vertebrates of as many localities as possible should be
