The National Center for Education Statistics (NCES) is the primary federal entity for collecting, analyzing, and reporting data related to education in the United States and other nations. It fulfills a congressional mandate to collect, collate, analyze, and report full and complete statistics on the condition of education in the United States; conduct and publish reports and specialized analyses of the meaning and significance of such statistics; assist state and local education agencies in improving their statistical systems; and review and report on education activities in foreign countries.

NCES activities are designed to address high-priority education data needs; provide consistent, reliable, complete, and accurate indicators of education status and trends; and report timely, useful, and high-quality data to the U.S. Department of Education, the Congress, the states, other education policymakers, practitioners, data users, and the general public. Unless specifically noted, all information contained herein is in the public domain.

We strive to make our products available in a variety of formats and in language that is appropriate to a variety of audiences. You, as our customer, are the best judge of our success in communicating information effectively. If you have any comments or suggestions about this or any other NCES product or report, we would like to hear from you. Please direct your comments to

## Foreword

Projections of Education Statistics to 2030 is the 48th report in a series begun in 1964. It presents statistics on elementary and secondary schools and degree-granting postsecondary institutions, including projections of enrollment, graduates, teachers, and expenditures to the year 2030. This report provides revisions of projections shown in Projections of Education Statistics to 2028, as well as the Digest of Education Statistics 2019 and 2020, which included projections through 2029. A formal report on the projections to 2029 was never published, because these projections were produced just prior to the onset of the coronavirus pandemic, which had immediate implications for the landscape of education in the United States.

While the current edition cannot forecast unprecedented changes in educational behaviors, it does incorporate more current data from the pandemic period. At the time these forecasts were produced, the latest historical data for public elementary and secondary enrollments were from fall 2020 (during the pandemic), while the latest historical data for other outcomes were from fall 2019 or earlier (prepandemic). By the time of this report publication, new historical data will be available for all of the education statistics presented in this report. These new historical data represent an additional year of education during the pandemic, which will be incorporated into the forthcoming Projections of Education Statistics to 2031.

In addition to projections at the national level, the report includes projections of public elementary and secondary school enrollment and public high school graduates to the year 2030 at the state level. The projections in this
report were produced by the National Center for Education Statistics (NCES) to provide researchers, policy analysts, and others with state-level projections developed using a consistent methodology. They are not intended to supplant detailed projections prepared for individual states.

Assumptions regarding the population and the economy are the key factors underlying the projections of education statistics. NCES projections do not reflect changes in national, state, or local education policies that may affect education statistics.

Appendix A of this report outlines the projection methodology and describes the models and assumptions used to develop the national and state projections. The enrollment models use enrollment data and population estimates and projections from NCES, the U.S. Census Bureau, and the forecasting service S\&P Global Inc. The models are based on the mathematical projection of past data patterns into the future. Some models also use projections of economic variables from S\&P Global Inc.

The projections presented in this report are based on assumptions for the fertility rate, internal migration, net immigration, and mortality rate from the Census Bureau. For further information, see appendix A.

## List of Reference Tables

Table ..... Page
Reference Tables

1. Enrollment in elementary, secondary, and degree-granting postsecondary institutions, by level and control of institution: Selected years, 1869-70 through fall 2030 ..... 34
2. Enrollment in public elementary and secondary schools, by level and grade: Selected years, fall 1980 through fall 2030 ..... 35
3. Enrollment in public elementary and secondary schools, by region, state, and jurisdiction: Selected years, fall 1990 through fall 2030 ..... 36
4. Public school enrollment in prekindergarten through grade 8, by region, state, and jurisdiction: Selected years, fall 1990 through fall 2030 ..... 38
5. Public school enrollment in grades 9 through 12, by region, state, and jurisdiction: Selected years, fall 1990 through fall 2030 ..... 40
6. Enrollment and percentage distribution of enrollment in public elementary and secondary schools, by race/ ethnicity and region: Selected years, fall 1995 through fall 2030 ..... 42
7. Enrollment and percentage distribution of enrollment in public elementary and secondary schools, by race/ ethnicity and level of education: Fall 1999 through fall 2030 ..... 43
8. Public and private elementary and secondary teachers, enrollment, pupil/teacher ratios, and new teacher hires: Selected years, fall 1955 through fall 2030 ..... 45
9. High school graduates, by sex and control of school; public high school averaged freshman graduation rate (AFGR); and total graduates as a ratio of 17-year-old population: Selected years, 1869-70 through 2030-31 ..... 46
10. Public high school graduates, by region, state, and jurisdiction: Selected years, 1980-81 through 2030-31 ..... 47
11. Public high school graduates, by race/ethnicity: 1998-99 through 2030-31 ..... 49
12. Current expenditures and current expenditures per pupil in public elementary and secondary schools: 1989-90 through 2030-31 ..... 50
13. Total fall enrollment in degree-granting postsecondary institutions, by attendance status, sex of student, and control of institution: Selected years, 1947 through 2030 ..... 51
14. Total fall enrollment in degree-granting postsecondary institutions, by attendance status, sex, and age of student: Selected years, 2001 through 2030 ..... 53
15. Total fall enrollment in degree-granting postsecondary institutions, by level and control of institution, attendance status, and sex of student: Selected years, 1970 through 2030 ..... 54
16. Total undergraduate fall enrollment in degree-granting postsecondary institutions, by attendance status, sex of student, and control and level of institution: Selected years, 1970 through 2030 ..... 56
17. Total postbaccalaureate fall enrollment in degree-granting postsecondary institutions, by attendance status, sex of student, and control of institution: 1970 through 2030 ..... 58
18. Fall enrollment of U.S. residents in degree-granting postsecondary institutions, by race/ethnicity: Selected years, 1976 through 2030 ..... 59
19. Total fall enrollment of first-time degree/certificate-seeking students in degree-granting postsecondary institutions, by attendance status, sex of student, and level and control of institution: 1960 through 2030 ..... 60
20. Full-time-equivalent fall enrollment in degree-granting postsecondary institutions, by control and level of institution: 1967 through 2030 ..... 61
21. Degrees conferred by postsecondary institutions, by level of degree and sex of student: Selected years, 1869-70 through 2030-31 ..... 62

## Appendix A. Text Tables

A. Mean absolute percentage errors (MAPEs) of enrollment projections, by lead time, control of school, and grade in elementary and secondary schools: MAPEs constructed using projections from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2028 ..... 73
B. Mean absolute percentage errors (MAPEs) of enrollment projections, by lead time and race/ethnicity: MAPEs constructed using projections from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2028 ..... 75
C. Mean absolute percentage errors (MAPEs) of projections of number of public elementary and secondary school teachers, by lead time: MAPEs constructed using projections from Projections of Education Statistics to 1997-98 through Projections of Education Statistics to 2028 ..... 83
D. Mean absolute percentage errors (MAPEs) of projections of high school graduates, by lead time and control of school: MAPEs constructed using projections from Projections of Education Statistics to 2000 through Projections of Education Statistics to 2028 ..... 89
E. Mean absolute percentage errors (MAPEs) of projections of public high school graduates, by lead time and race/ethnicity: MAPEs constructed using projections from Projections of Education Statistics to 2000 through Projections of Education Statistics to 2028 ..... 91
F. Mean absolute percentage errors (MAPEs) of projections for total and per pupil current expenditures for public elementary and secondary education, by lead time: MAPEs constructed using projections from Projections of Education Statistics to 1997-98 through Projections of Education Statistics to 2028 ..... 95
Appendix A. Introduction to Projections
A-1. Summary of forecast assumptions to 2030 ..... 68
A-2. Mean absolute percentage errors (MAPEs), by lead time for selected statistics in all elementary and secondary schools: MAPEs constructed using projections from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2030 ..... 68
A-3. Example of constructing mean absolute percentage errors (MAPEs) on public school enrollment in grades 9 through 12, part 1 ..... 69
A-4. Example of constructing mean absolute percentage errors (MAPEs) on public school enrollment in grades 9 through 12, part 2 ..... 69
A-5. Actual and projected national public school grade progression rates: Fall 2020, and fall 2021 through fall 2030 ..... 76
A-6. Actual and projected national enrollment rates in public schools, by grade level: Fall 2020, and fall 2021 through fall 2030 ..... 76
A-7. Mean absolute percentage errors (MAPEs) for projected prekindergarten through grade 12 enrollment in public elementary and secondary schools, by lead time, region, and state: MAPEs constructed using projections from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2028 ..... 77
A-8. Mean absolute percentage errors (MAPEs) for projected prekindergarten through grade 8 enrollment in public elementary and secondary schools, by lead time, region, and state: MAPEs constructed using projections from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2028 ..... 78
A-9. Mean absolute percentage errors (MAPEs) for projected grades 9-12 enrollment in public schools, by lead time, region, and state: MAPEs constructed using projections from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2028 ..... 79
A-10. Estimated equations and model statistics for public elementary and secondary teachers based on data from 1972 through 2019 ..... 85
A-11. Percentage distribution of full-time and part-time school teachers, by age group, control of school, and teaching status: School years 2011-12, 2015-16, and 2017-18 ..... 86
A-12. Percentage distribution of full-time and part-time newly hired teachers, by age and control of school: Selected school years, 1987-88 through 2017-18 ..... 86
A-13. Actual and projected continuation rates of full-time and part-time school teachers, by age and control of school: Selected school years, 1993-94 to 1994-95 through 2029-30 to 2030-31 ..... 87
A-14. Mean absolute percentage errors (MAPEs) for the projected number of high school graduates in public schools, by lead time, region, and state: MAPEs constructed using projections from Projections of Education Statistics to 2000 through Projections of Education Statistics to 2028 ..... 92
A-15. Estimated equations and model statistics for current expenditures per pupil in fall enrollment for public elementary and secondary schools, and education revenue from state sources per capita based on data from 1973-74 to 2018-19 ..... 95
A-16a. Estimated equations and model statistics for full-time and part-time enrollment rates at degree-granting postsecondary institutions based on data from 1995 to 2019 ..... 101
A-16b. Estimated fixed effects for model estimates of enrollment rates at degree-granting postsecondary institutions, by sex and enrollment status ..... 101
A-17. Actual and projected numbers for enrollment rates of all students at degree-granting postsecondary institutions, by sex, attendance status, and age: Fall 2019, fall 2025, and fall 2030 ..... 102
A-18. Actual and projected percentage distributions of full-time students at degree-granting postsecondary institutions, by sex, age group, student level, and level of institution: Fall 2019, and fall 2021 through fall 2030 ..... 103
A-19. Actual and projected percentage distributions of part-time students at degree-granting postsecondary institutions, by sex, age group, student level, and level of institution: Fall 2019, and fall 2021 through fall 2030 ..... 104
A-20. Actual and projected enrollment in public degree-granting postsecondary institutions as a percent of total postsecondary enrollment, by sex, attendance status, student level, and level of institution: Fall 2019, and fall 2021 through fall 2030 ..... 104
A-21. Estimated equations and model statistics for full-time and part-time enrollment rates of Asian/Pacific Islander males at degree-granting postsecondary institutions based on data from 1995 to 2019 ..... 105
A-22. Estimated equations and model statistics for full-time and part-time enrollment rates of Asian/Pacific Islander females at degree-granting postsecondary institutions based on data from 1995 to 2019 ..... 105
A-23. Estimated equations and model statistics for full-time and part-time enrollment rates of Black males at degree- granting postsecondary institutions based on data from 1995 to 2019 ..... 106
A-24. Estimated equations and model statistics for full-time and part-time enrollment rates of Black females at degree- granting postsecondary institutions based on data from 1995 to 2019 ..... 106
A-25. Estimated equations and model statistics for full-time and part-time enrollment rates of Hispanic males at degree-granting postsecondary institutions based on data from 1995 to 2019 ..... 107
A-26. Estimated equations and model statistics for full-time and part-time enrollment rates of Hispanic females at degree-granting postsecondary institutions based on data from 1995 to 2019 ..... 107
A-27. Estimated equations and model statistics for full-time and part-time enrollment rates of White males at degree- granting postsecondary institutions based on data from 1995 to 2019 ..... 108
A-28. Estimated equations and model statistics for full-time and part-time enrollment rates of White females at degree-granting postsecondary institutions based on data from 1995 to 2019 ..... 108
A-29. Estimated equations and model statistics for degrees conferred, by degree type and sex based on data from 1997 to 2018-19 ..... 110
Appendix B. Supplementary Tables
B-1. Actual and projected prekindergarten- and kindergarten-age populations, by age: 2010 through 2030 ..... 112
B-2. Actual and projected school-age populations, by selected ages: 2010 through 2030 ..... 113
B-3. Actual and projected college-age populations, by selected ages: 2010 through 2030 ..... 114
B-4. Actual and projected fall enrollment in public elementary and secondary schools, change in fall enrollment from previous year, resident population, and fall enrollment as a ratio of the population: 2010 through 2030 ..... 115
B-5. Actual and projected macroeconomic measures of the economy: School years 2010-11 through 2030-31 ..... 116

## List of Figures

Figure Page

1. Actual and projected numbers for enrollment in elementary and secondary schools, by grade level: Fall 2010 through fall 2030 ..... 4
2. Actual and projected numbers for enrollment in elementary and secondary schools, by control of school: Fall 2010 through fall 2030 ..... 5
3. Projected percentage change in enrollment in public elementary and secondary schools, by state: Fall 2020 to fall 2030 ..... 6
4. Actual and projected numbers for enrollment in public elementary and secondary schools, by region: Fall 2010, fall 2020, and fall 2030 ..... 7
5. Actual and projected numbers for enrollment in public elementary and secondary schools, by race/ethnicity: Fall 2010 through fall 2030 ..... 8
6. Actual and projected numbers for elementary and secondary teachers, by control of school: Fall 2010 through fall 2030 ..... 10
7. Actual and projected numbers for the pupil/teacher ratios in elementary and secondary schools, by control of school: Fall 2010 through fall 2030 ..... 11
8. Actual and projected numbers for elementary and secondary new teacher hires, by control of school: Fall 2011, fall 2019, and fall 2030 ..... 12
9. Actual and projected numbers for high school graduates, by control of school: School years 2005-06 through 2030-31 ..... 14
10. Projected percentage change in the number of public high school graduates, by state: School years 2012-13 and 2030-31 ..... 15
11. Actual and projected numbers for public high school graduates, by region: School years 2009-10, 2012-13, and 2030-31 ..... 16
12. Actual and projected numbers for public high school graduates, by race/ethnicity: School years 2005-06 through 2030-31 ..... 17
13. Actual and projected current expenditures for public elementary and secondary schools (in constant 2020-21 dollars): School years 2010-11 through 2030-31 ..... 19
14. Actual and projected current expenditures per pupil in fall enrollment in public elementary and secondary schools (in constant 2020-21 dollars): School years 2010-11 through 2030-31 ..... 20
15. Actual and projected population numbers for 18 - to 24 -year-olds and 25- to 29-year-olds: 2010 through 2030 ..... 21
16. Actual and projected numbers for total enrollment in all degree-granting postsecondary institutions: Fall 2010 through fall 2030 ..... 22
17. Actual and projected numbers for total enrollment in all degree-granting postsecondary institutions, by age group: Fall 2010, fall 2019, and fall 2030 ..... 23
18. Actual and projected numbers for enrollment in all degree-granting postsecondary institutions, by sex: Fall 2010 through fall 2030 ..... 24
19. Actual and projected numbers for enrollment in all degree-granting postsecondary institutions, by attendance status: Fall 2010 through fall 2030 ..... 25
20. Actual and projected numbers for enrollment in all degree-granting postsecondary institutions, by enrollment level of student: Fall 2010 through fall 2030 ..... 25
21. Actual and projected numbers for enrollment of U.S. residents in all degree-granting postsecondary institutions, by race/ethnicity: Fall 2010 through fall 2030 ..... 26
22. Actual and projected numbers for enrollment in all degree-granting postsecondary institutions, by control of institution: Fall 2010 through fall 2030 ..... 27
23. Actual and projected numbers for total first-time degree/certificate-seeking students in degree-granting
postsecondary institutions, by sex: Fall 2010 through fall 2030 ............................................................................. 28
24. Actual and projected numbers for full-time-equivalent fall enrollment in degree-granting postsecondary
institutions, by control: Fall 2010 through fall 2030 ............................................................................................. 29
25. Actual and projected numbers for associate's degrees conferred by postsecondary institutions, by sex of
recipient: Academic years 2010-11 through 2030-31 ............................................................................................. 31
26. Actual and projected numbers for bachelor's degrees conferred by postsecondary institutions, by sex of
recipient: Academic years 2010-11 through 2030-31 ............................................................................................ 31
27. Actual and projected numbers for master's degrees conferred by postsecondary institutions, by sex of
recipient: Academic years 2010-11 through 2030-31 ............................................................................................... 32
28. Actual and projected numbers for doctor's degrees conferred by postsecondary institutions, by sex of recipient:
Academic years 2010-11 through 2030-31 ........................................................................................................ 32

## About This Report

## PROJECTIONS

This edition of Projections of Education Statistics provides projections for key education statistics, including enrollment, graduates, teachers, and expenditures in elementary and secondary public and private schools, as well as enrollment and degrees conferred at degreegranting postsecondary institutions. Included are national data on enrollment and graduates since at least 2010 and projections to the year 2030. This historical period (roughly 10 years prior to the latest historical data) was chosen to highlight recent trends, but longer trends are available in select reference tables. Also included are state-level data on enrollment in public elementary and secondary schools over the same period. This report is organized by the level of schooling with sections 1,2 , 3 , and 4 covering aspects of elementary and secondary education and sections 5 and 6 covering aspects of postsecondary education.

There are a number of limitations in projecting some statistics. Because of this, state-level data on enrollment and graduates in private elementary and secondary schools and on enrollment and degrees conferred in degree- granting postsecondary institutions are not included. Neither the actual numbers nor the projections of public and private elementary and secondary school enrollment include homeschooled students. While there were enough years of data to produce projections of public elementary and secondary enrollment separately for Asians and Pacific Islanders, there were not enough years of data to produce separate projections for Asians and Pacific Islanders for either public high school graduates or enrollment in degree-granting postsecondary institutions.

Similar methodologies were used to obtain a uniform set of projections for each of the 50 states and the District of Columbia. These projections are further adjusted to agree with the national projections of public elementary and secondary school enrollment and public high school graduates contained in this report.

The summary of projections provides highlights of the national and state data, while the reference tables (in the Digest of Education Statistics 2021) and figures present more detail. All calculations within Projections of Education Statistics are based on unrounded estimates.

Therefore, the reader may find that a calculation, such as a difference or percentage change, cited in the text or figure may not be identical to the calculation obtained by using the rounded values shown in the accompanying tables. Most figures in this report present historical and forecasted data from 2010 through 2030. The shaded area of these figures highlights the projected data and begins at the last year of actual data and ends in 2030. As the last year of historical data differs by survey, the year in which the shaded area begins also differs.

Most statements in sections 1 through 6 examine a single statistic over a period of time. In each case, a trend test using linear regression was conducted to test for structure in the data over that time period. If the $p$ value for the trend variable was significant at less than or equal to .05 , the text states that the statistic has either "increased" or "decreased" (i.e., there was a measurable trend). If the $p$ value was greater than .05 and the data for both the first and last years of the time period come from a universe sample and/or are projections, then the text compares the first and last years in the time period, describing them as "higher" or "lower". However, if the data for at least one of the two years came from a sample survey, a twotailed $t$ test at the .05 level was conducted to determine if any apparent difference between the data for the two years is not reliably measurable due to the uncertainty around the data. Depending on the results of the test, the text will either include a comparison of the two numbers or say that there was no measurable difference between the two numbers.

Appendix A describes the methodology and assumptions used to develop the projections; appendix B presents supplementary tables; appendix C describes data sources; appendix $D$ is a list of the references; appendix E presents a list of abbreviations; and appendix F is a glossary of terms.

## LIMITATIONS OF PROJECTIONS

In this edition, projections are complicated by the onset of the coronavirus pandemic in 2020. Projections are based on the assumption that historical patterns will continue into the future. This presents challenges both for (1) using prepandemic historical data to predict unprecedented pandemic-era behaviors and (2) using
pandemic-era data to predict postpandemic behaviors. This edition of the Projections of Education Statistics includes both scenarios. At the time these forecasts were produced, the latest historical data for public elementary and secondary enrollments were from fall 2020 (during the pandemic), while the latest historical data for other outcomes were from fall 2019 or earlier (prepandemic). All data presented in this report were first published in the Digest of Education Statistics 2021. By the time of this report publication, new historical data will be available for all of the education statistics presented below. These new historical data represent an additional year of education during the pandemic, which will be incorporated into the forthcoming Projections of Education Statistics to 2031.

Even without a pandemic, projections of a time series usually differ from the final reported data due to errors
from many sources, such as the properties of the projection methodologies, which depend on the validity of many assumptions.

The mean absolute percentage error is one way to express the forecast accuracy of past projections. This measure expresses the average of the absolute values of errors in percentage terms, where errors are the differences between past projections and actual data. For example, based on past editions of Projections of Education Statistics, the mean absolute percentage errors of public school enrollment in grades prekindergarten through 12 for lead times of $1,2,5$, and 10 years were 0.3 , $0.5,1.1$, and 2.5 percent, respectively. In contrast, mean absolute percentage errors of private school enrollment in grades prekindergarten through 8 for lead times of $1,2,5$, and 10 years were $3.9,5.6,8.0$, and 19.2 percent, respectively. For more information on mean absolute percentage errors, see table A-2 in appendix A.

# Section 1 Elementary and Secondary Enrollment 

## INTRODUCTION

Total public and private elementary and secondary school enrollment was 56 million in fall 2019, representing a 3 percent increase since fall 2010 (Digest 2021 table 105.30). Between fall 2019, the last year of actual private school data, and fall 2030, a decrease of 8 percent is expected. This includes a 2 percent drop in total public and private enrollment from fall 2019 to the first fall of the coronavirus pandemic in fall 2020, which includes actual public school data. From fall 2020 to fall 2030, enrollments are expected to decrease another 6 percent. Both public and private school enrollments are projected to be lower in 2030 than in 2019.

Public school enrollments are projected to be higher in 2030 than in 2020 for Asians/Pacific Islander students, Hispanic students, and students of Two or more races (Digest 2021 table 203.50). Enrollment is projected to be lower for American Indian/Alaska Native, Black, and White students. Public school enrollments are projected to be lower in 2030 than in 2020 for all regions of the country (Northeast, Midwest, South, and West) (Digest 2021 table 203.20).

## Factors affecting the projections

The grade progression rate method was used to project school enrollments. This method assumes that future trends in factors affecting enrollments will be consistent with past patterns. It implicitly includes the net effect of factors such as dropouts, deaths, nonpromotion, transfers to and from public schools, and state-level migration. Progression rates were calculated using historical data through 2019, since pandemic-related changes in enrollments from fall 2019 to fall 2020 are not expected to persist throughout the 10-year forecast period. See appendixes A. 0 and A. 1 for more details.

## Factors that were not considered

The projections do not assume changes in policies or attitudes that may affect enrollment levels. For example, they do not account for changing state and local policies on prekindergarten (preK) and kindergarten programs. Continued expansion of these programs could lead to higher enrollments at the elementary school level. Projections exclude the number of students who are homeschooled.

## Accuracy of Projections

An analysis of projection errors from the past 36 editions of Projections of Education Statistics indicates that the mean absolute percentage errors (MAPEs) for lead times of $1,2,5$, and 10 years out for projections of public school enrollment in grades prekindergarten-12 were $0.3,0.5,1.1$, and 2.5 percent, respectively. For the 1 -year-out prediction, this means that the methodology used by the National Center for Education Statistics (NCES) has produced projections that have, on average, deviated from actual observed values by 0.3 percent. For projections of public school enrollment in grades prekindergarten-8, the MAPEs for lead times of $1,2,5$, and 10 years out were $0.3,0.6,1.3$, and 3.3 percent, respectively, while the MAPEs for projections of public school enrollment in grades $9-12$ were $0.4,0.6,1.2$, and 2.2 percent, respectively, for the same lead times. An analysis of projection errors from the past 18 editions of Projections of Education Statistics indicates that the MAPEs for lead times of $1,2,5$, and 10 years out for projections of private school enrollment in grades prekindergarten-12 were 3.7, $5.5,8.5$, and 14.2 percent, respectively. For projections of private school enrollment in grades prekindergarten-8, the MAPEs for lead times of $1,2,5$, and 10 years out were $3.9,5.6,8.0$, and 19.2 percent, respectively, while the MAPEs for projections of private school enrollment in grades 9-12 were 3.8, 5.2, 9.9, and 9.7 percent, respectively, for the same lead times. For more information, see table A-2 in appendix A.

## Enrollment by grade level

Total elementary and secondary enrollment

- increased 3 percent between 2010 and 2019 ( 54.9 million vs. 56.3 million); and
$\nabla$ is projected to decrease 8 percent between 2019 and 2030 to 52.1 million.

Enrollment in prekindergarten through grade 8

- increased 2 percent between 2010 and 2019 ( 38.7 million vs. 39.6 million); and
$\nabla$ is projected to decrease 10 percent between 2019 and 2030 to 35.8 million.

Enrollment in grades 9-12
$\triangle$ increased 3 percent between 2010 and 2019 ( 16.2 million vs. 16.7 million); and
$\nabla$ is projected to decrease 2 percent between 2019 and 2030 to 16.3 million.

## For more information:

Digest 2021 tables 105.30 and 203.10. (Reference tables 1 and $\underline{2}$ in this report)

Figure 1. Actual and projected numbers for enrollment in elementary and secondary schools, by grade level: Fall 2010 through fall 2030

NOTE: Data represent the 50 states and the District of Columbia. PreK = prekindergarten. Enrollment numbers for prekindergarten through 12th grade and prekindergarten through 8th grade include private nursery and prekindergarten enrollment in schools that offer kindergarten or higher grades. Public school enrollments include actual data for 2020; however, private school enrollments are projected, so total enrollments are shown as projected. Includes imputations for nonreported public prekindergarten enrollment in California and Oregon for fall 2020. Includes imputations for nonreported public enrollment for all grades in Illinois for fall 2020. Since the biennial Private School Universe Survey (PSS) is collected in the fall of odd-numbered years, private school numbers for alternate years are estimated based on data from the PSS. Some data have been revised from previously published figures. Mean absolute percentage errors of selected education statistics can be found in table A-2, appendix A.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2010-11 through 2020-21; Private School Universe Survey (PSS), selected years 2009-10 through 2019-20; and National Elementary and Secondary Enrollment Projection Model, through 2030. (This figure was prepared May 2022.)

Figure 2. Actual and projected numbers for enrollment in elementary and secondary schools, by control of school: Fall 2010 through fall 2030

NOTE: Data represent the 50 states and the District of Columbia. Projected data for public school enrollment begin in 2021, while projected data for private enrollment begin in 2020. Includes imputations for nonreported public prekindergarten enrollment in California and Oregon for fall 2020. Includes imputations for nonreported public enrollment for all grades in Illinois for fall 2020. Private school numbers include private nursery and prekindergarten enrollment in schools that offer kindergarten or higher grades. Since the biennial Private School Universe Survey (PSS) is collected in the fall of odd-numbered years, private school numbers for alternate years are estimated based on data from the PSS. Some data have been revised from previously published figures. Mean absolute percentage errors of selected education statistics can be found in table A-2, appendix A.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2010-11 through 2020-21; Private School Universe Survey (PSS), selected years 2009-10 through 2019-20; and National Elementary and Secondary Enrollment Projection Model, through 2030. (This figure was prepared May 2022.)

## Enrollment by control of school

Enrollment in public elementary and secondary schools
$\nabla$ was lower in 2020 than in 2010 by less than half of 1 percent (49.4 million vs. 49.5 million); and
$\nabla$ is projected to decrease 4 percent between 2020 and 2030 to 47.3 million.

Enrollment in private elementary and secondary schools

- increased 2 percent between 2010 and 2019 ( 5.4 million vs. 5.5 million); and
$\nabla$ is projected to decrease by 12 percent between 2019 and 2030 to 4.8 million.

For more information: Digest 2021 table 105.30. (Reference table 1 in this report)

## Enrollment by state

The expected 4 percent national decrease in public school enrollment between 2020 and 2030 plays out differently among the states.

- Enrollments are projected to be lower in 2030 than in 2020 for 38 states, with projected enrollments
- 5 percent or more lower in 20 states; and
- less than 5 percent lower in 18 states.
- Enrollments are projected to be higher in 2030 than in 2020 for 12 states and the District of Columbia, with projected enrollments
- less than 5 percent higher in 10 states; and
- 5 percent or more higher in 2 states and the District of Columbia.

Digest 2021 tables 203.20, 203.25, and 203.30. (Reference tables 3, 4, and 5 in this report)

Figure 3. Projected percentage change in enrollment in public elementary and secondary schools, by state: Fall 2020 to fall 2030

NOTE: Includes imputations for nonreported prekindergarten enrollment in California and Oregon for fall 2020. Includes imputations for nonreported enrollment for all grades in Illinois for fall 2020. Mean absolute percentage errors of enrollment in public elementary and secondary schools by state and region can be found in table A-7, appendix A. Calculations are based on unrounded numbers.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2020-21; and State Public Elementary and Secondary Enrollment Projection Model, through 2030. (This figure was prepared March 2022.)

Figure 4. Actual and projected numbers for enrollment in public elementary and secondary schools, by region: Fall 2010, fall 2020, and fall 2030

NOTE: Data represent the 50 states and the District of Columbia. See the glossary for a list of the states in each region. Includes imputations for nonreported prekindergarten enrollment in California and Oregon for fall 2020. Includes imputations for nonreported enrollment for all grades in Illinois for fall 2020. Mean absolute percentage errors of enrollment in public elementary and secondary schools by state and region can be found in table A-7, appendix A. Some data have been revised from previously published figures.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2010-11 and 2020-21; and State Public Elementary and Secondary Enrollment Projection Model, through 2030. (This figure was prepared March 2022.)

## Enrollment by region

Public elementary and secondary enrollment is projected to
$\nabla$ decrease 6 percent between 2020 and 2030 for students in the Northeast;
$\nabla$ decrease 4 percent between 2020 and 2030 for students in the Midwest;
$\nabla$ be 2 percent lower in 2030 than in 2020 for students in the South; and
$\nabla$ decrease 6 percent between 2020 and 2030 for students in the West.

For more information:
Digest 2021 tables 203.20, 203.25, and 203.30. (Reference tables 3 , 4 , and 5 in this report)

## Enrollment by race/ethnicity

Enrollment in public elementary and secondary schools is projected to
$\nabla$ decrease 15 percent between 2020 and 2030 for American Indian/Alaska Native students;

- increase 5 percent between 2020 and 2030 for Asian students;
$\nabla$ decrease 9 percent between 2020 and 2030 for Black students;
- be 2 percent higher in 2030 than in 2020 for Hispanic students;
$\nabla$ decrease 3 percent between 2020 and 2030 for Pacific Islander students;
$\nabla$ decrease 10 percent between 2020 and 2030 for White students; and

A increase 26 percent between 2020 and 2030 for students of Two or more races.

For more information:
Digest 2021 tables 203.50 and 203.60. (Reference tables 6 and $\underline{7}$ in this report)

Figure 5. Actual and projected numbers for enrollment in public elementary and secondary schools, by race/ethnicity: Fall 2010 through fall 2030

NOTE: Data represent the 50 states and the District of Columbia. Race categories exclude persons of Hispanic ethnicity. Enrollment data for students not reported by race/ethnicity were prorated based on the known racial/ethnic composition of a state by grade to match state totals. Includes imputations for nonreported prekindergarten enrollment in California for fall 2019 and 2020 and in Oregon for fall 2020. Includes imputations for nonreported enrollment for all grades in Illinois for fall 2020. Mean absolute percentage errors of selected education statistics can be found in table A-2, appendix A.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2010-11 through 2020-21; and National Public Elementary and Secondary Enrollment by Race/Ethnicity Projection Model, through 2030. (This figure was prepared March 2022.)

## Section 2 Elementary and Secondary Teachers

## INTRODUCTION

Between fall 2019, the last year of actual public school teacher data, and fall 2030, the number of teachers in elementary and secondary schools is projected to decrease 5 percent (Digest 2021 table 208.20). The decrease is projected to occur in both public and private schools. The annual number of new teacher hires is projected to be lower in 2030 than in 2019 in both public and private schools. However, both public and private schools are projected to experience a decline in pupil/teacher ratios.

## Factors affecting the projections

The projections of the number of elementary and secondary teachers are related to projected levels of enrollments and education revenue receipts from state sources per capita. For more details, see appendixes A. 0 and A.2.

## Factors that were not considered

The projections do not take into account possible changes in the number of teachers due to the effects of government policies. They also do not account for changes in hiring or retiring during the coronavirus pandemic.

## About pupil/teacher ratios

The overall elementary and secondary pupil/teacher ratio and pupil/teacher ratios for public and private schools were computed based on elementary and secondary enrollment and the number of classroom teachers by control of school.

## About new teacher hires

A teacher is considered to be a new teacher hire for a certain control of school (public or private) for a given year if the teacher teaches in that control that year but had not taught in that control in the previous year. A teacher who moves from teaching in one control of school to the other control is considered a new teacher hire, but a teacher who moves from one school to another school in the same control is not considered a new teacher hire.

## Accuracy of Projections

An analysis of projection errors from the past 29 editions of Projections of Education Statistics that included projections of teachers indicates that the mean absolute percentage errors (MAPEs) for projections of classroom teachers in public elementary and secondary schools were 0.7 percent for 1 year out, 1.3 percent for 2 years out, 2.7 percent for 5 years out, and 6.6 percent for 10 years out. For the 1 -year-out prediction, this means that one would expect the projection to be within 0.7 percent of the actual value, on average. For more information on the MAPEs of different National Center for Education Statistics (NCES) projection series, see table A-2 in appendix A.

## Number of teachers

The total number of elementary and secondary teachers

- increased 4 percent between 2010 and 2019 ( 3.5 million vs. 3.7 million); and
$\nabla$ is projected to decrease 5 percent between 2019 and 2030 to 3.5 million.

The number of teachers in public elementary and secondary schools

- increased 3 percent between 2010 and 2019 ( 3.1 million vs. 3.2 million); and
$\nabla$ is projected to decrease 5 percent between 2019 and 2030 to 3.0 million.

The number of teachers in private elementary and secondary schools

- increased 12 percent between 2010 and 2019 (429,000 vs. 481,000); and
$\nabla$ is projected to decrease by 6 percent between 2019 and 2030 to 454,000 .

For more information:
Digest 2021 table 208.20. (Reference table 8 in this report)

Figure 6. Actual and projected numbers for elementary and secondary teachers, by control of school: Fall 2010 through fall 2030

NOTE: Data represent the 50 states and the District of Columbia. Since the biennial Private School Universe Survey (PSS) is collected in the fall of odd-numbered years, private school numbers for alternate years are estimated based on data from the PSS. Data for teachers are expressed in full-time equivalents (FTE). Counts of private school teachers include prekindergarten through grade 12 in schools offering kindergarten or higher grades. Counts of public school teachers include prekindergarten through grade 12. Some data have been revised from previously published figures. Mean absolute percentage errors of selected education statistics can be found in table A-2, appendix A.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2010-11 through 2019-20; Private School Universe Survey (PSS), selected years, 2009-10 through 2019-20; Elementary and Secondary Teacher Projection Model, through 2030. (This figure was prepared March 2022.)

Figure 7. Actual and projected numbers for the pupil/teacher ratios in elementary and secondary schools, by control of school: Fall 2010 through fall 2030

NOTE: Data represent the 50 states and the District of Columbia. Since the biennial Private School Universe Survey (PSS) is collected in the fall of odd-numbered years, private school numbers for alternate years are estimated based on data from the PSS. Data for teachers are expressed in full-time equivalents (FTE). Counts of private school teachers and enrollment include prekindergarten through grade 12 in schools offering kindergarten or higher grades. Counts of public school teachers and enrollment include prekindergarten through grade 12. Some data have been revised from previously published figures. Mean absolute percentage errors of selected education statistics can be found in table A-2, appendix A.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2010-11 through 2019-20; Private School Universe Survey (PSS), selected years, 2009-10 through 2019-20; National Elementary and Secondary Enrollment Projection Model, through 2030; and Elementary and Secondary Teacher Projection Model, through 2030. (This figure was prepared March 2022.)

## Pupil/teacher ratios

The pupil/teacher ratio in all elementary and secondary schools
$\nabla$ decreased between 2010 and 2019 (15.5 vs. 15.3); and
$\nabla$ is projected to decrease to 14.9 in 2030.

The pupil/teacher ratio in public elementary and secondary schools

- was lower in 2019 than in 2010 (15.9 vs. 16.0); and
$\nabla$ is projected to decrease to 15.5 in 2030.

The pupil/teacher ratio in private elementary and secondary schools
$\nabla$ decreased from 12.5 to 11.4 between 2010 and 2019; and
$\nabla$ is projected to decrease to 10.6 in 2030.

For more information:
Digest 2021 table 208.20. (Reference table 8 in this report)

## New teacher hires

The total number of new teacher hires

- was higher in 2019 than in 2011 (358,000 vs. 241,000); and
$\nabla$ is projected to be 18 percent lower in $2030(304,000)$ than in 2019.

The number of new teacher hires in public schools
A was higher in 2019 than in 2011 (267,000 vs. 173,000 ); and
$\nabla$ is projected to be 21 percent lower in $2030(221,000)$ than in 2019.

The number of new teacher hires in private schools

- was higher in 2019 than in 2011 (91,000 vs. 68,000); and
$\nabla$ is projected to decrease 8 percent between 2019 and 2030, to 84,000 .

For more information:
Digest 2021 table 208.20. (Reference table 8 in this report)

Figure 8. Actual and projected numbers for elementary and secondary new teacher hires, by control of school: Fall 2011, fall 2019, and fall 2030

NOTE: Data represent the 50 states and the District of Columbia. Data for teachers are expressed in full-time equivalents (FTE). A teacher is considered to be a new hire for a public or private school if the teacher had not taught in that control of school in the previous year. A teacher who moves from a public to private or a private to public school is considered a new teacher hire, but a teacher who moves from one public school to another public school or one private school to another private school is not considered a new teacher hire. For more information about the New Teacher Hires Model, see appendix A.2. Some data have been revised from previously published figures. Detail may not sum to totals because of rounding.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2011-12 and 2019-20; Private School Universe Survey (PSS), 2011-12 and 2019-20; Schools and Staffing Survey (SASS), "Public School Teacher Data File," 2011-12; "Private School Teacher Data File," 2011-12; National Teacher and Principal Survey (NTPS) 2017-18; Elementary and Secondary Teacher Projection Model, through 2030, and New Teacher Hires Projection Model, through 2030. (This figure was prepared March 2022.)

## Section 3 <br> High School Graduates

## INTRODUCTION

The number of high school graduates increased nationally by 11 percent between 2005-06 and 2012-13, the last year of actual data for public schools (Digest 2021 table 219.10). The number of high school graduates is projected to be 2 percent higher in 2030-31 than in 2012-13. The numbers of both public and private high school graduates are projected to be higher in 2030-31 than in 2012-13. The numbers of public high school graduates are projected to be higher in 2030-31 than in 2012-13 in the South and lower in the Northeast, Midwest, and West (Digest 2021 table 219.20).

## Factors affecting the projections

The projections of high school graduates are related to projections of 12th-graders and the historical relationship between the number of 12th-graders and the number of high school graduates. The methodology implicitly includes the net effect of factors such as dropouts, transfers to and from public schools, and state-level migration. For more details, see appendixes A. 0 and A.3.

## Factors that were not considered

The projections do not assume changes or attitudes that may affect the high school graduate levels. For example, they do not account for changes in policies influencing graduation requirements.

## About high school graduates

A high school graduate is defined as an individual who has received formal recognition from school authorities, by the granting of a diploma, for completing a prescribed course of study. This definition does not include other high school completers or high school equivalency recipients.

## Accuracy of Projections

For National Center for Education Statistics (NCES) projections of public high school graduates produced over the last 29 editions, the mean absolute percentage errors (MAPEs) for lead times of $1,2,5$, and 10 years out were $1.0,1.1,2.5$, and 5.1 , respectively. For the 1 -year-out prediction, this means that one would expect the projection to be within 1.0 percent of the actual value, on average. For NCES projections of private high school graduates produced over the last 18 editions, the MAPEs for lead times of $1,2,5$, and 10 years out were 3.0, 2.2, 10.4, and 12.8 percent, respectively. For more information, see table $A-2$ in appendix A.

High school graduates by control of school

The total number of high school graduates

- increased 11 percent between 2005-06 and 2012-13 ( 3.1 million vs. 3.5 million); and
$\Delta$ is projected to be 2 percent higher in 2030-31 ( 3.5 million) than in 2012-13.

The number of public high school graduates

- increased 13 percent between 2005-06 and 2012-13 ( 2.8 million vs. 3.2 million); and
- is projected to be 1 percent higher in 2030-31 (3.2 million) than in 2012-13.

The number of private high school graduates

- was 1 percent higher in 2012-13 than in 2005-06 (309,000 vs. 307,000 ); and
$\Delta$ is projected to be 8 percent higher in 2030-31 $(333,000)$ than in 2012-13.

## For more information:

Digest 2021 table 219.10. (Reference table 9 in this report)

Figure 9. Actual and projected numbers for high school graduates, by control of school: School years 2005-06 through 2030-31

High school graduates (in millions)

NOTE: Data represent the 50 states and the District of Columbia. The private school data for 2014-15, 2016-17, and 2018-19 are actuals. Since the biennial Private School Universe Survey (PSS) is collected in the fall of odd-numbered years and the numbers collected for high school graduates are for the preceding year, private school numbers for odd years are estimated based on data from the PSS. Data for 2005-06, 2008-09 include imputations for nonreporting states. Includes graduates of regular day school programs. Excludes graduates of other programs, when separately reported, and recipients of high school equivalency certificates. Some data have been revised from previously published figures. Mean absolute percentage errors of selected education statistics can be found in table A-2, appendix A.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2005-06; "State Dropout and Completion Data File," 2005-06 through 2012-13; Private School Universe Survey (PSS), selected years, 2005-06 through 2019-20; and National High School Graduates Projection Model, through 2030-31. (This figure was prepared March 2022.)

Figure 10. Projected percentage change in the number of public high school graduates, by state: School years 2012-13 and 2030-31

NOTE: Data include regular diploma recipients, but exclude students receiving a certificate of attendance and persons receiving high school equivalency certificates. Some data have been revised from previously published figures. Includes graduates of regular day school programs. Calculations are based on unrounded numbers. Mean absolute percentage errors of public high school graduates by state and region can be found in table A-14, appendix A.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Dropout and Completion Data File," 2012-13; and State Public High School Graduates Projection Model, through 2030-31. (This figure was prepared March 2022.)

High school graduates by state
The number of public high school graduates is projected to be higher in 2030-31 than in 2012-13. This plays out differently among the states.
$\nabla$ The number of high school graduates are projected to be lower in 2030-31 than in 2012-13 for 22 states, with projected high school graduates

- less than 5 percent lower in 8 states; and
- 5 percent or more lower in 14 states.
- The number of high school graduates are projected to be higher in 2030-31 than in 2012-13 for 28 states and the District of Columbia, with projected high school graduates
- 5 percent or more higher in 21 states and the District of Columbia; and
- less than 5 percent higher in 7 states.

For more information:
Digest 2021 table 219.20. (Reference table 10 in this report)

## High school graduates by

 regionThe number of public high school graduates is projected to
$\nabla$ decrease 7 percent between 2012-13 and in 2030-31 in the Northeast;
$\nabla$ be 3 percent lower in 2030-31 than in 2012-13 in the Midwest;

- increase 10 percent between 2012-13 and 2030-31 in the South; and
- be 2 percent lower in 2030-31 than in 2012-13 in the West.

## For more information:

Digest 2021 table 219.20. (Reference table 10 in this report)

Figure 11. Actual and projected numbers for public high school graduates, by region: School years 2009-10, 2012-13, and 2030-31

NOTE: See the glossary for a list of the states in each region. Data include regular diploma recipients, but exclude students receiving a certificate of attendance and persons receiving high school equivalency certificates. Some data have been revised from previously published figures. Detail may not sum to totals because of rounding. Includes graduates of regular day school programs. Mean absolute percentage errors of public high school graduates by state and region can be found in table A-14, appendix A.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2009-10; "State Dropout and Completion Data File," 2012-13; and State Public High School Graduates Projection Model, through 2030-31. (This figure was prepared March 2022.)

Figure 12. Actual and projected numbers for public high school graduates, by race/ethnicity: School years 2005-06 through 2030-31

NOTE: Race categories exclude persons of Hispanic ethnicity. Data on students of Two or more races were not collected separately prior to 2007-08, and data on students of Two or more races from 2007-08 through 2009-10 were not reported by all states. Therefore, the data are not comparable to figures for 2010-11 and later years. Mean absolute percentage errors of selected education statistics can be found in table A-2, appendix A. Some data have been revised from previously published figures.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2005-06; "State Dropout and Completion Data File," 2005-06 through 2012-13; and National Public High School Graduates by Race/ Ethnicity Projection Model, through 2030-31. (This figure was prepared March 2022.)

High school graduates by race/ ethnicity
The number of public high school graduates is projected to
$\nabla$ decrease 26 percent between 2012-13 and 2030-31 (31,000 vs. 23,000 ) for students who are American Indian/Alaska Native;
$\Delta$ increase 29 percent between 2012-13 and 2030-31 (179,000 vs. 231,000 ) for students who are Asian/Pacific Islander;
$\nabla$ decrease 12 percent between 2012-13 and 2030-31 (462,000 vs. 404,000 ) for students who are Black;

- increase 51 percent between 2012-13 and 2030-31 (640,000 vs. 965,000 ) for students who are Hispanic;
$\nabla$ decrease 22 percent between 2012-13 and 2030-31 (1,791,000 vs. $1,391,000$ ) for students who are White; and
A increase 208 percent between 2012-13 and 2030-31 (66,000 vs. 202,000 ) for students who are of Two or more races.

For more information:
Digest 2021 table 219.30. (Reference table 11 in this report)

# Section 4 <br> Expenditures for Public Elementary and Secondary Education 

## INTRODUCTION

Current expenditures (e.g., instruction and support services) for public elementary and secondary education are projected to be 1 percent higher in constant 2020-21 dollars (adjusted for inflation) in school year 2030-31, compared to 2018-19, the last year of actual data ( Digest 2021 table 236.15).

## Factors affecting the projections

The projections of current expenditures are related to projections of economic growth as measured by disposable income per capita and assistance by state governments to local governments. For more details, see appendixes A. 0 and A.4.

## Factors that were not considered

Many factors that may affect future school expenditures were not considered in the production of these projections. Such factors include policy initiatives as well as potential changes in the age distribution of elementary and secondary teachers as older teachers retire and are replaced by younger teachers, or as older teachers put off retirement for various reasons.

## About constant dollars and current dollars

Throughout this section, projections of current expenditures are presented in constant 2020-21 dollars. The reference tables, later in this report, present these data both in constant 2020-21 dollars and in current dollars. The projections were developed in constant dollars and then placed in current dollars using projections for the Consumer Price Index (CPI) (table B-5 in appendix B).

## Accuracy of Projections

An analysis of projection errors from similar models used in the past 29 editions of Projections of Education Statistics that contained expenditure projections indicates that mean absolute percentage errors (MAPEs) for total current expenditures in constant dollars were 1.6 percent for 1 year out, 2.4 percent for 2 years out, 3.1 percent for 5 years out, and 6.9 percent for 10 years out. For the 1 -year-out prediction, this means that one would expect the projection to be within 1.6 percent of the actual value, on average. MAPEs for current expenditures per pupil in fall enrollment in constant dollars were 1.6 percent for 1 year out, 2.4 percent for 2 years out, 3.3 percent for 5 years out, and 7.0 percent for 10 years out. See appendix A for further discussion of the accuracy of recent projections of current expenditures, and see table A-2 in appendix A for the MAPEs of these projections.

## CURRENT EXPENDITURES

Figure 13. Actual and projected current expenditures for public elementary and secondary schools (in constant 2020-21 dollars): School years 2010-11 through 2030-31

${ }^{1}$ Projected expenditures do not account for relief funding administered during the coronavirus pandemic, such as the Coronavirus Aid, Relief, and Economic Security (CARES) Act or the American Rescue Plan (ARP). NOTE: Data represent the 50 states and the District of Columbia. Excludes prekindergarten expenditures for California in 2018-19. Numbers were placed in constant dollars using the Consumer Price Index (CPI) for all urban consumers, Bureau of Labor Statistics, U.S. Department of Labor. For more detail about CPI, see table B-5 in appendix B. Current expenditures include instruction, support services, food services, and enterprise operations. Some data have been revised from previously published figures. Mean absolute percentage errors of selected education statistics can be found in table A-2, appendix A.
SOURCE: SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "National Public Education Financial Survey," 2010-11 through 2018-19; Public Elementary and Secondary School Current Expenditures Projection Model, through 2030-31. (This figure was prepared March 2022.)

## Current expenditures

Current expenditures in constant 2020-21 dollars

- increased 10 percent from 2010-11 to 2018-19 (\$628 billion vs. $\$ 693$ billion); and
- are projected to be 1 percent higher in 2030-31 (\$698 billion) compared to 2018-19.

For more information:
Digest 2021 table 236.15. (Reference table 12 in this report)

## Current expenditures per pupil

Current expenditures per pupil in fall enrollment in constant 2020-21 dollars

- increased 8 percent from 2010-11 to 2018-19 (\$12,700 vs. \$13,700); and
- are projected to increase 8 percent, to $\$ 14,800$, from 2018-19 to 2030-31

For more information:
Digest 2021 table 236.15. (Reference table 12 in this report)

Figure 14. Actual and projected current expenditures per pupil in fall enrollment in public elementary and secondary schools (in constant 2020-21 dollars): School years 2010-11 through 2030-31

${ }^{1}$ Projected expenditures do not account for relief funding administered during the coronavirus pandemic, such as the Coronavirus Aid, Relief, and Economic Security (CARES) Act or the American Rescue Plan (ARP). NOTE: Data represent the 50 states and the District of Columbia. Excludes prekindergarten expenditures and prekindergarten enrollment for California in 2018-19. Numbers were placed in constant dollars using the Consumer Price Index (CPI) for all urban consumers, Bureau of Labor Statistics, U.S. Department of Labor. For more detail about CPI, see table B-5 in appendix B. Current expenditures include instruction, support services, food services, and enterprise operations. Some data have been revised from previously published figures. Mean absolute percentage errors of selected education statistics can be found in table A-2, appendix A. SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2010-11 through 2018-19; "National Public Education Financial Survey," 2010-11 through 2018-19; Public Elementary and Secondary School Current Expenditures Projection Model, through 2030-31. (This figure was prepared March 2022.)

# Section 5 Enrollment in Degree-Granting Postsecondary Institutions 

## INTRODUCTION

Total enrollment in degree-granting postsecondary institutions is expected to increase 8 percent between fall 2020, the last year of actual data, and fall 2030 (Digest 2021 table 303.10). Degree-granting institutions are postsecondary institutions that provide study beyond secondary school and offer programs terminating in an associate's, bachelor's, or higher degree and participate in Title IV federal financial aid programs. Differential growth is expected by student characteristics such as age, sex, and attendance status (part-time or full-time). Enrollment is expected to increase in both public and private degree-granting postsecondary institutions.

## Factors affecting the projections

The projections of enrollment levels are related to projections of college-age populations, disposable income, and unemployment rates. In a combination of approaches from earlier editions, this edition uses a new two-stage approach in which final projections are estimated by calculating a weighted average of economic "model-driven projections" and "population-driven projections." For more details, see appendixes A. 0 and A.5. An important factor in the enrollment projections is the expected change in the population of 18 - to 29-year- olds from 2010 through 2030 (table B-3 in appendix B). For example, figure 15 shows that the number of 18 - to 24 -year-olds-who make up the majority of postsecondary students-was 30.5 million in 2020 and is also projected to be 30.5 million in 2030.

Figure 15. Actual and projected population numbers for 18- to 24-year-olds and 25- to 29-year-olds: 2010 through 2030

NOTE: Some data have been revised from previously published figures. Historical population data are from the U.S. Census Bureau and are estimates of the population on July 1 of the given year. National population projections are S\&P Global forecasts produced in May 2021 with a cohort component model like that used by the Census Bureau. The model incorporates assumptions about fertility rates, survival rates, and net international migration from the 2020 Census Bureau projections, which were modified to take into account the demographic shocks of the previous three years.
SOURCE: U.S. Department of Commerce, Census Bureau, resident population by single year of age and sex retrieved from National Population by Characteristics: 2010-2020 (census.gov) and U.S. resident population retrieved from 2020 Census Apportionment Results; and S\&P Global Inc. Population service, May 2021 release (history through 2020 and forecasts through 2030). (This table was prepared April 2022.)

## Accuracy of Projections

No mean absolute percentage errors were calculated for enrollments in degree-granting postsecondary institutions, as projections were calculated using a new model. For information concerning the accuracy of the previous models used to produce projections of enrollment in degree-granting postsecondary institutions, see page 96 of Projections of Education Statistics to 2028.

Total enrollment in degreegranting postsecondary institutions
$\nabla$ decreased 10 percent from 2010 to 2020 ( 21.0 million vs. 19.0 million); and
$\Delta$ is projected to increase 8 percent, to 20.5 million, from 2020 to 2030.

For more information:
Digest 2021 table 303.10. (Reference table 13 in this report)

Figure 16. Actual and projected numbers for total enrollment in all degreegranting postsecondary institutions: Fall 2010 through fall 2030

NOTE: Data represent the 50 states and the District of Columbia. Degree-granting institutions grant
associate's or higher degrees and participate in Title IV federal financial aid programs. Actual data for Fall 2020 were not included in projection models. Some data have been revised from previously published figures. SOURCE: U.S. Department of Education, National Center for Education Statistics, Integrated Postsecondary
Education Data System (IPEDS), Spring 2011 through Spring 2021, Fall Enrollment component; and
Enrollment in Degree-Granting Institutions Projection Model, through 2030. (This figure was prepared March 2022.)

## ENROLLMENT BY SELECTED STUDENT CHARACTERISTICS AND CONTROL OF INSTITUTION

Figure 17. Actual and projected numbers for total enrollment in all degreegranting postsecondary institutions, by age group: Fall 2010, fall 2019, and fall 2030

NOTE: Data represent the 50 states and the District of Columbia. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. Persons with unknown age are excluded.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Integrated Postsecondary Education Data System (IPEDS), Spring 2010 and Spring 2020, Fall Enrollment component; Enrollment in Degree-Granting Institutions Projection Model, through 2030. (This figure was prepared March 2022.)

## Enrollment by age of student

Enrollment in degree-granting postsecondary institutions of students who are under 25 years old

- increased 6 percent between 2009 and 2019 ( 12.3 million vs. 13.1 million); and

A is projected to increase 2 percent between 2019 and 2030 to 13.3 million.

Enrollment in degree-granting postsecondary institutions of students who are 25 to 34 years old
$\nabla$ decreased 13 percent between 2009 and 2019 ( 4.5 million vs. 4.0 million); and

A is projected to be 4 percent higher in 2030 ( 4.1 million) than in 2019.

Enrollment in degree-granting postsecondary institutions of students who are 35 years old and over
$\nabla$ decreased 24 percent between 2009 and 2019 ( 3.3 million vs. 2.6 million); and

- is projected to increase 18 percent between 2019 and 2030 ( 3.0 million).

For more information:
Digest 2021 table 303.40. (Reference table 14 in this report)

## Enrollment by sex of student

Enrollment of males in degreegranting postsecondary institutions
$\nabla$ decreased 13 percent between 2010 and 2020 ( 9.0 million vs.
7.9 million); and

- is projected to increase 11 percent between 2020 and 2030 to 8.7 million.

Enrollment of females in degreegranting postsecondary institutions
$\nabla$ decreased 7 percent between 2010 and 2020 ( 12.0 million vs.
11.1 million); and

A is projected to increase 6 percent between 2020 and 2030 to 11.8 million.

For more information: Digest 2021 tables 303.10 and 303.40. (Reference tables 13 and 14 in this report)

Figure 18. Actual and projected numbers for enrollment in all degree-granting postsecondary institutions, by sex: Fall 2010 through fall 2030

NOTE: Data represent the 50 states and the District of Columbia. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. Actual data for Fall 2020 were not included in projection models. Some data have been revised from previously published figures. SOURCE: U.S. Department of Education, National Center for Education Statistics, Integrated Postsecondary Education Data System (IPEDS), Spring 2011 through Spring 2021, Fall Enrollment component; and Enrollment in Degree-Granting Institutions Projection Model, through 2030. (This figure was prepared March 2022.)

Figure 19. Actual and projected numbers for enrollment in all degree-granting postsecondary institutions, by attendance status: Fall 2010 through fall 2030

NOTE: Data represent the 50 states and the District of Columbia. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. Actual data for Fall 2020 were not included in projection models. Some data have been revised from previously published figures. SOURCE: U.S. Department of Education, National Center for Education Statistics, Integrated Postsecondary Education Data System (IPEDS), Spring 2011 through Spring 2021, Fall Enrollment component; and Enrollment in Degree-Granting Institutions Projection Model, through 2030. (This figure was prepared March 2022.)

Figure 20. Actual and projected numbers for enrollment in all degree-granting postsecondary institutions, by enrollment level of student: Fall 2010 through fall 2030

NOTE: Data represent the 50 states and the District of Columbia Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. Actual data for Fall 2020 were not included in projection models. Some data have been revised from previously published figures. SOURCE: U.S. Department of Education, National Center for Education Statistics, Integrated Postsecondary Education Data System (IPEDS), Spring 2011 through Spring 2021, Fall Enrollment component; and Enrollment in Degree-Granting Institutions Projection Model, through 2030. (This figure was prepared March 2022.)

## Enrollment by attendance status

Enrollment of full-time students in degree-granting postsecondary institutions

- decreased 11 percent between 2010 and 2020 ( 13.1 million vs. 11.6 million); and
- is projected to increase 7 percent between 2020 and 2030 to 12.4 million.

Enrollment of part-time students in degree-granting postsecondary institutions
$\nabla$ decreased 7 percent between 2010 and 2020 ( 7.9 million vs. 7.4 million); and

A is projected to increase 9 percent between 2020 and 2030 to 8.1 million.

## For more information:

Digest 2021 tables 303.10, 303.30, and 303.40. (Reference tables 13, 14, and 15 in this report)

## Enrollment by level of student

Enrollment of undergraduate students in degree-granting postsecondary institutions
$\nabla$ decreased 12 percent between 2010 and 2020 ( 18.1 million vs. 15.9 million); and

- is projected to increase 8 percent between 2020 and 2030 to 17.1 million.

Enrollment of postbaccalaureate students in degree-granting postsecondary institutions
$\Delta$ increased 7 percent between 2010 and 2020 ( 2.9 million vs. 3.1 million); and

- is projected to be 6 percent higher in 2030 ( 3.3 million) than in 2020.

## For more information:

Digest 2021 tables 303.70 and 303.80 . (Reference tables 16 and 17 in this report)

## Enrollment by race/ethnicity

Enrollment of U.S. residents is projected to

- be 3 percent higher for American Indian/Alaska Native students in 2030 than in 2020 (125,000 vs. 121,000);
- decrease 7 percent for Asian/ Pacific Islander students between 2020 and 2030 ( 1.4 million vs. 1.3 million);
- increase 19 percent for Black students between 2020 and 2030 ( 2.4 million vs. 2.8 million);
- increase 21 percent for Hispanic students between 2020 and 2030 ( 3.7 million vs. 4.4 million);
- be 3 percent higher for White students in 2030 than in 2020 (10.1 million vs. 9.8 million); and
$\Delta$ increase 4 percent for students of Two or more races between 2020 and 2030 ( 762,000 vs. 793,000 ).

For more information:
Digest 2021 table 306.30. (Reference table 18 in this report)

Figure 21. Actual and projected numbers for enrollment of U.S. residents in all degree-granting postsecondary institutions, by race/ethnicity: Fall 2010 through fall 2030

NOTE: Data represent the 50 states and the District of Columbia. Projections for Asian enrollment and Pacific Islander enrollment are not available separately due to the limited amount of historical data available upon which to base a projection model (prior to 2010, disaggregated data on students who were Asian, Pacific Islander, and of Two or more races were not collected). Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. Actual data for Fall 2020 were not included in projection models. Some data have been revised from previously published figures.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Integrated Postsecondary Education Data System (IPEDS), Spring 2010 through Spring 2020, Fall Enrollment component; and Enrollment in Degree-Granting Institutions by Race/Ethnicity Projection Model, through 2030. (This figure was prepared March 2022.)

Figure 22. Actual and projected numbers for enrollment in all degree-granting postsecondary institutions, by control of institution: Fall 2010 through fall 2030

NOTE: Data represent the 50 states and the District of Columbia. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. Actual data for Fall 2020 were not included in projection models. Some data have been revised from previously published figures. SOURCE: U.S. Department of Education, National Center for Education Statistics, Integrated Postsecondary Education Data System (IPEDS), Spring 2011 through Spring 2021, Fall Enrollment component; and Enrollment in Degree-Granting Institutions Projection Model, through 2030. (This figure was prepared March 2022.)

## Enrollment in public and private institutions

Enrollment in public degree-granting postsecondary institutions
$\nabla$ decreased 8 percent between 2010 and 2020 ( 15.1 million vs.
13.9 million); and
$\Delta$ is projected to increase 9 percent between 2020 and 2030 to 15.1 million.

Enrollment in private degree-granting postsecondary institutions
$\nabla$ decreased 13 percent between 2010 and 2020 ( 5.9 million vs. 5.1 million); and

- is projected to increase 5 percent between 2020 and 2030 to 5.4 million.

For more information: Digest 2021 table 303.10. (Reference table 13 in this report)

## First-time freshmen fall enrollment

Total first-time freshmen fall enrollment in all degree-granting postsecondary institutions
$\nabla$ decreased 18 percent between 2010 and 2020 ( 3.2 million vs. 2.6 million); and

- is projected to increase 14 percent between 2020 and 2030 to 3.0 million.

First-time freshmen fall enrollment of males in all degree-granting postsecondary institutions
$\nabla$ decreased 21 percent from 2010 to 2020 ( 1.5 million vs. 1.1 million); and

- is projected to be 17 percent higher in 2030 ( 1.3 million) than in 2020.

First-time freshmen fall enrollment of females in all degree-granting postsecondary institutions
$\nabla$ decreased 14 percent between 2010 and 2020 ( 1.7 million vs. 1.5 million); and

A is projected to increase 11 percent between 2020 and 2030 to 1.6 million.

## For more information:

Digest 2021 table 305.10. (Reference table 19 in this report)

Figure 23. Actual and projected numbers for total first-time degree/certificateseeking students in degree-granting postsecondary institutions, by sex: Fall 2010 through fall 2030

NOTE: Data represent the 50 states and the District of Columbia. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. Actual data for Fall 2020 were not included in projection models. Some data have been revised from previously published figures SOURCE: U.S. Department of Education, National Center for Education Statistics, Integrated Postsecondary Education Data System (IPEDS), Spring 2011 through Spring 2021, Fall Enrollment component; and FirstTime Freshmen Projection Model, through 2030. (This figure was prepared March 2022.)

FULL-TIME-EQUIVALENT ENROLLMENT, BY CONTROL OF INSTITUTION

Figure 24. Actual and projected numbers for full-time-equivalent fall enrollment in degree-granting postsecondary institutions, by control: Fall 2010 through fall 2030

NOTE: Data represent the 50 states and the District of Columbia. Full-time-equivalent fall enrollment is the full-time enrollment, plus the full-time-equivalent of the part-time students. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. Actual data for Fall 2020 were not included in projection models. Some data have been revised from previously published figures. SOURCE: U.S. Department of Education, National Center for Education Statistics, Integrated Postsecondary Education Data System (IPEDS), Spring 2011 through Spring 2021, Fall Enrollment component; and Enrollment in Degree-Granting Institutions Projection Model, through 2030. (This figure was prepared March 2022.)

## Full-time-equivalent fall enrollment

Total full-time-equivalent fall enrollment in degree-granting postsecondary institutions
$\nabla$ decreased 10 percent between 2010 and 2020 ( 15.9 million vs. 14.3 million); and

- is projected to increase 7 percent between 2020 and 2030 to 15.4 million.

Full-time-equivalent fall enrollment in public degree-granting postsecondary institutions
$\nabla$ decreased 9 percent between 2010 and 2020 (11.0 million vs. 10.1 million); and

- is projected to increase 8 percent between 2020 and 2030 to 10.9 million.

Full-time-equivalent fall enrollment in private degree-granting postsecondary institutions
$\nabla$ decreased 14 percent between 2010 and 2020 ( 4.9 million vs. 4.3 million); and

- is projected to increase 5 percent between 2020 and 2030 to 4.5 million.

For more information:
Digest 2021 table 307.10. (Reference table 20 in this report)

## Section 6 Postsecondary Degrees Conferred

## INTRODUCTION

Despite enrollment declines from 2010 to 2020 in Title IV degree-granting postsecondary institutions, the numbers of associate's, bachelor's, master's, and doctor's degrees conferred have generally increased (Digest 2021 tables 303.10 and 318.10). Increases in the number of degrees conferred are expected to continue between academic year 2019-20, the last year of actual data, and academic year 2030-31. During that period, the number of associate's degrees is projected to increase 38 percent, the number of bachelor's degrees is projected to increase 20 percent, the numbers of master's degrees is projected to increase 17 percent, and the number of doctor's degrees is projected to increase 16 percent.

## Factors affecting the projections

The projections of the number of degrees conferred are related to projections of the college-age populations developed by the Census Bureau and college enrollments from this report. For more details, see appendixes A. 0 and A. 6 .

## Factors that were not considered

Some factors that may affect future numbers of degrees, such as choice of degree and labor force requirements, were not included in the projection models.

## Accuracy of Projections

No mean absolute percentage errors were calculated for degrees conferred because these models are based on projections of enrollments in degree-granting postsecondary institutions, which were calculated using a new model. For information concerning the accuracy of the previous models used to produce projections of postsecondary degrees conferred, see page 125 of Projections of Education Statistics to 2026.

Figure 25. Actual and projected numbers for associate's degrees conferred by postsecondary institutions, by sex of recipient: Academic years 2010-11 through 2030-31

NOTE: Data represent the 50 states and the District of Columbia. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. Some data have been revised from previously published figures.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Integrated Postsecondary Education Data System (IPEDS), Fall 2011 through Fall 2020, Completions component; and Degrees Conferred Projection Model, through 2030. (This figure was prepared March 2022.)

Figure 26. Actual and projected numbers for bachelor's degrees conferred by postsecondary institutions, by sex of recipient: Academic years 2010-11 through 2030-31

NOTE: Data represent the 50 states and the District of Columbia. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. Some data have been revised from previously published figures.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Integrated Postsecondary Education Data System (IPEDS), Fall 2011 through Fall 2020, Completions component; and Degrees Conferred Projection Model, through 2030. (This figure was prepared March 2022.)

## Associate's degrees

The total number of associate's degrees

- was 8 percent higher in 2019-20 than in 2010-11 ( 1.0 million vs. 944,000); and
- is projected to increase 38 percent between 2019-20 and 2030-31 to 1.4 million.
The number of associate's degrees awarded to males
- increased 9 percent between 2010-11 and 2019-20 (361,000 vs. $393,000)$; and
- is projected to increase 35 percent between 2019-20 and 2030-31 to 529,000.

The number of associate's degrees awarded to females

- was 7 percent higher in 2019-20 than in 2010-11 (625,000 vs. $582,000)$; and
- is projected to increase 40 percent between 2019-20 and 2030-31 to 873,000

## For more information:

Digest 2021 table 318.10. (Reference table 21 in this report)

## Bachelor's degrees

The total number of bachelor's degrees

- increased 19 percent between 2010-11 and 2019-20 (1.7 million vs. 2.0 million); and
- is projected to increase 20 percent between 2019-20 and 2030-31 to 2.5 million.

The number of bachelor's degrees awarded to males

- increased 17 percent between 2010-11 and 2019-20 (734,000 vs. 861,000); and
- is projected to increase 17 percent between 2019-20 and 2030-31 to 1.0 million.

The number of bachelor's degrees awarded to females

- increased 20 percent between 2010-11 and 2019-20 (982,000 vs. 1.2 million); and
- is projected to increase 23 percent between 2019-20 and 2030-31 to 1.4 million.

For more information:
Digest 2021 table 318.10. (Reference table 21 in this report)

## Master's degrees

The total number of master's degrees
$\Delta$ increased 15 percent between 2010-11 and 2019-20 (731,000 vs. 843,000); and
$\Delta$ is projected to increase 17 percent between 2019-20 and 2030-31 to 983,000.
The number of master's degrees awarded to males
$\Delta$ increased 12 percent between 2010-11 and 2019-20 (292,000 vs. 326,000 ); and

- is projected to be 13 percent higher in 2030-31 $(368,000)$ than in 2019-20.

The number of master's degrees awarded to females

- increased 18 percent between 2010-11 and 2019-20 (439,000 vs. $518,000)$; and
- is projected to increase 19 percent between 2019-20 and 2030-31 to 615,000.

## For more information:

Digest 2021 table 318.10. (Reference table 21 in this report)

## Doctor's degrees

The total number of doctor's degrees

- increased 16 percent between 2010-11 and 2019-20 (164,000 vs. 190,000); and
- is projected to increase 16 percent between 2019-20 and 2030-31 to 221,000.
The number of doctor's degrees awarded to males
- increased 7 percent between 2010-11 and 2019-20 (80,000 vs. 85,000 ); and
- is projected to be 3 percent higher in 2030-31 $(88,000)$ than in 2019-20.

The number of doctor's degrees awarded to females
$\Delta$ increased 25 percent between 2010-11 and 2019-20 (84,000 vs. 105,000); and

- is projected to increase 27 percent between 2019-20 and 2030-31 to 133,000.

## For more information:

Digest 2021 table 318.10. (Reference table 21 in this report)

Figure 27. Actual and projected numbers for master's degrees conferred by postsecondary institutions, by sex of recipient: Academic years 2010-11 through 2030-31

NOTE: Data represent the 50 states and the District of Columbia. Includes some degrees formerly classified as first-professional, such as divinity degrees (M.Div. and M.H.L./Rav). Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. Some data have been revised from previously published figures.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Integrated Postsecondary Education Data System (IPEDS), Fall 2011 through Fall 2020, Completions component; and Degrees Conferred Projection Model, through 2030. (This figure was prepared March 2022.)

Figure 28. Actual and projected numbers for doctor's degrees conferred by postsecondary institutions, by sex of recipient: Academic years 2010-11 through 2030-31

NOTE: Data represent the 50 states and the District of Columbia. Doctor's degrees include Ph.D., Ed.D., and comparable degrees at the doctoral level. Includes most degrees formerly classified as first-professional, such as M.D., D.D.S., and law degrees. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. Some data have been revised from previously published figures.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Integrated Postsecondary Education Data System (IPEDS), Fall 2011 through Fall 2020, Completions component; and Degrees Conferred Projection Model, through 2030. (This figure was prepared March 2022.)

${ }^{1}$ Includes ungraded students as well as students whose grade was not specified. These students were prorated into either the prekindergarten through grade 8 level or the grades 9 through 12 level based on the known grade-level distribution of a state.
${ }^{2}$ Includes students reported as being enrolled in grade 13.
${ }^{3}$ Includes imputations for nonreported prekindergarten enrollment in California.
${ }^{4}$ Includes imputations for nonreported enrollment for all grades in Illinois.
${ }^{5}$ Includes imputations for nonreported prekindergarten enrollment in California and Oregon
NOTE: Data in this table represent the 50 states and the District of Columbia. Due to changes in reporting and
imputation practices, prekindergarten enrollment for years prior to 1992 represent an undercount compared
with later years. Projections in this table were calculated after the onset of the coronavirus pandemic and take into account the expected impacts of the pandemic. Detail may not sum to totals because of rounding. Some data have been revised from previously published figures.

- Not available.
'Includes imputations for nonreported prekindergarten enrollment.
${ }^{2}$ Includes imputations for nonreported enrollment for all grades.
${ }^{3}$ DODEA = Department of Defense Education Activity. Includes both domestic and overseas schools.
NOTE: The total counts of ungraded students and those whose grade was not specified were prorated into either the prekindergarten through grade 8 evel or the grades 9 through 12 level based on the known grade-level distribution of a state. Projections in this table were calculated after the onset of
acoroavirus pandemic and take into account the expected impacts of the pandemic. Detail may not sum to totals because of rounding. Some data have been revised from previously published figures.
OURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD) "State Nonfiscal Survey of Public Elementary/Secondary Education," $1990-91$ through 2019-20 and 2020-21 Preliminary; Department of Defense Education Activity (DoDEA) Data Center, Enrollment Data, 2009 through 2014 and 2016 through 2020. Retrieved September 27, 2021 , from https://www.dodea.edu/datacenter/enrollment.cfm; and State Public Elementary and Secondary Enrollment Projection Model, through 2030. (This table was prepared March 2022.)

Table 5. Public school enrollment in grades 9 through 12, by region, state, and jurisdiction: Selected years, fall 1990 through fall 2030

| Region, state, and jurisdiction | Actual total enrollment |  |  |  |  |  |  |  |  |  |  |  |  |  | Percent change in total enrollment, 2015 to 2020 | Projected enrollment |  |  |  |  | Percent change in total enrollment, 2020 to 2030 |

- Not available.

Includes imputations for nonreported enrollment for all grades
DODEA = Department of Defense Education Activity. Includes both domestic and overseas schools.
NOTE: The total counts of ungraded students and those whose grade was not specified were prorated into either the prekindergarten through grade 8 lever the grades 9 hrough 12 level based on the known grade-evel distribution of a state. In addition to students in grades 9 through 12 and ungraded students, this table includes a small number of students reported as being enrolled in grade 13. Projections in this table were calculated after the onset
of the coronavirus pandemic and take into account the expected impacts of the pandemic. Detail may not sum to totals because of rounding. Some data have been revised from previously published figures.

- Not available.
$\dagger$ Not applicable.
${ }^{1}$ For 2008 and 2009, data on Pacific Islanders and students of Two or more races were reported by only a small number of states. Therefore, the data are not comparable to figures for 2010 and later years.
${ }^{2}$ Includes imputations for nonreported prekindergarten enrollment in California.
${ }^{3}$ Includes imputations for nonreported enrollment for all grades in Illinois.
${ }^{4}$ Includes imputations for nonreported prekindergarten enrollment in California and Oregon.
${ }^{5}$ Projected.
NOTE: Data in this table represent the 50 states and the District of Columbia. Race categories exclude persons of Hispanic ethnicity. Enrollment data for students not reported by race/ethnicity were prorated based on the known racial/ethnic composition of a state by grade to match state totals. Prior to 2008, separate data on

Asian students and Pacific Islander students and data on students of Two or more races were not collected; each student could be assigned to only one of the available race categories. The total counts of ungraded students and those whose grade was not specified were prorated into either the prekindergarten through grade 8 level or the grades 9 through 12 level based on the known grade-level distribution of a state. Projections in this table were calculated after the onset of the coronavirus pandemic and take into account the expected impacts of the pandemic. Some data have been revised from previously published figures. Detail may not sum to totals because of rounding.

－Not available．
${ }^{1}$ A teacher is considered to be a new hire for a public or private school if the teacher had not taught in that control of school in the previous year．A teacher who moves from a public to private or a private to public school is considered a new teacher hire，but a teacher who moves from one public school to another public school or one private school to another private school is not considered a new teacher hire．
${ }^{2}$ Estimated．
${ }^{3}$ Projected．
NOTE：Data in this table represent the 50 states and the District of Columbia．Data for teachers are expressed in full－time equivalents（FTE）．Counts of private school enrollment include prekindergarten through grade 12 in schools offering kindergarten or higher grades．Counts of private school teachers exclude teachers who teach only prekindergarten students．Counts of public school teachers and enrollment include prekindergarten through grade 12．The pupil／teacher ratio includes teachers for students with disabilities and other special teachers，while these teachers are generally excluded from class size calculations．Ratios for public schools
reflect totals reported by states and differ from totals reported for schools or school districts．Projections in this table were calculated after the onset of the coronavirus pandemic and take into account the expected impacts of the pandemic．Some data have been revised from previously published figures．Detail may not sum to totals because of rounding．
SOURCE：U．S．Department of Education，National Center for Education Statistics，Statistics of Public Elementary and Secondary Day Schools，1955－56 through 1980－81；Statistics of Nonpublic Elementary and Secondary Schools， 1955 through 1980；1983－84，1985－86，and 1987－88 Private School Survey；Common Core of Data （CCD），＂State Nonfiscal Survey of Public Elementary／Secondary Education，＂1981－82 through 2019－20；Private School Universe Survey（PSS），1989－90 through 2019－20；Schools and Staffing Survey（SASS），＂Public School Teacher Data File＂and＂Private School Teacher Data File，＂1999－2000 through 2011－12；National Teacher and Principal Survey（NTPS），＂Public School Teacher Data File，＂2015－16 and 2017－18，＂Private School Teacher Data File，＂2017－18；Elementary and Secondary Teacher Projection Model，through 2030；and New Teacher Hires Projection Model，through 2030．（This table was prepared September 2021．）

Table 9. High school graduates, by sex and control of school; public high school averaged freshman graduation rate (AFGR); and total graduates as a ratio of 17-year-old population: Selected years, 1869-70 through 2030-31

## - Not available.

${ }^{1}$ Includes graduates of public and private schools.
${ }^{2}$ Includes estimates for states not reporting counts of graduates by sex.
${ }^{3}$ The averaged freshman graduation rate provides an estimate of the percentage of students who receive a regular diploma within 4 years of entering ninth grade. The rate uses aggregate student enrollment data to estimate the size of an incoming freshman class and aggregate counts of the number of diplomas awarded 4 years later. Averaged freshman graduation rates in this table are based on reported totals of enrollment by grade and high school graduates, rather than on details reported by race/ethnicity.
${ }^{4}$ Derived from Current Population Reports, Series P-25. For years 1869-70 through 1989-90, 17-year-old population is an estimate of the October 17 -year-old population based on July data. Data for 1990-91 and later years are October resident population estimates prepared by the Census Bureau.
${ }^{5}$ Based on persons of all ages graduating from high school in a given year divided by the 17 -year-old population in the same year. This ratio allows for comparisons over time but does not provide a measure of graduation rates for incoming freshmen who form a cohort (or class) that is scheduled to graduate 4 years later. The ratio of high school graduates to the 17 -year-old population differs from measures such as the AFGR, which are designed to estimate high school cohort graduation rates.
${ }^{6}$ Data for 1929-30 and preceding years are from Statistics of Public High Schools and exclude graduates from high schools that failed to report to the Office of Education.
'Estimated based on data appearing in Projections of Education Statistics and Biennial Survey in the United States, Statistical Summary of Education, 1949-50.
${ }^{8}$ Includes imputations for nonreporting states.
${ }^{9}$ Projected by private schools responding to the Private School Universe Survey.
${ }^{10}$ Includes estimates for public schools in New York and Wisconsin. Without estimates for these two states, the averaged freshman graduation rate for the remaining 48 states and the District of Columbia is 75.0 percent.
${ }^{11}$ Includes estimate for Connecticut, which did not report graduates by sex.
${ }_{12}$ Number of high school graduates is projected by the National Center for Education Statistics (NCES) unless otherwise noted.
${ }^{13}$ Private school data are actual.
NOTE: Data in this table represent the 50 states and the District of Columbia. Includes graduates of regular day school programs. Excludes graduates of other programs, when separately reported, and recipients of high school equivalency certificates. Projections in this table were calculated after the onset of the coronavirus pandemic and take into account the expected impacts of the pandemic. Some data have been revised from previously published figures. Detail may not sum to totals because of rounding and adjustments to protect student privacy. ## －Not available

${ }^{1}$ U．S．total includes estimates for nonreporting states．
${ }^{2}$ Beginning in 1989－90，graduates from adult programs are excluded．
${ }^{3}$ Projected data from NCES 91－490，Projections of Education Statistics to 2002.
${ }^{4}$ DoDEA $=$ Department of Defense Education Activity．Includes both domestic and overseas schools．
NOTE：Data include regular diploma recipients，but exclude students receiving a certificate of attendance and
persons receiving high school equivalency certificates．Projections in this table were calculated after the onset
of the coronavirus pandemic and take into account the expected impacts of the pandemic．Some data have been revised from previously published figures．Detail may not sum to totals because of rounding．
SOURCE：U．S．Department of Education，National Center for Education Statistics，Common Core of Data （CCD），＂State Nonfiscal Survey of Public Elementary／Secondary Education，＂1981－82 through 2005－06；＂State Dropout and Completion Data File，＂2005－06 through 2012－13；and State High School Graduates Projection Model，through 2030－31．（This table was prepared January 2022．）

Table 11. Public high school graduates, by race/ethnicity: 1998-99 through 2030-31

| Year | Number of high school graduates |  |  |  |  |  |  | Percentage distribution of graduates |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

"Rounds to zero
${ }^{1}$ Unadjusted (or "current") dollars have not been adjusted to compensate for inflation.
${ }^{2}$ Constant dollars based on the Consumer Price Index, prepared by the Bureau of Labor Statistics,
U.S. Department of Labor, adjusted to a school-year basis.
${ }^{3}$ Excludes prekindergarten expenditures for California.
${ }^{4}$ Excludes prekindergarten expenditures and prekindergarten enrollment for California.
${ }^{5}$ Projected. Projected expenditures do not account for relief funding administered during the coronavirus pandemic, such as the Coronavirus Aid, Relief, and Economic Security (CARES) Act or the American Rescue Plan (ARP).

NOTE: Data in this table represent the 50 states and the District of Columbia. Current expenditures include instruction, support services, food services, and enterprise operations. Projections in this table were calculated after the onset of the coronavirus pandemic and take into account the expected impacts of the pandemic. Some data have been revised from previously published figures.

— Not available.
${ }^{1}$ Degree-credit enrollment only.
${ }^{2}$ Includes part-time resident students and all extension students (students attending courses at sites separate from the primary reporting campus). In later years, part-time student enrollment was collected as a distinct category.
${ }^{3}$ Large increases are due to the addition of schools accredited by the Accrediting Commission of Career Schools and Colleges of Technology.
${ }^{4}$ Because of imputation techniques, data are not consistent with figures for other years.
${ }^{5}$ Projected.
NOTE: Data in this table represent the 50 states and the District of Columbia. Data through 1995 are for institutions of higher education, while later data are for degree-granting institutions. Degree-granting institutions
grant associate's or higher degrees and participate in Title IV federal financial aid programs. The degreegranting classification is very similar to the earlier higher education classification, but it includes more 2-year colleges and excludes a few higher education institutions that did not grant degrees. Projections in this table were calculated after the onset of the coronavirus pandemic and take into account the expected impacts of the pandemic. Some data have been revised from previously published figures.

NOTE: Data in this table represent the 50 states and the District of Columbia. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. Projections in this table were calculated after the onset of the coronavirus pandemic and take into account the expected impacts of the pandemic. Some data have been revised from previously published figures. Detail may not sum to totals because of rounding.

Table 15. Total fall enrollment in degree-granting postsecondary institutions, by level and control of institution, attendance status, and sex of student: Selected years, 1970 through 2030

| Level and control of institution, attendance status, and sex of student | Actual |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## -Not available.

${ }^{1}$ Large increase in private 2-year institutions in 1980 is due to the addition of schools accredited by the Accrediting Commission of Career Schools and Colleges of Technology.
NOTE: Data in this table represent the 50 states and the District of Columbia. Data through 1995 are for institutions of higher education, while later data are for degree-granting institutions. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. The degreegranting classification is very similar to the earlier higher education classification, but it includes more 2-year colleges and excludes a few higher education institutions that did not grant degrees. Projections in this table
were calculated after the onset of the coronavirus pandemic and take into account the expected impacts of the pandemic. Some data have been revised from previously published figures.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Higher Education General Information Survey (HEGIS), "Fall Enrollment in Colleges and Universities" surveys, 1970 through 1985; Integrated Postsecondary Education Data System (IPEDS), "Fall Enrollment Survey" (IPEDS-EF:90-99); IPEDS Spring 2001 through Spring 2021, Fall Enrollment component; and Enrollment in Degree-Granting Institutions Projection Model, through 2030. (This table was prepared November 2021.)

Table 16．Total undergraduate fall enrollment in degree－granting postsecondary institutions，by attendance status，sex of student，and control and level of institution：Selected years， 1970 through 2030

| Level and year | Total | Full－time | Part－time | Males | Females | Males |  | Females |  | Public | Private |  |  |

- Not available.
${ }^{1}$ Projected.
${ }^{2}$ Beginning in 1980, 2 -year institutions include schools accredited by the Accrediting Commission of Career Schools and Colleges of Technology.
NOTE: Data in this table represent the 50 states and the District of Columbia. Data through 1995 are for institutions of higher education, while later data are for degree-granting institutions. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. The degreegranting classification is very similar to the earlier higher education classification, but it includes more 2-year
colleges and excludes a few higher education institutions that did not grant degrees. Projections in this table were calculated after the onset of the coronavirus pandemic and take into account the expected impacts of the pandemic. Some data have been revised from previously published figures.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Higher Education General Information Survey (HEGIS), "Fall Enrollment in Colleges and Universities" surveys, 1970 through 1985; Integrated Postsecondary Education Data System (IPEDS), "Fall Enrollment Survey" (IPEDS-EF:86-99); IPEDS Spring 2001 through Spring 2021, Fall Enrollment component; and Enrollment in Degree-Granting Institutions Projection Model, through 2030. (This table was prepared November 2021.)

Table 17. Total postbaccalaureate fall enrollment in degree-granting postsecondary institutions, by attendance status, sex of student, and control of institution: 1970 through 2030

| Year | Total | Full-time | Part-time | Males | Females | Males |  | Females |  | Public | Private |  |  |

## - Not available.

${ }^{1}$ Projected.
NOTE: Data in this table represent the 50 states and the District of Columbia. Data through 1985 include unclassified graduate students. Data through 1995 are for institutions of higher education, while later data are for degree-granting institutions. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid programs. The degree-granting classification is very similar to the earlier higher education classification, but it includes more 2-year colleges and excludes a few higher education institutions that did not grant degrees. Projections in this table were calculated after the onset of
the coronavirus pandemic and take into account the expected impacts of the pandemic. Some data have been revised from previously published figures.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Higher Education General Information Survey (HEGIS), "Fall Enrollment in Colleges and Universities" surveys, 1970 through 1985; Integrated Postsecondary Education Data System (IPEDS), "Fall Enrollment Survey" (IPEDS-EF:86-99); IPEDS Spring 2001 through Spring 2021, Fall Enrollment component; and Enrollment in Degree-Granting Institutions Projection Model, through 2030. (This table was prepared November 2021.)

Table 18.
Fall enrollment of U.S. residents in degree-granting postsecondary institutions, by race/ethnicity: Selected years, 1976 through 2030

## - Not available. <br> ${ }^{1}$ Projected.

NOTE: Data in this table represent the 50 states and the District of Columbia. Prior to 2010, disaggregated data on students who were Asian, Pacific Islander, and of Two or more races were not collected. Data for students who were Asian included students who were Pacific Islander, and students of Two or more races were required to select a single category from among the offered race/ethnicity categories (i.e., White, Black, Hispanic, Asian, and American Indian/Alaska Native). Projections for Asian enrollment and Pacific Islander enrollment are not available separately due to the limited amount of historical data available upon which to base a projection model, Data through 1995 are for institutions of higher education, while later data are for degree-granting institutions. Degree-granting institutions grant associate's or higher degrees and participate in Title IV federal financial aid
programs. The degree-granting classification is very similar to the earlier higher education classification, but it includes more 2-year colleges and excludes a few higher education institutions that did not grant degrees Projections in this table were calculated after the onset of the coronavirus pandemic and take into account the expected impacts of the pandemic. Race categories exclude persons of Hispanic ethnicity. Detail may not sum to totals because of rounding. Some data have been revised from previously published figures
SOURCE: U.S. Department of Education, National Center for Education Statistics, Higher Education General Information Survey (HEGIS), "Fall Enrollment in Colleges and Universities" surveys, 1976 and 1980; Integrated Postsecondary Education Data System (IPEDS), "Fall Enrollment Survey" (IPEDS-EF:90-99); IPEDS Spring 2001 through Spring 2021, Fall Enrollment component; and Enrollment in Degree-Granting Institutions by Racel Ethnicity Projection Model, through 2030. (This table was prepared November 2021.)

Table 19. Total fall enrollment of first-time degree/certificate-seeking students in degree-granting postsecondary institutions, by attendance status, sex of student, and level and control of institution: 1960 through 2030

| - Not available. <br> ${ }^{1}$ Excludes first-time degree/certificate-seeking students in occupational programs not creditable toward a bachelor's degree. <br> ${ }^{2}$ Data for 2 -year branches of 4 -year college systems are aggregated with the 4 -year institutions. <br> ${ }^{3}$ Large increases are due to the addition of schools accredited by the Accrediting Commission of Career Schools and Colleges of Technology. <br> ${ }^{4}$ Projected. <br> NOTE: Data in this table represent the 50 states and the District of Columbia. Data through 1995 are for institutions of higher education, while later data are for degree-granting institutions. Degree-granting institutions grant associate's or higher degrees and participate in Titte IV federal financial aid programs. The degree-granting |  |  |  |  |  |  | classification is very similar to the earlier higher education classification, but it includes more 2 -year colleges and excludes a few higher education institutions that did not grant degrees. Alaska and Hawaii are included in all years. Projections in this table were calculated after the onset of the coronavirus pandemic and take into |  |  |  |  |  |  |

| - Not available. |  |  |  |  |  |  | and participate in Title IV federal financial aid programs. The degree-granting classification is very similar to the earlier higher education classification, but it includes more 2-year colleges and excludes a few higher education institutions that did not grant degrees. Projections in this table were calculated after the onset of the coronavirus pandemic and take into account the expected impacts of the pandemic. Some data have been revised from previously published figures. Detail may not sum to totals because of rounding. <br> SOURCE: U.S. Department of Education, National Center for Education Statistics, Higher Education General Information Survey (HEGIS), "Fall Enrollment in Colleges and Universities" surveys, 1967 through 1985; Integrated Postsecondary Education Data System (IPEDS), "Fall Enrollment Survey" (IPEDS-EF:86-99); IPEDS Spring 2001 through Spring 2021, Fall Enrollment component; and Enrollment in Degree-Granting Institutions Projection Model, through 2030. (This table was prepared December 2021.) |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Large increases are due to the addition of schools accredited by the Accrediting Commission of CareerSchools and Colleges of Technology. |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 2 Because of imputation techniques, data are not consistent with figures for other year${ }^{3}$ Projected. |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| NOTE: Data in this table represent the 50 states and the District of Columbia. Full-time-equivalent enrollment is the number of full-time students enrolled, plus the full-time equivalent of the part-time students. For more information, see "Calculation of FTE students (using fall student headcounts)" in the IPEDS Glossary (https:// surveys.nces.ed.gov/ipeds/public/glossary). Data through 1995 are for institutions of higher education, while later data are for degree-granting institutions. Degree-granting institutions grant associate's or higher degrees |  |  |  |  |  |  |  |  |  |  |  |  |  |

## Technical Appendixes

# Appendix A Introduction to Projection Methodology 

## A.0. INTRODUCTION TO PROJECTION METHODOLOGY

## Content of appendix $A$

Since its inception in 1964, the Projections of Education Statistics series has been providing projections of key education statistics to policymakers, educators, researchers, the press, and the general public. This edition of Projections of Education Statistics is the 48th in the series.

Appendix A contains this introduction, which provides a general overview of the projection methodology, as well as six additional sections that discuss the specific methodology for the different statistics projected:
» A.O. Introduction to Projection Methodology;
» A.1. Elementary and Secondary Enrollment;
» A.2. Elementary and Secondary Teachers;
» A.3. High School Graduates;
» A.4. Expenditures for Public Elementary and Secondary Education;
» A.5. Enrollment in Degree-Granting Postsecondary Institutions; and
» A.6. Postsecondary Degrees Conferred.
This introduction
» outlines the two major techniques used to make the projections;
» summarizes key demographic and economic assumptions underlying the projections;
» examines the accuracy of the projections; and
» introduces the subsequent sections of appendix A.

## Projection techniques

Two main projection techniques were used to develop the projections presented in this publication:
» Exponential smoothing was the technique used in the projections of elementary and secondary enrollments and high school graduates. This technique also played a role in the projections of teachers at the elementary and secondary level, as well as enrollments and degrees conferred at the postsecondary level.
» Linear regression was the primary technique used in the projections of teachers and expenditures at the elementary and secondary level, as well as enrollments and degrees conferred at the postsecondary level.

## Exponential smoothing

Single exponential smoothing produces a single forecast for all years in the forecast period and is used when the historical data have basically a horizontal pattern. In developing projections of elementary and secondary enrollments, for example, the rate at which students progress from one particular grade to the next (e.g., from grade 2 to grade 3 ) was projected using single exponential smoothing. Thus, this percentage was assumed to be constant over the forecast period.

In general, exponential smoothing places more weight on recent observations than on earlier ones. The weights for observations decrease exponentially as one moves further into the past. As a result, the older data have less influence on the projections. The rate at which the weights of older observations decrease is determined by the smoothing constant.

When using single exponential smoothing for a time series, $P_{t}$, a smoothed series, $\hat{P}$, is computed recursively by evaluating where

$$
\hat{P}_{\mathrm{t}}=\alpha P_{\mathrm{t}}+(1-\alpha) P_{\mathrm{t}-1}
$$

$0<\alpha \leq 1$ is the smoothing constant.
By repeated substitution, we can rewrite the equation as

$$
P_{t}=\alpha \sum_{s=0}^{t-1}(1-\alpha)^{s} P_{t-s}
$$

where time, $s$, goes from the first period in the time series, 0 , to time period $t-1$.
The forecasts are constant for all years in the forecast period. The constant equals

$$
\hat{P}_{T+k}=\hat{P}_{t}
$$

where $T$ is the last year of actual data and $k$ is the $k t h$ year in the forecast period where $k>0$.
These equations illustrate that the projection is a weighted average based on exponentially decreasing weights. For higher smoothing constants, weights for earlier observations decrease more rapidly than for lower smoothing constants.

For each of the approximately 1,200 single exponential smoothing equations in this edition of Projections of Education Statistics, a smoothing constant was individually chosen to minimize the sum of squared forecast errors for that equation. The smoothing constants used to produce the projections in this report ranged from 0.001 to 0.999.

## Multiple linear regression

Multiple linear regression was used in cases where a strong relationship exists between the variable being projected (the dependent variable) and independent variables. This technique can be used only when accurate data and reliable projections of the independent variables are available. Key independent variables for this publication include demographic and economic factors. For example, current expenditures for public elementary and secondary education are related to economic factors such as disposable income and education revenues from state sources. The sources of the demographic and economic projections used for this publication are discussed below, under "Assumptions."

The equations in this appendix should be viewed as forecasting rather than structural equations. That is, the equations are intended only to project values for the dependent variables, not to reflect all elements of underlying social, political, and economic structures. Lack of available data precluded the building of large-scale structural models. The particular equations shown were selected on the basis of their statistical properties, such as coefficients of determination $\left(R^{2} s\right)$, the $t$-statistics of the coefficients, the Durbin-Watson statistic, the Breusch-Godfrey Serial Correlation LM test statistic, and residual plots.

The functional form primarily used is the multiplicative model. When used with two independent variables, this model takes the form:

$$
Y=a \cdot X_{1}^{\mathrm{b}_{1}} \cdot X_{2}^{\mathrm{b}_{2}}
$$

This equation can easily be transformed into the linear form by taking the natural $\log (\ln )$ of both sides of the equation:

$$
\ln (Y)=\ln (a)+b_{1} \ln X_{1}+b_{2} \ln X_{2}
$$

One property of this model is that the coefficient of an independent variable shows how responsive in percentage terms the dependent variable is to a one percent change in that independent variable (also called the elasticity). For example, a 1 percent change in $X_{1}$ in the above equation would lead to a $b_{1}$ percent change in $Y$.

## Assumptions

All projections are based on underlying assumptions, and these assumptions determine projection results to a large extent. It is important that users of projections understand the assumptions to determine the acceptability of projected time series for their purposes. All the projections in this publication are to some extent dependent on demographic and/or economic assumptions.

## Demographic assumptions

Many of the projections in this publication are demographically based on the S\&P Global, Population Projections, May 2021 produced by S\&P Global Inc. This is the first edition of Projections of Education Statistics to use population projections at the national level from S\&P Global rather than from the Census Bureau and the fifth edition to use S\&P Global's projections at the state-level.

Historical estimates of national population by age, sex, and race/ethnicity were obtained from the Census Bureau's Population Estimates Program (PEP). The most recently available estimates were from the Vintage 2020 data released in May 2021 for total population by age from 2010 through 2020. These estimates were adjusted by S\&P Global to be consistent with total population as of April 1, 2020, from the 2020 Decennial Census. Population projections were done by S\&P Global using a cohort component model like the model used by the Census Bureau. The model incorporates assumptions about fertility rates, survival rates, and net international migration from the 2017 Census Bureau projections, which were modified to take into account the demographic shocks of the previous three years, one of them being the impact of the COVID-19 pandemic. An additional adjustment was applied to account for recent increases in drug overdose deaths (opioid crisis) using data on deaths by age, sex, and race/ethnicity obtained from the U.S. Centers for Disease Control and Prevention.

Annual estimates of state population by age and sex from 2010 through 2020 are the U.S. Census Bureau's Vintage 2020 estimates, adjusted by S\&P Global to be consistent with total population on April 1, 2020, by state reported in the 2020 Decennial Census. Annual estimates of state population by the more detailed age, sex, and race/ethnicity from 2010 through 2019 are the U.S. Census Bureau's Vintage 2019 estimates, adjusted by S\&P Global to be consistent with the national population estimates by sex and single year of age and the state estimates of total population described above. For more information on the methodology used for S\&P Global population projections, see appendix C, Data Sources.

The enrollment projections in this publication depend on population projections for the various age groups that attend school. The future fertility rate assumption (along with corresponding projections of female populations) determines projections of the number of births, a key factor for population projections. The fertility rate assumption plays a major role in determining population projections for the age groups enrolled in nursery school, kindergarten, and elementary grades. The effects of the fertility rate assumption are more pronounced toward the end of the forecast period, while immigration assumptions affect all years. For enrollments in secondary grades and college, the fertility rate assumption is of no consequence, since all the population cohorts for these enrollment ranges have already been born.

## Economic assumptions

Various economic variables are used in the forecasting models for numbers of elementary and secondary teachers, public elementary and secondary school expenditures, and postsecondary enrollment.

Projections of the economic variables were from the trend scenario of the "U.S. Quarterly Macroeconomic Model June 2021 Short-Term Baseline Projections" developed by the S\&P Global Inc. This set of projections was S\&P Global Inc.'s most recent set at the time the education projections in this report were produced. The baseline projections depict a mean of possible paths that the economy could take over the forecast period given the incorporation of latest historical macroeconomic data, barring major shocks. The economy, in this scenario, evolves smoothly, without major fluctuations.

## More information about specific assumptions

For details about the primary assumptions used in this edition of Projections of Education Statistics, see table A-1 on page 68.

## Accuracy of the projections

Projections of time series data usually differ from the final reported (actual) data due to errors from many sources. This is because of the inherent nature of the statistical universe from which the basic data are obtained and the properties of projection methodologies, which depend on the validity of many assumptions.

The mean absolute percentage error (MAPE) is one way to express the forecast accuracy of past projections. This measure expresses the average absolute value of errors over past projections in percentage terms. For example, an analysis of projection errors over the past 36 editions of Projections of Education Statistics indicates that the MAPEs for public school enrollment in grades preK-12 for lead times of $1,2,5$, and 10 years were $0.3,0.5,1.1$, and 2.5 percent, respectively. For the 1-year-out projection, this means that one would expect the projection to be within 0.3 percent of the actual value, on average.

For a list of MAPEs for selected national statistics in this publication, see table A-2 on page 68. Sections A. 1 through A. 4 each contain at least one text table (tables A through F) that presents the MAPEs for the key national statistics of that section. Each text table appears directly after the discussion of accuracy of that section's national projections. For a list of MAPEs by state and region for public elementary and secondary enrollment, see tables A-7 through A-9 on pages 77-79 and for a list of MAPEs by state and region for the number of high school graduates in public schools, see table A-14 on page 92.

Tables A-3 and A-4 present an example of how the MAPEs were constructed using actual values for public school enrollment in grades 9 through 12 for schools years 2014-15 through 2017-18 and enrollment projections from the last four editions of Projections of Education Statistics. The top two panels of table A-3 shows the actual values fall 2014 through fall 2017 and enrollment projections for each year from Projections of Education Statistics to 2025 with the number of projections generally decreasing by one for each subsequent edition. The bottom panel of table A-3 shows the percentage differences between the actual values and the projected values. For example, the projected value for fall 2014 presented in Projections of Education Statistics to 2025 was 0.4 percent lower than the actual value for that year.

The top panel of table A-4 shows the absolute value of the percent differences from table A-3 arranged by lead time rather than year. For example, in the Projections of Education Statistics to 2025, the last actual data reported was for fall 2013 and thus the lead time for the projection of fall 2014 data was 1 year. Thus, the 0.4 appearing in the 2014 column of table A-3 for Projections of Education Statistics to 2025 appears in the column for lead times of 1 year in table A-4, indicating that projection of the one-year-out forecast from Projections of Education Statistics to 2025 differed by 0.4 percent in absolute terms from its actual value. The MAPEs for each lead time shown in the bottom panel of table A-4 were calculated by computing the average of the absolute values of the percentage differences for that lead time. For example, actual values are available to calculate the absolute values of the percentage differences for a lead time of 2 years for the first three editions of the Projections of Education Statistics listed in table A-4. These absolute values are $0.5,0.2$, and 0.6 . The MAPE for a lead time of 2 years was then calculated by taking the average of these numbers, or 0.4 . This matches the MAPE that appears in the bottom panel for a lead time of 2 years. (Calculations for table A-3 are based on unrounded numbers.) These MAPEs are different from the MAPEs for public school enrollment in grades 9 through 12 projections elsewhere in this report because the MAPEs in the example were calculated using only the last four editions of Projections of Education Statistics.

The number of years used in the analyses of the projection errors differ both because projections of additional education statistics have been added to the report over time and because, in some cases, there have been substantial changes in the methodology used to produce the projections such that the MAPEs for the earlier projections are no longer relevant. MAPEs are presented for a statistic only after it has been produced using substantially the same methodology in five previous editions of Projections of Education Statistics and there are at least 5 years of historical data for use in calculating the MAPEs.

Table A-1. Summary of forecast assumptions to 2030

| Variable | Assumption |
| :---: | :---: |
| 1 | 2 |
| Demographic assumptions Population | Projections are consistent with the historical Census Bureau estimates ${ }^{1}$ |
| 18- to 24-year-old population | S\&P Global projection: average annual growth rate of -0.1\% |
| 25 - to 29-year-old population | S\&P Global projection: average annual growth rate of -0.5\% |
| 30- to 34-year-old population | S\&P Global projection: average annual growth rate of 0.2\% |
| 35 - to 44-year-old population | S\&P Global projection: average annual growth rate of 1.2\% |

## Economic assumptions

Disposable income per capita in constant dollars
Education revenue receipts from state sources per capita in constant dollars Inflation rate

Annual percentage changes range between $-2.8 \%$ and $2.3 \%$ with an average annual growth rate of 2.0\% Annual percentage changes range between $-2.9 \%$ and $4.9 \%$ with an average annual growth rate of $0.5 \%$ Inflation rate ranges between 1.9\% and 2.9\%

Unemployment rate (males)
Ages 18 and 19
Remains between $3.6 \%$ and $16.0 \%$
Ages 20 to 24
Remains between 7.6\% and 12.1\%
Age 25 and over
Remains between 3.1\% and 6.1\%
Unemployment rate (females)
Ages 18 and 19
Ages 20 to 24
Remains between $9.2 \%$ and $12.7 \%$ Remains between $5.7 \%$ and $10.8 \%$
Age 25 and over Remains between $2.9 \%$ and $6.2 \%$
${ }^{1}$ Annual estimates of U.S. population, total and by age, through 2020 are the U.S. Census Bureau's Vintage 2020 estimates, adjusted by S\&P Global to be consistent with total population on April 1, 2020 reported in the 2020 Census of Population.
SOURCE: Historical population data are from the U.S. Department of Commerce, Census Bureau, resident population by single year of age and sex retrieved from National Population by Characteristics: 2010-2020 (census.gov) and U.S. resident population retrieved from 2020 Census Apportionment Results. National population projections are S\&P Global forecasts produced in May 2021 with a cohort component model
like that used by the Census Bureau. The model incorporates assumptions about fertility rates, survival rates, and net international migration from the 2017 Census Bureau projections, which were modified to take into account the demographic shocks of the previous three years. Other macroeconomic data are from S\&P Global Macroeconomic service, June 2021 release (history through 2020 and forecasts through 2030) and S\&P Global Costs and Prices service (history through 2020 and forecasts though 2030). (This table was prepared in April 2022.)

Table A-2. Mean absolute percentage errors (MAPEs), by lead time for selected statistics in all elementary and secondary schools: MAPEs constructed using projections from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2030

| Statistic | Lead time (years) |  |  |  |  |  |  |  |  |  |

## -Not available.

${ }^{1}$ MAPEs for public prekindergarten through grade 12 enrollments were calculated using the last 36 editions of Projections of Education Statistics, from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2028.
${ }^{2}$ MAPEs for public prekindergarten through grade 12 enrollments and high school graduates by race/ ethnicity were calculated using the last 11 editions of Projections of Education Statistics, from Projections of Education Statistics to 2019 through Projections of Education Statistics to 2028.
${ }^{3}$ Data for teachers expressed in full-time equivalents. MAPEs for teachers were calculated from the past 29 editions of Projections of Education Statistics, from Projections of Education Statistics to 1997-98 through Projections of Education Statistics to 2028, excluding Projections of Education Statistics to 2012 which did not include projections of teachers.
${ }^{4}$ MAPEs for public high school graduates were calculated from the past 29 editions of Projections of Education Statistics, from Projections of Education Statistics to 2000 through Projections of Education Statistics to 2028.
${ }^{5}$ In constant dollars based on the Consumer Price Index for all urban consumers, Bureau of Labor Statistics, U.S. Department of Labor. MAPEs for current expenditures were calculated using projections from the
last 29 editions of Projections of Education Statistics, from Projections of Education Statistics to 1997-98 through Projections of Education Statistics to 2028, excluding Projections of Education Statistics to 2012 which did not include projections of current expenditures.
${ }^{6}$ MAPEs for private prekindergarten-12 enrollments and high school graduates were calculated from the past 18 editions of Projections of Education Statistics, from Projections of Education Statistics to 2011 through Projections of Education Statistics to 2028.
NOTE: Mean absolute percentage error is the average value over past projections of the absolute values of errors expressed in percentage terms. No MAPEs are presented for enrollments in degree-granting postsecondary institutions and postsecondary degrees conferred as projections of some of these statistics were calulated using a new model and all remaining projections were calculated using projections from a new model. Calculations were made using unrounded numbers. Some data have been revised from previously published figures.

## A.1. ELEMENTARY AND SECONDARY ENROLLMENT

## Projections in this edition

This edition of Projections of Education Statistics presents projected trends in elementary and secondary enrollment from 2021 to 2030. These projections were made using three models:
» The National Elementary and Secondary Enrollment Projection Model was used to project total, public, and private school enrollments for the nation by grade level and for ungraded elementary and ungraded secondary programs.
» The State Public Elementary and Secondary Enrollment Projection Model was used to project total public school enrollments by grade level for individual states and regions.
» The National Public Elementary and Secondary Enrollment by Race/Ethnicity Projection Model was used to project public school enrollments for the nation by race/ethnicity and grade level.

All three elementary and secondary enrollment models used the following same methods.

## Overview of approach

Two methods were used in all the elementary and secondary enrollment models:
» The grade progression rate method was used to project enrollments in grades 2 through 12. In this method, a rate of progression from each grade ( 1 through 11) to the next grade ( 2 through 12) was projected using single exponential smoothing. (For example, the rate of progression from grade 2 to grade 3 is the current year's grade 3 enrollment expressed as a percentage of the previous year's grade 2 enrollment.) To calculate enrollment for each year in the forecast period, the progression rate for each grade was applied to the previous year's enrollment in the previous grade.
» The enrollment rate method was used to project prekindergarten, kindergarten, and first-grade enrollments as well as elementary and secondary ungraded enrollments. In this method, an enrollment rate for each grade (or ungraded level) was projected using single exponential smoothing. (For example, the enrollment rate for grade 1 is the number of students enrolled in grade 1 divided by the number of 6 -year-olds.) To calculate enrollment for each year in the forecast period, the enrollment rate for each category was applied to the projected population in the appropriate age group.

## Assumptions underlying these methods

The grade progression and enrollment rate methods assume that past trends in factors affecting public and private elementary and secondary school enrollments will continue over the forecast period. This assumption implies that all factors influencing enrollments will display future patterns consistent with past patterns. This method implicitly includes the net effect of such factors as migration, dropouts, deaths, nonpromotion, and transfers between public and private schools.

## Procedures and equations used in all three elementary and secondary enrollment projection models

The notation and equations that follow describe the basic procedures used to project elementary and secondary enrollments in each of the three elementary and secondary enrollment projection models.

Let:
i = Subscript denoting age
j = Subscript denoting grade
$t=$ Subscript denoting time
$T=$ Subscript of the first year in the forecast period
$N_{t}=$ Enrollment at the prekindergarten (nursery) level
$K_{t}=$ Enrollment at the kindergarten level
$G_{j, t}=$ Enrollment
$E_{t}=$ Enrollment in elementary ungraded programs
$S_{t}=$ Enrollment in secondary ungraded programs
$P_{i, t}=$ Population
$R_{j, t}=$ Progression rate
$R N_{t}=$ Enrollment rate for prekindergarten (nursery school)
$R K_{t}=$ Enrollment rate for kindergarten
$R G_{1, t}=$ Enrollment rate for grade 1
$R E_{t}=$ Enrollment rate for elementary ungraded programs
$R S_{t}=$ Enrollment rate for secondary ungraded programs.

Step 1. Calculate historical grade progression rates for each of grades 2 through 12. The first step in projecting the enrollments for grades 2 through 12 using the grade progression method was to calculate, for each grade, a progression rate for each year of actual data used to produce the projections except for the first year. The progression rate for grade $j$ in year $t$ equals

$$
R_{j, t}=G_{j, t} / G_{j-1, t-1}
$$

Step 2. Produce a projected progression rate for each of grades 2 through 12. Projections for each grade's progression rate were then produced for the forecast period using single exponential smoothing. A separate smoothing constant, chosen to minimize the sum of squared forecast errors, was used to calculate the projected progression rate for each grade. Single exponential smoothing produces a single forecast for all years in the forecast period. Therefore, for each grade $j$, the projected progression rate, $\hat{R}_{j}$, is the same for each year in the forecast period.

Step 3. Calculate enrollment projections for each of grades 2 through 12. For the first year in the forecast period, T, enrollment projections, $\hat{G}_{j, t}$, for grades 2 through 12, were produced using the projected progression rates and the enrollments of grades 1 through 11 from the last year of actual data, $T-1$. Specifically,

$$
\hat{G}_{j, T}=\hat{R}_{j} * \hat{G}_{j-1, T-1}
$$

This same procedure was then used to produce the projections for the following year, $T+1$, except that enrollment projections for year $T$ were used rather than actual numbers:

$$
\hat{G}_{j, T+1}=\hat{R}_{j} * \hat{G}_{j, T}
$$

The enrollment projections for grades 2 through 11 for year $T$ were those just produced using the grade progression method. The projection for grade 1 for year T was produced using the enrollment rate method, as outlined in steps 4,5 and 6 below.

The same procedure was used for the remaining years in the projections period.

Step 4. Calculate historical enrollment rates for prekindergarten, kindergarten, grade 1, elementary ungraded, and secondary ungraded. The first step in projecting prekindergarten, kindergarten, first-grade, elementary ungraded, and secondary ungraded enrollments using the enrollment rate method was to calculate enrollment rates for each enrollment category for the last year of actual data, $\mathrm{T}-1$, where:

$$
\begin{aligned}
R N_{t} & =N_{t} / P_{5, t} \\
R K_{t} & =K_{t} / P_{5, t} \\
R G_{1, t} & =G_{1, t} / P_{6, t} \\
R E_{t} & =E_{t} / \sum_{i=9}^{13} P_{i, t} \\
R S_{t} & =S_{\mathrm{t}} / \sum_{i=14}^{17} P_{i, t}
\end{aligned}
$$

Step 5. Produce a projected enrollment rate for prekindergarten, kindergarten, grade 1, elementary ungraded, and secondary ungraded. Projections for each category's enrollment rate were produced for the forecast period using single exponential smoothing. A separate smoothing constant, chosen to minimize the sum of squared forecast errors, was used to calculate the projected enrollment rate for each of these grades (or ungraded levels), specifically for prekindergarten, kindergarten, grade 1, elementary ungraded, and secondary ungraded. Single exponential smoothing produces a single forecast for all years in the forecast period. These enrollment rates were then used as the projected enrollment rates for each year in the forecast period ( $\widehat{R N}, \widehat{R K}, \widehat{R G}, \widehat{R E}$, and $\widehat{R S}$ ).

Step 6. Calculate enrollment projections for prekindergarten through grade 1 and the ungraded categories. For each year in the forecast period, the enrollment rates were then multiplied by the appropriate population projections from S\&P Global $\left(\hat{P}_{i, t}\right)$ to calculate enrollment projections for prekindergarten (nursery school) $\left(\hat{N}_{t}\right)$, kindergarten $\left(\hat{K}_{t}\right)$, first grade ( $\hat{G}_{l, t}$ ), elementary ungraded $\left(\hat{E}_{t}\right)$, and secondary ungraded $\left(\hat{S}_{t}\right)$.

$$
\begin{aligned}
& \hat{N}_{\mathrm{t}}=\widehat{\mathrm{RN}} * \hat{\mathrm{P}}_{5, t} \\
& \hat{\mathrm{~K}}_{\mathrm{t}}=\widehat{\mathrm{RK}} * \hat{\mathrm{P}}_{5, t} \\
& \hat{\mathrm{G}}_{1, t}=\widehat{R G}_{1} * \hat{\mathrm{P}}_{6, t} \\
& \hat{E}_{t}=\widehat{R E} * \sum_{i=1}^{11} \hat{P}_{i, t} \\
& \hat{S}_{t}=\widehat{R S} * \sum_{k=4}^{n} \hat{P}_{i, t}
\end{aligned}
$$

Step 7. Calculate total elementary and secondary enrollments by summing the projections for each grade and the ungraded categories. To obtain projections of total enrollment, projections of enrollments for the individual grades (prekindergarten through 12), elementary ungraded, and secondary ungraded were summed.

## National Elementary and Secondary Enrollment Projection Model

This model was used to project national total, public, and private school enrollments by grade level and for ungraded elementary and ungraded secondary programs. National enrollment projections for public and private schools were developed separately, then added together to yield total elementary and secondary enrollment projections for the nation. To develop these projections, enrollment data from NCES were used, along with population estimates and projections from S\&P Global. Below is information about the specific data used to develop the public school projections and the private school projections, as well as information about the grade progression rates and enrollment rates specific to public schools and private schools.

For details on procedures used to develop the projections, see "Procedures and equations used in all three elementary and secondary enrollment projection models," earlier in this section of appendix $A$.

## Data used to develop national elementary and secondary enrollment projections

Public school enrollment data. Public school enrollment data from the NCES Statistics of Public Elementary and Secondary School Systems for 1972 to 1980 and the NCES Common Core of Data (CCD) for 1981 to 2020 were used to develop the national public school enrollment projections.

Private school enrollment data. Private school enrollment data from the NCES Private School Universe Survey (PSS) for 198990, 1991-92, 1993-94, 1995-96, 1997-98, 1999-2000, 2001-02, 2003-04, 2005-06, 2007-08, 2009-10, 2011-12, 2013-14, 2015-16, 2017-18, and 2019-2020 were used to develop the national private school enrollment projections. Since the PSS is collected in the fall of odd-numbered years, data for even-numbered years without a PSS collection were estimated by interpolating grade-by-grade progression data from PSS.

Population estimates and projections used for public school enrollment projections. Population estimates for 1972 to 2020 from the U.S. Census Bureau and population projections for 2021 to 2030 from S\&P Global were also used to develop the public school enrollment projections. (See table B-1 on page 112 and table B-2 on page 113.) The set of population projections used in this year's Projections of Education Statistics are S\&P Global's May 2021 National Population Projections by age and sex. For more details on the underlying population utilized in the public school enrollment projections, see the earlier section, Demographic assumptions.

Population estimates and projections used for private school enrollment projections. Population estimates for 1989 to 2020 from the U.S. Census Bureau and population projections for 2021 to 2030 from S\&P Global were used to develop the private school enrollment projections.

## Grade progression and enrollment rates for national elementary and secondary enrollment projections

Public school grade progression and enrollment rates. Table A-5 on page 76 shows the public school grade progression rates for 2020 and projections for 2021 through 2030. Table A-6 on page 76 shows the public school enrollment rates for 2020 and projections for 2021 through 2030.

## Special note on calculating projected progression and enrollment rates during the coronavirus pandemic

Latest year of historical data. In the procedure for calculating projected progression and enrollment rates, single exponential smoothing heavily weights the most recent year of history. The most recent year of history for public school enrollments for these projections was fall 2020, the beginning of the first full school year of the coronavirus pandemic. To avoid producing a forecast based on the unprecedented public school enrollment declines in fall 2020, steps 2 and 5, above, instead treat 2019 as the last year of historical data. However, in step 3, projected progression rates were applied to enrollment levels from 2020 to produce the first year of projected enrollment levels for 2021.

Handling 2020 public school leavers. Enrollment in public schools dropped 3 percent from fall 2019 to fall 2020. Even though drops were most pronounced in prekindergarten and kindergarten, enrollments were also generally lower in grades 1 through 8, when schooling is compulsory (see Digest 2021 table 203.10 for more detail). Since enrollment in grades 1 through 8 is compulsory in the United States, it follows that students who left public schools in these grades would have sought
alternatives, rather than leaving schooling altogether. However, the latest historical data for private school enrollments was from fall 2019. Therefore, a portion of public school leavers in compulsory grades in 2020 were assumed to have enrolled in private schools. This portion was based on the percentage of nonpublic (i.e., private school students and homeschooled students) who attended private schools in 2019, according to the National Household Educational Survey (NHES).

## Accuracy of national elementary and secondary enrollment projections

Mean absolute percentage errors (MAPEs) for projections of public school enrollment were calculated using the last 36 editions of Projections of Education Statistics, while MAPEs for projections of private school enrollment were calculated using the last 18 editions. Table A, below, shows MAPEs for both public and private school enrollment projections.

Table A. Mean absolute percentage errors (MAPEs) of enrollment projections, by lead time, control of school, and grade in elementary and secondary schools: MAPEs constructed using projections from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2028

| Statistic | Lead time (years) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| Public elementary and secondary schools |  |  |  |  |  |  |  |  |  |  |
| Prekindergarten through 12 enrollment | 0.3 | 0.5 | 0.7 | 0.9 | 1.1 | 1.3 | 1.6 | 1.9 | 2.2 | 2.5 |
| Prekindergarten through grade 8 enrollment | 0.3 | 0.6 | 0.8 | 1.0 | 1.3 | 1.6 | 2.0 | 2.5 | 2.9 | 3.3 |
| Grades 9 through 12 enrollment | 0.4 | 0.6 | 0.9 | 1.1 | 1.2 | 1.4 | 1.6 | 1.8 | 2.0 | 2.2 |
| Private elementary and secondary schools |  |  |  |  |  |  |  |  |  |  |
| Prekindergarten through 12 enrollment | 3.7 | 5.5 | 5.8 | 9.8 | 8.5 | 11.7 | 9.6 | 12.2 | 10.6 | 14.2 |
| Prekindergarten through grade 8 enrollment | 3.9 | 5.6 | 5.6 | 9.8 | 8.0 | 12.0 | 9.4 | 13.2 | 12.3 | 19.2 |
| Grades 9 through 12 enrollment | 3.8 | 5.2 | 6.5 | 9.7 | 9.9 | 10.4 | 10.9 | 13.7 | 13.7 | 9.7 |

NOTE: Mean absolute percentage error is the average value over past projections of the absolute values of errors expressed in percentage terms. MAPEs for public prekindergarten through grade 12 enrollments were calculated using the last 36 editions of Projections of Education Statistics, from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2028. MAPEs for private prekindergarten through grade 12 enrollments were calculated from the past 18 editions, from Projections of Education Statistics to 2011 through Projections of Education Statistics to 2028. Calculations were made using unrounded numbers. Some data have been revised from previously published figures.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Projections of Education Statistics, various issues. (This table was prepared March 2022.)

## State Public Elementary and Secondary Enrollment Projection Model

This edition of Projections of Education Statistics contains projected trends in public elementary and secondary enrollment by grade level from 2021 to 2030 for each of the 50 states and the District of Columbia, as well as for each region of the country. The state enrollment projections were produced in two stages:
» first, an initial set of projections for each state was produced; and
» second, these initial projections were adjusted to sum to the national public enrollment totals produced by the National Elementary and Secondary Enrollment Projection Model.

For each region, the enrollment projections equaled the sum of enrollment projections for the states within that region. The states within each geographic region can be found in appendix F .

## Initial set of state projections

The same methods used to produce the national enrollment projections-namely, the grade progression rate method and the enrollment rate method-were used to produce the initial sets of public school enrollment projections for each state and the District of Columbia. A separate smoothing constant, chosen to minimize the sum of squared forecast errors, was used to calculate the projected progression rate for each combination of jurisdiction and grade.

For details on the procedures used to develop the initial sets of projections, see "Procedures and equations used in all three elementary and secondary enrollment projection models," earlier in this section of appendix A.

## Limitations of the grade progression method for state projections

The grade progression rate method assumes that past trends in factors affecting public school enrollments will continue over the forecast period. This assumption implies that all factors influencing enrollments will display future patterns consistent with past patterns. Therefore, this method has limitations when applied to states with unanticipated changes in migration rates. This method implicitly includes the net effect of such factors as migration, dropouts, deaths, nonpromotion, and transfers to and from private schools.

## Adjustments to the state projections

The initial projections of state public school enrollments were adjusted to sum to the national projections of public school prekindergarten (preK)-12, preK-8, and 9-12 enrollments shown in Digest 2021 table 105.30. This was done through the use of ratio adjustments in which all the states' initial enrollment projections for each grade level were multiplied by the ratio of the national enrollment projection for that grade level to the sum of the state enrollment projections for that grade level.

## Data used to develop state elementary and secondary enrollment projections

Public school enrollment data. Public school enrollment data from the NCES Statistics of Public Elementary and Secondary School Systems for 1980 and from the NCES Common Core of Data (CCD) for 1981 to 2020 were used to develop these projections.

Population estimates and projections. Population estimates for 1980 to 2020 from the U.S. Census Bureau and population projections for 2021 to 2030 from S\&P Global were used to develop the state-level enrollment projections. This is the fifth edition of Projections of Education Statistics to use population projections from S\&P Global rather than from the U.S. Census Bureau. The change was made because it had been many years since the Census Bureau had produced population projections at the state level. Annual estimates of state population by age and sex from 2010 through 2020 are the U.S. Census Bureau's Vintage 2020 estimates, adjusted by S\&P Global to be consistent with total population on April 1, 2020, by state reported in the 2020 Decennial Census. Annual estimates of state population by the more detailed age, sex, and race/ethnicity from 2010 through 2019 are the U.S. Census Bureau's Vintage 2019 estimates, adjusted by S\&P Global to be consistent with the national population estimates by sex and single year of age and the state estimates of total population described above.

## Accuracy of state elementary and secondary enrollment projections

MAPEs for projections of public school enrollment by state were calculated using the last 24 editions of Projections of Education Statistics. Tables A-7 through A-9 on pages 77-79 show MAPEs for preK-12, preK-8, and 9-12 enrollment in public elementary and secondary schools by state.

## National Public Elementary and Secondary Enrollment by Race/Ethnicity Projection Model

This edition of Projections of Education Statistics contains projected trends in national public elementary and secondary enrollment by race/ethnicity from 2021 to 2030. Race categories exclude persons of Hispanic ethnicity.

The enrollment projections by race/ethnicity were produced in two stages:
» first, an initial set of projections by race/ethnicity was produced; and
» second, these initial projections were adjusted to sum to the national totals.

## Initial set of projections by race/ethnicity

The same methods used to produce the national enrollment projections-namely, the grade progression rate method and the enrollment rate method-were used to produce initial sets of projections for each of the following seven racial/ethnic groups: American Indian/Alaska Native, Asian, Black, Hispanic, Pacific Islander, White, and Two or more races. A separate smoothing constant, chosen to minimize the sum of squared forecast errors, was used to calculate the projected progression rate for each combination of race/ethnicity and grade.

For details on the procedures used to develop the initial sets of projections, see "Procedures and equations used in all three elementary and secondary enrollment models," earlier in this section of appendix A.

## Adjustments to the projections by race/ethnicity

The initial projections of enrollments by race/ethnicity were adjusted to sum to the national projections of public school preK-12, preK-8, and 9-12 enrollments shown in Digest 2021 table 105.30. This was done through the use of ratio adjustments in which all the initial enrollment projections by race/ethnicity for each grade level were multiplied by the ratio of the national enrollment projection for that grade level to the sum of the initial enrollment projections by race/ethnicity for that grade level.

## Data and imputations used to develop enrollment projections by race/ethnicity

Public school enrollment data. Public school enrollment data by grade level and race/ethnicity from the NCES Common Core of Data (CCD) for 1994 to 2020 were used to develop these projections. Data for Pacific Islander students and students of Two or more races became consistently available across states in 2010. While projections by race/ethnicity were produced at the national level only, the national data used to develop these projections were constructed from state-level data on enrollment by grade level and race/ethnicity. In those instances where states did not report their enrollment data by grade level and race/ethnicity, the state-level data had to be examined and some imputations made in order to produce the national public school enrollment by grade level and race/ethnicity data. For example, in 1994, North Dakota did not report gradelevel enrollment data by race/ethnicity. It did, however, report these numbers for 1995. So, to impute these numbers for 1994, North Dakota's 1994 grade-level enrollment data were estimated by the state's 1995 racial/ethnic distribution at each grade level.

Population estimates and projections. Population estimates for 2000 to 2019 from the U.S. Census Bureau and population projections for 2020 to 2030 from S\&P Global were used to develop the enrollment projections by race/ethnicity. The set of population projections used in this year's Projections of Education Statistics are S\&P Global's May 2021 National Population Projections by age, sex, and race/ethnicity. For more details on the underlying population utilized in the enrollment projections by race/ethnicity, see the earlier section, Demographic assumptions.

## Accuracy of enrollment projections by race/ethnicity

MAPEs for projections of public school enrollment by race/ethnicity were calculated using the last 10 editions of Projections of Education Statistics. Table B, below, shows MAPEs for public school enrollment by race/ethnicity projections.

Table B. Mean absolute percentage errors (MAPEs) of enrollment projections, by lead time and race/ethnicity: MAPEs constructed using projections from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2028

| Statistic | Lead time (years) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| Total enrollment | 0.3 | 0.5 | 0.7 | 1.0 | 1.1 | 1.3 | 1.6 | 1.9 | 2.2 | 2.5 |
| American Indian/Alaska Native | 1.4 | 2.3 | 4.0 | 5.4 | 7.4 | 10.0 | 13.9 | 18.3 | 30.3 | 33.9 |
| Asian/Pacific Islander | 0.7 | 1.7 | 2.7 | 3.5 | 4.5 | 5.3 | 5.9 | 6.1 | 8.3 | 10.3 |
| Black | 0.6 | 1.3 | 1.9 | 2.3 | 2.5 | 2.1 | 2.7 | 3.7 | 6.3 | 6.9 |
| Hispanic | 0.8 | 1.0 | 1.2 | 1.5 | 2.2 | 3.0 | 3.7 | 3.9 | 3.7 | 4.0 |
| White | 0.4 | 0.8 | 1.3 | 1.7 | 2.3 | 2.8 | 3.9 | 5.1 | 8.5 | 10.4 |

Table A-5. Actual and projected national public school grade progression rates: Fall 2020, and fall 2021 through fall 2030

| Grade | Actual 2020 | Projected 2021 through 2030 |
| :---: | :---: | :---: |
| 1 | 2 | 3 |
| 1 to 2 | 96.8 | 99.9 |
| 2 to 3 | 97.7 | 100.8 |
| 3 to 4 | 97.9 | 99.8 |
| 4 to 5 | 98.4 | 100.4 |
| 5 to 6 | 98.6 | 100.4 |
| 6 to 7 | 99.1 | 100.6 |
| 7 to 8 | 99.3 | 100.4 |
| 8 to 9 | 103.9 | 106.8 |
| 9 to 10 | 96.4 | 96.6 |
| 10 to 11 | 95.6 | 95.4 |
| 11 to 12 | 99.8 | 99.1 |

NOTE: The progression rate for a particular grade in a year equals the enrollment in the grade for that year divided by the enrollment in the previous grade in the previous year all multiplied by 100 . For example, the progression rate for third-graders in 2020 equals the enrollment of third-graders in 2020 divided by the enrollment of second-graders in 2019, all multiplied by 100. Progression rates for fall 2020 were impacted by the coronavirus pandemic. Progression rates for the projected period are based on historical progression rates through fall 2019.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2019-20 and 2020-21; and National Elementary and Secondary Enrollment Projection Model, through 2030. (This table was prepared March 2022.)

Table A-6. Actual and projected national enrollment rates in public schools, by grade level: Fall 2020, and fall 2021 through fall 2030

| Grade | Actual 2020 |  |
| :--- | ---: | ---: |
| 1 | 2 | Projected 2021 through 2030 |
| Prekindergarten | 30.3 |  |
| Kindergarten | 82.9 |  |
| Grade 1 | 86.7 | 39.1 |
| Elementary ungraded | 0.2 | 9.7 |
| Secondary ungraded | 0.2 | 9.2 |

NOTE: The enrollment rate for each grade level equals the enrollment at that grade level divided by the population of that grade's base age, all multiplied by 100 . The base age for each grade level is as follows: prekindergarten and kindergarten, 5 years old; grade 1, 6 years old; elementary ungraded, 5 to 13 years olds; and secondary ungraded, 14 to 17 years olds. Enrollment rates for fall 2020 were impacted by the coronavirus pandemic. Enrollment rates for the projected period are based on historical enrollment rates through fall 2019.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "State Nonfiscal Survey of Public Elementary/Secondary Education," 2020-21; and National Elementary and Secondary Enrollment Projection Model, through 2030. (This table was prepared March 2022.)

Table A-7. Mean absolute percentage errors (MAPEs) for projected prekindergarten through grade 12 enrollment in public elementary and secondary schools, by lead time, region, and state: MAPEs constructed using projections from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2028

NOTE: Mean absolute percentage error (MAPE) is the average value over past projections of the absolute values of errors expressed in percentage terms. National MAPEs for public prekindergarten through grade 12 enrollments were calculated using the last 36 editions of Projections of Education Statistics, from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2028. State MAPEs were calculated using the last 24 editions of Projections of Education Statistics, from Projections
of Education Statistics to 2005 through Projections of Education Statistics to 2028. Calculations were made using unrounded numbers. Some data have been revised from previously published figures. SOURCE:U.S. Department of Education, National Center for Education Statistics, Projections of Education Statistics, various issues. (This table was prepared March 2022.)

| Wyoming | 0.7 | 1.1 | 1.7 | 2.5 | 3.6 | 4.5 | 5.7 | 6.9 | 8.2 | 8.8 |

NOTE: Mean absolute percentage error (MAPE) is the average value over past projections of the absolute values of errors expressed in percentage terms. National MAPEs for public grades 9 through 12 enrollments were calculated using the last 36 editions of Projections of Education Statistics, from Projections of Education Statistics to 1984-85 through Projections of Education Statistics to 2028. State MAPEs were calculated using the last 24 editions of Projections of Education Statistics, from Projections of Education

Statistics to 2005 through Projections of Education Statistics to 2028. Calculations were made using unrounded numbers. Some data have been revised from previously published figures.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Projections of Education Statistics, various issues. (This table was prepared March 2022.)

## A.2. ELEMENTARY AND SECONDARY TEACHERS

## Projections in this edition

This edition of Projections of Education Statistics presents projected trends in elementary and secondary teachers, pupil/ teacher ratios, and new teacher hires from 2019 to 2030. These projections were made using two models:
» The Elementary and Secondary Teacher Projection Model was used to project the number of public school teachers, the number of private school teachers, and the total number of teachers for the nation. It was also used to project pupil/ teacher ratios for public schools, private schools, and all elementary and secondary schools.
» The New Teacher Hires Projection Model was used to project the number of new teacher hires in public schools, private schools, and all schools.

## Overview of approach

## Approach for numbers of teachers and pupil/teacher ratios

Public schools. Linear regression was used to produce initial projections of public school pupil/teacher ratios separately for elementary and secondary schools. The initial projections of elementary pupil/teacher ratios and secondary pupil/teacher ratios were applied to enrollment projections to project the numbers of elementary teachers and secondary teachers, which were summed to get the total number of public school teachers. Final projections of the overall public school pupil/teacher ratios were produced by dividing total projected public school enrollment by the total projected number of public school teachers.

## Assumptions underlying this method

This method assumes that past relationships between the public school pupil/teacher ratio (the dependent variable) and the independent variables used in the regression analysis will continue throughout the forecast period. For more information about the independent variables, see "Elementary and Secondary Teacher Projection Model," later in this section of appendix A.

Private schools. Private school teachers were projected by applying the ratio of private school teachers to public school teachers in 2019 to each year's projected number of public school teachers. This was done separately for elementary and secondary teachers, which were summed to get the total number of private school teachers. The projections for private pupil/ teacher ratios were produced by dividing total projected private school enrollment by the total projected number of private school teachers.

## Assumptions underlying this method

This method assumes that the future pattern in the trend of private school teachers will be the same as that for public school teachers. The reader is cautioned that a number of factors could alter the assumption of consistent patterns of change in private/public teacher ratios over the forecast period.

## Approach for new teacher hires

The following numbers were projected separately for public schools and for private schools:
» The number of teachers needed to fill openings when there is an increase in the size of the teaching workforce from one year to the next and the decrease in the number of replacement teachers needed if there is a decrease in the size of the teaching workforce from one year to the next. This number was estimated based on continuation rates of teachers by their age.
» The number of teachers needed to fill openings due to an increase in the size of the teaching workforce from one year to the next. This number was estimated by subtracting the projected number of teachers in one year from the projected number of teachers in the next year.

These two numbers were summed to yield the total number of "new teacher hires" for each control (public or private) of school-that is, teachers who will be hired in a given year, but who did not teach in that control the previous year. A teacher who moves from one control to the other control (i.e., from a public to private school or from a private to a public school) is considered a new teacher hire, but a teacher who moves from one school to another school in the same control is not considered a new teacher hire.

## ELEMENTARY AND SECONDARY TEACHER PROJECTION MODEL

Projections for public schools were produced first. Projections for private schools were produced based partially on input from the public school projections. Finally, the public and private school projections were combined into total elementary and secondary school projections (not shown in the steps below).

## Steps used to project numbers of teachers and pupil/teacher ratios

Public school teachers. The following steps were used for the public school projections:
Step 1. Produce projections of pupil/teacher ratios for public elementary schools and public secondary schools separately. Two separate regression models were developed-one for elementary schools and one for secondary schools. The independent variables for each of the equations are as follows:
» Independent variables for public elementary school pupil/teacher ratios-(1) level of education revenue from state sources in constant dollars per public elementary student. The equation for elementary schools includes an error correction term to capture the long-term relationship between the elementary pupil-to-teacher ratio and state education funding per elementary student.
» Independent variables for public secondary school pupil/teacher ratios-(1) level of education revenue from state sources in constant dollars per public secondary student, and (2) the number of students enrolled in public secondary schools relative to the secondary school-age population.

To estimate the model, each equation was first transformed into nonlinear dlog-dlog form and then the coefficients were estimated by applying Marquardt nonlinear least squares to the public secondary school pupil/teacher ratio equation and least squares estimation to the public elementary school pupil/teacher ratio equation.

For details on the equations, model statistics, and data used to project public school pupil/teacher ratios, see "Data and equations used for projections of teachers and pupil/teacher ratios," below.

Step 2. Produce projections of the number of teachers for public elementary schools and public secondary schools separately. The projections of the public elementary pupil/teacher ratio and public secondary pupil/teacher ratio were applied to projections of enrollments in elementary schools and secondary schools, respectively, to produce projections of public elementary teachers and public secondary teachers.

Step 3. Produce projections of the total number of teachers for public elementary and secondary schools combined. The projections of public elementary teachers and public secondary teachers were added together to produce the projections of the total number of public elementary and secondary teachers.

Step 4. Produce projections of the pupil/teacher ratio for public elementary and secondary schools combined. The projections of total enrollment in public elementary and secondary schools were divided by the projections of the total number of public elementary and secondary teachers to produce projections of the overall pupil/teacher ratio in public elementary and secondary schools.

Private school teachers. The following steps were used for the private school projections:
Step 1. Produce projections of the elementary and secondary private teachers to public teachers ratio. First, the historical ratio of elementary private teachers to elementary public teachers and secondary private school teachers to secondary public school teachers were generated through the last historical year for which both public and private data exist. Then, given the typical one-year lag in the private school data, the ratio of private teachers to public teachers for both elementary and secondary were calculated for the missing year of private data by setting the missing year equal to the last historical estimate. This method was applied throughout the forecast period such that the elementary and secondary private teachers to public teachers ratio throughout the projections period equaled the last historical ratio-for the projections through 2030, that year was 2019.

Step 2. Produce projections of the number of private school teachers. The projected public teachers/private teachers ratios were applied to projected public school teachers to produce projections of private school teachers from 2020 through 2030 for both elementary and secondary levels.

For information about the private school teacher and enrollment data used for the private school projections, see "Data and equations used for projections of teachers and pupil/teacher ratios," below.

## Data and equations used for projections of teachers and pupil/teacher ratios

Public school data used in these projections were by organizational level (i.e., school level), not by grade level. Thus, secondary school enrollment is not the same as enrollment in grades 9 through 12 because many jurisdictions count some grade 7 and 8 enrollment as secondary. For example, some jurisdictions may have 6 -year high schools with grades 7 through 12.

Data used to estimate the equation for public elementary school pupil/teacher ratios. The following data were used to estimate the equation:
» To compute the historical elementary school pupil/teacher ratios, data on 1972-73 to 1980-81 enrollments in public elementary schools came from the NCES Statistics of Public Elementary and Secondary Day Schools and data on 1981-82 to 2019-20 enrollment came from the NCES Common Core of Data (CCD). The proportion of public school teachers who taught in elementary schools was taken from the National Education Association and then applied to the total number of public school teachers from the CCD to produce the number of teachers in elementary schools.
» For 1973-74 and 1975-76, the education revenue from state sources data came from Statistics of State School Systems, published by NCES. For 1972-73, 1974-75, and 1976-77, the education revenue from state sources data came from Revenues and Expenditures for Public Elementary and Secondary Education, also published by NCES. For 1977-78 through 2018-19, these data came from the NCES Common Core of Data (CCD).

Estimated equation and model statistics for public elementary school pupil/teacher ratios. For the estimated equation and model statistics, see table A-10 on page 85 . In the public elementary pupil/teacher ratio equation, the independent variable affects the dependent variable in the expected ways:
» As the level of education revenue from state sources in constant dollars per public elementary student increases, the pupil/teacher ratio decreases.

Data used to project public elementary school pupil/teacher ratios. The estimated equation was run using projected values for education revenues from state sources from 2019-20 through 2030-31. For more information, see Section A.0. Introduction to Projection Methodology, earlier in this appendix and Section A.4. Expenditures for Public Elementary and Secondary Education later in this appendix.

Data used to estimate the equation for public secondary school pupil/teacher ratios. The following data were used to estimate the equation:
» To compute the historical secondary school pupil/teacher ratios-Data on 1972-73 to 1980-81 enrollments in public secondary schools came from the NCES Statistics of Public Elementary and Secondary Day Schools and data on 1981-82 to 2019-20 enrollment came from the NCES Common Core of Data (CCD). The proportion of public school teachers who taught in secondary schools was taken from the National Education Association and then applied to the total number of public school teachers from the CCD to produce the number of teachers in secondary schools.
» For 1973-74 and 1975-76, the education revenue from state sources data came from Statistics of State School Systems, published by NCES. For 1972-73, 1974-75, and 1976-77, the education revenue from state sources data came from Revenues and Expenditures for Public Elementary and Secondary Education, also published by NCES. For 1977-78 through 2018-19, these data came from the NCES Common Core of Data (CCD).
» To compute the historical secondary school enrollment rate-Data on the secondary school-age population from 1972-73 to 2019-20 came from the U.S. Census Bureau. Data on enrollments in public secondary schools during the same period came from the CCD, as noted above.

Estimated equation and model statistics for public secondary school pupil/teacher ratios. For the estimated equation and model statistics, see table A-10 on page 85. In the public secondary pupil/teacher ratio equation, the independent variables affect the dependent variable in the expected way:
» As the level of education revenue from state sources in constant dollars per public secondary student increases, the pupil/ teacher ratio decreases.
» As enrollment rates (number of enrolled students relative to the school-age population) increase, the pupil/teacher ratio increases; and

Data used to project public secondary school pupil/teacher ratios. The estimated equation was run using projections for education revenues, public secondary enrollments, and secondary school-age populations from 2019-20 through 2030-31. Secondary enrollment projections were derived from the enrollment projections described in Section A.1. Elementary and Secondary Enrollment. Population projections were from S\&P Global's May 2021 National Population Projections by age and sex. For more details on the underlying population utilized in the public school enrollment projections, see the earlier section, Demographic assumptions.

Private school teacher and enrollment data. Private school data for 1989-90, 1991-92, 1993-94, 1995-96, 1997-98, 19992000, 2001-02, 2003-04, 2005-06, 2007-08, 2009-10, 2011-12, 2013-14, 2015-16, 2017-18, and 2019-20 came from the biennial NCES Private School Universe Survey (PSS). Since the PSS is collected in the fall of odd-numbered years, data for years without a PSS collection were estimated using data from the PSS.

Private school enrollment projections. Private school enrollments from 2020 to 2030 came from the projections described in Section A.1. Elementary and Secondary Enrollment, earlier in this appendix.

## Accuracy of projections of numbers of teachers

Mean absolute percentage errors (MAPEs) for projections of public school teachers were calculated using the last 29 editions of Projections of Education Statistics that included projections of teachers. Table C shows MAPEs for projections of the numbers of public school teachers. No MAPEs were calculated for private elementary and secondary teachers as this is the second edition of Projections of Education Statistics to use the new Private Elementary and Secondary Teachers Model. For information concerning the accuracy of the previous models used to produce projections of private elementary and secondary teachers, see page 91 of Projections of Education Statistics to 2027.

For more information about MAPEs, see Section A.O. Introduction to Projection Methodology, earlier in this appendix.
Table C. Mean absolute percentage errors (MAPEs) of projections of number of public elementary and secondary school teachers, by lead time: MAPEs constructed using projections from Projections of Education Statistics to 1997-98 through Projections of Education Statistics to 2028

| Statistic | Lead time (years) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| Public elementary and secondary teachers | 0.7 | 1.3 | 1.5 | 2.1 | 2.7 | 3.6 | 4.6 | 5.4 | 6.0 | 6.6 |

 figures. Number of teachers reported in full-time equivalents.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Projections of Education Statistics, various issues. (This table was prepared March 2022.)

## New Teacher Hires Projection Model

The New Teacher Hires Projection Model was estimated separately for public and private school teachers. The model produces projections of the number of teachers who were not teaching in the previous year, but who will be hired in a given year.

## About new teacher hires

A teacher is considered to be a new teacher hire for a control of school (public or private) for a given year if the teacher teaches in that control that year but had not taught in that control in the previous year. Included among new teachers hires are: (1) teachers who are new to the profession; (2) teachers who had taught previously but had not been teaching the previous year; and (3) teachers who had been teaching in one control the previous year but have moved to the other control. Concerning the last category, if a teacher moves from one public school to a different public school, that teacher would not be counted as a new teacher hire for the purposes of this model. On the other hand, if a teacher moves from a public school to a private school, that teacher would be counted as a private school new teacher hire, since the teacher did not teach in a private school in the previous year.

The New Teacher Hires Projection Model measures the demand for teacher hires. Due to difficulties in defining and measuring the pool of potential teachers, no attempt was made to measure the supply of new teacher candidates.

## Steps used to project numbers of new teacher hires

The steps outlined below provide a general summary of how the New Teacher Hires Projection Model was used to produce projections of the need for new teacher hires.

First, the series of steps outlined below was used to produce projections of public school new teacher hires. Then, the same steps were used to produce projections of private school new hires. Finally, the public and private new teacher hires were combined to produce projections of total new teacher hires.

Step 1. Estimate the age distribution of full-time-equivalent (FTE) teachers in 2017-18 (the most recent year of data available from the National Teacher and Principals Survey [NTPS]). For this estimate, the age distribution of the headcount of school teachers (including both full-time and part-time teachers) in 2017-18 was applied to the national number of FTE teachers in the same year.

Step 2. Project the number of new FTE teacher hires needed to replace those who left teaching between 2017-18 and 2018-19.
» Age-specific continuation rates from 2011-12 to 2012-13 for public school teachers and 2007-08 to 2008-09 for private school teachers (based on latest available data from the Teacher Follow-Up Survey) were applied to the FTE count of teachers by age for fall 2017, resulting in estimates of the number of FTE teachers who remained in teaching in fall 2018 by individual age.
» The FTE teachers who remained in teaching by individual age were summed across all ages to produce a projection of the total number of FTE teachers who remained teaching in fall 2018.
» The total projection of remaining FTE teachers in fall 2018 was subtracted from the total FTE teacher count for 2017 to produce the projected number of FTE teachers who left teaching.

Step 3. Project the number of new FTE teacher hires needed due to the overall increase in the teacher workforce between fall 2017 and 2018. The total number of FTE teachers in fall 2017 was subtracted from the total projected number of FTE teachers in 2018 to project the overall increase in the teaching workforce between 2017 and 2018.

Step 4. Project the total number of new FTE teacher hires needed in 2018-19. The number of FTE teachers who left teaching from step 2 was added to the projected net change in the number of FTE teachers from step 3 to project the total number of new FTE teacher hires needed in 2017-18.

Step 5. Project the FTE count of teachers by age for 2017-18. In this step
» The age distribution for the headcount of newly hired teachers in 2017-18 was applied to the projected total number of new FTE teacher hires in fall 2018, resulting in the projected number of new FTE teacher hires by age.
» For each individual age, the projected number of new FTE teacher hires was added to the projected number of remaining FTE teachers (from step 2, first bullet) to produce the projected FTE count of teachers by age for fall 2018.

Step 6. Repeat steps 2 to 5 for each year from 2019-20 through 2030-31.
» In step 2, teacher ages were capped at 80 .
» In step 3, projections of the numbers of FTE teachers were used for all years in which there were no actual teacher numbers. The projections of FTE teachers are described under "Elementary and Secondary Teacher Projection Model," earlier in this section of appendix A .

## Assumptions underlying this method

A number of assumptions are made in order to make these projections. They include that (1) the age distribution of FTE teachers in 2017-18 was similar to that of full-time and part-time teachers in that year (step 1); (2) the age-specific continuation rates for FTE teachers for each year from 2018-19 through 2030-31 are similar to the values for 2017-18, depending on the age of the teachers (step 2); (3) the age distribution for newly hired FTE teachers from fall 2018 through fall 2030 is similar to that of newly hired full-time and part-time teachers in 2017-18 (step 3); (4) the actual numbers of FTE teachers for each year from 2018-19 through 2030-31 are similar to projections of FTE teachers shown in Digest 2021 table 208.20; and (5) no economic or political changes further affect the size of the teaching force.

## Data used for projections of new teacher hires

Data on numbers of public school teachers. The number of FTE teachers for fall 2017, fall 2018, and fall 2019 came from the NCES Common Core of Data (CCD).

Data on numbers of private school teachers. Private school data on the numbers of FTE teachers in 2017-18 and 2019-20 came from the biennial NCES Private School Universe Survey (PSS). Since the PSS is collected in the fall of odd-numbered years, data for years without a PSS collection were estimated using data from the PSS.

Data on the age distribution of public and private school teachers. Data on the age distribution of full-time and part-time public and private school teachers came from the National Teacher and Principal Survey (NTPS), 2017-18. These data and their standard errors are shown in table A-11 on page 86.

Data on the age distribution of public and private new teacher hires. Data on the age distribution of newly hired fulltime and part-time public and private school teachers came from the National Teacher and Principal Survey (NTPS), 2017-18. These data and their standard errors are shown in table A-12 on page 86.

Data on the projections of age-specific continuation rates of public and private school teachers. The 2007-08 to 2008-09 continuation rates came from the 2008-09 NCES Teacher Follow-Up Survey (TFS) and the 2011-12 to 2012-13 continuation rates came from the 2012-13 TFS. The actual data, their standard errors, and the projections are shown in table A-13 on page 87.

Projections of the numbers of public and private elementary and secondary school teachers. These projections are described under "Elementary and Secondary Teacher Projection Model," earlier in this section of appendix A.

## Accuracy of projections of new teacher hires

No MAPEs are presented for new teacher hires as there has only been four additional years of historical data for this statistic since it was first included in Projections of Education Statistics to 2018.

Table A-10. Estimated equations and model statistics for public elementary and secondary teachers based on data from 1972 through 2019

${ }^{1}$ Standard errors in parentheses. D() refers to the first difference of a variable, or the difference between the variable at time $t$ and time $t-1$. This transformation is used in models to make the data series "stationary," meaning that it has the same statistical properties over time. LN() refers to the natural $\log$ of a variable. ELEM_ECT is included in the elementary teachers model to capture the long-term relationship between the elementary pupil-to-teacher ratio and state education funding per elementary student.
${ }^{2}$ The number in parentheses is the probability of the Chi-Square associated with the Breusch-Godfrey Serial Correlation LM Test. A p value greater that 0.05 implies that we do not reject the null hypothesis of no autocorrelation at the 5 percent significance level for a two-tailed test and 10 percent significance level for a one-tailed test, i.e., there is no autocorrelation present. For an explanation of the Breusch-Godfrey Serial Correlation LM test statistic, see Greene, W. (2000). Econometric Analysis. New Jersey: Prentice-Hall. NOTE: Adjusted $R^{2}$ indicates the coefficient of determination adjusted for the number of explanatory variables. RELENRPU_TCH = Ratio of public elementary school enrollment to classroom teachers (i.e., pupil/teacher ratio).

RSCENRPU_TCH = Ratio of public secondary school enrollment to classroom teachers (i.e., pupil/teacher ratio). TSGRANT/ELENRPU = State education revenue per public elementary pupil in constant dollars (index 2012 = 100).
TSGRANT/SCENRPU = State education revenue per public secondary pupil in constant dollars (index $2012=100$ ).
RSCENRPU/N11TO18 = Ratio of enrollment in public secondary schools to the 11-to 18-year-old population. ELEM_ECT (Elementary Error Correction Term) = LN(RELENRPU_TCH(-1))-0.3*LN([TSGRANT) ELENRPU](-1)), where the (-1) term indicates that the variable is lagged by one year. @DURING("2010") = Dummy variable to account for a structural shift in historical data in 2010. @DURING("2012") = Dummy variable to account for a structural shift in historical data in 2012. SOURCE: U.S. Department of Education, National Center for Education Statistics, Elementary and Secondary Teacher Projection Model. (This table was prepared April 2022.)

Table A-11. Percentage distribution of full-time and part-time school teachers, by age group, control of school, and teaching status: School years 2011-12, 2015-16, and 2017-18

$\dagger$ Not applicable.
! Interpret data with caution. The coefficient of variation (CV) for this estimate is between 30 and 50 percent. NOTE: Detail may not sum to totals because of rounding. Standard errors appear in parentheses. Some data have been revised from previously published figures.

## A.3. HIGH SCHOOL GRADUATES

## Projections in this edition

This edition of Projections of Education Statistics presents projected trends in the number of high school graduates from 2013-14 to 2030-31. These projections were made using three models:
» The National High School Graduates Projection Model was used to project the number of public high school graduates, the number of private high school graduates, and the total number of high school graduates for the nation.
» The State Public High School Graduates Projection Model was used to project the number of public high school graduates for individual states and regions.
» The National Public High School Graduates by Race/Ethnicity Projection Model was used to project the number of public high school graduates for the nation by race/ethnicity.

## Overview of approach

All the high school graduates models first calculated the number of high school graduates as a percentage of grade 12 enrollment based on historical data. Single exponential smoothing was used to project this percentage. The projected percentage was then applied to projections of grade 12 enrollment.

## Assumptions underlying this approach

The percentage of 12th-graders who graduate was assumed to remain constant at levels consistent with the most recent rates. This methodology assumes that past trends in factors affecting graduation rates, such as dropouts, migration, and public or private transfers, will continue over the forecast period. No specific assumptions were made regarding the dropout rate, retention rate, or the rate at which alternative credentials are awarded. The combined effect of these proportions is reflected implicitly in the graduate proportion. In addition to student behaviors, the projected number of graduates could be affected by changes in graduation requirements, but this is not considered in the projections in this report.

## Procedures used in all three high school graduates projection models

The following steps were used to project the numbers of high school graduates:
Step 1. For each year in the historic period, express the number of high school graduates as a percentage of grade 12 enrollment. This value represents the approximate percentage of 12th graders who graduate. For information about the specific historical data and analysis periods used for the National High School Graduates Model, the State Public High School Graduates Model, and the National Public High School Graduates by Race/Ethnicity Model, see the description of the appropriate model, later in this section of appendix A.

Step 2. Project the percentage of 12th-graders who graduate from step 1. This percentage was projected using single exponential smoothing with a smoothing constant chosen to minimize the sum of squared forecast errors. Because single exponential smoothing produces a single forecast for all years in the forecast period, the same projected percentage of grade 12 enrollment was used for each year in the forecast period.

Step 3. Calculate projections of the numbers of high school graduates. For each year in the forecast period, the projected percentage from step 2 was applied to projections of grade 12 enrollment to yield projections of high school graduates.

## National High School Graduates Projection Model

This model was used to project the number of public high school graduates, the number of private high school graduates, and the total number of high school graduates for the nation. Public and private high school graduates were projected separately. The public and private projections were then summed to yield projections of the total number of high school graduates for the nation.

For details of the procedures used to develop the projections, see "Procedures used in all three high school graduates projection models," above.

## Data used in the National High School Graduates Projection Model

Public school data on graduates and grade 12 enrollment. Data on public school high school graduates and 12th-grade enrollments from the NCES Statistics of Public Elementary and Secondary School Systems for 1972-73 to 1980-81 and the NCES Common Core of Data (CCD) for 1981-82 through 2005-06 were used to develop national projections of public high school. Also, for 2006-07 through 2012-13 data on high school graduates from the "State Dropout and Completion Data File" were used. Finally, for 2006-07 through 2020-21, data on public school 12th-grade enrollments from the CCD were also used.

Private school data on graduates and grade 12 enrollment. Data on private school 12th-grade enrollments for 1989-90 through 2019-20 and high school graduates for 1988-89 through 2018-19 were used to develop national projections of private high school graduates. The data were from the biennial NCES Private School Universe Survey (PSS) from 1989-90 to 2019-20 with data for 12th grade enrollment the same as the year of the survey and the data for high school graduates for the preceding year (i.e., the 2019-20 PSS presents high school graduates for 2018-19). Since the PSS is collected in the fall of odd-numbered years, data for missing years were estimated using data from the PSS. For 12th grade enrollment, estimates for missing years were linear interpolations of the prior year's and succeeding year's actual values. For high school graduates, estimates for the missing years were the interpolations of the high school graduates to estimated 12th grade enrollment percentages for the prior and succeeding years multiplied by the estimated enrollments for the current year.

Public and private school enrollment projections for grade 12. Projections of grade 12 enrollment in public schools and in private schools were used to develop projections of public high school graduates and private high school graduates, respectively. The grade 12 enrollment projections were made using the grade progression method. For more information, see Section A.1. Elementary and Secondary Enrollment, earlier in this appendix.

## Accuracy of national high school graduates projections

Mean absolute percentage errors (MAPEs) for projections of graduates from public high schools were calculated using the last 29 editions of Projections of Education Statistics, while MAPEs for projections of graduates from private high schools were calculated using the last 18 editions. Table D, below, shows MAPEs for both public and private school graduation projections.

Table D. Mean absolute percentage errors (MAPEs) of projections of high school graduates, by lead time and control of school: MAPEs constructed using projections from Projections of Education Statistics to 2000 through Projections of Education Statistics to 2028

| Statistic | Lead time (years) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| Public high school graduates | 1.0 | 1.1 | 1.8 | 2.2 | 2.5 | 2.9 | 3.5 | 4.2 | 4.8 | 5.1 |
| Private high school graduates | 3.0 | 2.2 | 5.9 | 5.5 | 10.4 | 9.9 | 12.5 | 12.5 | 11.0 | 12.8 |

NOTE: Mean absolute percentage error is the average value over past projections of the absolute values of errors expressed in percentage terms. MAPEs for public high school graduates were calculated from the past 29 editions of Projections of Education Statistics, from Projections of Education Statistics to 2000 through Projections of Education Statistics to 2028. MAPEs for private high school graduates were calculated from the past 18 editions of Projections of Education Statistics, from Projections of Education Statistics to 2011 through Projections of Education Statistics to 2028 . Calculations were made using unrounded numbers. Some data have been revised from previously published figures.

## State Public High School Graduates Projection Model

This edition of Projections of Education Statistics contains projections of public high school graduates from 2013-14 to 2030-31 for each of the 50 states and the District of Columbia, as well as for each region of the country. The state projections of high school graduates were produced in two stages:
» first, an initial set of projections for each state was produced; and
» second, these initial projections were adjusted to sum to the national public school totals produced by the National High School Graduates Projection Model.

For each region, the high school graduate projections equaled the sum of high school graduate projections for the states within that region.

## Initial set of state projections

The same steps used to produce the national projections of high school graduates were used to produce an initial set of projections for each state and the District of Columbia. A separate smoothing constant, chosen to minimize the sum of squared forecast errors, was used to calculate the projected percentage of 12th grade enrollment for each jurisdiction.

For details on the steps used to develop the initial sets of projections, see "Procedures used in all three high school graduate projection models," earlier in this section of appendix A.

## Adjustments to the state projections

The initial projections of state public high school graduates were adjusted to sum to the national projections of public high school graduates shown in Digest 2021 table 219.10. This was done through the use of ratio adjustments in which all the states' high school graduate projections were multiplied by the ratio of the national public high school graduate projection to the sum of the state public high school graduate projections.

## Data used in the State Public High School Graduates Projection Model

Public school data on graduates and grade 12 enrollment at the state level. State-level data on public school high school graduates from the NCES Statistics of Public Elementary and Secondary School Systems for 1972-73 to 1980-81, the NCES Common Core of Data (CCD) for 1981-82 through 2004-05, and the "State Dropout and Completion Data File" for 2005-06 through 2012-13 were used to develop state-level projections of public high school graduates. State-level data on public school 12th-grade enrollments from the NCES Statistics of Public Elementary and Secondary School Systems for 1972-73 to 1980-81 and the NCES Common Core of Data (CCD) for 1981-82 through 2020-21 were also used.

Public school projections for grade 12 enrollment at the state level. State-level projections of grade 12 enrollment in public schools were used to develop the state-level projections of public high school graduates. The grade 12 enrollment projections were made using the grade progression method. For more information, see Section A.1. Elementary and Secondary Enrollment, earlier in this appendix.

## Accuracy of state public high school graduate projections

Mean absolute percentage errors (MAPEs) for projections of the number of public high school graduates by state were calculated using the last 24 editions of Projections of Education Statistics. Table A-14 on page 92 shows MAPEs for the number of high school graduates by state.

## National Public High School Graduates by Race/Ethnicity Projection Model

The projections of public high school graduates by race/ethnicity were produced in two stages:
» first, an initial set of projections for each racial/ethnic group was produced; and
» second, these initial projections were adjusted to sum to the national public school totals produced by the National High School Graduates Projection Model.

## Initial set of projections by race/ethnicity

The same steps used to produce the national projections of high school graduates were used to produce an initial set of projections for each of the following five racial/ethnic groups: American Indian/Alaska Native, Asian, Black, Hispanic, Pacific Islander, White, and Two or more races. For example, the number of White public high school graduates was projected as a percentage of White grade 12 enrollment in public schools. A separate smoothing constant, chosen to minimize the sum of squared forecast errors, was used to calculate the projected percentage of 12th-grade enrollment for each racial/ethnic group. As noted above, data for Pacific Islander students and students of Two or more races was consistently reported beginning in 2010. Because of the short time series of historical data available for these groups, exponential smoothing was not used to project high school graduates. To produce an initial set of projections for these racial/ethnic groups, the 2012-13 ratio of 12thgrade enrollment to high school graduates of the group were multiplied by the 12th-grade enrollment projections of the group from the data file used to produce Digest 2021 table 203.50.

## Adjustments to the projections by race/ethnicity

The projections of public high school graduates by race/ethnicity were adjusted to sum to the national projections of public high school graduates shown in Digest 2021 table 219.10. This was done through the use of ratio adjustments in which all high school graduate projections by race/ethnicity were multiplied by the ratio of the national high school graduate projection to the sum of the high school projections by race/ethnicity.

## Data and imputations used in the Public High School Graduates by Race/Ethnicity Projection Model

Public school data on graduates and grade 12 enrollment by race/ethnicity. Data on public school high school graduates by race/ethnicity from the NCES Common Core of Data (CCD) for 1994-95 through 2004-05, and the "State Dropout and Completion Data File" for 2005-06 through 2012-13 were used to develop projections of public high school graduates by race/ ethnicity. Data on public school 12th-grade enrollments by race/ethnicity from the NCES Statistics of Public Elementary and Secondary School Systems for 1972-73 to 1980-81 and the NCES Common Core of Data (CCD) for 1981-82 through 2020-21 were also used. In those instances where states did not report their high school graduate data by race/ethnicity, the state-level data had to be examined and some imputations made. For example, in 1994, Arizona did not report high school graduate data by race/ethnicity. It did, however, report grade 12 enrollment numbers by race/ethnicity for that year. So, to impute the high school graduate numbers by race/ethnicity for that year, Arizona's total number of high school graduates for 1994 was multiplied by the state's 1994 racial/ethnic distribution for grade 12 enrollment.

Public enrollment projections for grade 12 by race/ethnicity. Projections of grade 12 enrollment in public schools by race/ethnicity were used to develop the projections of public high school graduates by race/ethnicity. The grade 12 enrollment projections were made using the grade progression method. For more information, see Section A.1. Elementary and Secondary Enrollment, earlier in this appendix.

## Accuracy of public high school graduate projections by race/ethnicity

Mean absolute percentage errors (MAPEs) for projections of the number of public high school graduates by race/ethnicity were calculated using the last 10 editions of Projections of Education Statistic. Table E, below, shows MAPEs for public high school graduates by race/ethnicity projections.

Table E. Mean absolute percentage errors (MAPEs) of projections of public high school graduates, by lead time and race/ethnicity: MAPEs constructed using projections from Projections of Education Statistics to 2000 through Projections of Education Statistics to 2028

| Statistic | Lead time (years) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| Total high school graduates | 1.0 | 1.1 | 1.8 | 2.2 | 2.5 | 2.9 | 3.5 | 4.2 | 4.8 | 5.1 |
| American Indian/Alaska Native | 1.9 | 1.8 | 3.7 | 6.9 | 8.8 | 7.8 | - | - | - | - |
| Asian/Pacific Islander | 1.5 | 2.6 | 2.7 | 1.6 | 2.2 | 0.3 | - | - | - | - |
| Black | 2.3 | 3.0 | 3.5 | 5.8 | 7.1 | 9.3 | - | - | - | - |
| Hispanic | 3.6 | 4.5 | 6.6 | 13.2 | 16.9 | 16.2 | - | - | - | - |
| White | 1.0 | 0.5 | 0.8 | 1.3 | 2.5 | 3.5 | - | - | - | - |

NOTE: Mean absolute percentage error (MAPE) is the average value over past projections of the absolute values of errors expressed in percentage terms. National MAPEs for public high school graduates were calculated using the last 29 editions of Projections of Education Statistics, from Projections of Education Statistics to 2000 through Projections of Education Statistics to 2028. State MAPEs were calculated using the last 24 editions of Projections of

Education Statistics, from Projections of Education Statistics to 2005 through Projections of Education Statistics to 2028. Calculations were made using unrounded numbers. Some data have been revised from previously published figures. SOURCE: U.S. Department of Education, National Center for Education Statistics, Projections of Education Statistics, various issues. (This table was prepared March 2022.)

## A.4. EXPENDITURES FOR PUBLIC ELEMENTARY AND SECONDARY EDUCATION

## Projections in this edition

This edition of Projections of Education Statistics presents projections of total current expenditures for public elementary and secondary education, current expenditures per pupil in fall enrollment, and current expenditures per pupil in average daily attendance for 2019-20 through 2030-31.

As the source of the elementary and secondary private school data, the NCES Private School Universe Survey, does not collect data for current expenditures, there are no projections for private school current expenditures.

## Overview of approach

## Theoretical and empirical background

The Public Elementary and Secondary Education Current Expenditure Projection Model used in this report is based on the theoretical and empirical literature on the demand for local public services such as education. ${ }^{1}$ Specifically, it is based on a median voter model. A median voter model posits that spending for each public good in the community (in this case, spending for education) reflects the preferences of the "median voter" in the community. This individual is identified as the voter in the community with the median income and median property value. The amount of spending in the community reflects the price of education facing the voter with the median income, as well as their income and tastes. There are competing models in which the level of spending reflects the choices of others in the community, such as government officials.

In a median voter model, the demand for education expenditures is typically linked to four different types of independent variables: (1) measures of the income of the median voter; (2) measures of intergovernmental aid for education going indirectly to the median voter; (3) measures of the price to the median voter of providing one more dollar of education expenditures per pupil; and (4) any other variables that may affect one's tastes for education. The Public Elementary and Secondary Education Current Expenditure Projection Model contains independent variables of the first two types. It uses linear regression analysis to identify the relationships between these independent variables and current expenditures (the dependent variable).

## Elementary and Secondary Education Current Expenditure Projection Model

Projections for current expenditures per pupil in fall enrollment were produced first. These projections were then used in calculating total expenditures and expenditures per pupil in average daily attendance.

## Steps used to project current expenditures for public elementary and secondary education

Step 1. Produce projections of education revenue from state sources. The equation for education revenue included an error correction term to capture the long-term relationship between state education revenue and enrollment and the following independent variables:
» disposable income per capita in constant dollars; and
» a 1-year lag disposable income per capita in constant dollars.
Step 2. Produce projections of current expenditures per pupil in fall enrollment. The equation for current expenditures per pupil for fall enrollment included an error correction term to capture the long-term relationship between current expenditures and state education grants and the following independent variables:
» education revenue from state sources per capita in constant dollars. This variable was projected in step 1 ; and
» a 1-year lag of current expenditures per pupil.
For details on the equations used in steps 1 and 2, the data used to estimate these equations, and their results, see "Data and equations used for projections of current expenditures for public elementary and secondary education," below.

[^3]Step 3. Produce projections of total current expenditures. Projections of total current expenditures were made by multiplying the projections for current expenditures per pupil in fall enrollment by projections for fall enrollment.

Step 4. Produce projections of current expenditures per pupil in average daily attendance. The projections for total current expenditures were divided by projections for average daily attendance to produce projections of current expenditures per pupil in average daily attendance.

All the projections were developed in 1982-84 dollars and then placed in 2020-21 dollars using the projections of the Consumer Price Index. Current-dollar projections were produced by multiplying the constant-dollar projections by projections for the Consumer Price Index. The Consumer Price Index and the other economic variables used in calculating the projections presented in this report were placed in school year terms rather than calendar year terms.

## Data and equations used for projections of current expenditures for public elementary and secondary education

Data used to estimate the equations for revenue from state sources and current expenditures per pupil. The following data for the period from 1973-74 to 2018-19 were used to estimate the equations:
» Current expenditures and revenues from state sources-For 1973-74 and 1975-76, the current expenditures data came from Statistics of State School Systems, published by NCES. For 1974-75 and 1976-77, the current expenditures data came from Revenues and Expenditures for Public Elementary and Secondary Education, also published by NCES. For 1977-78 through 2018-19, these data came from the NCES Common Core of Data (CCD) and unpublished data. For most years, the sources for the past values of revenue from state sources were identical to the sources for current expenditures.
» Disposable personal income per capita-Disposable personal income data from the Bureau of Economic Analysis were divided by population data to convert to a per capita basis.

Estimated equations and model statistics for revenue from state sources and current expenditures per pupil. For the results of the equations, see table A-15 on page 95 . In each equation, the independent variables affect the dependent variable in the expected way. In the revenues from state sources equation:
» All other things being equal, as disposable income per capita increases so does local governments' education revenue from state sources per capita; and
» As local governments' education revenue from state sources per capita increases, so does current expenditures per pupil.
Projections for economic variables. Projections for economic variables, including disposable income and the Consumer Price Index, were from the "U.S. Quarterly Macroeconomic Model: June 2021 Short-Term Baseline Projections" from the economic consulting firm, S\&P Global Inc. (see supplemental table B-5). This set of projections was S\&P Global Inc.'s most recent set at the time the education projections in this report were produced. The values of all the variables from S\&P Global Inc. were placed in school-year terms. The school-year numbers were calculated by taking the average of the last two quarters of one year and the first two quarters of the next year.

Projections for fall enrollment. The projections for fall enrollment are those presented in section 1 of this publication. The methodology for these projections is presented in Section A.1. Elementary and Secondary Enrollment, earlier in this appendix.

Projections for population. Population estimates for 1973 to 2020 from the U.S. Census Bureau and population projections for 2021 to 2030 from S\&P Global Inc. were used to develop the public school current expenditure projections. The set of population projections used in this year's Projections of Education Statistics are the S\&P Global's May 2021 National Population Projections.

Historical data for average daily attendance. For 1973-74 and 1975-76, these data came from Statistics of State School Systems, published by NCES. For 1974-75 and 1976-77, the current expenditures data came from Revenues and Expenditures for Public Elementary and Secondary Education, also published by NCES. For 1977-78 through 2018-19, these data came from the CCD and unpublished NCES data.

Projections for average daily attendance. These projections were made by multiplying the projections for enrollment by the average value of the ratios of average daily attendance to enrollment from 1993-94 to 2018-19; this average value was approximately 0.93.

## Accuracy of projections for current expenditures

Mean absolute percentage errors (MAPEs) for projections of current expenditures for public elementary and secondary education were calculated using the last 30 editions of Projections of Education Statistics that included projections of current expenditures. Table F, below, shows the MAPEs for projections of current expenditures. Please note that the independent variables used in the models have changed slightly since the last edition. For more information on the models used to project expenditures for public elementary and secondary education in prior editions, see page 92 of Projections of Education Statistics to 2028.

Table F. Mean absolute percentage errors (MAPEs) of projections for total and per pupil current expenditures for public elementary and secondary education, by lead time: MAPEs constructed using projections from Projections of Education Statistics to 1997-98 through Projections of Education Statistics to 2028

| Statistic | Lead time (years) |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| Total current expenditures | 1.6 | 2.4 | 2.6 | 2.8 | 3.1 | 4.0 | 5.0 | 5.9 | 6.4 | 6.9 |
| Current expenditures per pupil in fall enrollment | 1.6 | 2.4 | 2.6 | 2.8 | 3.3 | 4.1 | 5.0 | 5.9 | 6.5 | 7.0 |

NOTE: Mean absolute percentage error is the average value over past projections of the absolute values of errors expressed in percentage terms. Expenditures were in constant dollars based on the Consumer Price Index for all urban consumers, Bureau of Labor Statistics, U.S. Department of Labor. MAPEs for current expenditures were calculated using projections from the last 29 editions of Projections of Education Statistics, from Projections of Education Statistics to 1997-98 through Projections of Education Statistics to 2028, excluding Projections of Education Statistics to 2012 which did not include projections of current expenditures. Calculations were made using unrounded numbers. Some data have been revised from previously published figures.
SOURCE: U.S. Department of Education, National Center for Education Statistics, Projections of Education Statistics, various issues. (This table was prepared April 2022.)

For more information about MAPEs, see Section A.O. Introduction to Projection Methodology, earlier in this appendix.

Table A-15. Estimated equations and model statistics for current expenditures per pupil in fall enrollment for public elementary and secondary schools, and education revenue from state sources per capita based on data from 1973-74 to 2018-19

| Dependent variable | Equation ${ }^{1}$ |  |  |  | Adjusted | Breusch-Godfrey Serial Correlation LM test statistic ${ }^{2}$ |  | Time period |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 |  |  |  | 2 |  |  | 4 | 5 |
| Current expenditures per pupil | $D(\text { LN(CUREXP)) }=\underset{(0.077)}{0.23}+\underset{(0.102)}{0.28 \mathrm{D}(\text { LN }(\text { CUREXP }(-1)))}$ | $+\underset{(0.053)}{0.27 \mathrm{D}(\text { LN(SGRANT }))}$ | $\text { - } \underset{(0.031)}{0.09 \text { CUREXP_ECT + }}$ | $\begin{aligned} & 0.01 \text { @BEFORE ("1990") } \\ & (0.004) \end{aligned}$ | 0.77 | 2.38 | (0.304) | $\begin{array}{r} 1981-82 \text { to } \\ 2018-19 \end{array}$ |
| Education revenue from state sources per capita | $\mathrm{D}(\mathrm{LN}(\mathrm{SGRANT}))=\underset{(0.655)}{1.66}+\underset{(0.241)}{0.75 \mathrm{D}(\mathrm{LN}(\mathrm{PCI}(-1)))}$ | $+\underset{(0.258)}{0.54 \mathrm{D}(\mathrm{LN}(\mathrm{PCl}))}$ | $\begin{aligned} & -\quad 0.12 \text { SGRANT_ECT- } \\ & (0.049) \end{aligned}$ | $\begin{aligned} & 0.04 \text { @DURING("2008 2012") } \\ & (0.009) \end{aligned}$ | 0.67 | 0.03 | (0.984) | $\begin{array}{r} 1982-83 \text { to } \\ 2018-19 \end{array}$ |

${ }^{1}$ Standard errors in parentheses. D() refers to the first difference of a variable, or the difference between the variable at time $t$ and time $t-1$. This transformation is used in models to make the data series "stationary," meaning that it has the same statistical properties over time. LN() refers to the natural $\log$ of a variable. The ( -1 ) term indicates that the variable is lagged by one year. CUREXP_ECT is included in the current expenditures model to capture the long-term relationship between current expenditures and state education grants. SGRANT_ECT is included in the education revenue model to capture the long-term relationship between state education revenue and enrollment
${ }^{2}$ The number in parentheses is the probability of the Chi-Square associated with the Breusch-Godfrey Serial Correlation LM Test. A p value greater that 0.05 implies that we do not reject the null hypothesis of no autocorrelation at the 5 percent significance level for a two-tailed test and 10 percent significance level for a one-tailed test, (i.e., there is no autocorrelation present). For an explanation of the Breusch-Godfrey Serial Correlation LM test statistic, see Greene, W. (2000). Econometric Analysis. New Jersey: Prentice-Hall. NOTE: Adjusted $R^{2}$ indicates the coefficient of determination adjusted for the number of explanatory variables. CUREXP = Current expenditures of public elementary and secondary schools per pupil in fall enrollment in constant dollars (index 1982-1984 = 1.00).

SGRANT = Local governments' education revenue from state sources, per capita, in constant dollars (index 1982-1984 = 1.00).
PCI = Disposable income per capita in 2012 chained dollars.
CUREXP_ECT (Current expenditures error correction term) = LN(CUREXP(-1)) - LN(SGRANT(-1)).
SGRANT_ECT (State education revenue error correction term) = LN(SGRANT(-1)) - 1.8*LN(ENROLL(-1)), where ENROLL = total elementary and secondary public school enrollment.
@BEFORE("1990") = Dummy variable to account for the shift in trend that occurred in historical data in 1990. @DURING("2008 2012") = Dummy variable to account for a structure shift in historical data between 2008 and 2012.

## A.5. ENROLLMENT IN DEGREE-GRANTING POSTSECONDARY INSTITUTIONS <br> Projections in this edition

This edition of Projections of Education Statistics presents projections of enrollment in degree-granting postsecondary institutions for fall 2021 through fall 2030. Throughout the report, actual historical data are reported for fall 2020. However, at the time the models were run, historical data were only available through fall 2019. Three different models were used to produce these enrollment projections:
» The Enrollment in Degree-Granting Institutions Projection Model produced projections of enrollments by attendance status, level of student, level of institution, control of institution, sex, and age. It also produced projections of full-timeequivalent enrollments by level of student, level of institution, and control of institution.
» The Enrollment in Degree-Granting Institutions by Race/Ethnicity Projection Model produced projections of enrollments by race/ethnicity.
» The First-Time Freshmen Projection Model produced projections of enrollments of first-time freshmen by sex.

## Overview of approach

## Basic features of the three degree-granting enrollment projection models

The Enrollment in Degree-Granting Institutions Projection Model is the primary model for projecting enrollment in degreegranting postsecondary institutions. Beginning with Projections of Education Statistics to 2030 (this edition), enrollment rates by attendance status are projected for various age categories using 2 -stage panel models. The first stage equation estimates the long-term trend and is driven by economic measures-the overall unemployment rate (interacted with enrollment status, because employment may have a different impact on the decision to enroll full- vs. part-time), and real disposable income per capita (lagged by 1 year). The result of this first equation generates an enrollment rate trend variable that represents the long-term relationship between the enrollment rate and the economic measures. The second stage equation estimates the short-term (year-to-year) dynamics through an error-correction, auto-regressive process where year-to-year changes in the rate of enrollment are explained by the previous changes in the enrollment rate, changes in the long-term path for enrollment (estimated in the first stage), and any deviations in the rate of enrollment from its long-term path. Predicted values from the first equation are used as an explanatory variable in the second equation to capture the short-term trend-reversion in enrollment. These rates are applied to projections of populations of the same sex and age to produce projections of enrollment by attendance status, sex, and age. This set of projections are referred to as "model-driven projections." Final projections were estimated by calculating a weighted average of the model-driven projections and population-driven projections, where the weight for the model-driven projections is equal to the adjusted of the second stage model and the weight for the population-driven projections is 1 - adj. $R^{2}$ ). To project enrollments by level of student, level of institution, and control of institution, rates for these characteristics are projected using single exponential smoothing and applied to overall enrollment projections produced by the model. For information on the models used to project enrollment in degree-granting institutions in prior editions, see page 95 of Projections of Education Statistics to 2028.

The Enrollment in Degree-Granting Institutions by Race/Ethnicity Projection Model is also driven by economic measures and student age. As in earlier editions, enrollment rates by attendance status, sex, and race/ethnicity are projected for the age categories using the pooled seemingly unrelated regression method. The resulting rates are iteratively corrected to ensure consistency with those projected by the Enrollment in Degree-Granting Institutions Projection Model. The adjusted rates are then applied to projections of populations of the same sex, age, and race/ethnicity.

The First-Time Freshmen Enrollment in Degree-Granting Institutions Projection Model uses single exponential smoothing to project the ratio of freshmen enrollment to undergraduate enrollment separately for males and for females. It then applies the projected ratios to the projections of undergraduate enrollment by sex that were produced by the Enrollment in DegreeGranting Institutions Projection Model.

## The Enrollment in Degree-Granting Institutions Projection Model

The Enrollment in Degree-Granting Institutions Projection Model produces projections of enrollment counts by six levels of detail, as well as projections of full-time-equivalent enrollments by level of student, level of institution, and control of institution.

## Steps used in the Enrollment in Degree-Granting Institutions Projection Model

Step 1. Adjust age-specific enrollment counts. The Enrollment in Degree-Granting Institutions Projection Model projects enrollments by six levels of detail: attendance status, level of student, level of institution, control of institution, sex, and age. NCES produces enrollment counts by the first five levels of detail, annually. However, it produces data by the sixth level of detail, age, biannually. In previous editions of the Projections, data from the U.S. Census Bureau was used for annual agespecific enrollment counts. For the Projections of Education Statistics to 2030 (this edition), the biannual data from NCES are used. The latest data for all six levels of detail at the time the models were run were from fall 2019.

Step 2. Calculate historical enrollment rates by attendance status, sex, and age category. The enrollment data were broken up into 7 age categories: under 18,18 to 19,20 to 21,22 to 24,25 to 29,30 to 34 , and 35 and older. For each of the 7 age categories, 4 enrollment rates were calculated-part-time male, full-time male, part-time female, and full-time female-resulting in a total of 28 enrollment rates. Each of the 28 enrollment rates was calculated by dividing the enrollment count for that combination of attendance status, sex, and age category by the total population for the corresponding combination of sex and age category. For each combination of attendance and sex, the enrollment rate for the youngest age category was calculated by dividing the enrollment count for those under 18 by the total population for those ages 16 and 17, and the enrollment rate for the oldest age category was calculated by dividing the enrollment count for those 35 and over by the total population for those 35 to 44 .

Step 3. Produce projections of enrollment rates by attendance status, sex, and age category. Enrollment rates by attendance status and sex were produced for the following 7 age categories: under 18,18 to 19,20 to 21,22 to 24,25 to 29,30 to 34 , and 35 and older. In the 2027 and 2028 editions, these enrollment rates were set to their most recent historic values. This was a change from earlier econometric approaches, based on increases in the forecast's errors when enrollment projections were compared to their actual values. The current edition combines the two approaches by producing both model-driven projections and population-driven projections and weighting them together based on the econometric model performance. In other words, for age groups whose enrollment behaviors are not as well predicted by unemployment and income (younger age groups), a smaller weight is given to the econometric model-driven projections and more weight is given to the population-driven projections, which use the most recent known historical enrollment rates, and vice versa. Because enrollment in degreegranting postsecondary institutions is rare for those under 18, enrollment rates for this group were estimated exclusively using exponential smoothing.

For the projected enrollment rates and the actual 2019 values, see table A-17 on page 102.
Step 4. Produce projections of enrollments by attendance status, sex, and age category. For each combination of attendance status, sex, and age category, enrollment projections were produced by multiplying the projected enrollment rate for that combination by projections of the total population with the corresponding combination of sex and age category.

Step 5. Add three additional levels of detail-level of student, control of institution, and level of institution-to the projected enrollments by attendance status and sex. In this step, the data on enrollment by age category were not used. Step 5 can be broken into two parts:

First, data for 2019 were used to calculate the percentage distribution of enrollment by level of student, control of institution, and level of institution for each combination of attendance status and sex. Because it was assumed that there was no enrollment in 2-year institutions at the postbaccalaureate level, six combinations of student level and institution type were used: undergraduates at public 2-year institutions, undergraduates at public 4-year institutions, postbaccalaureate students at public 4-year institutions, undergraduates at private 2-year institutions, undergraduates at private 4 -year institutions, and postbaccalaureate students at private 4-year institutions.

For the projected percentage distributions from step 5 and the actual 2019 distributions, see table A-18 on page 103.
Second, the 2018 distributions by level of student, control of institution, and type of institution were applied to the projected enrollments by attendance status and sex from step 4 to obtain the enrollment projections by attendance status, sex, level of student, control of institution, and level of institution.

This is the first edition of Projections of Education Statistics to use this methodology to produce enrollments by level of student, control of institution, and level of institution.

Step 6. Produce projections of full-time-equivalent enrollment by level of student, level of institution, and control of institution. Full-time-equivalent enrollment represents total full-time and part-time enrollment as if it were enrollment on a full-time basis. It equals the sum of full-time enrollment plus the full-time-equivalent of part-time enrollment. Full-time-equivalent enrollment projections were produced in the following manner:

First, for each combination of level of student, level of institution, and control of institution, the historic data were used to calculate the full-time-equivalent of part-time enrollment as a percentage of part-time enrollment.

Second, for each combination of level of student, level of institution, and control of institution, the full-time equivalent of part-time enrollment as a percentage of part-time enrollment was projected using single exponential smoothing. A separate smoothing constant, chosen to minimize the sum of squared forecast errors, was used for each percentage.

Third, for each combination of level of student, level of institution, and control of institution, the projected percentages were applied to the projections of part-time enrollment to project the full-time equivalent of the part-time enrollment.

Fourth, the projections of full-time equivalents of part-time enrollment were added to projections of full-time enrollment to obtain projections of full-time-equivalent enrollment.

## Data for the Enrollment in Degree-Granting Institutions Projection Model

Enrollment data for degree-granting postsecondary institutions. Enrollment data for 2000 to 2018 by attendance status, level of student, level of institution, control of institution, and sex came from the NCES Integrated Postsecondary Education Data System (IPEDS). These are universe counts. The U.S. Census Bureau was the source for enrollment estimates for 1981 to 2018 by the characteristics listed above, as well as age of student.

Population data and projections. Population counts for 2000 to 2019 came from the U.S. Census Bureau. Population projections for 2020 to 2029 are the Census Bureau's 2017 National Population Projections of the population by sex and age (September 2018), ratio-adjusted to line up with the most recent historical estimates. For more information, see Section A.O. Introduction to Projection Methodology, earlier in this appendix.

Data and results for the model. The following details for the model are shown on pages 101-104:
» Tables A-16a and A-16b shows the results of the econometric equations.
» Table A-17 shows enrollment rates by sex, attendance status, and age for fall 2019 and projected enrollment rates for fall 2025 and fall 2030.
» Table A-18 shows actual and projected percentage distributions of full-time students.
» Table A-19 shows actual and projected percentage distributions of part-time students.
» Table A-20 shows actual and projected data for enrollment in public degree-granting institutions as a percentage of total (public and private) enrollment by sex, attendance status, student level, and level of institution.

## Accuracy of projections for the Enrollment in Degree-Granting Institutions Projection Model

No mean absolute percentage errors (MAPEs) were calculated for enrollments in degree-granting postsecondary institutions as this is the first edition of Projections of Education Statistics to use the new model Enrollment in Degree-Granting Institutions Model. For information concerning the accuracy of the previous models used to produce projections of enrollment in degreegranting postsecondary institutions, see page 104 of Projections of Education Statistics to 2026.

## The Enrollment in Degree-Granting Institutions by Race/Ethnicity Projection Model

The Enrollment in Degree-Granting Institutions by Race/Ethnicity Projection Model projects enrollments in degree-granting institutions by attendance status, sex, age, and race/ethnicity. Race categories exclude persons of Hispanic ethnicity. The following groups are projected in this model:
» American Indian/Alaska Native;
» Asian/Pacific Islander;
» Black;
» Hispanic;
» White;
» Two or more races; and
» U.S. nonresident.
See the glossary for definitions of the six racial/ethnic categories and the U.S. nonresident category. (The race/ethnicity of U.S. nonresident is unknown, but they are considered a separate group for purposes of this analysis.)

## Steps used in the Degree-Granting Institutions by Race/Ethnicity Projection Model

Step 1. Adjust age-specific enrollment counts. As mentioned above, NCES produced enrollment data by all necessary levels of detail, but only includes age detail biannually. In alternating years, adjustments will be required to produce the required age detail. The latest data for all six levels of detail at the time the models were run were from fall 2019, so no adjustments were needed for this edition.

Step 2. Calculate enrollment rates by attendance status, sex, age category, and race/ethnicity. The enrollment data were broken up into 7 age categories: under 18, 18 to 19, 20 to 21,22 to 24,25 to 29,30 to 34 , and 35 and over. For each of the 7 age categories, enrollment rates were calculated for each combination of attendance status, sex, and the six racial/ethnic groups, resulting in a total of 168 enrollment rates (enrollment for Two or more races was projected to increase at the same rate as enrollment as total degree-granting postsecondary enrollment each year). Each of the 168 enrollment rates was calculated by dividing the enrollment count for that combination of attendance status, sex, age category, and race/ethnicity by the total population for the corresponding combination of sex, age category, and race/ethnicity. For each combination of attendance status, sex and racial/ethnic group, the enrollment rate for the youngest age category was calculated by dividing the enrollment count for those under 18 by the total population for those ages 14 to 17 , and the enrollment rate for the oldest age category was calculated by dividing the enrollment count for those 35 and over by the total population for those 35 to 44.

Step 3. Produce projections of enrollment rates by attendance status, sex, age category, and race/ethnicity. Enrollment rates for most of the age groups and racial/ethnic groups were projected using multiple linear regression. However, there were several exceptions:
» Due to the relatively large fluctuations in the historical enrollment rates resulting from small sample sizes, American Indian/Alaska Native enrollments were projected using single exponential smoothing.
» Since there were no applicable population counts to compute enrollment rates for U.S. nonresident, their enrollments were projected using patterns in recent historical growth.

Four racial/ethnic groups were modeled: Asian/Pacific Islander, Black, Hispanic, and White. Enrollment rates by attendance status, sex, and race/ethnicity were produced using 16 pooled seemingly unrelated regression models-one for each combination of attendance status, sex, and the four racial/ethnic groups-with fixed effects for age. Each equation included variables measuring
» recent trends; and
» socioeconomic conditions (such as disposable income).
For more information on the equations used to project enrollment rates for the combinations of attendance status, sex, and race/ ethnicity, see tables A-21 through A-28, under "Data and equations used for the Enrollment in Degree-Granting Institutions by Race/ Ethnicity Projection Model," below.

The final set of projected rates by attendance status, sex, age, and race/ethnicity were controlled to enrollment rates by attendance status, sex, and age produced by the Enrollment in Degree-Granting Institutions Projection Model to ensure consistency across models.

Step 4. Produce projections of enrollments by attendance status, sex, age category, and race/ethnicity. For each combination of attendance status, sex, age category, and race/ethnicity, enrollment projections were produced by multiplying the projected enrollment rate for that combination by projections of the total population with the corresponding combination of sex, age category, and race/ethnicity.

## Data and equations used for the Enrollment in Degree-Granting Institutions by Race/Ethnicity Projection Model

Enrollment data for degree-granting institutions by race/ethnicity. Enrollment data for 1981 to 2019 by attendance status, sex, and race/ethnicity came from the NCES Integrated Postsecondary Education Data System (IPEDS). These are universe counts.

Population data and projections by race/ethnicity. Population counts for 1981 to 2019 came from the U.S. Census Bureau, Population Estimates series. Population projections for 2020 to 2030 are S\&P Global's May 2021 National Population Projections of the population by sex, age and race/ethnicity. For more details on the underlying population utilized in the enrollment projections by race/ethnicity, see the earlier section, Demographic assumptions.

Projections for economic variables. The economic variables used in developing these projections were from the "U.S. Quarterly Macroeconomic Model: June 2021 Short-Term Baseline Projections" from the economic consulting firm, S\&P Global Inc. This set of projections was S\&P Global Inc.'s most recent set at the time the education projections in this report were produced.

Estimated equations and model statistics. Tables A-21 through A-28 show the estimated equations and model statistics used to project enrollment rates for the various combinations of attendance status, sex, and race/ethnicity.

## Accuracy of projections for the Degree-Granting Institutions by Race/Ethnicity Projection Model

No mean absolute percentage errors (MAPEs) were calculated for enrollments in degree-granting postsecondary institutions by race/ethnicity, as projections from the new Enrollment in Degree-Granting Institutions Model were used in the calculating the enrollment by race/ethnicity projections. For information concerning the accuracy of the previous models used to produce projections of enrollment in degree-granting postsecondary institutions, see page 107 of Projections of Education Statistics to 2026.

## The First-Time Freshmen Enrollment in Degree-Granting Institutions Projection Model

The First-Time Freshmen Enrollment in Degree-Granting Institutions Projection Model produced projections of first-time freshmen enrollment in degree-granting institutions by sex.

## Steps used in the First-Time Freshmen Enrollment in Degree-Granting Institutions Projection Model

The projections were produced in the following manner:
Step 1. Calculate the ratio of first-time freshmen enrollment to undergraduate enrollment. For 1975 to 2019, the ratio of first-time freshmen enrollment to undergraduate enrollment was calculated for males and females.

Step 2. Project the ratio of first-time freshmen enrollment to undergraduate enrollment. The percentages of undergraduate enrollment for both males and females were projected using single exponential smoothing. A separate smoothing constant, chosen to minimize the sum of squared forecast errors, was used for each percentage.

Step 3. Apply the projected ratio to projected undergraduate enrollment. The projected ratios were applied to projections of undergraduate enrollment by sex from the Enrollment in Degree-Granting Institutions Model to yield projections of first-time freshmen enrollment.

## Assumptions underlying this method

This method assumes that the future pattern in the trend of first-time freshmen enrollment will be the same as that for undergraduate enrollment.

## Data used in the First-Time Freshmen Enrollment in Degree-Granting Institutions Projection Model

Undergraduate and freshmen enrollment data for degree-granting institutions. Undergraduate and freshmen enrollment data by sex for 1975 to 2019 came from the NCES Integrated Postsecondary Education Data System (IPEDS).

Projections of undergraduate enrollment. Projections of undergraduate enrollment by sex came from the Enrollment in Degree-Granting Institutions Model, discussed earlier in this section of appendix A.

## Accuracy of projections for the First-Time Freshmen Enrollment Projection Model

No mean absolute percentage errors (MAPEs) were calculated for first-time freshmen enrollments in degree-granting postsecondary institutions, as projections from the new Enrollment in Degree-Granting Institutions Model were used in the calculating the first-time freshmen enrollment projections. For information concerning the accuracy of the previous models used to produce projections of enrollment in degree-granting postsecondary institutions, see page 109 of Projections of Education Statistics to 2026.

Table A-16a. Estimated equations and model statistics for full-time and part-time enrollment rates at degree-granting postsecondary institutions based on data from 1995 to 2019

| Dependent variable | Equation ${ }^{1}$ | Adjusted $R^{2}$ | statistic | Time period |
| :---: | :---: | :---: | :---: | :---: |

${ }^{1} \mathrm{D}()$ refers to the first difference of a variable, or the difference between the variable at time $t$ and time $t-1$. This transformation is used in models to make the data series "stationary," meaning that it has the same statistical properties over time. LN() refers to the natural log of a variable. The ( -1 ) term indicates that the variable is lagged by one year. RENRC_TREND is included in the second stage models to capture the long-term relationship between enrollment rates by age and real disposable income per capita. RENRC_ECT is included in the second stage model to "correct" the short-term estimates towards the fitted values Final projections were estimated by calculating a weighted average of the second-stage estimates and a population-driven (i.e., exponentially smoothed) model, where the weight for the second stage estimate is equal to the adjusted $R^{2}$.
NOTE: Adjusted $R^{2}$ indicates the coefficient of determination adjusted for the number of explanatory variables. D.W. statistic = Durbin-Watson statistic, a test for autocorrelation among regression residuals. For more details see Johnston, J., and Dinardo, J. (1996).
RENRC = College enrollment rate, by age.
$C=$ The constant term. The equations include fixed effects by sex and enrollment status, so each equation has four different constant terms, which are shown in table A-16b

RUC = Unemployment rate
FULLTIME = Full-time enrollment, by age.
PARTTIME = Part-time enrollment, by age
YPDRPC = Real disposable income per capita in 2012 chained dollars.
RENRC_TREND = Fitted values from first-stage equations, by age. This variable represents the enrollment rate expected based only on the economic variables..
RENRC_ECT (college enrollment rate error correction term) = (RENRC-RENRC_TREND)(-1). This term is the difference between the actual and fitted value of a separate equation (first regression) where RENRC level was regressed on the level of income per capita. The fitted value, RENRC_TREND, contains forecasts and since it enters the second equation with a lag, it continues to capture the deviation of the forecasted RENRC from its trend during the forecast period and that deviation is not constant.

NOTE: This table accompanies table A-16a as part of the stimated equations for full-time and part-time enrollment rates at degree-granting postsecondary institutions based on data from 1995 to 2019.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Enrollment in Degree-Granting Postsecondary Institutions Projection Model, through 2030. (This table was prepared September 2022.)

Table A-17. Actual and projected numbers for enrollment rates of all students at degree-granting postsecondary institutions, by sex, attendance status, and age: Fall 2019, fall 2025, and fall 2030

| Sex, attendance status, and age | Actual 2019 | Projected |  |
| :---: | :---: | :---: | :---: |
|  |  | 2025 | 2030 |
| 1 | 2 | 3 | 4 |
| Males |  |  |  |
| Full-time |  |  |  |
| Under $18{ }^{1}$ | 2.3 | 2.3 | 2.3 |
| 18 and 19 | 37.2 | 37.4 | 37.6 |
| 20 and 21 | 32.7 | 33.1 | 33.5 |
| 22 to 24 | 13.5 | 13.7 | 14.1 |
| 25 to 29 | 4.8 | 4.9 | 5.1 |
| 30 to 34 | 2.2 | 2.3 | 2.4 |
| 35 to $44^{2}$ | 1.5 | 1.5 | 1.6 |
| Part-time |  |  |  |
| Under $18{ }^{1}$ | 11.5 | 11.5 | 11.5 |
| 18 and 19 | 7.8 | 8.0 | 8.2 |
| 20 and 21 | 8.1 | 8.6 | 9.1 |
| 22 to 24 | 6.7 | 6.9 | 7.1 |
| 25 to 29 | 4.1 | 4.0 | 4.1 |
| 30 to 34 | 2.8 | 2.8 | 2.8 |
| 35 to $44^{2}$ | 3.0 | 2.9 | 2.9 |
| Females |  |  |  |
| Full-time |  |  |  |
| Under $18{ }^{1}$ | 3.8 | 3.8 | 3.8 |
| 18 and 19 | 49.3 | 49.6 | 49.8 |
| 20 and 21 | 42.3 | 42.6 | 43.0 |
| 22 to 24 | 16.3 | 16.6 | 17.0 |
| 25 to 29 | 6.2 | 6.5 | 6.9 |
| 30 to 34 | 3.0 | 3.2 | 3.4 |
| 35 to $44^{2}$ | 2.5 | 2.6 | 2.8 |
| Part-time |  |  |  |
| Under $18{ }^{1}$ | 17.2 | 17.2 | 17.2 |
| 18 and 19 | 9.6 | 9.9 | 10.1 |
| 20 and 21 | 10.7 | 11.2 | 11.7 |
| 22 to 24 | 9.5 | 9.8 | 10.1 |
| 25 to 29 | 6.6 | 6.7 | 6.9 |
| 30 to 34 | 4.5 | 4.6 | 4.7 |
| 35 to $44^{2}$ | 5.3 | 5.3 | 5.3 |

${ }^{1}$ Enrollment rates for the under 18 age group includes all enrollments for students under 18 but use the population of 16 - and 17 -year-olds as the denominator.
${ }^{2}$ Enrollment rates for the 35 - to 44 -year old age group includes all enrollments for students 35 and over, but use the population of 35 - to 44 -year-olds as the denominator.
NOTE: Enrollments can include students who are concurrently enrolled in postsecondary courses while in high school. Although fall 2020 postsecondary enrollments are included in figures throughout the report,
fall 2019 was the latest historical year available at the time the Enrollment in Degree-Granting Institutions Projections Model was run.

The regression method used to estimate the full-time and part-time equations was the pooled estimated generalized least squares regression method. The time period used to estimate the equations is from 1995 to 2019. The number of observations is 175 . Race categories exclude persons of Hispanic ethnicity.

## A.6. POSTSECONDARY DEGREES CONFERRED

## Projections in this edition

This edition of Projections of Education Statistics presents projections of postsecondary degrees conferred by level of degree and sex of recipient for 2019-20 through 2030-31. Throughout the report, actual historical data are reported for 2019-20. However, at the time the models were run, historical data were only available through 2019-20.

## Overview of approach

## Basic approach

Projections of associate's, bachelor's, master's, and doctor's degrees for males and females were produced using forecasting equations that relate degrees conferred to full-time enrollment in degree-granting institutions by sex, student level (undergraduate or postbaccalaureate), and institution level (2-year or 4-year). For associate's degrees, the relevant enrollment is undergraduate enrollment in 2-year institutions; for bachelor's degrees, it is undergraduate enrollment in 4-year institutions; and for both master's and doctor's degrees, it is postbaccalaureate enrollment in 4-year institutions.

## Degrees Conferred Projection Model

## Procedures used to project degrees

For all degree levels, projections of degrees conferred were made separately for males and for females. The projections for males and females were then summed to get projections of the total number of degrees.

Autoregressive-moving-average with exogenous inputs (ARMAX) models were used to project associate's, bachelor's, master's, and doctor's degrees based on enrollment variables for males and females. The enrollment variables used for the different levels of degrees are briefly described below. The equations included an AR(1) term for correcting autocorrelation. Dummy variables were introduced in the models for particular years to capture any large shifts in the underlying data that would not be captured by other explanatory variables.

For details and results of the regression analyses used to project associate's, bachelor's, master's, and doctor's degrees, see table A-29, under "Data and equations used to project degrees," later in this section.

Associate's degrees. Projections were based on full-time undergraduate enrollment in 2-year institutions by sex. For males and females, projections of associate's degrees were based on relevant enrollment lagged 1 year.

Bachelor's degrees. Projections were based on full-time undergraduate enrollment in 4-year institutions by sex. For males and for females, projections of bachelor's degree were based on relevant enrollment lagged 1 year.

Master's degrees. Projections were based on full-time postbaccalaureate enrollment by sex. For males and females, projections of master's degrees were based on relevant current enrollment and enrollment lagged 1 year.

Doctor's degrees. Projections were based on full-time and part-time postbaccalaureate enrollment by sex. For males and females, projections of doctor's degrees were based on relevant enrollment lagged 2, 3 and 4 years.

## Data and equations used to project degrees

Enrollment data and projections for degree-granting institutions. Historical enrollment data by sex, level of student, and level of institution came from the NCES Integrated Postsecondary Education Data System (IPEDS). The enrollment projections used are those produced for this edition of Projections of Education Statistics. For more information about the enrollment projections, see Section A.5. Enrollment in Degree-granting postsecondary Institutions, earlier in this appendix.

Data on degrees awarded at all levels. Historical data by level of degree and sex of recipient came from the NCES Integrated Postsecondary Education Data System (IPEDS). Associate's, bachelor's, and master's degrees were projected using data from 1997-98 to 2018-19 and doctor's degrees were projected using data from 2000-01 to 2018-19.

## Accuracy of projections for degrees conferred

No mean absolute percentage errors (MAPEs) were calculated for first-time freshmen enrollments in degree-granting postsecondary institutions, as projections from the new Enrollment in Degree-Granting Institutions Model were used in the calculating the first-time freshmen enrollment projections. For information concerning the accuracy of the previous models used to produce projections of degrees conferred, see page 125 of Projections of Education Statistics to 2026.

Table A-29. Estimated equations and model statistics for degrees conferred, by degree type and sex based on data from 1997 to 2018-19

$D()$ refers to the first difference of a variable, or the difference between the variable at time $t$ and time $t-1$. This transformation is used in models to make the data series "stationary," meaning that it has the same statistical properties over time. LN() refers to the natural log of a variable. The $(-\mathrm{X})$ term indicates that the variable is lagged by the given number of years, where $X$ ranges from 1 to 4 . $\operatorname{AR}(1)$ indicates that the model was estimated to account for first-order autocorrelation. To estimate the model, it was first transformed into a nonlinear model and then the coefficients were estimated simultaneously by applying a Marquardt nonlinear least squares algorithm to the transformed equation. For a general discussion of the problem of autocorrelation, and the method used to forecast in the presence of autocorrelation, see Judge, G., Hill, W. Grififiths, R., Lutkepohl, H., and Lee, T. (1985). The Theory and Practice of Econometrics. New York: John Wiley and Sons, pp. 315-318. Numbers in parentheses are $t$-statistics. Standard errors are in parentheses. NOTE: Adjusted $R^{2}$ indicates the coefficient of determination adjusted for the number of explanatory variables. D.W. statistic $=$ Durbin-Watson statistic, a test for autocorrelation among regression residuals. For more details see Johnston, J., and Dinardo, J. (1996)
ASSOCM = associate's degrees awarded to males.
ASSOCW = associate's degrees awarded to females.
BACHM = bachelor's degrees awarded to males.
BACHW = bachelor's degrees awarded to females.

MASTM = master's degrees awarded to males
MASTW = master's degrees awarded to females
DOCM = doctor's degrees awarded to males.
DOCW = doctor's degrees awarded to females
UGFT2M = full-time male undergraduate enrollment in 2 -year institutions. UGFT2W = full-time female undergraduate enrollment in 2-year institutions. UGFT4M = full-time male undergraduate enrollment in 4 -year institutions. UGFT4W = full-time female undergraduate enrollment in 4 -year institutions. PBFTM = full-time male postbaccalaureate enrollment.
PBFTW = full-time female postbaccalaureate enrollment.
PBM = total male postbaccalaureate enrollment (full-time and part-time).
PBW = total female postbaccalaureate enrollment (full-time and part-time).
@DURING ("2012") = Dummy variable to account for a structural shift in historical data in 2012.
@DURING ("2000") = Dummy variable to account for a structural shift in historical data in 2000.
@DURING("1999") = Dummy variable to account for a structural shift in historical data in 1999.

# Appendix C Data Sources 

## SOURCES AND COMPARABILITY OF DATA

The information in this report was obtained from many sources, including federal and state agencies, private research organizations, and professional associations. The data were collected by many methods, including surveys of a universe (such as all colleges) or of a sample, and compilations of administrative records. Care should be used when comparing data from different sources. Differences in procedures, such as timing, phrasing of questions, and interviewer training, mean that the results from the different sources are not strictly comparable. More extensive documentation of one survey's procedures than of another's does not imply more problems with the data, only that more information is available on the survey.

## ACCURACY OF DATA

The accuracy of any statistic is determined by the joint effects of "sampling" and "nonsampling" errors. Estimates based on a sample will differ from the figures that would have been obtained if a complete census had been taken using the same survey instruments, instructions, and procedures. Besides sampling errors, both of the survey types, universe and sample, are subject to errors of design, reporting, and processing, and errors due to nonresponse. To the extent possible, these nonsampling errors are kept to a minimum by methods built into the survey procedures. In general, however, the effects of nonsampling errors are more difficult to gauge than those produced by sampling variability.

## SAMPLING ERRORS

The standard error is the primary measure of the sampling variability of an estimate. Standard errors can be used to produce confidence intervals. A confidence interval is a range of values that we expect to contain the true value of an estimate. For example, from table A-11, an estimated 94.0 percent of public school teachers reported that they worked full time in 2017-18. This figure has an estimated standard error of 0.14 percent. Therefore, the estimated 95 percent confidence interval for this statistic is approximately 93.72 to 94.28 percent ( $94.0 \pm 1.96$ [0.14]). That is, if the processes of selecting a sample, collecting the data, and constructing the confidence interval were repeated, it would be expected that in 95 out of 100 samples from the same population, the confidence interval would contain the true full-time working rate.

Analysis of standard errors can help assess how valid a comparison between two estimates might be. The standard error of a difference between two independent sample estimates is equal to the square root of the sum of the squared standard errors of the estimates. The standard error (se) of the difference between independent sample estimates $a$ and $b$ is

$$
s e_{a-b}=\sqrt{\left(s e_{a}^{2}+s e_{b}^{2}\right)}
$$

Note that some of the standard errors in the original documents are approximations. That is, to derive estimates of standard errors that would be applicable to a wide variety of items and could be prepared at a moderate cost, a number of approximations were required. As a result, most of the standard errors presented provide a general order of magnitude rather than the exact standard error for any specific item.

## NONSAMPLING ERRORS

Both universe and sample surveys are subject to nonsampling errors. Nonsampling errors are of two kinds: random and nonrandom. Random nonsampling errors may arise when respondents or interviewers interpret questions differently, when respondents must estimate values, or when coders, keyers, and other processors handle answers differently. Nonrandom nonsampling errors result from total nonresponse (no usable data obtained for a sampled unit), partial or item nonresponse (only a portion of a response may be usable), inability or unwillingness on the part of respondents to provide information,
difficulty interpreting questions, mistakes in recording or keying data, errors of collection or processing, and overcoverage or undercoverage of the target universe. Random nonresponse errors usually, but not always, result in an understatement of sampling errors and thus an overstatement of the precision of survey estimates. Because estimating the magnitude of nonsampling errors would require special experiments or access to independent data, these magnitudes are seldom available.

To compensate for suspected nonrandom errors, adjustments of the sample estimates are often made. For example, adjustments are frequently made for nonresponse, both total and partial. Imputations are usually made separately within various groups of sample members that have similar survey characteristics. Imputation for item nonresponse is usually made by substituting for a missing item the response to that item of a respondent having characteristics similar to those of the respondent.

Although the magnitude of nonsampling errors in the data used in Projections of Education Statistics is frequently unknown, idiosyncrasies that have been identified are noted on the appropriate tables.

## FEDERAL AGENCY SOURCES

## National Center for Education Statistics (NCES)

## Common Core of Data

The Common Core of Data (CCD) is NCES's primary database on public elementary and secondary education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts containing data designed to be comparable across all states. This database can be used to select samples for other NCES surveys and provide basic information and descriptive statistics on public elementary and secondary schools and schooling in general.

The CCD collects statistical information annually from approximately 100,000 public elementary and secondary schools and approximately 19,000 public school districts (including supervisory unions and regional education service agencies) in the 50 states, the District of Columbia, the Department of Defense Education Activity (DoDEA), the Bureau of Indian Education (BIE), Puerto Rico, American Samoa, Guam, the Northern Mariana Islands, and the U.S. Virgin Islands. Three categories of information are collected in the CCD survey: general descriptive information on schools and school districts; data on students and staff; and fiscal data. The general school and district descriptive information includes name, address, and phone number; the data on students and staff include selected demographic characteristics; and the fiscal data pertain to revenues and current expenditures.

The EDFacts data collection system is the primary collection tool for the CCD. NCES works collaboratively with the U.S. Department of Education's Performance Information Management Service to develop the CCD collection procedures and data definitions. Coordinators from state education agencies (SEAs) submit the CCD data at different levels (school, agency, and state) to the EDFacts collection system. Prior to submitting CCD files to EDFacts, SEAs must collect and compile information from their respective local education agencies (LEAs) through established administrative records systems within their state or jurisdiction.

Once SEAs have completed their submissions, the CCD survey staff analyzes and verifies the data for quality assurance. Even though the CCD is a universe collection and thus not subject to sampling errors, nonsampling errors can occur. The two potential sources of nonsampling errors are nonresponse and inaccurate reporting. NCES attempts to minimize nonsampling errors through the use of annual training of SEA coordinators, extensive quality reviews, and survey editing procedures. In addition, each year, SEAs are given the opportunity to revise their state-level aggregates from the previous survey cycle.

The CCD survey consists of five components: The Public Elementary/Secondary School Universe Survey, the Local Education Agency (School District) Universe Survey, the State Nonfiscal Survey of Public Elementary/Secondary Education, the National Public Education Financial Survey (NPEFS), and the School District Finance Survey (F-33).

## State Nonfiscal Survey of Public Elementary/Secondary Education

The State Nonfiscal Survey of Public Elementary/Secondary Education provides state-level, aggregate information about students and staff in public elementary and secondary education. This survey covers public school student membership by grade, race/ethnicity, and state or jurisdiction and covers number of staff in public schools by category and state or jurisdiction. Beginning with the 2006-07 school year, the number of diploma recipients and other high school completers were no longer included in the State Nonfiscal Survey of Public Elementary/Secondary Education File.

## National Public Education Financial Survey

The purpose of the National Public Education Financial Survey (NPEFS) is to provide district, state, and federal policymakers, researchers, and other interested users with descriptive information about revenues and expenditures for public elementary and secondary education. The data collected are useful to (1) chief officers of state education agencies; (2) policymakers in the executive and legislative branches of federal and state governments; (3) education policy and public policy researchers; and (4) the public, journalists, and others.

Data for NPEFS are collected from SEAs in the 50 states, the District of Columbia, Puerto Rico, American Samoa, Guam, the Northern Mariana Islands, and the U.S. Virgin Islands. The data file is organized by state or jurisdiction and contains revenue data by funding source; expenditure data by function (the activity being supported by the expenditure) and object (the category of expenditure); average daily attendance data; and total student membership data from the CCD State Nonfiscal Survey of Public Elementary/Secondary Education.

## Integrated Postsecondary Education Data System

The Integrated Postsecondary Education Data System (IPEDS) consists of 12 interrelated survey components that provide information on postsecondary institutions and academic libraries at these institutions, student enrollment, student financial aid, programs of study offered, retention and graduation rates, degrees and certificates conferred, and the human and financial resources involved in the provision of institutionally based postsecondary education. Prior to 2000, the IPEDS survey had the following subject-matter components: Institutional Characteristics; Total Institutional Activity (these data were moved to the Institutional Characteristics component in 1990-91, then to the Fall Enrollment component in 2000-01); Fall Enrollment; Fall Staff; Salaries, Tenure, and Fringe Benefits of Full-Time Faculty; Completions; Finance; Academic Libraries (in 2000, the Academic Libraries component separated from the IPEDS collection); and Graduation Rates. Since 2000, IPEDS survey components occurring in a particular collection year have been organized into three seasonal collection periods: fall, winter, and spring. The Institutional Characteristics and Completions components first took place during the fall 2000 collection. The Employees by Assigned Position (EAP); Salaries, Tenure, and Fringe Benefits of Full-Time Faculty; and Fall Staff components first took place during the winter 2001-02 collection. The Fall Enrollment, Student Financial Aid, Finance, and Graduation Rates components first took place during the spring 2001 collection. In the winter 2005-06 data collection, the EAP; Fall Staff; and Salaries, Tenure, and Fringe Benefits of Full-Time Faculty components were merged into the Human Resources component. During the 2007-08 collection year, the Fall Enrollment component was broken into two components: 12-month Enrollment (taking place in the fall collection) and Fall Enrollment (taking place in the spring collection). In the 2011-12 IPEDS data collection year, the Student Financial Aid component was moved to the winter data collection to aid in the timing of the net price of attendance calculations displayed on the College Navigator (https://nces.ed.gov/collegenavigator/). In the 2012-13 IPEDS data collection year, the Human Resources component was moved from the winter data collection to the spring data collection, and
in the 2013-14 data collection year, the Graduation Rates and Graduation Rates 200 Percent components were moved from the spring data collection to the winter data collection. In the 2014-15 data collection year, a new component (Admissions) was added to IPEDS and a former IPEDS component (Academic Libraries) was reintegrated into IPEDS. The Admissions component, created out of admissions data contained in the fall data collection's Institutional Characteristics component, was made a part of the winter data collection. The Academic Libraries component, after having been conducted as a survey independent of IPEDS between 2000 and 2012, was reintegrated into IPEDS as part of the spring data collection. Finally, in the 2015-16 data collection year, the Outcome Measures survey component was added to IPEDS.

Beginning in 2008-09, the first-professional degree category was combined with the doctor's degree category. However, some degrees formerly identified as first-professional that take more than 2 full-time-equivalent academic years to complete, such as those in Theology (M.Div., M.H.L./Rav), are included in the master's degree category. Doctor's degrees were broken out into three distinct categories: research/scholarship, professional practice, and other doctor's degrees.

The collection of race/ethnicity data also changed in 2008-09. IPEDS now collects a count of students who identify as Hispanic and counts of non-Hispanic students who identify with each race category. The "Asian" race category is now separate from the "Native Hawaiian or Other Pacific Islander" category, and a new category of "Two or more races" has been added.

The degree-granting institutions portion of IPEDS is a census of colleges that award associate's or higher degrees and are eligible to participate in Title IV financial aid programs. Prior to 1993, data from technical and vocational institutions were collected through a sample survey. Beginning in 1993, all data are gathered in a census of all postsecondary institutions. Beginning in 1996, the survey was restricted to institutions participating in Title IV programs.

The classification of institutions offering college and university education changed as of 1996. Prior to 1996, institutions that either had courses leading to an associate's or higher degree or that had courses accepted for credit toward those degrees were considered higher education institutions. Higher education institutions were accredited by an agency or association that was recognized by the U.S. Department of Education or were recognized directly by the Secretary of Education. The newer standard includes institutions that award associate's or higher degrees and that are eligible to participate in Title IV federal financial aid programs. Tables that contain any data according to this standard are titled "degree-granting" institutions. Time-series tables may contain data from both series, and they are noted accordingly. The impact of this change on data collected in 1996 was not large. For example, tables on faculty salaries and benefits were affected only to a small extent. Also, degrees awarded at the bachelor's level or higher were not heavily affected. The largest impact was on private 2 -year college enrollment. In contrast, most of the data on public 4-year colleges were affected to a minimal extent. The impact on enrollment in public 2-year colleges was noticeable in certain states, such as Arizona, Arkansas, Georgia, Louisiana, and Washington, but was relatively small at the national level. Overall, total enrollment for all institutions was about one-half of 1 percent higher in 1996 for degree-granting institutions than for higher education institutions.

Prior to the establishment of IPEDS in 1986, the Higher Education General Information Survey (HEGIS) acquired and maintained statistical data on the characteristics and operations of higher education institutions. Implemented in 1966, HEGIS was an annual universe survey of institutions accredited at the college level by an agency recognized by the Secretary of the U.S. Department of Education. These institutions were listed in NCES's Education Directory, Colleges and Universities.

HEGIS surveys collected information on institutional characteristics, faculty salaries, finances, libraries, fall enrollment, student residence and migration, and earned degrees. Since these surveys, like IPEDS, were distributed to all higher education institutions, the data presented are not subject to sampling error. However, they are subject to nonsampling error, the sources of which varied with the survey instrument.

The NCES Taskforce for IPEDS Redesign recognized that there were issues related to the consistency of data definitions as well as the accuracy, reliability, and validity of other quality measures within and across surveys. The IPEDS redesign in 2000 provided institution-specific web-based data forms. While the new system shortened data processing time and provided better data consistency, it did not address the accuracy of the data provided by institutions.

Beginning in 2003-04 with the Prior Year Data Revision System, prior-year data have been available to institutions entering current data. This allows institutions to make changes to their prior-year entries either by adjusting the data or by providing missing data. These revisions allow the evaluation of the data's accuracy by looking at the changes made.

NCES conducted a study (NCES 2005-175) of the 2002-03 data that were revised in 2003-04 to determine the accuracy of the imputations, track the institutions that submitted revised data, and analyze the revised data they submitted. When institutions
made changes to their data, NCES accepted that the revised data were the most accurate, correct, and "true" data. The data were analyzed for the number and type of institutions making changes, the type of changes, the magnitude of the changes, and the impact on published data.

Because NCES imputes for missing data, imputation procedures were also addressed by the Redesign Taskforce. For the 2003-04 assessment, differences between revised values and values that were imputed in the original files were compared (i.e., revised value minus imputed value). These differences were then used to provide an assessment of the effectiveness of imputation procedures. The size of the differences also provides an indication of the accuracy of imputation procedures. To assess the overall impact of changes on aggregate IPEDS estimates, published tables for each component were reconstructed using the revised 2002-03 data. These reconstructed tables were then compared to the published tables to determine the magnitude of aggregate bias and the direction of this bias. The aggregate bias analysis revealed that, generally, differences between originally published estimates and revised estimates were small.

Since the 2000-01 data collection year, IPEDS data collections have been web based. Data have been provided by "keyholders," institutional representatives appointed by campus chief executives, who are responsible for ensuring that survey data submitted by the institution are correct and complete. Because Title IV institutions are the primary focus of IPEDS and because these institutions are required to respond to IPEDS, response rates for Title IV institutions have been high (data on specific components are cited below). More details on the accuracy and reliability of IPEDS data can be found in the Integrated Postsecondary Education Data System Data Quality Study (NCES 2005-175).

## Fall (12-Month Enrollment)

The 12 -month period during which data are collected is July 1 through June 30. Unduplicated headcount enrollment data are collected by gender, attendance status (full-time, part-time), race/ethnicity, first-time (entering), transfer-in (non-first-time entering), continuing/returning, and degree/certificate-seeking statuses for undergraduate students and by race/ethnicity and gender for graduate students. The 12-month Enrollment component also collects total enrollment in distance education courses. Instructional activity is collected as total credit and/or clock hours attempted at the undergraduate, graduate, and doctor's professional levels, and these data are used to calculate a full-time-equivalent (FTE) enrollment. FTE enrollment is useful for gauging the size of the educational enterprise at the institution. Prior to the 2007-08 IPEDS data collection, the data collected in the 12-month Enrollment component were part of the Fall Enrollment component, which is conducted during the spring data collection period. However, to improve the timeliness of the data, a separate 12 -month Enrollment survey component was developed in 2007. These data are now collected in the fall for the previous academic year.

The response rate for the 12 -month Enrollment component of the fall 2020 data collection was nearly 100 percent. Data from 6 of the 6,055 Title IV institutions that were expected to respond to this component were imputed due to unit nonresponse.

Further information on the IPEDS 12-Month Enrollment component may be obtained from

[^5]
## Fall (Completions)

The Completions component collects data on the number of students who complete a postsecondary education program (completers) and the number of postsecondary awards earned (completions). This component was part of the HEGIS series throughout its existence. However, the degree classification taxonomy was revised in 1970-71, 1982-83, 1986-87, 1991-92, 200203, 2009-10, and 2020-21. Collection of degree data has been maintained through IPEDS.

The nonresponse rate does not appear to be a significant source of nonsampling error for this component. The response rate over the years has been high; for the fall 2020 Completions component, the response rate rounded to 100 percent. Data from 5 of the 6,063 Title IV institutions that were expected to respond to this component were imputed due to unit nonresponse.

Further information on the IPEDS Completions component may be obtained from
Tara Lawley

Washington, DC 20202
tara.lawley@ed.gov
https://nces.ed.gov/ipeds

## Spring (Fall Enrollment)

This survey has been part of the HEGIS and IPEDS series since 1966. Response rates have been relatively high, generally exceeding 85 percent. Beginning in 2000, with web-based data collection, higher response rates were attained. In the spring 2021 data collection, in which the Fall Enrollment component covered student enrollment in fall 2020, the response rate was greater than 99 percent. Of the 6,059 institutions that were expected to respond, 6 institutions did not respond, and these data were imputed.

Beginning with the fall 1986 survey and the introduction of IPEDS (see above), a redesign of the survey resulted in the collection of data by race/ethnicity, gender, level of study (i.e., undergraduate and graduate), and attendance status (i.e., full-time and part-time). Other aspects of the survey include allowing (in alternating years) for the collection of age and residence data. The Fall Enrollment component also collects data on first-time retention rates, student-to-faculty ratios, and student enrollment in distance education courses. Finally, in even-numbered years, 4 -year institutions provide enrollment data by level of study, race/ethnicity, and gender for nine selected fields of study or Classification of Instructional Programs (CIP) codes. (The CIP is a taxonomic coding scheme that contains titles and descriptions of primarily postsecondary instructional programs.)

Beginning in 2000, the survey collected instructional activity and unduplicated headcount data, which are needed to compute a standardized, full-time-equivalent (FTE) enrollment statistic for the entire academic year. As of 2007-08, the timeliness of the instructional activity data has been improved by collecting these data in the fall as part of the 12-month Enrollment component instead of in the spring as part of the Fall Enrollment component.

## National Teacher and Principal Survey

The National Teacher and Principal Survey is a set of related questionnaires that collect descriptive data on the context of elementary and secondary education. Data reported by schools, principals, and teachers provide a variety of statistics on the condition of education in the United States that may be used by policymakers and the general public. The NTPS system covers a wide range of topics, including teacher demand, teacher and principal characteristics, teachers' and principals' perceptions of school climate and problems in their schools, teacher and principal compensation, general conditions in schools, and basic characteristics of the student population.

The NTPS is a redesign of the Schools and Staffing Survey (SASS), which was conducted from the 1987-88 school year to the 2011-12 school year. Although the NTPS maintains the SASS survey's focus on schools, teachers, and administrators, the NTPS has a different structure and sample than SASS. In addition, whereas SASS operated on a 4-year survey cycle, the NTPS operates on a 2- or 3-year survey cycle. The NTPS universe of schools is confined to the 50 states plus the District of Columbia. It excludes the Department of Defense dependents schools overseas, schools in U.S. territories overseas, and CCD schools that do not offer teacher-provided classroom instruction in grades 1-12 or the ungraded equivalent. Bureau of Indian Education schools are included in the NTPS universe, but these schools were not oversampled and the data do not support separate BIE estimates.

The NTPS includes three key components: school questionnaires, principal questionnaires, and teacher questionnaires. NTPS data are collected by the U.S. Census Bureau through mail and online questionnaires with telephone and in-person field follow-up. The school and principal questionnaires were sent to sampled schools, and the teacher questionnaire was sent to a sample of teachers working at sampled schools.

The school questionnaire asks knowledgeable school staff members about grades offered, student attendance and enrollment, staffing patterns, teaching vacancies, programs and services offered, curriculum, and community service requirements. In addition, basic information is collected about the school year, including the beginning time of students' school days and the length of the school year.

The principal questionnaire collects information about principal/school head demographic characteristics, training, experience, salary, goals for the school, and judgments about schools' working conditions and climate. Information is also obtained on professional development opportunities for teachers and principals, teacher performance, barriers to dismissal of underperforming teachers, school climate and safety, parent/guardian participation in school events, and attitudes about educational goals and school governance.

The teacher questionnaire collects data from teachers about their current teaching assignment, workload, education history, and perceptions and attitudes about teaching. Questions are also asked about teacher preparation, induction, organization of classes, computers, and professional development.

The NTPS was first conducted during the 2015-16 school year. The school sample for the 2015-16 NTPS was based on an adjusted public school universe file from the 2013-14 Common Core of Data (CCD), a database of all the nation's public school districts and public schools. Schools outside of the United States, schools that teach only prekindergarten, kindergarten, or postsecondary students, and administrative units that do not offer teacher-provided classroom instruction were deleted from the CCD frame prior to sampling for NTPS. Public schools that closed in school year 2013-14 or were not yet opened were not included. Prior to stratification and sampling, CCD schools were collapsed to match the NTPS definition of a school. (The NTPS definition of a school is the same as the SASS definition of a school-an institution or part of an institution that provides classroom instruction to students, has one or more teachers to provide instruction, serves students in one or more of grades 1-12 or the ungraded equivalent, and is located in one or more buildings apart from a private home.)

In the 2015-16 NTPS, the school sample consisted of about 8,300 public schools; the principal sample consisted of about 8,300 public school principals; and the teacher sample consisted of about 50,000 public school teachers. Weighted unit response rates were 72.5 percent for the school survey, 71.8 percent for the principal survey, and 67.8 percent for the teacher survey.

Whereas the 2015-16 NTPS covered only schools, teachers, and principals in the public sector, the 2017-18 NTPS covered schools, teachers, and principals in both the public and private sectors. In the 2017-18 NTPS, all principals associated with sampled public and private schools were also included in the sample. Teachers associated with a selected school were sampled from a list of teachers that was provided by the school, collected from school websites, or purchased from a vendor. The
selected samples included about 10,600 traditional and charter public schools and their principals, 60,000 public school teachers, 4,000 private schools and their principals, and 9,600 private school teachers.

Weighted unit response rates for the 2017-18 NTPS were 72.5 percent for the public school survey and 64.5 percent for the private school survey, 70.2 percent for the public school principal survey and 62.6 percent for the private school principal survey, and 76.9 percent for the public school teacher survey and 75.9 percent for the private school teacher survey.

General information on NTPS and electronic copies of the questionnaires are available at the NTPS home page (https://nces. ed.gov/surveys/ntps).

## Private School Universe Survey

The purposes of the Private School Universe Survey (PSS) data collection activities are (1) to build an accurate and complete list of private schools to serve as a sampling frame for NCES sample surveys of private schools and (2) to report data on the total number of private schools, teachers, and students in the survey universe. Since its inception in 1989, the survey has been conducted every 2 years. Selected findings from the 2019-20 PSS are presented in the First Look report Characteristics of Private Schools in the United States: Results From the 2019-20 Private School Universe Survey (NCES 2021-061).

The PSS produces data similar to that of the Common Core of Data for public schools, and can be used for public-private comparisons. The data are useful for a variety of policy- and research-relevant issues, such as the growth of religiously affiliated schools, the number of private high school graduates, the length of the school year for various private schools, and the number of private school students and teachers.

The target population for this universe survey is all private schools in the United States that meet the PSS criteria of a private school (i.e., the private school is an institution that provides instruction for any of grades K through 12, has one or more teachers to give instruction, is not administered by a public agency, and is not operated in a private home).

The survey universe is composed of schools identified from a variety of sources. The main source is a list frame initially developed for the 1989-90 PSS. The list is updated regularly by matching it with lists provided by nationwide private school associations, state departments of education, and other national guides and sources that list private schools. The other source is an area frame search in approximately 124 geographic areas, conducted by the U.S. Census Bureau. The frame may include schools that are eventually determined not to meet the PSS criteria of a private school, and are thus out-of-scope.

Of the 40,302 schools included in the 2009-10 sample, 10,229 were considered as out-of-scope (not eligible for the PSS). Those not responding numbered 1,856 , and those responding numbered 28,217 . The unweighted response rate for the 2009-10 PSS survey was 93.8 percent.

Of the 39,325 schools included in the 2011-12 sample, 10,030 were considered as out-of-scope (not eligible for the PSS). A total of 26,983 private schools completed a PSS interview ( 15.8 percent completed online), while 2,312 schools refused to participate, resulting in an unweighted response rate of 92.1 percent.

Of the 40,298 schools included in the 2013-14 sample, 10,659 were considered as out-of-scope (not eligible for the PSS). A total of 24,566 private schools completed a PSS interview ( 34.1 percent completed online), while 5,073 schools refused to participate, resulting in an unweighted response rate of 82.9 percent.

Of the 42,389 schools included in the 2015-16 sample, 12,754 were considered as out-of-scope (not eligible for the PSS). A total of 22,428 private schools completed a PSS interview and 7,207 schools failed to respond, which resulted in an unweighted response rate of 75.7 percent.

Of the 43,384 schools included in the 2017-18 sample, 15,272 were considered as out-of-scope (not eligible for the PSS). A total of 22,895 private schools completed a PSS interview, while 5,217 schools failed to respond, resulting in an unweighted response rate of 81.4 percent.

Of the 42,836 schools included in the 2019-20 sample, 13,895 were considered as out-of-scope (not eligible for the PSS). A total of 21,572 private schools completed a PSS interview, while 7,369 schools failed to respond, resulting in an unweighted response rate of 74.5 percent.

## Schools and Staffing Survey

The Schools and Staffing Survey (SASS) was a set of related questionnaires that collected descriptive data on the context of public and private elementary and secondary education. Data reported by districts, schools, principals, and teachers provide a variety of statistics on the condition of education in the United States that may be used by policymakers and the general public.

The SASS system covered a wide range of topics, including teacher demand, teacher and principal characteristics, teachers' and principals' perceptions of school climate and problems in their schools, teacher and principal compensation, district hiring and retention practices, general conditions in schools, and basic characteristics of the student population.

SASS data were collected through a mail questionnaire with telephone and in-person field follow-up. SASS has been conducted by the Census Bureau for NCES since the first administration of the survey, which was conducted during the 1987-88 school year. Subsequent SASS administrations were conducted in 1990-91, 1993-94, 1999-2000, 2003-04, 2007-08, and 2011-12.

SASS was designed to produce national, regional, and state estimates for public elementary and secondary schools, school districts, principals, teachers, and school library media centers and national and regional estimates for public charter schools, as well as principals, teachers, and school library media centers within these schools. For private schools, the sample supports national, regional, and affiliation estimates for schools, principals, and teachers.

From its inception, SASS had four core components: school questionnaires, teacher questionnaires, principal questionnaires, and school district (prior to 1999-2000, "teacher demand and shortage") questionnaires. A fifth component, school library media center questionnaires, was introduced in the 1993-94 administration and was included in every subsequent administration of SASS. School library data were also collected in the 1990-91 administration of the survey through the school and principal questionnaires.

School questionnaires used in SASS include the Public and Private School Questionnaires, teacher questionnaires included the Public and Private School Teacher Questionnaires, principal questionnaires included the Public and Private School Principal (or School Administrator) Questionnaires, and school district questionnaires included the School District (or Teacher Demand and Shortage) Questionnaires.

Although the four core questionnaires and the school library media questionnaires remained relatively stable over the various administrations of SASS, the survey was changed to accommodate emerging issues in elementary and secondary education. Some questionnaire items were added, some were deleted, and some were reworded.

During the 1990-91 SASS cycle, NCES worked with the Office of Indian Education to add an Indian School Questionnaire to SASS, and it remained a part of SASS through 2007-08. The Indian School Questionnaire explored the same school-level issues that the Public and Private School Questionnaires explore, allowing comparisons among the three types of schools. The 1990-91, 1993-94, 1999-2000, 2003-04, and 2007-08 administrations of SASS obtained data on Bureau of Indian Education (BIE) schools (schools funded or operated by the BIE), but the 2011-12 administration did not obtain BIE data. SASS estimates
for all survey years presented in this report exclude BIE schools, and as a result, estimates in this report may differ from those in previously published reports.

The SASS teacher surveys collected information on the characteristics of teachers, such as their age, race/ethnicity, years of teaching experience, average number of hours per week spent on teaching activities, base salary, average class size, and highest degree earned. These teacher-reported data may be combined with related information on their school's characteristics, such as school type (e.g., public traditional, public charter, Catholic, private other religious, and private nonsectarian), community type, and school enrollment size. The teacher questionnaires also asked for information on teacher opinions regarding the school and teaching environment. In 1993-94, about 53,000 public school teachers and 10,400 private school teachers were sampled. In 1999-2000, about 56,300 public school teachers, 4,400 public charter school teachers, and 10,800 private school teachers were sampled. In 2003-04, about 52,500 public school teachers and 10,000 private school teachers were sampled. In 2007-08, about 48,400 public school teachers and 8,200 private school teachers were sampled. In 2011-12, about 51,100 public school teachers and 7,100 private school teachers were sampled. Weighted overall response rates in 2011-12 were 61.8 percent for public school teachers and 50.1 percent for private school teachers.

The SASS 2011-12 sample of schools was confined to the 50 states and the District of Columbia and excludes the other jurisdictions, the Department of Defense overseas schools, the BIE schools, and schools that do not offer teacher-provided classroom instruction in grades 1-12 or the ungraded equivalent. The SASS 2011-12 sample included 10,250 traditional public schools, 750 public charter schools, and 3,000 private schools.

The public school sample for the 2011-12 SASS was based on an adjusted public school universe file from the 2009-10 Common Core of Data, a database of all the nation's public school districts and public schools. The private school sample for the 2011-12 SASS was selected from the 2009-10 Private School Universe Survey (PSS), as updated for the 2011-12 PSS. This update collected membership lists from private school associations and religious denominations, as well as private school lists from state education departments. The 2011-12 SASS private school frame was further augmented by the inclusion of additional schools that were identified through the 2009-10 PSS area frame data collection.

The NCES data product 2011-12 Schools and Staffing Survey (SASS) Restricted-Use Data Files (NCES 2014-356) contains eight files (Public School District, Public School Principal, Public School, Public School Teacher, Public School Library Media Center, Private School Principal, Private School, and Private School Teacher) in multiple formats. It also contains a six-volume User's Manual, which includes a codebook for each file. (Information on how to obtain a restricted-use data license is located at https://nces.ed.gov/pubsearch/licenses.asp.)

## Teacher Follow-Up Survey

The Teacher Follow-up Survey (TFS) is a follow-up survey of selected elementary and secondary school teachers who participate in the NCES Schools and Staffing Survey (SASS). Its purpose is to determine how many teachers remain at the same school, move to another school, or leave the profession in the year following a SASS administration. It is administered to elementary and secondary teachers in the 50 states and the District of Columbia. The TFS uses two questionnaires, one for teachers who left teaching since the previous SASS administration and another for those who are still teaching either in the same school as last year or in a different school. The objective of the TFS is to focus on the characteristics of each group in order to answer questions about teacher mobility and attrition.

The 2008-09 TFS is different from any previous TFS administration in that it also serves as the second wave of a longitudinal study of first-year teachers. Because of this, the 2008-09 TFS consists of four questionnaires. Two are for respondents who were first-year public school teachers in the 2007-08 SASS and two are for the remainder of the sample.

The 2012-13 TFS sample was made up of teachers who had taken the 2011-12 SASS survey. The 2012-13 TFS sample contained about 5,800 public school teachers and 1,200 private school teachers. The weighted overall response rate using the initial basic weight for private school teachers was notably low (39.7 percent), resulting in a decision to exclude private school teachers from the 2012-13 TFS data files. The weighted overall response rate for public school teachers was 49.9 percent (50.3 percent for current and 45.6 percent for former teachers). Additional information about the 2012-13 TFS, including the analysis of unit nonresponse bias, is available in the First Look report Teacher Attrition and Mobility: Results From the 2012-13 Teacher Follow-up Survey (NCES 2014-077).

## Bureau of Economic Analysis

## National Income and Product Accounts

The National Income and Product Accounts (NIPAs), produced by the Bureau of Economic Analysis, are a set of economic accounts that provide information on the value and composition of output produced in the United States during a given period. NIPAs present measures of economic activity in the United States, including production, income distribution, and personal savings. NIPAs also include data on employee compensation and wages. These estimations were first calculated in the early 1930s to help the government design economic policies to combat the Great Depression. Most of the NIPA series are published quarterly, with annual reviews of estimates from the three most recent years conducted in the summer.

Revisions to the NIPAs have been made over the years to create a more comprehensive economic picture of the United States. For example, in 1976, consumption of fixed capital (CFC) estimates shifted to a current-cost basis. In 1991, NIPAs began to use gross domestic product (GDP) instead of gross national product (GNP) as the primary measure of U.S. production. (At that time, virtually all other countries were already using GDP as their primary measure of production.) In the 2003 comprehensive revision, a more complete and accurate measure of insurance services was adopted. The incorporation of a new classification system for personal consumption expenditures (PCE) was among the changes contained in the 2009 comprehensive revision. The comprehensive revision of 2013 included the treatment of research and development expenditures by business, government, and nonprofit institutions serving households as fixed investment. The 2017 NIPA annual update contained estimates that reflected the incorporation of newly available and revised source data and the adoption of improved estimating methods.

NIPAs are slowly being integrated with other federal account systems, such as the federal account system of the Bureau of Labor Statistics.

Further information on NIPAs may be obtained from
U.S. Department of Commerce

Bureau of Economic Analysis
www.bea.gov

## Bureau of Labor Statistics

## Consumer Price Indexes

The Consumer Price Index (CPI) represents changes in prices of all goods and services purchased for consumption by urban households. Indexes are available for two population groups: a CPI for All Urban Consumers (CPI-U) and a CPI for Urban Wage Earners and Clerical Workers (CPI-W). Unless otherwise specified, data in this report are adjusted for inflation using the CPI-U. These values are generally adjusted to a school-year basis by averaging the July through June figures. Price indexes
are available for the United States, the 4 Census regions, 9 Census divisions, 2 size of city classes, 8 cross-classifications of regions and size-classes, and 23 local areas. The major uses of the CPI include as an economic indicator, as a deflator of other economic series, and as a means of adjusting income.

Also available is the Consumer Price Index research series using current methods (CPI-U-RS), which presents an estimate of the CPI-U from 1978 to the present that incorporates most of the improvements that the Bureau of Labor Statistics has made over that time span into the entire series. The historical price index series of the CPI-U does not reflect these changes, though these changes do make the present and future CPI more accurate. The limitations of the CPI-U-RS include considerable uncertainty surrounding the magnitude of the adjustments and the several improvements in the CPI that have not been incorporated into the CPI-U-RS for various reasons. Nonetheless, the CPI-U-RS can serve as a valuable proxy for researchers needing a historical estimate of inflation using current methods. This series has not been used in NCES tables.

Further information on consumer price indexes may be obtained from
Bureau of Labor Statistics
U.S. Department of Labor

2 Massachusetts Avenue NE
Washington, DC 20212
https://www.bls.gov/cpi

## Employment and Unemployment Surveys

Statistics on the employment and unemployment status of the population and related data are compiled by the Bureau of Labor Statistics (BLS) using data from the Current Population Survey (CPS) (see below) and other surveys. The CPS, a monthly household survey conducted by the U.S. Census Bureau for the Bureau of Labor Statistics, provides a comprehensive body of information on the employment and unemployment experience of the nation's population, classified by age, sex, race, and various other characteristics.

Further information on unemployment surveys may be obtained from
Bureau of Labor Statistics
U.S. Department of Labor

2 Massachusetts Avenue NE
Washington, DC 20212
cpsinfo@bls.gov
https://www.bls.gov/bls/employment.htm

## Census Bureau

## Current Population Survey

The Current Population Survey (CPS) is a monthly survey of about 50,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics. The CPS is the primary source of labor force statistics on the U.S. population. In addition, supplemental questionnaires are used to provide further information about the U.S. population. The March supplement (also known as the Annual Social and Economic [ASEC] supplement) contains detailed questions on topics such as income, employment, and educational attainment; additional questions, such as items on disabilities, have also been included. In the November supplement, items on computer and internet use are the principal focus. The October supplement also contains some questions about computer and internet use, but most of its questions relate to school enrollment and school characteristics.

CPS samples are initially selected based on results from the decennial census and are periodically updated to reflect new housing construction. The current sample design for the main CPS, last revised in July 2015, includes about 70,000 households. Each month, about 50,000 of the 70,000 households are interviewed. Information is obtained each month from those in the household who are 15 years of age and over, and demographic data are collected for children 0-14 years of age. In addition, supplemental questions regarding school enrollment are asked about eligible household members age 3 and over in the October CPS supplement.

In January 1992, the CPS educational attainment variable was changed. The "Highest grade attended" and "Year completed" questions were replaced by the question "What is the highest level of school ... has completed or the highest degree ... has
received?" Thus, for example, while the old questions elicited data for those who completed more than 4 years of high school, the new question elicited data for those who were high school completers, that is, those who graduated from high school with a diploma as well as those who completed high school through equivalency programs, such as a GED program.

A major redesign of the CPS was implemented in January 1994 to improve the quality of the data collected. Survey questions were revised, new questions were added, and computer-assisted interviewing methods were used for the survey data collection. Further information about the redesign is available in Current Population Survey, October 1995: (School Enrollment Supplement) Technical Documentation at https://www2.census.gov/programs-surveys/cps/techdocs/cpsoct95.pdf.

Caution should be used when comparing data from 2012 through 2020 (which reflect 2010 Census-based controls) with data from 2002 through 2011 (which reflect 2000 Census-based controls) and with data from 2001 and earlier (which reflect population controls based on the 1990 and earlier Censuses). Changes in population controls generally have relatively little impact on summary measures such as means, medians, and percentage distributions; they can, however, have a significant impact on population counts. For example, use of 2010 census-based population controls results in about a 0.2 percent increase from the 2000 Census-based controls in the civilian noninstitutionalized population and in the number of families and households. Thus, estimates of levels for data collected in 2012 and later years will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain subpopulation groups than for the total population.

Caution should also be exercised when comparing March CPS (ASEC) estimates from data collected in 2020 to those from previous years due to the effects that the coronavirus (COVID-19) had on interviewing and response rates. Interviewing for the March CPS began on March 15, 2020. In order to protect the health and safety of Census Bureau staff and respondents, the survey suspended in-person interviewing and closed the two CATI contact centers on March 20. For the rest of March and through April, the Census Bureau continued to attempt all interviews by phone. While the Census Bureau went to great lengths to complete interviews by telephone, the response rate for the CPS basic household survey in March 2020 was 73 percent, about 10 percentage points lower than in preceding months and in the same period in 2019.

Beginning in 2003, the race/ethnicity questions were expanded. Information on people of Two or more races were included, and the Asian and Pacific Islander race category was split into two categories-Asian and Native Hawaiian or Other Pacific Islander. In addition, questions were reworded to make it clear that self-reported data on race/ethnicity should reflect the race/ethnicity with which the responder identifies, rather than what may be written in official documentation.

The estimation procedure employed for monthly CPS data involves inflating weighted sample results to independent estimates of characteristics of the civilian noninstitutional population in the United States by age, sex, and race. These independent estimates are based on statistics from decennial censuses; statistics on births, deaths, immigration, and emigration; and statistics on the population in the armed services. Generalized standard error tables are provided in the Current Population Reports; methods for deriving standard errors can be found within the CPS technical documentation at https://www.census. gov/programs-surveys/cps/technical-documentation/complete.html. The CPS data are subject to both nonsampling and sampling errors.

Standard errors were estimated using the generalized variance function prior to 2005 for March CPS data and prior to 2010 for October CPS data. The generalized variance function is a simple model that expresses the variance as a function of the expected value of a survey estimate. Standard errors were estimated using replicate weight methodology beginning in 2005 for March CPS data and beginning in 2010 for October CPS data. Those interested in using CPS household-level supplement replicate weights to calculate variances may refer to Estimating Current Population Survey (CPS) Household-Level Supplement Variances Using Replicate Weights at https://www.nber.org/cps/HH-level Use of the Public Use Replicate Weight File.doc.

## School Enrollment

Each October, the Current Population Survey (CPS) includes supplemental questions on the enrollment status of the population ages 3 years and over. Currently, the October supplement consisted of approximately 50,000 interviewed households, the same households interviewed in the basic Current Population Survey. The main sources of nonsampling variability in the responses to the supplement are those inherent in the survey instrument. The question of current enrollment may not be answered accurately for various reasons. Some respondents may not know current grade information for every student in the household, a problem especially prevalent for households with members in college or in nursery school. Confusion over college credits or hours taken by a student may make it difficult to determine the year in which the student is enrolled. Problems may occur with the definition of nursery school (a group or class organized to provide educational experiences for children) where respondents' interpretations of "educational experiences" vary.

For the October 2018 basic CPS, the household-level nonresponse rate was 15.2 percent. The person-level nonresponse rate for the school enrollment supplement was an additional 8.0 percent. Since the basic CPS nonresponse rate is a household-level rate and the school enrollment supplement nonresponse rate is a person-level rate, these rates cannot be combined to derive an overall nonresponse rate. Nonresponding households may have fewer persons than interviewed ones, so combining these rates may lead to an overestimate of the true overall nonresponse rate for persons for the school enrollment supplement.

Further information on CPS methodology may be obtained from https://www.census.gov/programs-surveys/cps.html.

## Decennial Census, Population Estimates, and Population Projections

The Decennial Census is a universe survey mandated by the U.S. Constitution. It is a questionnaire sent to every household in the country, and it is composed of seven questions about the household and its members (name, sex, age, relationship, Hispanic origin, race, and whether the housing unit is owned or rented). The Census Bureau also produces annual estimates of the resident population by demographic characteristics (age, sex, race, and Hispanic origin) for the nation, states, and counties. The reference date for population estimates is July 1 of the given year. With each new issue of July 1 estimates, the Census Bureau revises estimates for each year back to the last census. Previously published estimates are superseded and archived.

Further information on the Decennial Census may be obtained from
Population Division
Census Bureau

## Other Sources

## S\&P Global Inc.

S\&P Global Inc. provides an information system that includes databases of economic and financial information; simulation and planning models; regular publications and special studies; data retrieval and management systems; and access to experts on economic, financial, industrial, and market activities. One service is the S\&P Global Inc. Model of the U.S. Economy, which contains annual projections of U.S. economic and financial conditions, including forecasts for the federal government, incomes, population, prices and wages, and state and local governments, over a long-term (10-to 25-year) forecast period.

National and state-level population estimates and projections are obtained from S\&P Global's Economics and Country Risk Service. S\&P Global's foundation for estimating historical population estimates are the Census Bureau's estimates by age, sex, and race/ethnicity. To generate population projections, S\&P Global estimates a cohort component model (similar to the Census Bureau's methodology) by forecasting births, deaths, and net international migration. Forecasts of births are obtained from S\&P Global’s US Regional Economic Service. The most recent historical data on deaths by age, sex, and race/ethnicity are obtained from the U.S. Centers for Disease Control and Prevention in order to generate projections. Projections of net international migration are also sourced from the S\&P Global US Regional Economic Service.

In its simplest form, the cohort component method is expressed as:

$$
P_{t}=P_{t-1}+B_{t-1, t}-D_{t-1, t}+M_{t-1, t}
$$

where:

$$
\begin{aligned}
P_{t} & =\text { population at time } t \\
P_{t-1} & =\text { population at time } t-1 ; \\
B_{t-1, t} & =\text { births in the interval from time } t-1 \text { to time } t ; \\
D_{t-1, t} & =\text { deaths in the interval from time } t-1 \text { to time } t ; \text { and } \\
M_{t-1, t} & =\text { net migration in the interval from time } t-1 \text { to time } t
\end{aligned}
$$

# Appendix F Glossary 

## A

#### Abstract

Associate's degree A degree granted for the successful completion of a sub-baccalaureate program of studies, usually requiring at least 2 years (or equivalent) of full-time collegelevel study. This includes degrees granted in a cooperative or work-study program.

Autocorrelation Correlation of the error terms from different observations of the same variable. Also called Serial correlation.

Average daily attendance (ADA) The aggregate attendance of a school during a reporting period (normally a school year) divided by the number of days school is in session during this period. Only days on which the pupils are under the guidance and direction of teachers should be considered days in session.

## B

Bachelor's degree A degree granted for the successful completion of a baccalaureate program of studies, usually requiring at least 4 years (or equivalent) of full-time collegelevel study. This includes degrees granted in a cooperative or work-study program.

Breusch-Godfrey serial correlation LM test A statistic testing the independence of errors in least-squares regression against alternatives of first-order and higher degrees of serial correlation. The test belongs to a class of asymptotic tests known as the Lagrange multiplier (LM) tests.

## C

Capital outlay Funds for the acquisition of land and buildings; building construction, remodeling, and additions; the initial installation or extension of service systems and other built-in equipment; and site improvement. The category also encompasses architectural and engineering services including the development of blueprints.

Certificate A formal award certifying the satisfactory completion of a postsecondary education program. Certificates can be awarded at any level of postsecondary education and include awards below the associate's degree level.

Classroom teacher A staff member assigned the professional activities of instructing pupils in self-contained classes or courses, or in classroom situations; usually expressed in fulltime equivalents.

Coefficient of variation (CV) Represents the ratio of the standard error to the estimate. For example, a CV of 30 percent indicates that the standard error of the estimate is equal to 30 percent of the estimate's value. The CV is used to compare the amount of variation relative to the magnitude of the estimate. A CV of 30 percent or greater indicates that an estimate should be interpreted with caution. For a discussion of standard errors, see Appendix C: Data Sources.

Cohort A group of individuals that have a statistical factor in common, for example, year of birth.

Cohort-component method A method for estimating and projecting a population that is distinguished by its ability to preserve knowledge of an age distribution of a population (which may be of a single sex, race, and Hispanic origin) over time.

College A postsecondary school that offers general or liberal arts education, usually leading to an associate's, bachelor's, master's, or doctor's degree. Junior colleges and community colleges are included under this terminology.

Constant dollars Dollar amounts that have been adjusted by means of price and cost indexes to eliminate inflationary factors and allow direct comparison across years.

Consumer Price Index (CPI) This price index measures the average change in the cost of a fixed market basket of goods and services purchased by consumers. Indexes vary for specific areas or regions, periods of time, major groups of consumer expenditures, and population groups. The CPI reflects spending patterns for two population groups: (1) all urban consumers and urban wage earners and (2) clerical workers. CPIs are calculated for both the calendar year and the school year using the U.S. All Items CPI for All Urban Consumers (CPI-U). The calendar year CPI is the same as the annual CPI-U. The school year CPI is calculated by adding the monthly CPI-U figures, beginning with July of the first year and ending with June of the following year, and then dividing that figure by 12 .

Control of institutions A classification of institutions of elementary/secondary or postsecondary education by whether the institution is operated by publicly elected or appointed officials and derives its primary support from public funds (public control) or is operated by privately elected or appointed officials and derives its major source of funds from private sources (private control).

Current dollars Dollar amounts that have not been adjusted to compensate for inflation.

## Current expenditures (elementary/secondary) The

 expenditures for operating local public schools, excluding capital outlay and interest on school debt. These expenditures include such items as salaries for school personnel, benefits, student transportation, school books and materials, and energy costs. Beginning in 1980-81, expenditures for state administration are excluded.Instruction expenditures Include expenditures for activities related to the interaction between teacher and students. Include salaries and benefits for teachers and instructional aides, textbooks, supplies, and purchased services such as instruction via television, webinars, and other online instruction. Also included are tuition expenditures to other local education agencies.

Administration expenditures Includes expenditures for school administration (i.e., the office of the principal, fulltime department chairpersons, and graduation expenses), general administration (the superintendent and board of education and their immediate staff), and other support services expenditures.

Transportation Includes expenditures for vehicle operation, monitoring, and vehicle servicing and maintenance.

Food services Includes all expenditures associated with providing food to students and staff in a school or school district. The services include preparing and serving regular and incidental meals or snacks in connection with school activities, as well as the delivery of food to schools.

Enterprise operations Includes expenditures for activities that are financed, at least in part, by user charges, similar to a private business. These include operations funded by sales of products or services, together with amounts for direct program support made by state education agencies for local school districts.

## Current expenditures per pupil in average daily attendance

Current expenditures for the regular school term divided by the average daily attendance of full-time pupils (or full-time equivalency of pupils) during the term. See also Current expenditures and Average daily attendance.

## D

Degree An award conferred by a college, university, or other postsecondary education institution as official recognition for the successful completion of a program of studies. Refers specifically to associate's or higher degrees conferred by degree-granting institutions. See also Associate's degree, Bachelor's degree, Master's degree, and Doctor's degree.

Degree/certificate-seeking student A student enrolled in courses for credit and recognized by the institution as seeking a degree, certificate, or other formal award. High school students also enrolled in postsecondary courses for credit are not considered degree/certificate-seeking. See also Degree and Certificate.

Degree-granting institutions Postsecondary institutions that are eligible for Title IV federal financial aid programs and grant an associate's or higher degree. For an institution to be eligible to participate in Title IV financial aid programs, it must be accredited by an agency or association that was recognized by the U.S. Department of Education or be recognized directly by the Secretary of Education.

Department of Defense (DoD) dependents schools Schools that are operated by the Department of Defense Education Activity (a civilian agency of the U.S. Department of Defense) and provide comprehensive prekindergarten through 12thgrade educational programs on military installations both within the United States and overseas.

Dependent variable A mathematical variable whose value is determined by that of one or more other variables in a function. In regression analysis, when a random variable, $y$, is expressed as a function of variables $x 1, x 2, \ldots x k$, plus a stochastic term, then $y$ is known as the "dependent variable."

Disposable personal income Current income received by people less their contributions for social insurance, personal tax, and nontax payments. It is the income available to people for spending and saving. Nontax payments include passport fees, fines and penalties, donations, and tuitions and fees paid to schools and hospitals operated mainly by the government. See also Personal income.

Doctor's degree The highest award a student can earn for graduate study. Includes such degrees as the Doctor of Education (Ed.D.); the Doctor of Juridical Science (S.J.D.); the Doctor of Public Health (Dr.P.H.); and the Doctor of Philosophy (Ph.D.) in any field, such as agronomy, food technology, education, engineering, public administration, ophthalmology, or radiology. The doctor's degree classification encompasses three main subcategoriesresearch/scholarship degrees, professional practice degrees, and other degrees-which are described below.

Doctor's degree-research/scholarship A Ph.D. or other doctor's degree that requires advanced work beyond the master's level, including the preparation and defense of a dissertation based on original research, or the planning and execution of an original project demonstrating substantial artistic or scholarly achievement. Examples of this type of degree may include the following and others, as designated by the awarding institution: the Ed.D. (in education), D.M.A. (in musical arts), D.B.A. (in business administration), D.Sc. (in science), D.A. (in arts), or D.M. (in medicine).

Doctor's degree-professional practice A doctor's degree that is conferred upon completion of a program providing the knowledge and skills for the recognition, credential, or license required for professional practice. The degree is typically awarded after a period of study such that the total time to the degree, including both preprofessional and professional preparation, equals at least 6 full-timeequivalent academic years. Some doctor's degrees of this type were formerly classified as first-professional degrees. Examples of this type of degree may include the following and others, as designated by the awarding institution: the D.C. or D.C.M. (in chiropractic); D.D.S. or D.M.D. (in dentistry); L.L.B. or J.D. (in law); M.D. (in medicine); O.D. (in optometry); D.O. (in osteopathic medicine); Pharm.D. (in pharmacy); D.P.M., Pod.D., or D.P. (in podiatry); or D.V.M. (in veterinary medicine).

Doctor's degree-other A doctor's degree that does not meet the definition of either a research/scholarship doctor's degree or a professional practice doctor's degree.

Dropout The term is used to describe both the event of leaving school before completing high school and the status of an individual who is not in school and who is not a high school completer. High school completers include both graduates of school programs as well as those completing high school through equivalency programs such as the GED program. Transferring from a public school to a private school, for example, is not regarded as a dropout event. A person who drops out of school may later return and graduate but is called a "dropout" at the time he or she leaves school. Measures to describe these behaviors include the event dropout rate (or the closely related school persistence rate), the status dropout rate, and the high school completion rate.

Durbin-Watson statistic A statistic testing the independence of errors in least squares regression against the alternative of first-order serial correlation. The statistic is a simple linear transformation of the first-order serial correlation of residuals and, although its distribution is unknown, it is tested by bounding statistics that follow R. L. Anderson's distribution.

## $E$

Econometrics The quantitative examination of economic trends and relationships using statistical techniques, and the development, examination, and refinement of those techniques.

Elementary/secondary school Includes only schools that are part of state and local school systems, and also most nonprofit private elementary/secondary schools, both religiously affiliated and nonsectarian. Includes regular, alternative, vocational, and special education schools. U.S. totals exclude federal schools for American Indians, and federal schools on military posts and other federal installations. Data from the Common Core of data include all public school students in prekindergarten through grade 12. Data from the Private School Survey include all private school students attending schools that offer kindergarten or higher grades.

Enrollment The total number of students registered in a given school unit at a given time, generally in the fall of a year.

Estimate A numerical value obtained from a statistical sample and assigned to a population parameter. The particular value yielded by an estimator in a given set of circumstances or the rule by which such particular values are calculated.

Estimating equation An equation involving observed quantities and an unknown that serves to estimate the latter.

Estimation Estimation is concerned with inference about the numerical value of unknown population values from incomplete data, such as a sample. If a single figure is calculated for each unknown parameter, the process is called point estimation. If an interval is calculated within which the parameter is likely, in some sense, to lie, the process is called interval estimation.

Expenditures, total For elementary/secondary schools, these include all charges for current outlays plus capital outlays and interest on school debt. For degree-granting postsecondary institutions, these include current outlays plus capital outlays. For government, these include charges net of recoveries and other correcting transactions other than for retirement of debt, investment in securities, extension of credit, or as agency transactions. Government expenditures include only external transactions, such as the provision of perquisites or other payments in kind. Aggregates for groups of governments exclude intergovernmental transactions among the governments.

Expenditures per pupil Charges incurred for a particular period of time divided by a student unit of measure, such as average daily attendance or fall enrollment.

Exponential smoothing A method used in time series analysis to smooth or to predict a series. There are various forms, but all are based on the supposition that more remote history has less importance than more recent history.

Financial aid Grants, loans, assistantships, scholarships, fellowships, tuition waivers, tuition discounts, veteran's benefits, employer aid (tuition reimbursement), and other monies (other than from relatives or friends) provided to students to help them meet expenses. Except where designated, includes Title IV subsidized and unsubsidized loans made directly to students.

First-order serial correlation When errors in one time period are correlated directly with errors in the ensuing time period.

First-professional degree NCES no longer uses this classification. Most degrees formerly classified as firstprofessional (such as M.D., D.D.S., Pharm.D., D.V.M., and J.D.) are now classified as doctor's degrees-professional practice. However, master's of divinity degrees are now classified as master's degrees.

First-time student (undergraduate) A student who has no prior postsecondary experience (except as noted below) attending any institution for the first time at the undergraduate level. Includes students enrolled in the fall term who attended college for the first time in the prior summer term, and students who entered with advanced standing (college credits earned before graduation from high school).

Forecast An estimate of the future based on rational study and analysis of available pertinent data, as opposed to subjective prediction.

Forecasting Assessing the magnitude that a quantity will assume at some future point in time, as distinct from "estimation," which attempts to assess the magnitude of an already existent quantity.

Full-time enrollment The number of students enrolled in postsecondary education courses with total credit load equal to at least 75 percent of the normal full-time course load. At the undergraduate level, full-time enrollment typically includes students who have a credit load of 12 or more semester or quarter credits. At the postbaccalaureate level, full-time enrollment includes students who typically have a credit load of 9 or more semester or quarter credits, as well as other students who are considered full time by their institutions.

Full-time-equivalent (FTE) enrollment For postsecondary institutions, enrollment of full-time students, plus the full-time equivalent of part-time students. The full-time equivalent of the part-time students is estimated using different factors depending on the type and control of institution and level of student.

Full-time-equivalent (FTE) teachers Number of full-time teachers plus the full-time equivalent of part-time teachers.

Function A mathematical correspondence that assigns exactly one element of one set to each element of the same or another set. A variable that depends on and varies with another.

Functional form A mathematical statement of the relationship among the variables in a model.

## G

Geographic region One of the four regions of the United States used by the U.S. Census Bureau, as follows:

| Northeast | Midwest |
| :--- | :--- |
| Connecticut (CT) | Illinois (IL) |
| Maine (ME) | Indiana (IN) |
| Massachusetts (MA) | Iowa (IA) |
| New Hampshire (NH) | Kansas (KS) |
| New Jersey (NJ) | Michigan (MI) |
| New York (NY) | Minnesota (MN) |
| Pennsylvania (PA) | Missouri (MO) |
| Rhode Island (RI) | Nebraska (NE) |
| Vermont (VT) | North Dakota (ND) |
|  | Ohio (OH) |
| South | South Dakota (SD) |
| Alabama (AL) | Wisconsin (WI) |
| Arkansas (AR) |  |
| Delaware (DE) | West |
| District of Columbia (DC) | Alaska (AK) |
| Florida (FL) | Arizona (AZ) |
| Georgia (GA) | California (CA) |
| Kentucky (KY) | Colorado (CO) |
| Louisiana (LA) | Hawaii (HI) |
| Maryland (MD) | Idaho (ID) |
| Mississippi (MS) | Montana (MT) |
| North Carolina (NC) | Nevada (NV) |
| Oklahoma (OK) | New Mexico (NM) |
| South Carolina (SC) | Oregon (OR) |
| Tennessee (TN) | Utah (UT) |
| Texas (TX) | Washington (WA) |
| Virginia (VA) | Wyoming (WY) |
| West Virginia (WV) |  |

Graduate An individual who has received formal recognition for the successful completion of a prescribe program of studies.

## H

High school diploma A formal document regulated by the state certifying the successful completion of a prescribed secondary school program of studies. In some states or communities, high school diplomas are differentiated by type, such as an academic diploma, a general diploma, or a vocational diploma.

High school equivalency certificate A formal document certifying that an individual has met the state requirements for high school graduation equivalency by obtaining satisfactory scores on an approved examination and meeting other performance requirements (if any) set by a state education agency or other appropriate body. One particular version of this certificate is the GED test. The GED test is a comprehensive test used primarily to appraise the educational development of students who have not completed their formal high school education and who may earn a high school equivalency certificate by achieving satisfactory scores. GEDs are awarded by the states or other agencies, and the test is developed and distributed by the GED Testing Service (a joint venture of the American Council on Education and Pearson).

High school graduate An individual who has received formal recognition from school authorities, by the granting of a diploma, for completing a prescribed course of study. This definition does not include other high school completers or recipients of an equivalent credential, such as a GED certificate.

## I

Independent variable In regression analysis, a random variable, $y$, is expressed as a function of variables $x 1$, $x 2, \ldots x k$, plus a stochastic term; the $x$ 's are known as "independent variables."

Inflation A rise in the general level of prices of goods and services in an economy over a period of time, which generally corresponds to a decline in the real value of money or a loss of purchasing power. See also Constant dollars and Purchasing Power Parity indexes.

Interpolation See Linear interpolation.

## L

$\boldsymbol{L a g}$ An event occurring at time $t+k(k>0)$ is said to lag behind an event occurring at time $t$, the extent of the lag being $k$. An event occurring $k$ time periods before another may be regarded as having a negative lag.

Lead time When forecasting a statistic, the number of time periods since the last time period of actual data for that statistic used in producing the forecast.

Level of school A classification of elementary/secondary schools by instructional level. Includes elementary schools, middle schools, secondary schools, high schools, and other/ ungraded schools. For the purposes of the Elementary and Secondary Teacher Projection Model, students and teachers were split dichotomously into elementary and secondary school levels based on data from the National Education Association (NEA).

Linear interpolation A method that allows the prediction of an unknown value if any two particular values on the same scale are known and the rate of change is assumed constant.

Local education agency (LEA) See School district.

## M

Master's degree A degree awarded for successful completion of a program generally requiring 1 or 2 years of full-time college-level study beyond the bachelor's degree. One type of master's degree, including the Master of Arts degree, or M.A., and the Master of Science degree, or M.S., is awarded in the liberal arts and sciences for advanced scholarship in a subject field or discipline and demonstrated ability to perform scholarly research. A second type of master's degree is awarded for the completion of a professionally oriented program, for example, an M.Ed. in education, an M.B.A. in business administration, an M.F.A. in fine arts, an M.M. in music, an M.S.W. in social work, and an M.P.A. in public administration. Some master's degrees-such as divinity degrees (M.Div. or M.H.L./Rav), which were formerly classified as "first-professional"-may require more than 2 years of full-time study beyond the bachelor's degree.

Mean absolute percentage error (MAPE) The average value of the absolute value of errors expressed in percentage terms.

Migration Geographic mobility involving a change of usual residence between clearly defined geographic units, that is, between counties, states, or regions.

Model A system of postulates, data, and inferences presented as a mathematical description of a phenomenon, such as an actual system or process. The actual phenomenon is represented by the model in order to explain, predict, and control it.

## N

Nursery school An instructional program for groups of children during the year or years preceding kindergarten, which provides educational experiences under the direction of teachers. See also Prekindergarten and Preschool.

## 0

Ordinary least squares (OLS) The estimator that minimizes the sum of squared residuals.

## P

Parameter A quantity that describes a statistical population.
Part-time enrollment The number of students enrolled in postsecondary education courses with a total credit load less than 75 percent of the normal full-time credit load. At the undergraduate level, part-time enrollment typically includes students who have a credit load of less than 12 semester or quarter credits. At the postbaccalaureate level, part-time enrollment typically includes students who have a credit load of less than 9 semester or quarter credits.

Personal income Current income received by people from all sources, minus their personal contributions for social insurance. Classified as "people" are individuals (including owners of unincorporated firms), nonprofit institutions serving individuals, private trust funds, and private noninsured welfare funds. Personal income includes transfers (payments not resulting from current production) from government and business such as social security benefits and military pensions, but excludes transfers among people.

Postbaccalaureate enrollment The number of students working towards advanced degrees and of students enrolled in graduate-level classes but not enrolled in degree programs.

Postsecondary education The provision of formal instructional programs with a curriculum designed primarily for students who have completed the requirements for a high school diploma or equivalent. This includes programs of an academic, vocational, and continuing professional education purpose, and excludes avocational and adult basic education programs.

## Postsecondary institutions (basic classification by level)

4-year institution An institution offering at least a 4-year program of college-level studies wholly or principally creditable toward a baccalaureate degree.

2-year institution An institution offering at least a 2-year program of college-level studies which terminates in an associate degree or is principally creditable toward a
baccalaureate degree. Data prior to 1996 include some institutions that have a less-than-2-year program, but were designated as institutions of higher education in the Higher Education General Information Survey.

Less-than-2-year institution An institution that offers programs of less than 2 years' duration below the baccalaureate level. Includes occupational and vocational schools with programs that do not exceed 1,800 contact hours.

Prekindergarten Preprimary education for children typically ages 3-4 who have not yet entered kindergarten. It may offer a program of general education or special education and may be part of a collaborative effort with Head Start.

Preschool An instructional program enrolling children generally younger than 5 years of age and organized to provide children with educational experiences under professionally qualified teachers during the year or years immediately preceding kindergarten (or prior to entry into elementary school when there is no kindergarten). See also Nursery school and Prekindergarten.

Private institution An institution that is controlled by an individual or agency other than a state, a subdivision of a state, or the federal government, which is usually supported primarily by other than public funds, and the operation of whose program rests with other than publicly elected or appointed officials.

Private nonprofit institution An institution in which the individual(s) or agency in control receives no compensation other than wages, rent, or other expenses for the assumption of risk. These include both independent nonprofit institutions and those affiliated with a religious organization.

Private for-profit institution An institution in which the individual(s) or agency in control receives compensation other than wages, rent, or other expenses for the assumption of risk (e.g., proprietary schools).

Private school Private elementary/secondary schools surveyed by the Private School Universe Survey (PSS) are assigned to one of three major categories of religious orientation (Catholic, other religious, or nonsectarian) and, within each major category, one of three subcategories based on the school's religious affiliation provided by respondents.

Catholic Schools categorized according to governance, provided by Roman Catholic school respondents, into (i) parochial, (ii) diocesan, and (iii) private Catholic schools.

Other religious Schools that have a religious orientation or purpose but are not Catholic. Other religious schools are categorized according to religious association membership, provided by respondents,
into (i) Conservative Christian, (ii) other affiliated, and (iii) unaffiliated schools. Conservative Christian schools are those "Other religious" schools with membership in at least one of four associations: Accelerated Christian Education, American Association of Christian Schools, Association of Christian Schools International, and Oral Roberts University Education Fellowship. Affiliated schools are those "Other religious" schools not classified as Conservative Christian with membership in at least 1 of 11 associations-Association of Christian Teachers and Schools, Christian Schools International, Evangelical Lutheran Education Association, Friends Council on Education, General Conference of the Seventh-Day Adventist Church, Islamic School League of America, National Association of Episcopal Schools, National Christian School Association, National Society for Hebrew Day Schools, Solomon Schechter Day Schools, and Southern Baptist Association of Christian Schoolsor indicating membership in "other religious school associations." Unaffiliated schools are those "Other religious" schools that have a religious orientation or purpose but are not classified as Conservative Christian or affiliated.

Nonsectarian Schools that do not have a religious orientation or purpose and are categorized according to program emphasis, provided by respondents, into (i) regular, (ii) special emphasis, and (iii) special education schools. Regular schools are those that have a regular elementary/secondary or early childhood program emphasis. Special emphasis schools are those that have a Montessori, vocational/technical, alternative, or special program emphasis. Special education schools are those that have a special education program emphasis.

Projection In relation to a time series, an estimate of future values based on a current trend.

Public school or institution A school or institution controlled and operated by publicly elected or appointed officials and deriving its primary support from public funds.

Pupil/teacher ratio The enrollment of pupils at a given period of time, divided by the full-time-equivalent number of classroom teachers serving these pupils during the same period.

## R

$\boldsymbol{R}^{2}$ The coefficient of determination; the square of the correlation coefficient between the dependent variable and its ordinary least squares (OLS) estimate.

Racial/ethnic group Classification indicating general racial or ethnic heritage. Race/ethnicity data are based on the Hispanic
ethnic category and the race categories listed below (five single-race categories, plus the Two or more races category). Race categories exclude persons of Hispanic ethnicity unless otherwise noted.

American Indian or Alaska Native A person having origins in any of the original peoples of North and South America (including Central America), and who maintains tribal affiliation or community attachment.

Asian A person having origins in any of the original peoples of the Far East, Southeast Asia, or the Indian subcontinent, including, for example, Cambodia, China, India, Japan, Korea, Malaysia, Pakistan, the Philippine Islands, Thailand, and Vietnam. Prior to 2010-11, the Common Core of Data (CCD) combined Asian and Pacific Islander categories.

Black or African American A person having origins in any of the black racial groups of Africa. Used interchangeably with the shortened term Black.

Hispanic or Latino A person of Cuban, Mexican, Puerto Rican, South or Central American, or other Spanish culture or origin, regardless of race. Used interchangeably with the shortened term Hispanic.

Native Hawaiian or Other Pacific Islander A person having origins in any of the original peoples of Hawaii, Guam, Samoa, or other Pacific Islands. Prior to 2010-11, the Common Core of Data (CCD) combined Asian and Pacific Islander categories. Used interchangeably with the shortened term Pacific Islander.

White A person having origins in any of the original peoples of Europe, the Middle East, or North Africa.

Two or more races A person identifying himself or herself as of two or more of the following race groups: White, Black, Asian, Native Hawaiian or Other Pacific Islander, or American Indian or Alaska Native. Some, but not all, reporting districts use this category. "Two or more races" was introduced in the 2000 Census and became a regular category for data collection in the Current Population Survey (CPS) in 2003. The category is sometimes excluded from a historical series of data with constant categories. It is sometimes included within the category "Other."

Region See Geographic region.
Regression analysis A statistical technique for investigating and modeling the relationship between variables.

Resident population Includes civilian population and armed forces personnel residing within the United States; excludes armed forces personnel residing overseas.

Revenue All funds received from external sources, net of refunds, and correcting transactions. Noncash transactions, such as receipt of services, commodities, or other receipts in kind are excluded, as are funds received from the issuance of debt, liquidation of investments, and nonroutine sale of property.

Revenue receipts Additions to assets that do not incur an obligation that must be met at some future date and do not represent exchanges of property for money. Assets must be available for expenditures.

## S

Salary The total amount regularly paid or stipulated to be paid to an individual, before deductions, for personal services rendered while on the payroll of a business or organization.

School district An education agency at the local level that exists primarily to operate public schools or to contract for public school services. Synonyms are "local basic administrative unit" and "local education agency."

Secondary school See Elementary/secondary school
Serial correlation Correlation of the error terms from different observations of the same variable. Also called Autocorrelation.

Standard error of estimate An expression for the standard deviation of the observed values about a regression line. An estimate of the variation likely to be encountered in making predictions from the regression equation.

Student membership Student membership is an annual headcount of students enrolled in school on October 1 or the school day closest to that date. The Common Core of Data (CCD) allows a student to be reported for only a single school or agency. For example, a vocational school (identified as a "shared time" school) may provide classes for students from a number of districts and show no membership.

Time series A set of ordered observations on a quantitative characteristic of an individual or collective phenomenon taken at different points in time. Usually the observations are successive and equally spaced in time.

Time series analysis The branch of quantitative forecasting in which data for one variable are examined for patterns of trend, seasonality, and cycle.

## U

Unadjusted dollars See Current dollars.
Undergraduate students Students registered at an institution of postsecondary education who are working in a baccalaureate degree program or other formal program below the baccalaureate, such as an associate's degree, vocational, or technical program.

Ungraded student (elementary/secondary) A student who has been assigned to a school or program that does not have standard grade designations.
U.S. nonresident A person who is not a citizen or national of the United States and who is in this country on a visa or temporary basis and does not have the right to remain indefinitely.

## V

Variable A quantity that may assume any one of a set of values.

## Y

Years out In forecasting by year, the number of years since the last year of actual data for that statistic used in producing the forecast.
