Úrtak

Eitt dagfært yvirlit yvir soppar, sum eru skrásettir í Føroyum, verður lagt fram. Til samans eru 610 sløg í yvirlitinum, og næstan 300 teirra eru funnin fyrri fyrstu ferð undir rannsóknnum í tíðarskeiðnum frá 1988 til 1994.

Abstract

An updated check-list of fungi recorded from the Faroe Islands is presented. A total of 610 species are listed of which almost 300 have been found as new to the Faroes during expeditions in the period from 1988 to 1994.

Introduction

The first important contribution to the knowledge of fungi of the Faroe Islands was made by the Danish teacher and amateur mycologist F.H. Møller. His 'Fungi of the Færöes' was published with the first volume in 1945 and the second in 1958. A very large number of the species listed by Møller were collected by himself during a three-month stay in 1938.

There has never been a local tradition of collecting fungi on the Faroes, and fungi are generally held in low esteem. The first popular book on fungi in the Faroese language was published only a few years ago (Petersen *et al.*, 1994).

Very few local inhabitants have become

interested in fungi during the years, and only to a limited extent. Therefore, most of our knowledge is due to mycologists from abroad, who have visited the islands during the summer period.

In recent years a large number of collections have been made by Jacob Heilmann-Clausen (1994), Morten Lange (1961 and 1987), Jens H. Petersen (1988 and 1989), Erik Rald (1988) and Jan Vesterholt (1981, 1988, 1989, 1992 and 1994). Furthermore, Gro Gulden, Torbjørn Borgen and Karin Toft have also collected fungi on the Faroes.

During the 1990s, three papers devoted to or including Faroese fungi have been published, one on *Entoloma* subgenus *Lep-tonia* (Vesterholt and Brandt-Pedersen, 1990), one on *Descolea* (Vesterholt and Petersen, 1992) and one on lignicolous *Aphyllphorales* (Vesterholt and Petersen, 1993). A paper dealing with the genus *Galerina* (by Gulden and Vesterholt) is in preparation.

There is still a large number of collections from the Faroes, which are awaiting critical studies. This is especially the case with inoperculate discomycetes and

with collections belonging to the agaric genera *Cortinarius* and *Inocybe*.

Comments to the check-list

This check-list includes the Ascomycetes, Basidiomycetes, Phycomycetes and Zygomycetes known from the Faroe Islands. Although not being true fungi, Myxomycetes are often collected and studied by mycologists, and therefore they are included too.

Generally, imperfect fungi have been excluded. In the cases where the association to a perfect state is well known, findings of the anamorph are included under the teleomorphic name. If only the anamorph (and not the teleomorph) has been found on the Faroes, this is indicated in the list.

Some of the taxa reported by Møller have been excluded here, because I consider their true identity to be doubtful. A large part of the material studied and collected by Møller is kept in the Botanical Museum of Copenhagen. These collections are often in a fairly bad state, apparently due to his poor drying facilities. I have studied a limited number of Møller's collections, but it has not been my ambition to revise his material thoroughly.

All information on ecology and temporal occurrence is based entirely on observations from the Faroe Islands. The temporal occurrence is indicated with Roman numerals for the months in which the species have been collected or observed. For a large number of species the true temporal occurrence might be considerably wider than indicated. This is due to the fact that most mycologists have visited the islands during

the summer period only.

If herbarium material exists, this is indicated using the abbreviation C for the Botanical Museum of Copenhagen, FR for Føroya Náttúrugripasavn in Tórshavn, O for Oslo University, TB for the private herbarium of Torbjørn Borgen and ZT for Geobotanical Institute in Zürich.

If a species is known from one locality only, the locality name is indicated. If it is known from more than one locality, a list is given of the islands where the species has been found. The islands are abbreviated as follows: Bo: Borðoy – Ey: Eysturoy – Fu: Fugloy – He: Hestur – Ka: Kalsoy – Ko: Koltur – Ku: Kunoy – My: Mykines – No: Nólsoy – Sa: Sandoy – St: Stremoy – Su: Suðuroy – Sv: Svínø – Va: Vágoy – Vi: Viðoy.

Acknowledgements

Without the enthusiasm and effort of Jóhannes Jóhansen (1937-1995) the investigations made during the last 10 years would never have been carried out. It has been a pleasure for me to collect fungi on the islands with Jens H. Petersen and Erik Rald in 1988, with my family in 1992 and with Jacob Heilmann-Clausen in 1994. Henning Knudsen is thanked for drawing my attention to the presence of Morten Lange's collections, and Torbjørn Borgen is thanked for placing a number of collections from 1993 at my disposal. Gro Gulden, Henrik F. Gøtzsche, Knud Hauerslev, Egon Horak, Klaus Høiland, Mauri Korhonen, Christian Lange, Machiel E. Noordeloos, Jukka Vauras and Leif Örstadius are thanked for studying and identifying material collected from the Faroes. Ernest and Valerie Emmett are thanked for suggesting linguistic improvements of the text.
