## New Heathkit ${ }^{8}$ H89 All-In-One Computer

Heath takes the risk out of selecting a balanced computer system. Now, video terminal, floppy, keyboard and 8 -bit computer are brought together in one self-contained, compact unit. Nothing hangs out.

## Two Z80's

The personal computer has never been simpler. Or smarter. Two $Z 80$ microprocessors mean terminal never shares power with computer, as do most desk-top units. So this terminal is capable of a multitude of high-speed functions, all controllable by keyboard or software.

## 102 K bytes storage

Built-in floppy disk system gives you fast access to programs and data. Each $51 / 4-$ inch diskette has more than 102 K bytes of storage area, enough to hold entire files. The All-In-One comes with 16 K RAM, expandable to 48 K .

## Hundreds of uses at home or work

The All-In-One Computer runs programs written in MICROSOFT ${ }^{\text {™ }}$ BASIC and ASSEMBLER Languages. And it accepts all current software written for the popular Heathkit H8 computer. You can choose from scores of practical programs for home and business.

## Learn by building

What better way to learn about computers than to build one yourself? The All-In-One is available in easy-to-build kit form, as well as completely assembled. Like all Heath electronic kits, it comes to you with its own easy-to-follow assembly manual and a nationwide network of service centers to assure smooth sailing.

## FREE CATALOG

For complete detaifs on the Heathkit H89 All-In-One Computer and nearly 400 other electronic kits for your home, work or pleasure, send today for the latest Heathkit Cataliog of values.

* $\$ 1195$ without floppy. Mail order kit price, F.O.B. Benton Harbor, MI. Also available at Heathkit Electronic Centers at slightly higher prices. Prices subject to change without notice.

# No-Fault Radar 

## If you've ever been caught by radar or if you own a radar detector, please read this important message.

JS\&A has never offered a radar detector.
As our president put it, "A radar detector is a flagrant anti-police device that does nothing but permit abuse of our traffic laws.

Although many devices were presented to JS\&A, none were acceptable. Despite all of our efforts, our president stood firm, "Our company will not, under any circumstances. sell radar detectors.

For three years we saw radar detectorssome good, some bad-but because of our president's policy, we were unable to offer a single unit. We saw the units go to both $X$ and $K$ bands; we saw the police develop radar jamming devices; and we saw the FCC prohibit these jamming devices. We followed with great envy as other companies sold thousands of them while JS\&A stood firm on its decision not to sell them.
In January of 1979, our president was travelling on an interstate highway at 55 miles per hour. Other cars were passing him.
As he approached the top of a hill, he neglected to pay attention to his speedometer. As he rolled down the hill his speed increased to 63 MPH . At the bottom of the hill was a police radar trap.
He was apprehended and charged with exceeding the speed limit by eight miles per hour. He was taken to a Justice of the Peace who was in the barber shop, so our president had to wait until he finished. Finally there was a quick trial and a fine was paid.

Our president was four hours late. He felt that he was treated like a common criminal despite his good driving record and he lost very valuable time.

## ATTITUDE CHANGES

This small incident created an entire change in his attitude. Our president saw for the first time that even law-abiding citizens are subject to the inequities of radar justice. He saw that the law-abiding citizen must also be protected from the abuses of radar power when unfairly used.

And when he studied the entire situation, our president realized something very frightening for all motorists. Many police departments have quotas imposed on them to realize either federal or state funds. They must issue a
certain amount of tickets to qualify. With more and more motorists using radar detectors and CB's, police must strictly enforce speed limits to reach their quotas. Now, even law-abiding motorists, who might make a slight mistake. are more vulnerable to speeding violations.

## NEW MEMORANDUM

In a recent memorandum our president stated, "Due to the changing nature of police radar, JS\&A may offer radar detectors as part of its program if presented within the quality image of our company and if the product represents a truly unique radar detector product."

With the green light to find a radar detector, our product selection group was prepared. They had brochures from practically every manufacturer in the worid. And they eventually selected what even our president thought was the most professional and well-designed unit available.

## HIDDEN ANTENNA

Manufactured by a company called Chicago Radar, the unit consists of two parts - one that is hidden behind your grill, and the other under your dash. There's nothing on top of your dash board to indicate that you've got a radar detector and the system is difficult for anybody to steal. The unit under your dash is attached with a self-adhesive Velcro material so there's no screws or installation to worry about.

The control unit has two lights-one to indi-, cate that the unit is on, and the other to indicate that your car is under radar surveillance. There is also an audible alarm that will sound. But at night, when the light is all that you need, you can switch off the audible sound.

The control unit plugs into your cigarette lighter. The radar antenna is placed behind your grill. Just pull into any service station and the mechanic can easily install the entire system. The Velcro material and mounting brackets are all provided.

## AMPLIFIED SENSING

The antenna is one of the keys to the unit's high performance. Instead of the squareshaped dish antennas, the Chicago Radar version is a round cylinder. It tends to sense the radar signals sooner and around curves and hills because of its unique design.

The unit responds to both police radar bands $X$ and $K$ and uses all solid-state computer technology in its design.

We urge you to test our selection of what we feel to be the nation's finest radar detector. Order one from JS\&A. When you receive it, drive to your nearest service station or CB dealer and have them install your unit. The antenna installs with just a few brackets and the control unit attaches under your dash with the Velcro material.
Then use it for 30 days. During that time, count the number of radar traps you encounter. On the 30th day, turn off your unit as you travel. See how naked and unprotected you feel.

## 40 DAYS PROOF

If for any reason you are not completely satisfied, just return your unit within our 40-day trial period and we'll gladly send you a prompt and courteous refund.
To order your system, send $\mathbf{\$ 1 7 9 . 9 5}$ plus $\$ 3.00$ for postage and handling to the address shown below. (llinois residents, please add $5 \%$ sales tax.) Credit card buyers may call our toll-free number below. By return mail, you'll receive the complete system, all cables, Velcro material, instructions and a 90 -day limited warranty.

The patented unit is precision crafted by Chicago Radar-one of the most respected names in radar detection systems. JS\&A is America's largest single source of space-age products-further assurance that your modest investment is well protected.

We firmly support our police departments and their efforts, but if they are encouraged to use radar to maintain quotas, the law abiding consumer has no choice but to protect himself. Start today. Order your unit now at no obligation.

## THE TV PIGGYBACKING FUROR

In what appears to be a David vs. Goliath contest, Texas Instruments, with inspirational support from RCA, is attempting to have rules on Class I devices for TV amended to include a Class II category. This would permit legal sale of standalone $r$ - $f$ modulators to be used for computers and peripherals. Such a change in the present interface rule that requires r-f modulators to be FCC type approved together with signal-source equipment is vociferously opposed by Radio Shack, Apple. Commodore, and Interact, among personal computer makers.

TI says, essentially, that it's unfair to make a buyer purchase a video monitor when he could just as easily use an existing TV receiver if only the FCC would OK the use of separate $r$-f modulators. Other computer makers, who are already marketing personal computers, cry "foul," saying, in a nutshell, that such approval would give TI an unfair marketing advantage. Moreover, they point out that this would also cause increased interference with radio and TV reception.

Tl also requested a temporary permit to go ahead with the separate r-f modulator concept while the FCC's bureaucratic wheels turn ever so slowly to reply to the company's initial request for changing the rules. (Note: the FCC has yet to act on a similar request by RCA made about two years ago.) The National Association of Broadcasters (NAB) observes that this second request amounts to trying to solve a private marketplace problem by changing the rules.

With the foregoing as background, let's examine the pro's and con's of the rules change proposal. [I'll ignore the waiver request entirely because (1) it indeed gives a company not yet in the field an unfair advantage and (2) since the Part 15 radiation standards are under active review, it's possible that the "temporary" r-f modulators will not be in line with new standards.]

From a typical consumer's viewpoint, using a separate modulator to connect a computer to one's own TV receiver would likely appear to be an ideal opportunity to save substantial monies. Given the fact that computers are great noise generators, however, it is possible that interference within the household and on nearby neighbors' receivers would be objectionable. Furthermore, using a home TV receiver as information display equipment results in lowered video quality under the best of circumstances when compared to video monitors.
Nevertheless, the possibility of employing a legalized separate r-f modulator is an appealing one, and should be pursued. I firmly believe, though. that the FCC should not rush into making a positive decision on this without setting signal radiation standards that we can live with in the future. On the other hand, it's unfair to penalize manufacturers by the foot-dragging procedures practiced by the FCC.

RCA, by the way, has pointed out that the TI request for an r-f modulator physically separated from computers is not the same as its petition for a rules change that relates to all-in-one-package video disk and tape machines. So the company suggests three classifications: the present Class I TV devices that require type approval, a second classification for built-in r-f modulators, and a third for stand-alone modulators. (How come RCA and other TV makers don't incorporate video jacks in their TV receivers, which would make these rules change requests moot?)

Since this is written in May, I hopefully will learn more about all this at the Consumer Electronics Show in Chicago in June.

# Don't take our word forit. 

"We can heartily recommend the Superboard II computer system for the beginner who wants to get into microcomputers with a minimum of cost. Moreover, this is a 'real' computer with full expandability."

Popular Electronics March, 1979
"(Their) new Challenger 1P weighs in at $\$ 279$ and provides a remarkable amount of computing for this incredible price."

Kilobaud Microcomputing February, 1979
"Over the past four years we have taken delivery on over 25 computer systems. Only two have worked totally glitch free and without adjustment as they came out of the carton: The Tektronic 4051 (at $\$ 7,000$ the most expensive computer we tested) and the Ohio Scientific Superboard II (at \$279 the least expensive) . . . The Superboard II and companion C1P deserve your serious consideration."

Creative Computing January, 1979
"The Superboard II and its fully dressed companion the Challenger 1P series incorporate all the fundamental necessities of a personal computer at a very attractive price. With the expansion capabilities provided, this series becomes a very formidable competitor in the home computer area."

Interface Age April, 1979
"The graphics available permit some really dramatic effects and are relatively simple to program... The fact that the system can be easily expanded to include a floppy means that while you are starting out with a low-cost minimal system, you don't have to throw it away when you are ready to go on to more complex computer functions. Everything is there that you need; you simply build on to what you already have. You don't have to worry about trading off existing equipment to get the system that will really do what you want it to do. At $\$ 279$, Superboard II is a tough act to follow."

Radio Electronics June, 1979
"The Superboard II is an excellent choice for the personal computer enthusiast on a budget."

Byte May, 1979

## SOLENOID THAT ISN'T

We at Eumig thank Popular Electonics for the fine review regarding our Metropolitan CCD cassette deck in the May 1979 issue. We did, however, note an error regarding the deck's transport in the "User Comment" section: "The solenoid-operated transport is astonishingly silent. We heard none of the thumps or clunks usually associated with solenoid operation." You then go on to state that there is a "motor" sound instead of a solenoid sound.

As a point of information, the reason solenoids are not heard is that there are no solenoids. The motor sound is heard because the head mounting assembly is step-motor engaged, using the same motor that governs last forward and rewind. -Tom Bensen, Eumig (U.S.A.) Inc., Great Neck. NY

## MAKING A BETTER WINDOW?

The window comparator circuit shown above has fewer parts and has better input protection than that shown in Fig. 5 of the May

1979 "Experimenter's Corner." Resistors R1, $R 2$, and R3 form the reference voltage source with the upper limit defined by $V_{C c}(R 2$ $+R 3) /(R 1+R 2+R 3)$ and the lower limit defined by $V_{c c} R 3 /(R 1+R 2+R 3)$. For small windows, R2 determines the window opening. For very small windows, on the order of 0 to 15 mV . R2 can be eliminated and the opening can be adjusted via R7. Resistors R4 and R5 protect the inputs from excessive current during accidental inputs exceeding $V_{\mathrm{CC}}$ or ground. Diode limiting can be added from the inputs to $V_{C C}$ and ground, using D1 and $D 2$.
System stability is a function of $\mathrm{V}_{\mathrm{cc}}$ stability and op-amp drifts. For 741 s and $747 \mathrm{~s}, \mathrm{~V}_{\mathrm{CC}}$ should be between 8 and 30 volts. FET-input op-amps lend themselves well to this application. Resistors R4, R5, and R6 limit LED current and should be chosen to allow about 10 mA.-Glenn Fasnacht, Lakewood, OH .

## MOPED TURN INDICATORS

Many thanks for "Solid-State Turn Indicators for Mopeds" (May 1979). The article was clearly written. The project will almost certainly prevent accidents because blinking lights are easier to see and interpret. Also, the project is small enough to easily mount on all mopeds. -Bill Saehler, Minnesota City, MN.

While looking over the moped turn-indicator article, I noticed that D4 and C3 are not switched out of the power circuit by S1. While this is not particularly important when the de-
vice is connected to a moped generator, if a battery is used, as suggested in the article, it would quickly discharge to the zener voltage. To obviate this, I would rewire the circuit as shown below.

Note, too, that by substituting a dpdt (cen-ter-off) switch for S1 several advantages arise. Diodes D3 and D4 are eliminated, light assemblies do not have to be insulated from the frame, and return wiring from the lamps to the switch is not required. -Roy F. Gordon, Hampton. VA.

# Introducing the Troubleshooter. 

## Six functions and 24 ranges for $\$ 129^{*}$ make the jump from Analog to Digital more affordable than ever.

We call our new hand-held 8022A DMM the Troubleshooter. It combines the basic performance features you want with all the advantages that give digital DMM's the edge over analog$0.25 \%$ basic dc accuracy, a rugged, reliable design, a razor sharp $3^{1 / 2}$-digit LCD readout, small size and light weight.

Measure for measure you won't find a better value. Six functions high and low ohms, ac and dc voltage and current (24 ranges in all) make the Troubleshooter a 13 ounce ( 0.37 kg ) package of excellent measurement value. This kind of value wasn't possible until our custom CMOS LSI single chip design made hand-held DMM's an affordable reality and Fluke the industry leader.

Here's something new that won't shock you. Fluke's exclusive probe design features finger guards on the probe and shrouded connections to discourage accidental contact with circuit voltages.

You won't find a more rugged or reliable hand-held DMM. There's a lot more to building a high-quality hand-held DMM than you might suspect. The case has to survive bumps, scrapes, and scuffs. The LCD readout must withstand the extremes of humid*U.S. Price Only
ity, temperature, and vibration. Function switches need to perform reliably through thousands of cycles. And electrical circuitry must survive both physical shock and electrical overloads.

We built the 8022A to withstand all these tortures - with a rugged impact resistant plastic case, a custom LCD display, reliable push-buttons instead of rotary switches and over $20 \%$ of the components devoted to overload protection.

Take the next step. Contact the Fluke office, representative or authorized distributor in your area. In the U.S., CALL TOLL FREE (800) 426-0361. (For resi-

## Low-Cost <br> $\mu \mathrm{C}$ Printer

Radio Shack has introduced an inexpensive printer that produces low-cost hard copy on $2^{3 / 3} \mathrm{~s}^{\prime \prime}(60.3-\mathrm{cm})$ wide aluminumcoated paper. The TRS-80 Quick Printer II

prints upper- and lower-case, double-size, and double-spaced characters to allow special effects such as titling pages and printing headings. Automatic "wraparound" prevents data loss due to overflow when text exceeds maximum line length. Printer software is selectable for 16 or 32 characters/line and produces 120 lines/ minute ( 64 characters/second). The 96 -character, $5 \times 7$ dot-matrix characters are a modified ASCII subset. Vertical spacing is 6 lines/inch. All 32 ASCII codes can be produced, as well as codes for the printed characters. Although designed for use with Radio Shack's Level II TRS-80 systems, the printer can also be used with other computers. Measures $91 / s^{\prime \prime} \mathrm{W} \times 63 / 4{ }^{\prime \prime} \mathrm{D} \times$ $3^{5 / 16 " H} . \$ 219.00$.

## Digital <br> Capacitance Meter

A new digital capacitance meter has been introduced by Data Precision Corp. The $3^{1 / 2}$-digit Model 938 has a rated measuring range of 0.1 pF to $1999 \mu \mathrm{~F}$ in eight switchable ranges, with a basic accuracy of $0.1 \%$. Range selection is via pushbutton switches handily located along the left side of the case. A zero-adjust control with a +20 pF range is provided for compensat-

ing for stray capacitance of test leads. Measurements appear on a 0.5" (12.7mm ) high liquid crystal display. An internal fuse prevents instrument damage from charged capacitors and should the test leads be inadvertently connected across a voltage source. Uses a single 9 -volt alkaline battery. \$149.00

CIRCLEHO. BON FTEEINFORMATIONCERD

The craftsmen at Realtime ${ }^{\text {rM }}$ have done something quite unusual. They've created a dramatically thin, rugged alarm chronograph for under $\$ 250$.

In fact, way under $\$ 250$.
And while they've trimmed their timepiece's profile to a slim 9 mm , they have done it without sacrificing a single feature, or compromising quality.

We have yet to see an alarm chronograph that even approaches the value of this superb new product, either in a store or offered through the mail.

## Microcomputer technology pushed to the limit.

It's truly remarkable the amount of information you can now carry on your wrist, especially when you consider it's within a piece of jewelry no bulkier than an ordinary, slim wristwatch.

With this chronograph, you have bright liquid crystal digits always telling you the time of day. In hours, minutes and seconds (with accuracy to $\pm 5$ seconds a month).

What's more, you can even program the hours, minutes and seconds for any other time zone you wish for immediate recall, thanks to Realtime's dual time-zone feature.

5 POPULAR ALARM CHRONOGRAPHS COMPARE THINNESS.

It's a multitalented wrist alarm too. You may set it to beep-beep you in both time zones, and at precisely the minute you choose.

And because of Reaitime's "PM" indicator, you won't be setting your alarm for the evening when you had intended to set it for the morning.

Is it Monday in New York? Or Tuesday in Hong Kong? You'll never have to ask that question

again. The day of the week is always displayed. To see the date, simply flick a button. When the sun's down, press another and the Realtime's face is instantly illuminated.

And just as quickly as you recalled the date, you can set into motion a full-featured stopwatch. By the way, this stopwatch doesn't just count to 59 minutes like many other chronographs do-but up to 12 hours or more. It also precisely cleaves every second into tenths.

You may record split times, lap times or freeze the figures anytime. You may even alternate between your stopwatch functions and normal time ones without concern; by activating one mode, you don't interrupt the other.

## $\$ 99$ buys an honest design

We wish you had a Realtime alarm chronograph in your hands right now. You'd see and feel the difference a $100 \%$ solid stainless steel case makes. (Most other comparably priced chronographs are chrome plated and not solid stainless.) Realtime's back and bracelet are also solid stainless. And every one of those bracelet links is double stamped to produce the exact size and taper required. Each link is then ground and polished. (We defy anyone to find workmanship like this, elsewhere at this price.)

You'll also notice there's no front speaker grill on this alarm chronograph; it doesn't need one. The alarm sound emanates from the rear of the case. Many other chronographs, in trying to look like Seiko with its front-mounted speaker, cleverly paste on printed front grills. These are functionless; they are just imitation. Everything you see on your Realtime chronograph is there for function, nct for show.

## Water? Don't you worry.

The Realtime's face crystal isn't plastic like most chronographs you see. It's tough rock crystal. And not only is it hard enough to resist scratches, but it is fitted so tightly to the case that the chronograph has passed water immersion tests of up to 100 feet. We know of no other chrono-graph-at any price-that can ofter you this security.
This chronograph also has no moving parts to break down, and it is unlikely that servicing will ever be required even after years of hard use. It comes with batteries in place (easily changed by any jeweler), a oneyear factory warranty from its manufacturer, complete instructions, convenient service-by-mail facilities right here in the U.S., and The Sharper Image's own guarantee to customers: if for any reason at all, you are not completely delighted with your purchase, please return it within two weeks for a complete and courteous retund.

## Compact Electric Drill

Wahl Clipper Corporation's "Iso-Tip" is a compact electric drill that's said to be ideal for circuit board revision, solder removal,

and lead hole cleaning. among other jobs. It runs at about 9000 rpm and accommodates drills and burrs with shank size up to $1 / \mathrm{s}^{\prime \prime}$. Less than $5^{\prime \prime}$ long (excluding drill bit), the Iso-Tip is small enough to use at close quarters. The device is housed in highimpact plastic and is equipped with a 10 power cord, as well as a collet chuck, four collets and two drill bits.

## Antenna Rotor System

The new Ham IV from Cornell-Dubilier Electric Corp. is an antenna rotor system for large communication arrays with maximum wind load areas of 15 sq it when tower mounted. Includes such features as ma-

chined steel drive gears, dual transformer circuitry, power braking, a control unit with illuminated meter readout, and low-voltage operation. \$224.95.

## Bose Spatial-Control Receiver

Designed to complement Bose 901 Direct/ Reflecting speakers, but usable with other speakers as well, the Spatial Control Receiver contains equalization for the 901's and "source and room compensation" controls that function in lieu of tone controls. In addition, it is capable of directing mid and high frequencies to either the inner or outer banks of reflected drivers of the 901's, narrowing or widening the stereo image at the listener's option. Bass is directed equally to all drivers at all times. The unit contains four main power amplifiers and two secondary amplifiers for driving headphones. Strapped in pairs, the large amps are rated at 100 watts per channel into 8 ohms, 20 Hz to 20 kHz , with no more than $0.09 \%$ THD The FM section is said to achieve 50 dB of quieting in stereo with an input signal of just over 36 dBf. $\$ 799$.

# Using a computer is easy... for onComputing readers. 

## Read onComputing to find out . . .

- What a microcomputer can do
- How to get started
- What's new in personal computers
- Where to buy your computer
- How to use your computer

The editors of onComputing realize that much of the material written about computers is not at all suited to the person who just wants to use a computer as a tool for business, education, home entertainment, laboratory work, or other applications onComputing is dedicated to helping the computer user understand the capabilities of a microcomputer-in non-technical language
onComputing is entertaining and informative. It contains practical articles on how to get started, including what you'll need for your application and what it will cost. It features book reviews, product reviews, information on what's
new in personal computers, where to buy a personal computer, and how to use it.
onComputing is a totally new publication. It is issued quarterly and contains articles from some of the best known names as well as from competent amateurs. It is edited and produced under the guidance of an experienced staff of computer experts. The articles in onComputing have never appeared in any other publication. They are all fresh, informative, and valuable reading for anyone interested in using a computer - for fun or profit!

Grandfather's Clock'Was $\mathfrak{O}$ Never Like This!

If you love contemporary design but want the more traditional, here is the clock for you. In creating our own version of the ever popular Grandfather Clock, we use the electronic eye to display each second, minute, and hour, and also the simulated pendulum motion.

The diagonal model which has no simulated pendulum is available for wall mounting or with base as a desk clock.
Our synthesized sounds composed of tic toc, modified Westminster Chimes and Bongs are available for any AMELECT clock. The chimes and bongs are composed of six frequencies, providing realistic bell sounds. They are totally within clock cabinet.

The AMELECT clocks, cabinets may be your choice of Cherry. Mahogany, Maple, or Walnut hardwoods.

## Programmable Clock Radio

General Electric announced the first AM/ FM programmable digital standard broadcast clock radio. "The Great Awakening" Model 4880. It has a programming keyboard for entering a variety of time and operating functions. For example. two people

can wake up at different times to different stations without resetting, or the two systems can be used for weekday/weekend wake-up times. Further, one can fall asleep listening to one station and wake up to a completely different station. Memory capability to store six radio stations, instantly recallable by touching a button, is built in. Also all timekeeping and memory information is protected by battery back-up during power outages. \$116.95.

RADIO SHACK MICROCOMPUTER CATALOG
The TRS-80 Microcomputer Catalog \#RSC-2 is offered by Radio Shack. The 20 page catalog includes current information on the TRS-80 microcomputer, its peripherals and accessories with descriptions, application ideas and specifications. A general section explains what a computer is, what it can do. "Who can use the TRS-80." and "Why the TRS-80?" The catalog then describes the TRS-80 System, Level-1 and Level-1I Basic Language, and the peripheral equipment avallable for use with the TRS-80 including its expansion interface. Mini-Disk System, printers, interfaces, manuals and TRS-80 System Desk Address Radio Shack. 1400 One Tandy Center, Fort Worth, TX 76102

## AKAI STEREO COMPONENT CATALOG

Akai's 56 -page catalog describes its full line of stereo components, including tape decks. turntables, receivers, amplifiers. tuners, loudspeaker systems, an equipment cabinet. a mic /line mixer and stereo accessories. The catalog has information on product features. specifications, and color photos of each model, plus a glossary to explain specifications and provide stereo terminology. Address Catalog. Akai America. Ltd P.O. Box 6010. Complon. CA 90224

## ANTENNA INCORPORATED CATALOG

An expanded Land Mobile Antenna catalog for commercial two-way communications
systems is offered by Antenna Incorporated The catalog includes several new antenna models and provides reference material in chart format. enabling the reader to match antenna frequency range and model number with the desired type of antenna mount. Included are: 100- and 200-watt low-band vhi antennas: 100 , 150 and 200 -watt. $3-\mathrm{dB}$ gain, high-band vhf antennas; 100 -watt and 150-watt, 5 -dB gain collinear uhf antennas; 1-wavelength models: heavy-duty mobile antennas for use between 25 and 54 MHz ; "disguise" cowl-mount models and base station antennas. Address: Antenna Incorporated, 26301 Richmond Road, Cleveland. OH 44146

Stop reading. And start listening. It's that simple. Even with today's tape technology, there's no such thing as an ideal tape for every machine. Only what's best for you. Which depends only on the sound you like and the response of your deck.

Compare specs if you wish we'll match ours against anyone else's. But we honestly think you'll be more impressed by comparing the sound of our FX-I or II to that of any other premium cassette.

Visit your audio dealer and take the Fuji challenge.

Magnetic Tape Division of Fuji Photo Film U.S.A., Inc. 350 Fifth Avenue, New York, New York 10001

# Now NRImakesit TV/Audiohome 

Side-by-side equipment comparison of NRI and two other leading schools shows what you get for what you pay. When you have to pay as much as $\$ 905$ more for another school's course, you should carefully consider your tuition investment.

When you sit down and try to pick out the school that's best for you, it gets
to be a problem. Catalogs are radically different and some are not too clear as to what you actually get for your money. So NRI has done a lot of the work for you. And put the prices right up front so you can make your own judgment.

Of course, we can't compare everything. Lesson clarity and content vary. What one covers here, another covers there...or not at all. The material one school breaks down into eight lessons may be four at another. And the qualifications and abilities of instructors are another question.

|  | NRI | SCHOOL A | SCHOOL B |

All data as shown in each school's catalog as of April l, 1979.

## One Million Students, Over 65 Years' Experience

So we can only tell you what NRI has to offer. We've been in education since 1914 , starting as a radio school six years before commercial broadcasting was even on the scene. Since then, we've kept right up with the times, improving techniques, adding material, creating new courses to help people improve their skills and income.

Early on, we learned to keep our lessons compact. . thoroughly covering a subject, but not so much that students would be overwhelmed. We call them "bite-size" lessons because they're easy to digest.

## Learn by Doing

with "Hands-on" Training
And, we pioneered the concept of "hands-on" training. NRI goes far beyond theory and textbooks to give our students actual bench experience and prepare them for the realities of electronic servicing. Every piece of equipment in our Master Course in TV and Audio Servicing is designed for learning.

You build your own big-screen TV, the only one complete with computer tuning that lets you program an entire evening's entertainment . . a solid-state

Learn as you build with "hands-on" training.

# easy to compare study courses. 

stereo tuner and amplifier with speakers ...your own oscilloscope, digital frequency counter, and other instruments you use in your course, use later to service TV's, audio equipment, and video tape units.

The point is, none of this equipment is hobby-kit or conmercial assembly line units with lessons "retrofitted" to what was at hand. NRI has designed each so you get invaluable training and experience you just can't get any other way As you build. you study operation of circuitry, see how sections interact, perform "power-on" experiments only possible with NRI. This total training is exclusive with NRI...no other school, home study or resident. offers it.

## Instructors <br> Who Know Their Business

NRI instructors are thoroughly qualified, with both technical and educational experience. Most of them helped develop NRI courses, lessons, and equipment, so they really know what they're talking about. They're interested in their students, always ready to help with a question, a problem....give good advice to help you reach your goals.

It's instructors and training like this that have made NRI the choice of professional TV servicemen who have taken home study courses. As a national survey shows (summary on request), they recommend NRI by a majority of three to one over any other school.

So how does NRI give you all this and still cost so little? We keep costs down by designing our own training kits, eliminating the middleman's profit on hobby kits or commercial units. And by offering our training by mail only. We have no sales force, no commissions to pay. You make up your mind in your own time, without pressure, let the facts speak for themselves. We pass these savings on to you in the form of lower tuitions, more equipment, carefully designed courses and effective lessons.

## Send for Free Catalog, No Salesman Will Call

Send for our free catalog today and get all the details. See every piece of equipment and kit you get ... a complete listing of fully described lessons. . .explanations of each and every experiment you perform. Read about NRI's background and qualifications. . career opportunities .what NRI graduates say about their training ...costs and monthly payment plans for the courses that interest you. Then compare NRI value and results and make your decision. Like the million that have gone before you, we think you'll choose NRI. Send the card today.

Build and keep 2-meter Iransceiver, test equipment for a communications career.

## Orcheck out NRI value-training in Computer or Communications/ CB Equipment Servicing.

NRI's new Microcomputer and Microprocessor course trains you to be the complete computer technician, at home with both hardware and software. As you learn, you build your own advanced technology microcomputer, get "handson" experience in servicing and programming. Or you may want to look into

microwave, commercial broadcasting, and more NRI can help you as you build and experiment with your own digitally synthesized 2-meter transceiver. For facts on these and other NRI home study courses, check the postage-paid card and mail today If card is missing, write to:

## RECORDING AS NATURE INTENDED

IT WAS to be a typical recording session (details of time and place are not pertinent to this discussion), and once it began, our little party of journalists took just five minutes to zero in on the best seats from which to hear the orchestra. What we heard as the music untolded was indeed magnificent. As I sat, spellbound by the glorious sound, I could almost visualize my own microphones hanging there just so tar off the floor and just the right distance from the front desks of musicians.
However, that wasn't where the mikes were at all! For one thing, instead of the two or perhaps three I had visualized, there were some two dozen (neither the producer nor the engineer could recall the exact number) and they were strewn around the orchestra like raisins in a fruit cake. The treatment of French horns was particularly puzzling. Sound-reflecting panels had been erected a short distance behind them; which seemed logical because the bell of the horn faces to the rear and the back wall of the stage reflects the sound out to the audience.
Since the recording team had brought the orchestra off the stage and out into what would be the audience seating area-a very common practice in U.S. orchestra recording-something was needed to take the place of the stage's enclosure. What seemed less logical was that the mikes were not in front of the horns but behind them, a few feet away from the reflecting panels. Now if God intended the French horn to be heard with its bell pointing away from the listener or the microphone, what were mikes doing behind the horns and in line with the bell openings? Certainly the sound in the control room did nothing to throw light on the matter.
I suppose I have heard worse emanating from a set of monitors, but that's not saying much. When, for example,
the producer wanted to make sure the brass did not drown out the strings, he had the engineer turn up the string mikes-often to the point where the violins became shrill caricatures of themselves. With microphones sprinkled hither and yon throughout the orchestra, there were no landmarks by which a listener could get his bearings in the stereo image. Perhaps this was just as well, for a more plausible perspective that churned and twisted as this one did (because of the continual changes in insitrumental balance that were being dialed in), might have caused motion sickness. The tympani were getting into all the microphones, thus losing their crispness and much of the "snap" of their impact. It was discouraging to realize that this sound was the product for which many dollars per minute were being spent, when you could walk 30 steps into the hall and hear how wrong it all was.

Miking the Space. A reaction against this sort of recording technique has been underway for some time now. As a concept it might be termed "miking the space." Instead of trying to pick up 40 violins, 25 violas, 20 cellos, 10 string basses, 2 oboes, etc., you adopt the outlook that you're going to try to capture every acoustic event that takes place in an area of, say, 80 by 40 feet-the sort of area a symphony orchestra might occupy. The nature of the acoustic event doesn't matter-it might be a concert of music, a tap-danclng competition, a game of dice, or a fly buzzing around. What matters is that the event as recorded sounds natura!; that it seems to occupy the âmount of space that it did in reality: and that its aural perspectives are preserved. If something is happening in the rear or over to the left, the sound should come from there when the finished recording is played back.

Of course, this is not the sort of recording technique you use if you are trying to cover up deficiencies in the performance or flatter the sound in some way. What actually takes place is what the microphones hear and the tape preserves, warts and all. Nor is it a technique that is easy to bring off in every environment. But if you accept the idea that the space need not be a nice neat rectangle as long as your performing forces can be squeezed into it, and if you realize in advance that the minimum number of microphones required is usually best, with additional microphones often proving detrimental, you can usually manage something.
Here is a procedure I very often find helpful, although like everything in audio, it is fallible. First consider the recording environment, because it will determine the character of the reverberation present on the finished tape. A small auditorium, for example, is usually less reverberant than a stone church. This means that microphones can usually be placed a bit farther away from the performers without loss of clarity. An advantage can be realized here when working with very few microphones, because a more distant mike means less variation in performer-to-mike distance for any given performer and fewer problems with balance. If the performers know how to balance themselves, the recording will be balanced

A church may require closer miking if reverberation is not to interfere with clarity. In this case, you might want to try more closely spaced mikes and group the performers in an arc around them; in other words, the "space" you're defining now becomes a rough semicircle instead of a rectangle. These suggestions are perforce very general; every recording situation is a cut-and-try proposition.

Setting Up. Once the mikes are roughly placed (and before the performers arrive), send your assistant to stage center and have him move forward and back, continuously announcing his distance from an imaginary line connecting the microphones. When the monitor system yields what seems to you the most pleasing balance between the sound coming directly from him and the reverberation his voice sets up in the environment, you've established an approximate "subjective distance" for the per-formance-subjective because you will usually find that he is somewhat closer to the mikes than he sounds to be. Have him mark his positiori on the stage floor

## POLCE RADARMEETSITSMATCH．

With GUL＇s Micro Scan，you can own a high－technology radar detector for only $\$ \mathbf{7} \mathbf{9}$ ．

Your radar detector should do two things well：give you as much advance warning of police radar as possible，and screen out false signals．And few competitive units are able to perform both these functions well．However，the GUL G．73，developed by B．E．L．Labora－ tories represents a breakthrough in both sensitivity and false signal rejection in a compact，well－ designed case．

## Road Superiority．

The 10 －year researched GUL has been tested numerous times against such units as the Fuzzbuster XK，the Whistler XK and the XK Snooper．In separate tests conducted by the Canadian Tire Corporation and Motor Consumer Report，the GUL demonstrated a detection dis－ tance significantly greater on both X and K bands，than all three competi－ tors．Its nondirectional elliptical horn antenna receives these signals from front，back，and sides，and is even sensitive enough to detect the new short pulse KR－11 radar．Sicnals of less than .01 millionths of a volt （ranging from 9．445－24．445 GHz） are sufficient to trigger the alert signal and provide valuable warn－ ings when approaching hills and curves．An adjustable gain control

A good driving record makes for lower insurance
rates and prevents possible loss of your driver＇s license rates and prevents possible It may even pay for itself within the first year of use．depending upon your driving habits．
knob lets you optimize GUL＇s sen－ sitivity for both city and country conditions．

## Doesn＇t Cry＂Wolf．＂

The GUL takes full advantage of modern integrated circuit tech－ nology to provide a capability of more than 100 transistors．Many competitive units try to get by with

as few as 20 transistors and they just don＇t work as well．GUL＇s sophisti－ cated circuitry is completely shielded by a diecast and extruded aluminum case．This not only provides a better wearing case than the often used plastic ones，but also protects the input terminals from stray signals，the most common cause of false alarms．In addition， the GUL uses an internal voltage regulator，commutating filter，and
synchronous detector to reduce power consumption to a minimum and provide a more stable gain setting－features usually found only in units costing twice as much．
Two Warnings You Can＇t Miss．
The GUL uses a double warning system．Both a tone and light come on in the presence of radar．And both remain on until radar is gone． You＇re never lulled into a false sense of security by a tone that sounds once and then goes off．And you can control the tone with a front－ mounted on／off switch．

## Quick Installation．

The GUL detector is one of the most compact units available，meas－ uring only 4 ＂$\times 3$＂$\times 41 / 2$＂，and weigh－ ing just 20 oz ．Its aluminum case is finished in glare－free matte black and comes with its bracket in place． To mount，simply take the adhesive Velcro pad，peel off the back，and adhere it to the top of your dash－ board．The bottom of the bracket has a matching Velcro foot which anchors your unit securely on top of the dash．It plugs into your cigarette lighter．That＇s all there is to it．The same Velcro mounting also allows for easy removal in seconds to prevent theft．The small size GUL will fit into any glove compartment．

## Try It Yourself．

Order the new GUL detector today．Better yet，road test it your－ self．See how comforting it is to observe police radar when it＇s ob－ serving you．If you don＇t find it to be the best electronic counter－intelli－ gence you can have for $\$ 79$ ，simply mail it back．Your GUL comes with The Sharper Image two－week return privilege and a manufacturer＇s 120－day warranty．

with a strip of that indispensable silver tape.

Then, while he faces forward and talks continuously, have him move left and right on a traverse that approximately encompasses the width you expect the performing group to occupy on stage. If at any time during his traverse his voice seems to recede, have him move forward until the original sense of distance is restored and mark that position with tape. (And, of course, have him move back appropriately if his voice seems to approach the microphones.) When this process is over you will have established a base line for the front row of performers. Ultimately you'll be able to move them slightly forward or back of this line to establish final balances.
Finally, your assistant should cavort around the performing area stamping his feet, clapping his hands, and making as much noise as possible, but never stepping forward of the base line. As he does his act, you should get a vivid sense of continuous movement within a well-defined space. The space may not sound quite like the area blocked out on stage, but it should seem plausible.

## NEW CATALOG OF HARD-TO-FIND PRECISION TOOLS

Jensen's new catalog is jam-packed with more than 2000 quality items. Your single source for hard-to-find precision tools used by electronic technicians, scientists, engineers, instrument mechanics, schools, laboratories and government agencies. This popular catalog also contains Jensen's worldfamous line of more than 40 tool kits. Send for your free copy today!

CIRCLE NO. 33 ON FREEINFORMATION CARD

The Inevitable Little Things. By this time you should be in pretty good shape for the arrival of the performers, who it is to be hoped will give you a few minutes of run-through so you can set fi nal balances. If the environment is reverberant and you have had to mike fairly closely, you-may find that sibilants are exaggerated in vocals. Raising the mikes somewhat and instructing the performers not to sing at the mikes but instead straight out into the presumed audience is the usual remedy.

A frequent problem that can be baffling unless you're prepared for it is the initial sound reflection that comes from the performer, caroms off the floor just in front of him, and reaches the microphone an instant after the direct sound. As a rule this is the strongest reflection you'll have to deal with, and it can have an appreciable influence on the sound. The easiest remedy is a sound absorber at the exact bounce point. Churchpew cushions can be highly recommended as absorbers. Do not, however, overdo the treatment at first. Start with a single cushion at the bounce pointwhich can be easily worked out when you consider that the angle of reflection will equal the angle of incidence-and work up from there as necessary.
If the performance calls upon the performers to move-or if they move whether required or not-you have a special problem. Practical stereo microphone setups simply do not respond to movement as two ears attached to a human head do. To get the most naturalsounding effect, you will probably have to discuss their movements with them in advance, using the subjective-distance base line as a guide. Even then there are likely to be difficulties.
. . . and it works. You may not believe it now, but with luck, application, and a mere two microphones, it is possible to get startlingly credible and satisfactory results with this basic technique, as many brilliant tapes produced by persevering amateurs have shown. Even large-studio professional recordists, who sometimes seem incapable of believing, have inadvertantly proven it. Here, an anecdote might serve. It may be apocryphal in some details, but I believe it to be true in the overall sense.

Back shortly before the era of stereo, a major label had proposed to do an LP of excerpts from Swan Lake with a wellknown orchestra. Evidently, the production was to be a quick and easy job just to fulfill contractual agreements. But
there was a hitch-the orchestra was going to be on tour on the date for which the session was scheduled, and the engineers knew nothing about miking the hall in which the recording would have to be made. Worse yet, there was no time to experiment.

This was an intimidating state of affairs because recording engineers and the particular hall had had a long history of enmity. Engineers had found the place prone to echoes, lack of clarity, unfortunate balances, and almost any other sonic ill you can name. The only statement that could be made in the hall's favor was that expert listeners have long found it to be one of the most thrilling and satisfactory environments in the world for listening to symphonic music. In the end, not knowing what else to do, the engineers hung a single microphone above the orchestra on stage and crossed their fingers.

The recording that resulted was peculiar in a number of respects. The strings sounded like strings instead of strident implements of aural torture; you could sense that the brasses could totally overpower them unless held in check by the conductor; and the instruments in the back of the orchestra actually sounded more distant than those in the front. The bass drum was a special revelation; when it went off, you knew something had really hit you-right in the gut. In short, the record had a signal on it that actually managed to represent a symphony orchestra with some plausibility.

And this recording sold-not immediately or in great numbers, but strongly and steadily. The company, convinced it had discovered a hitherto secret love affair between the American record-buying public and Swan Lake, some years later issued a two-LP stereo set of excerpts played by the same orchestra. This time, however, the engineers were on familiar ground and were able to fuss around with mikes and mike placements to their hearts' content. Imagine their surprise when the new, much more lavishly produced recording didn't sell.

As adamant as my ears may be on this point, I can't prove that the differences in recording technique alone account for the wide variation in sales between the two versions. But I suspect that anyone who has no investment in the status quo in recording will prefer the results of simple miking over the multimike "forest" technique, at least for classical music, given the chance to compare. If you have the opportunity, try it for yourself.

# Julian Hirsch Audio Reports 

Fisher Model ST460 Speaker System

The Model ST460 from Fisher is a floor-standing three-way speaker system whose salient characteristic is high efficiency , which permits it to develop very high output levels when driven by lowto moderate-power amplifiers. Bass frequencies are propagated by a $15^{\prime \prime}$ ( $38.1-\mathrm{cm}$ ) woofer that operates at frequencies up to about 1000 Hz , where a pair of $5^{\prime \prime}(12.7-\mathrm{cm})$ cone-type midrange drivers take over. There is a second crossover at 5000 Hz to a single horn-loaded tweeter with a nominal $3^{\prime \prime}(7.5-\mathrm{cm})$ mouth diameter. Both crossovers have symmetrical, $12-\mathrm{dB}$ / octave slopes.

Overall size of the ST460 is $291 / 4^{\prime \prime} \times$ $181 / 4^{\prime \prime} \times 149 / 16^{\prime \prime}(74.3 \times 46.4 \times 37$ cm ) and weight is 53 lb . Suggested retail price is $\$ 389.95$, or with genuine walnut veneer finish as the Model ST461 for \$409.95.

General Description. The drivers are mounted symmetrically on the front of the cabinet, with the woofer at the bottom in its own approximately 4-cu-ft ducted-port enclosure. The two midrange drivers are side by side above the woofer with the tweeter centered above them. At the top of the cabinet is a control panel with sepa-
rate three-position switches for adjusting the levels of the midrange and high-frequency drivers over a range of $\pm 3 \mathrm{~dB}$. A pushbutton near the controls resets the circuit breaker that protects the system against overloads. The front of the speaker is covered by removable, acoustically transparent cloth.

Laboratory Measurements. We
made our basic measurements on the ST460 with the system's midrange and tweeter level controls in their 0-dB (center) positions. The frequency response curve obtained in the reverberant field of our testing room was spliced to a woofer response curve taken with close microphone spacing. The latter includes the separately measured contribution of the port radiation at very low frequencies, corrected for the relative radiating areas of the port and the driven cone.

As a rule, even a $12^{\prime \prime}$ woofer might be expected to show cone breakup, beaming, and other undesirable effects at an operating frequency as high as 1 kHz . We were not too surprised, therefore, to find response irregularities and a general drop in output from the ST460's 15" woofer beyond about 500 Hz .

Maximum bass output was reached at frequencies between 70 and 90 Hz , falling off steeply at lower frequencies. Contribution of the port is mostly at frequencies below 40 Hz ; while it is effective to a degree between 20 and 40 Hz , the average output in this octave is far below that of the upper-bass. Above 100 Hz , the output dropped off smoothly and gradually to a minimum at 1000 Hz of 10 dB below the maximum bass level. Beyond 1000 Hz , the output again rose gradually to

Performance Specifications

|  | Rating |  |
| :---: | :---: | :---: |
| Frequency response | $40-20,000 \mathrm{~Hz} \pm 10 \mathrm{~dB}$ | $48-18,000 \mathrm{~Hz} \pm 5 \mathrm{~dB}$ |
|  |  | $20-19,000 \mathrm{~Hz} \pm 10 \mathrm{~dB}$ |
| Efficiency (avg SPL at 1 meter, 1 watt) | 92 dB | 92 dB |
| Recommended amplifier power | 25-130 watts | Confirmed |
| Peak distortion-free SPL with stereo pair in typical room | 112 dB | Not checked |
| Crossover frequencies | 1000 and 5000 Hz | Confirmed |
| Woofer diameter | 15" | Confirmed |
| Voice coil | 2" | Not checked |

| Midrange (size/type) | Two 5" cones | Confirmed |
| Voice coil diameter | 9/16" | Not checked |
| Tweeter (size/type) | 3" horn | 2" mount diam. |
| Nominal impedance | 8 ohms | Confirmed |
| Enclosure dimensions | $291 / 4^{\prime \prime} \times 181 / 4^{\prime \prime} \times 149 / 16^{\prime \prime}$ | Confirmed |
| Weight | 53 pounds | Confirmed |

about +5 dB between 7000 and $16,000 \mathrm{~Hz}$ and fell off sharply at about $18,000 \mathrm{~Hz}$. Overall frequency response (with the controls centered) was $\pm 5 \mathrm{~dB}$ from 48 to $19,000 \mathrm{~Hz}$, well within Fisher's ratings. Tweeter dispersion was quite good.

The ST460's high efficiency was demonstrated by its ability to produce a 92-dB sound pressure level (SPL) at a distance of 1 meter when driven by 2.83 volts of random noise in an octave centered at 1000 Hz . The toneburst response was uniformly good, with no signs of prolonged ringing or spurious output frequencies. Impedance averaged about 8 ohms, reaching a maximum of about 30 ohms at the $65-\mathrm{Hz}$ bass resonance and a minimum of 6 ohms at 750 Hz . Bass distortion at a 1 -watt input was less than $1 \%$ from 100 to 50 Hz , and only $7 \%$ at 30 Hz . At a 10 -watt input, distortion measured less than $2 \%$ down to about 50 Hz and climbed to $14 \%$ at 30 Hz .

User Comment. We listened to a stereo pair of the Fisher ST460 speakers mounted on stands that raised them about $7^{\prime \prime}$ above the floor-an arrangement that, while not critical, seems to enhance the sound of many speakers. What we heard sounded clean, with a generally good frequency balance that correlated well

Composite corrected frequency response for $S T 460$ Speaker System.
with what we had measured. Occasionally, we experienced a heaviness in male speaking voices and in some musical material. We attribute this to the emphasis in bass response around 80 Hz . Although some of the low-frequency performance is based on psychoacoustic illusion, it is convincing enough to give an overall impression of very solid bass.

Clearly, the balance of compromises (a component of all loudspeaker design) has been tipped in favor of disco and rock music in the case of the ST460. The frequency response gives a little extra "punch" to the bass and "sizzle" to the treble, without weakening the midrange to an extent that would cloud vocals. And while the CIRCLENO 101 ON FREEINFORMATION CARD
system's performance with classical music might not suit the most demanding listeners, it is more than adequate for its intended application.

One characteristic of the ST460 that will probably have a special appeal to the rock and disco listener is its ability to conserve amplifier power. We were able to drive the system to ear-shattering levels with a 20-watt amplifier. On the other hand, the system took the output of a 200-watt amplifier right in stride. By most standards, the ST460 would not be considered cheap, but if the potential saving in amplifier power is taken into account, along with the level of musical performance offered, it seems like quite an economical speaker.

The Model M95ED stereo cartridge has occupied the position just below the V-15 Type III in Shure's product line, 24
filling the gap between the moderately priced M91 series and the deluxe $\mathrm{V}-15$ series. Although priced only slightly above the M91, the M95 cartridge was designed for a somewhat flatter high-frequency response.

When Shure introduced the top-of-the-line Model V-15 Type IV phono cartridge last year, one of its features was a hyperelliptical stylus shape derived from the hyperbolic stylus previously developed for the M24H (CD-4) cartridge. This type of stylus has an extended contact area against the groove wall and a small radius that gives it excellent high-frequency tracing ability. It occupies the same position in the Shure products that the Shibata and its derivatives do in the lines of other manufacturers.

The new M95HE consists of an M95 body fitted with the new N95HE stylus. The diamond tip of the stylus is identical to that of the V-15 Type IV. According to Shure, it makes a reduction of as much as $25 \%$ in harmonic and intermodulation distortion compared to the elliptical stylus used in the M95ED. Since the M95 cartridge is electromagnetically similar to the

V-15 series, it would appear that adding the N95HE stylus to the M95 body might result in a cartridge that has many of the special qualities of the V-15 Type IV but at a substantially lower price

The M95HE is designed to track at forces from 0.75 to 1.5 grams. Shure's "trackability" ratings rank it a close second to the V-15 Type IV. Since the body is that of a standard M95ED, owners of that cartridge can upgrade to an M95HE at any time by merely plugging in a new N95HE stylus assembly. The M95HE costs $\$ 89.50$, the N95HE stylus $\$ 34.00$.

Laboratory Measurements. We tested the M95HE in the tonearm of a Thorens Model TD-115C record player at the maximum tracking force of 1.5 grams. The electrical load was 47,000 ohms in parallel with 500 picofarads. Shure recommends capacitance between 400 and 500 pF , (more than most turntables and preamps supply), but response measurements with both values showed that 500 pF yielded flatter overall response.

The cartridge's output was 4.75 $\mathrm{mV} /$ ctiannel at a $3.54-\mathrm{cm} / \mathrm{s}$ velocity. Channel levels balanced within 0.9 dB. The vertical stylus angle, measured with a CBS STR160 record, was $26^{\circ}$. Frequency response and channel separation were measured with CBS STR100, JVC TRS-1007, and B\&K QR-2009 test records. In addition, we measured the separation at a number of spot frequencies with an Audio-Technica AT-6605 record.

Frequency response differences between the records were relatively minor. With the STR100 record, response was flat within $\pm 1 \mathrm{~dB}$ from 40 to $16,000 \mathrm{~Hz}$ falling to about -6 dB at $20,000 \mathrm{~Hz}$. Channel separation readings fell into two groups. The CBS and $B \& K$ records revealed less separation than the JVC and Audio-Technica records, which were fairly similar. The midrange separation was 22 to 23 dB with the first two discs and 30 to 35 dB with the other two. At $10,000 \mathrm{~Hz}$, the

Frequency response and crosstalk for M95HE Stereo Phono Cartridge.
separation was 28 to 30 dB with all but the $B \& K$ record, which gave a $20-\mathrm{dB}$ reading. At $20,000 \mathrm{~Hz}$, the CBS and $B \& K$ records gave respective separation readings of 17.5 and 15 dB , while the JVC and Audio-Technica records showed a $22-\mathrm{dB}$ separation.

The low-frequency resonance in the low-mass Thorens tonearm (14 grams effective mass, including the 6.3 grams of the cartridge) was at 10 Hz , with an amplitude of about 7 dB . Tracking distortion was measured with Shure's TTR102 (400- and $4000-\mathrm{Hz}$ intermodulation distortion) and TTR103 (10.8-kHz tone bursts at a $270-\mathrm{Hz}$ repetition rate) test records. The 1 M readings with the TTR102 increased from $2 \%$ or $3 \%$ at low levels to $6 \%$ to $8 \%$ at velocities in the 22 to $-27-\mathrm{cm} / \mathrm{s}$ range. With the tracking force reduced to 1 gram, the cartridge mistracked severely above $22 \mathrm{~cm} / \mathrm{s}$. The repetition rate distortion with the TTR103 record was extremely low (Shure cartridges have consistently been outstanding in this test), increasing from $0.63 \%$ to $0.84 \%$ as the velocity increased from 15 to $30 \mathrm{~cm} / \mathrm{s}$.

Subjective tracking of the M95HE was judged with Shure "Audio Obstacle Course" records. As with the TRR103, we have found that Shure cartridges tend to be among the best in their ability to track these very-highvelocity musical selections without audible distortion. The M95HE was no exception, handling everything on the

ERA III record without difficulty and revealing only a trace of "hardness" on the highest levels of the bells and combined harp and flute sections of the ERA IV record.

User Comment. While it is easy to distinguish between a low-priced cartridge and a high-priced one by listening or measurement, differences tend to become more elusive when comparing cartridges of similar overall quality. Consequently, we found no dramatic audible differences between Shure's M95ED and M95HE cartridges. Their measured performance was similar, too, although most of the differences did favor the M95HE. Of course, we could not measure record wear, which should be appreciably lower with the greater contact area of the hyperelliptical stylus.

The M95HE supplements, but does not supplant, the M95ED in the Shure line. Anyone about to replace a worn stylus on the M95ED would do well to choose an N95HE, but it would be harder to justify replacing a good N95ED stylus with the N95HE just to modernize. While these two siblings can be distinguished on the basis of audible and measured performance, it is the family resemblance that prevails. It may be that reduced record wear, a fairly intangible factor hard to confirm through measurement, will tip the balance in favor of the M95HE.

CIRCLENO 102 ONFREE INFORMATION CARD

# Lectrotech Model PPI-400 Dual-channel Peak Power Indicator 

for monitoring the outputs of a stereo or two mono power amplifiers. It indicates power levels over a $30-\mathrm{dB}$ range on two vertical columns of LEDs. A range switch provides 18 calibration points for the $0-\mathrm{dB}$ level (six power levels at impedances of 4,8 , and 16 ohms ). The indicator can also be calibrated to any other power or impedance over a very wide range by connecting appropriate resistances across terminals on the rear apron. The $0-\mathrm{dB}$ power level can be set anywhere from 3 to 1250 watts at 8 ohms or over a different power range for impedances between 2 and 35 ohms.

The device can be connected across the speaker outputs of an amplifier or across the input terminals of the speaker systems themselves. It measures $14^{\prime \prime} \mathrm{W} \times 8^{\prime \prime} \mathrm{D} \times 3{ }^{3} / /^{\prime \prime} \mathrm{H}(35.6$ $\times 20.3 \times 9.5 \mathrm{~cm}$ ) and weighs 3.5 lb $(1.6 \mathrm{~kg})$. Suggested retail price is $\$ 129.95$ (plus $\$ 24.95$ for optional No. LWC-1 walnut cabinet).

General Description. Each column of power indicators consists of eight calibrated LEDs. The bottom four are green LEDs and are labelled $-30,-28,-24$, and -12 dB . The next two are yellow LEDs and are labelled -9 and -6 dB . Finally, the two top LEDs are red and are labelled -3 and 0 dB . If the red LEDs flash during operation, it can be assumed that the amplifier is being overdriven or is being driven too close to its limits. This, of course, assumes that 0 dB corresponds to the amplifier's rated maximum output power.
The seven-position range switch has six positions calibrated in watts full-scale from 25 to 800 at a 4 -ohm impedarice. Separate inner scales are used for 8 - and 16 -ohm loads, with $0-\mathrm{dB}$ power levels corresponding to 12.5 to 400 watts full-scale at 8 ohms and 6.25 to 200 watts full-scale at 16 ohms. The seventh position, labelled AUX, can be used with the optional calibration procedure to set the $0-\mathrm{dB}$ sensitivity for almost any power and impedance level one wishes.
The Model PPI-400 is shipped from the factory with its calibration terminals connected together by jumper links and the aux sensitivity set for 6.25 watts into 4 ohms for a $0-\mathrm{dB}$ level indication. (This is 6 dB more sensitive than the lowest standard range.) By replacing the links with suitable resistances, their values determined according to a formula given in the own-

er's manual, the 0-dB sensitivity can be set as desired.

Although the accuracy of the 0-dB calibration depends on the accuracy of the resistors, the relationship between it and other power-level LEDs is fixed by the internal design of the Model PPI-400. (Precision resistors are available from Lectrotech.) Since the two channels are fully independent of each other, it is possible to set each for a different $0-\mathrm{dB}$ reference.

Laboratory Measurements. We connected the Model PPI-400 across the output of an amplifier capable of developing the 60 volts or so required to activate its highest level LEDs. We then drove both channels in parallel to check the device's tracking.
The accuracy of the LED displays was checked at 1000 Hz . At each setting of the range switch, we increased the signal level until each of the LEDs in turn began to glow at its maximum brightness. The actual voltage applied to the device was then measured with an accurate meter and converted to an equivalent power level. Since the LEDs are not driven by a flip-flop or similar circuit, there was some ambiguity as to exactly when each LED was just on. The LEDs began to glow well below the level that produced full brightness, which resulted in an uncertainty factor of a couple of decibels when reading the display. In every case, however, the two channels behaved in identical manner.

The readings we obtained were consistently low. (The indicated power was less than the actual power.) If we had elected to use the point at which a LED first began to glow as our measuring criterion, the error would have been even greater. The error was not significant in any case, measuring about 1 dB and a maximum of 2 or 3 dB near the $-24-\mathrm{dB}$ indicator.

We measured the response of the
device with $1000-\mathrm{Hz}$ tone-burst signals. As we changed the duty cycle from continuous to 4 cycles on and 128 cycles off, the error did not exceed 1 dB . Sensitivity was up about 0.7 dB at 20 Hz and down 4.4 dB at $20,000 \mathrm{~Hz}$, relative to 1000 Hz .

User Comment. In view of its intended application as a peak-power indicator (not a meter), the errors we observed in the Model PPI-400 are of no significant import. The device does a fine job of displaying the actual operating signal levels-both average, shown by the number of LEDs lighted during any passage, and peak. (Even the briefest peak registers visibly on the display.)

The PPI-400 is easy to connect into an audio system, and its LED displays are clearly visible and easy to interpret even from a distance.

The owner's manual refers to the use of the Model PPI-400 as a speak-er-system phasing checker. This is not entirely accurate, since all it can check is a polarity reversal of the two sets of signal leads coming from the amplifier to the speaker systems and to the device itself. Actual phasing of the connections at the speaker systems can have no effect on the behavior of the Model PPl-400.

A power-on indicator in the Model PPl-400 would have been a welcome addition. Its absence, for example, caused us to unwittingly leave the device powered for days on end. But even leaving it powered continuously, the PPI-400 operated coolly, even under full-load conditions.

In sum, this was one of the most versatile and inexpensive peak-power indicators we have used. It is attractive, flexible, and does exactly what it is supposed to do. Such a device can be an educational addition to an audio system.

MODEL 500 HH
$50 \mathrm{~Hz}-500 \mathrm{MHz}$
Without Battery Capability

## SAVE ${ }^{\$ 5} 5^{00}$

With Battery Capability
MODEL 500 HH . . $\$ 169.95$
MODEL 100 HH .. \$119.95

The 100 HH and 500 HH hand held frequency counters represent a significant new advancement, utilizing the latest LSI design . . . and because it's a DSI innovation, you know it obsoletes any competitive makes, both in price and performance. No longer do you have to sacrifice accuracy, ultra small readouts and poor resolution to get a calculator size instrument. Both the 100 HH and 500 HH have eight .4 inch LED digits -1 Hz resolution - direct in only 1 sec . or 10 Hz in .1 sec - 1 PPM TCXO time base. These counters are perfect for all applications be it mobile, hilltop, marine or bench work.

$\bigcup_{0} \begin{aligned} & \text { solid-state level-sensing } \\ & \text { switch for sump pumps }\end{aligned}$

AFLOODED basement is a minor household disaster. That's why most homeowners whose basements are prone to flooding install sump pumps. Some, however, have discoveared to their chagrin that the pump somehow fails to operate when it is most needed. In many instances of failure, the pump itself is actually in perfect working order. Rather, it is the water-detecting actuator switch that's the culprit. never sending a turn-on command to the pump.

Here's a simple, dependable circuit to replace the often-unreliable (usually mechanical) switch supplied as part of the pump assembly. It will automatically activate the pump when the water level reaches the level of a pump trigger probe. Once activated, the pump will re-
main energized until the water level falls below a keep-alive probe. If the pump fails or cannot keep the water in check, an optional alarm will sound as the water level reaches a trigger probe specifically for that purpose. The project can be powered either by batteries or the ac line Inexpensive components are employed, most of which will be found in any well-stocked junk box

About the Circuit. The Electronic Sump Pump Switch is shown schematically in the figure. Positive voltage from the power supply is applied to the COMMON probe via resistors R1 and R2. (This and all other probes are stiff wires or metal rods suspended above and extending to different levels in the sump.)
 if water level continues to mise ar prumin) isis' tworrfing

Sour-cost Pergiects conntinued...

As can be seen in the figure, the COMMON probe extends almost to the bottom of the sump. Any water entering the sump comes into contact with this probe, but as yet nothing which would cause activation of the pump happens.
As the water level in the sump rises, the KEEP-ALIVE probe touches the water. but this still does not activate the pump. If the water reaches the level of the PUMP TRIGGER probe, current can flow from the positive supply voltage terminal through R1, R2, the water in the sump, R5 and finally into the base of Q3. This transistor then turns on and provides base current for Q4. When Q4 conducts, it energizes the coil of relay K 1 .
Once this relay is energized, the normally open contacts are closed and two things happen. Line current is able to flow through the coil of $K 2$, a heavy-duty ac relay. Also, the path between the KEEP-ALIVE probe and the base of Q3 is completed. Energizing K2 provides line
voltage across S01 for the pump. If the sump pump is connected to the socket, it will be activated and will start to pump the water out of the sump.
As the water level drops, the conductive path provided by the water in the sump between the COMMON and PUMP trigger probes will be interrupted. However, current will continue to reach the base of Q3 via the KEEP-ALIVE probe, R7, and one set of contacts of relay K1. Because this probe extends almost to the bottom of the sump, relays $K 1$ and $K 2$ remain energized (as does the pump motor) until practically all of the water has been evacuated. When the water level drops below the free end of the KEEP-ALIVE probe, Q3 is deprived of base current and is cut off. This causes Q4 to stop conducting, deenergizing $K 1, K 2$ and the pump motor
If the pump motor fails or cannot cope with the amount of water entering the sump, the water level will rise above the

PUMP TRIGGER and KEEP alive probes and eventually reach the ALARM TRIGGER probe. This probe is part of the optional alarm circuit and should be mounted near the top of the sump. Although the alarm circuit is independent of the pump controller, it is a valuable addition to the project.

The alarm circuit closely resembles that of the pump controller and operates in a similar manner. Water reaching the alarm trigger probe provides a path for current to reach the base of Q1. This transistor begins to conduct and provides base drive for Q2. Transistor Q2 then conducts and completes the circuit for audible alarm At, which alerts the homeowner to the fact that water in the sump has risen to a critically high level. He can then try to get the pump working

POPULAR ELECTRONICS
or, if necessary, bail the water out of the sump manually.

Two switches are associated with the alarm circuit and one switch is included in the pump controller. These switches provide test facilities for the alarm and pump (S1 and S3, respectively) and the ability to silence the alarm (S2). The currents handled by $S 1$ and $S 2$ are relatively small, so miniature components can be used in these locations. Switch S3, however, as well as the contacts of K2 must be capable of handling the current demanded by the pump motor, so use heavy-duty components.

The author employed a solenoid/ spring-type buzzer as his prototype's audible alarm. Diode D1 is connected across the buzzer to protect Q2 from inductive spikes generated by the buzzer. Other lypes of alarms can be used, some of which will not require the inclusion of D1. A Sonalert ${ }^{T M}$ or similar audio oscillator will not necessitate diode protection for Q2, but an alarm bell will.

Which type of audible alarm you choose is largely a matter of personal preference and parts availability. Similarly, there is a great deal of leeway in the choice of components Q1 through Q4 and R1 through R7. General-purpose 2N2222 transistors are suggested in the parts list. Just about any low-power npn transistor is suitable for use as Q1 and Q3. Exactly which transistor types are acceptable for use as Q2 and Q4 depends on the audible alarm and relay (K1) used. If the current demand of either load is fairly low, say, 300 mA or less, a general-purpose component such as type 2N2222 can be used as a relay or alarm driver.

However, if a load draws more than 300 mA , a higher-power driver will have to be used. A good rule of thumb is to use a transistor with a collector current rating that is double the current required by the alarm or relay coil. The author employed a sensitive 6 -volt relay for K1 (Sigma No. 70R4T-6DC), which permitted the use of a low-power npn driver. Diode D2 was included to protect the relay driver from inductive spikes.

The values specified for the fixed resistors ( $R 1$ through R7) are nominal ones. Substitutions can be made freely if you want to use components you have on hand. However, do not make the fixed resistances so low that they tax the base current ratings of the transistors employed in the project.

Either a line-powered or battery supply can be used for the project. The exact value of supply voltage is not critical
and can be chosen to accommodate a particular dc relay (K1). Practical supply voltages range from 6 to 15 volts. Although it is not necessary, voltage regulation is desirable in a line-powered supply. The widespread availability of voltage regulator ICs makes the inclusion of regulation simple and inexpensive.

If the alarm circuit is included in the project, battery power enjoys a significant advantage over a line-powered supply-it will still provide power to the project if the commercial power line is blacked out. Of course, if line power is not available, the pump motor will not be activated, even though $K 1$ will be energized. The alarm circuit, however, will be activated if the water in the sump rises to the level of the ALARM TRIGGER probe. This will alert the homeowner that water is accumulating and had best be bailed out before any damage occurs. Also, when neither the alarm nor pump controller circuit is triggered, practically no current is drawn from the battery supply. If nonrechargeable batteries are used to power the project, long operational life can be expected.

Construction. The circuit is relatively simple, which suggests the use of perforated board and point-to-point wiring techniques. Remote mounting of the alarm and pump controller circuits will simplify any future servicing. If this is done, the circuit board, relays, switches and power supply can be housed in a suitable enclosure which can be installed at some convenient location.

A four-terminal barrier strip can be mounted on the control box for the leads running to the sump probes. These probes can be fashioned from either metal rods or lengths of solid No. 12 or No. 14 copper wire and should be mounted rigidly above the sump. The probes are of varying length, with the COMMON probe extending almost to the bottom of the sump, the KEEP-ALIVE probe extending almost as deeply, the PUMP TRIGGER probe reaching about halfway down, and the ALARM TRIGGER probe extending only a short distance into the sump. Suitable lengths of hookup wire should be soldered to the probes and routed to the barrier terminal strip on the control box.

When constructing the control box, be sure to observe the polarities of all semiconductors and, if a line-powered supply is built in, of electrolytic capacitors. Use the minimum amount of solder and heat consistent with making good connections. Take special care in wiring the

117 -volt ac portions of the project so that no shock hazard is present.

Checkout and Installation. After the control box has been wired, connect short lengths of hookup wire to the barrier terminal strip. Remove a portion of the insulation from the free end of each wire. Next, fill a drinking glass or measuring cup with water and place the wire connected to the COMMON probe terminal into the water. Place the wire connected to the KEEP-ALIVE probe terminal into the water. (Keep these and all probes from touching each other to realistically simulate aclual operation. No damage will occur, however, if the probes accidentally come into contact.) Activation of the pump controller, indicated by a click as the relays are energized, should not yet happen.

Now insert the wire connected to the PUMP TRIGGER probe terminal into the water. You should hear a click as the relays are energized. If desired, a lamp can be connected to power socket SO1 and the line cord connected to the power line (assuming this has not yet been done). The lamp will then indicate that the relays are energized and that line power is reaching socket SO1.

Remove the PUMP TRIGGER wire from the water. The relays should remain energized and no click should be heard. Then remove the KEEP ALIVE wire from the water. At this time, the relays should drop out and a click heard. Finally, insert the ALARM TRIGGER wire into the water. The alarm should sound and remain on until the wire is removed from the water.

Press the ALARM TEST pushbutton and keep it depressed. The alarm should sound and remain activated until the ALARM DEFEAT switch is opened. The operation of the PUMP TEST switch can be checked by closing it and observing whether the load connected to socket SO1 receives line power.

Once it has been determined that the control box is functioning properly, a permanent installation can be made. Mount the control box at some convenient point and interconnect it with the sump probes and pump motor. Be sure to bypass the stock pump-activating switch as it is no longer needed. As a final check, you can quickly fill the sump with water. The alarm should sound until the pump has lowered the water level beyond the reach of the ALARM TRIGGER probe. The pump should remain on until the keep alive probe is no longer immersed, at which point nearly all of the water will have been taken out.
(Projects continued overleaf)

## AUGUST 1979

RUNNING outof gas can be an exasperating experience. The low-fuel indicator described here can help you avoid this situation. It will sound an alarm when the fuel level in your gas tank reaches a predetermined minimum. This level can be preset by a simple potentiometer adjustment.

Circuit Operation. In most vehicles, the fuel-level sensor is a float-controlled potentiometer (sender) wired in series with the dashboard-mounted fuel gauge (meter) and connected between the chassis and +12 -volt line as shown in Fig. 1. As the fuel level changes, the resistance changes, making the meter indication change.

The voltage level thus generated across the fuel-level sensor can be tapped off (at the meter) and, as shown in Fig. 2, applied through a low-pass filter R8-C4 so that the voltage across C4 is the average across the sender. This low-pass filter also eliminates any rapid voltage fluctuations due to gasoline sloshing and a bouncing sensor float, or

## By Bradley Albing

Fig. 1. Typical fuel-gauge circuit.
voltage transients generated by the switching voltage regulator as used in some vehicles.

The C4 voltage is applied to the noninverting ( + ) input of comparator IC1, and rises with decreasing fuel in the tank. When this voltage exceeds the R4
preset voltage on the inverting (-) input, the output of IC1 (pin 6) goes high.
This voltage (approximately 9 volts) is high enough to cause zener diode $D 6$ to conduct and turn on transistor Q1. When turned on, this transistor draws current through audible alarm A1, and turns on optional indicator LED1.
As long as the fuel level is low, the output of IC1 remains high. To silence the alarm until the tank is filled, CANCEL switch S1 is depressed to trigger SCR1. When triggered, the SCR brings the junction of R5-D6 (the input to Q1) down to approximately 2.2 voits, which is not high enough to cause $D 6$ to conduct and activate the alarm circuit. Since the SCR is powered by dc, it will remain turned on as long as the IC1 output is high (the fuel level is low).

As long as SCR1 is conducting, there will be about 1.2 volts (two diode drops) across $D 7$ and $D 8$, enough to turn on Q2 and cause LED2 to operate. This LED is a special type that incorporates a buill-in flasher circuit that makes the LED flash at a $2.5-\mathrm{Hz}$ rate as long as the LED is Cable on author's prototype has connector for +12 rolts, ground and tank sender unit.

If you're interested in learming how to fix air conditioners, service cars or install heating systems - talli to some other school. But if yon're serions abont electronies, come to CIE-The Electronies Specialists.
 Cleveland Institute of Electronies

My father always told me that there were certain advantages to putting all your eggs in one basket. "John," he said, "learn to do one important thing better than anyone else, and you'll always be in demand.

I believe he was right. Today is the age of spectalization. And I think that's a very good thing.

Consider doctors. You wouldn't expect your fanily doctor to perform open heart surgery or your dentist to set a broken bone, either. Would you?

For these things, you'd want a specialist, And you'd trust him. Because you'd know if he weren't any good, he'd be out of business.

## Why trust your education

 and career future to anything less than a specialist?You shouldn't. And you certainly don't have to.

FACT: CIE is the largest independent home study school in the world that specializes exelusively in electronics.

We have to be good at it because we put all our eggs in one basket: electronics. If we hadn't done a good job, we'd have closed our doors long ago.

## Specialists aren't for everyone.

I'll tell it to you straight. If you think electronics would make a nice hobby, check with other schools.

But if you think you have the cool-and want the training it takes - to make sure that a sound blackout during a prime time TV show will be corrected in seconds - then answer this ad. You'll probably find CIE has a course that's just right for you!

## At CIE, we combine theory and practice. You learn the best of both.

Learning electronics is a lot more than memorizing a laundry list of facts about circuits and transistors. Electronics is interesting be cause it's based on some fairly recent scientific discoveries. It's built on ideas. So, look for a program that starts with ideas-and builds on them.

That's what happens with CIE's Auto-Programmed ${ }^{\circledR}$ Lessons. Each lesson uses world-famous "programmed learning" methods to teach you important principles. You explore them, master them completely... before you start to apply them!

But beyond theory, some of our courses come fully equipped with the electronics gear to actually let you perform hundreds of checking, testing and analyzing projects.

In fact, depending on the course you take, you'll do most of the basic things professionals do every day things like servicing a beauty of a Zenith color TV set . . or studying a varicty of screen display patterns with the help of a color bar generator

Plus there's a professional quality oscilloscope you build and use to "see" and "read" the characteristic wave form patterns of electronic equipment.

## Tou work with experienced specialists.

When you send us a completed lesson, you can be sure it will be reviewed and graded by a trained clectronics instructor, backed by a team of technical specialists. If you need specialized help, you get it fast .. in writing from the faculty specialists best qualified to handle your question.

## People who have known us a long time, think of us as the "FCC License

## School."

We don't mind. We have a fine record of preparing people to take and pass. . . the governmentadministered FCC License exams. In fact, in continuing surveys nearly 4 out of 5 of our graduates who take
the exams get their Licenses. Yon may already know that an FCC License is needed for some careers in electronics-and it can be a valuable credential anytime.

## Find ont more: Mail this card for your FREE CATALOG today:

If the card is gone, cut out and mail the coupon.

I'll send you a copy of CIE's FREE school catalog, along with a complete package of independent home study information.

For your convenience, I'll try to arrange for a CIE representative to contact you to answer any questions you may have.

Remember, if yon are serions about learning elcetronics... or building upon your present skills, your best bet is to go with the electronics specialists-CIE. Mail the card or conpon today or write CIE (and mention the name and date of this magazine ), 1776 East 17th Street, Cleveland, Ohio 44114.

Patterns shown on TV and oscilloseope sereens are simulated.

Fig. 3. Actual-size etching and drilling guide is shoun at left. Component placement guide is above.
powered. The maximum voltage permitted across this special LED is 6 volts, hence the presence of 5.1 -volt zener diode D9.

The incoming dc power line is noise decoupled by R1, C1 and C3. Zener diode D2 clamps any transients to a maximum of 18 volts while diode D1 makes sure that the correct polarity is supplied to $I C 1$. Filter R2-C2 decouples the power line to the alarm and indicator circuit. Diode D5 clamps any voltage spikes that may occur if an inductive load, such as a buzzer, is used as the alarm. Resistor R6, connected between the output of IC1 (pin 6) and the noninverting ( + ) input, adds a small amount of positive feedback to give the comparator a little hysteresis and speed up the transition from low to high. This also reduces the likelihood of comparator oscillation.

Construction. The circuit may be constructed on perf board, WireWrapped, or on a pc board such as that
shown in Fig. 3 along with the component installation.

The two LED indicators, CANCEL switch S1, level-select potentiometer R4, and the selected audible alarm are not mounted on the pc board.

The finished pc board can be mounted within a selected enclosure that will also mount the off-board components. Power can be derived from any +12 -volt source that becomes active when the vehicle ignition key is operated. The ground can be any convenient metal element that is solidly connected to the vehicle chassis.

You will have to locate the dashboard end of the fuel sensor lead. Test this lead by measuring the voltage across it with various levels of fuel. Usually, the lower the fuel level, the higher the voitage. It is possible for this voltage to vary due to the action of the vehicle switching voltage regulator (if your vehicle uses one) so this must be considered.

If you have any doubt as to the type
and wiring of the fuel-level sensor in your vehicle, consult the vehicle repair manual.

Calibration. There are two ways to calibrate the system. The first is to wait until the fuel level is down to the selected low level, then adjust R4 until the alarm sounds off.

The second approach is to disconnect the fuel gauge from its feed line to the fuel sender but leave the lead connected to the low-fuel alarm, then connect a re-sistor-substitution box between the fuel gauge and ground (as a substitute for the fuel sender). Adjust the value of the resistor until the fuel gauge indicates the desired level. Adjust R4 to sound the alarm at that point. Disconnect the resistor box and replace the fuel sender line.

Once the fuel-level turn-on point has been determined, depress S1 to silence the alarm. After the tank is filled, the alarm will be reset until the fuel level drops below the predetermined point. $\diamond$

# §) 

 Whtra-sensitise instrument gives querntitratiur

TOXIC and explosive gases are an ever-present danger in our modern society. They include natural gas, propane, fuel vapors and invisible and odorless carbon monoxide

The ultra-sensitive gas-leak detector presented here indicates the quantitalive presence of these gases and enable one to track down and pinpoint the source of a gas leak by observing the unit's meter indication. Moreover, it is a portable, battery-powered model for use in boats, automobiles, at campsites, or in any other location where ac power is not available. (An ac-operated noxious gas detector with an audible alarm for preset gas levels was described in a project that appeared in Popular ElecTRONICS, August 1976.)

Circuit Operation. The gas sensor, GS 1 in Fig. 1. consists of an electrically heated tin-oxide pellet that changes resistance when exposed to carbon monoxide, hydrogen, propane. alcohol, gasoline vapor and other oxygenreducing gases. Power for the circuit can be obtained from either six D cells, preferably rechargeable. connected in series or from an optional 9 -volt battery eliminator. Regulator IC1 reduces the available 9 -volt level to the 5 volts require by the circuit. Optional $\angle E D 1$ is a 9 -volt power-on indicator

Current from the regulator heats gas sensor GS 1's semiconductor pellet. The sensor. R4. R7. and $R 8$ are arranged in a bridge configuration. The null indicator consists of M1 and R6, while D1 and D2
serve as protection for M1. Overall circult sensitivity is determined by the valle of resistor R5, while S2 provides a BATT. TEST function

Once the bridge is balanced, by NULL potentiometer R8, any change in the resistance of GS1 will create an unbalanced condition. When this occurs, the meter's pointer swings up-scale, by an amount proportional to the change in resistance of GS 1

Construction. With the exception of GS, It M1, B1. R8, S1, and S2, the circuit can be assembled on a piece of perforated board. Select an enclosure large enough to accommodate the board and all off-board components, including B1 and its holder

Thmeghow Company Led. - A company exclusively devoted to electronic time "movements"

## Low-cost Projects continued...

Mount the meter movement on one side of the enclosure's front panel, the remaining off-board components (exsept B1 and J1) on the other side of the panel. The battery holder and optional battery-eliminator/charger jack J1 are best mounted on the rear wall of the en-

\end{aligned}
$$

AN INEXPENSIVE pocket calculator can be converted to operate as an electronic pedometer to keep an ongoing tally of the number of steps taken while walking and jogging. Then, with a 42
simple conversion, you can use the calculator to determine the number of yards, meters, miles, or kilometers travelled. Although the conversion described here is "hard wired" into the cal-
culator, you sacrifice none of the calculator's basic builtin capability

Calculator Conversion. The first thing you must do is determine whether

POPULAR ELECTRONICS
or not your calculator has a built-in constant function. To do this, press CLEAR, $1 .+, 1,=,=$. If your calculator has the necessary constant function, the display should read 3 and should increment by 1 for each additional operation of the $=$ key. Having established the fact that your calculator does indeed have the constant function, you can proceed with the conversion.

Conversion of the calculator consists in simply wiring a foot-operated switch across the $=$ key First, carefully open the calculator's case and locate the contacts for the $=$ key. Then solder a $5^{\prime}$ (1.5-meter) or so length of 26 -gauge flexible stranded wire to each = switch contact. Insulate the soldered connections with a layer of electrical tape.

Now, test your hookups in the following manner. Turn on the calculator and key in $1,+, 1$. Touch together and separate the free ends of the wires two times. With the first touch, the display should read 2 and with the second, 3 . If the test checks out properly, turn off the calculator and reassemble it, routing the wires out through the side of the case. If necessary, use a sharp knife to cut a slot to allow the wires to exit the case. No other modification is necessary.

Footswitch Fabrication. As shown in the drawing, the footswitch is fabricated from a commercially available "airpillow" foam insole. Begin by cutting a $1^{\prime \prime}(25.4-\mathrm{cm})$ square away from the center of the heel area of the insole. Cement a square of copper-coated Mylar or any other flexible conductive material over the cutout on both sides of the insole, conductive surfaces face-to-face.

Solder the free ends of the flexible wires from the calculator to the conductive material. Then cover the "switch" assembly with duct or other durable tape to keep out dirt and moisture.

Slide the insole into your shoe and put on the shoe Turn on the calculator and

Place copper foil on each side of insole hole and insulate with tape.
key in $1,+1$. Now, as you walk around the display should read 2 , then 3 , then 4. etc.. as you successively put weight on the switch shoe with each step. If you do not obtain these results, turn off the cal-
culator and carefully check out the switch arrangement.

Determining Distance. Every time you use the pedometer, you must first key in $1,+, 1$. Thereafter, the calculator increments the display by 1 for each step taken by the shoe in which the switch is installed. To determine how far you have run or walked, you must find out how many steps you take in a given measured distance (mile, kilometer, etc.). You must, therefore, measure off the "control" distance and walk or run it to determine how many steps are required to cover the course.

Let us assume you wish to know how many miles you have walked and have previously determined that it takes you 1056 steps to walk a mile. (Note that a step is two strides. If the switch is in your right shoe, a step is completed every time you set down your right foot.) Now, subtract 1 from the total displayed by the calculator. This is necessary because the first step you take will register 2. If we assume you stopped at 7200 steps, simply divide this number by 1056 your "control" number, using the calculator to obtain the number of miles walked. Therefore. $7200 / 1056=6.82$ miles

levels increase dramaticatly-including the levels of local signals. This can lead to problems. The most serious forms of scanning monitor interference are frontend overloading and intermodulation distortion, recognized by their frequent recurrence throughout the tuning range of the receiver. Images from aircraft communication and FM and TV signals that pop up in the middle of the public safety bands are another problem.
The problems that plague the public-safely-band listener are especially severe in metropolitan areas. The problem is compounded with the use of omnidirectional ground-plane antennas that respond equally well in all directions. What is really needed to maximize reception is a beam antenna with high forward gain and greatly limited side and rear gain. Such an antenna can be aimed at the transmitting source to zero in on that single signal to the virtual exclusion of other signals that can interfere with and mask the desired signal.

A few modifications to a low-cost TV antenna can produce an excellent beam antenna for vhf/uhf public-safety-band monitoring. We modified a Radio Shack "Super Color Special" (similar to the Model VU-90) antenna for our purposes. The results we obtained were so satisfactory that no further experimentation was necessary.

The TV antenna employs a log-periodic design in which every element is cross-connected to the feed line. The antenna is actually a series of center-fed dipoles, each slightly different in length to resonate at a slightly different frequency. The dipoles are connecled to a common feedline. The response of the elements is related to the logarithm of the frequency; hence, the name logperiodic dipole array.

Electrically, elements that are not resonant at the frequency to which a receiver is tuned at any given moment behave like directors and reflectors. This endows the antenna array with both directivity and gain. The elements of a logperiodic antenna are incrementally shortened from the longest wavelength at the lowest frequency to the shortest wavelength at the highest frequency which gives the antenna a characteristic $V$-shaped outline.
Each dipole is used at two frequen-cies-its resonant half-wave ( $\lambda / 2$ ) frequency and its three-half-wave ( $3 \lambda / 2$ ) frequency. Hence, the longest element performs on 140 and 420 MHz , while the shortest element performs on 174 and 522 MHz . Also, because of the large diameter of the elements, compared to their length, the dipoles are very broadband. This makes the modified antenna usable over a range from well below 130
to beyond 174 Mhz in its $\lambda / 2$ mode and from below 400 to beyond 550 MHz in its $3 \lambda / 2$ mode
With the antenna erected, you will note that its elements are angled forward. This is done to merge the front lobes of the characteristic cloverleaf pattern that occurs on any $3 \lambda / 2$ dipole. The result is that the directivity of the antenna is considerably increased.
When used for TV only applications, the Radio Shack Super Color Special (as well as the Model VU-90) antenna offers an average gain of 4 to 6 dB (about 1 S unit) over a single dipole. Its front-to-back ratio is around 12 dB . Antennas with more elements will provide better gain and directivity figures.

Because the feed impedance for the antenna is approximately 300 ohms or less, a standard 4:1 TV Balun matching transformer is required between the antenna and the coaxial line you will be using. You need not concern yourself about the impedance of the feed line; either 50 - or 75 -ohm coax will work fine. For cable runs in excess of $50^{\circ}(15.2 \mathrm{~m})$. use RG-8/U foam dielectric coax. Although new dry 300 -ohm Iwin-lead feed cable is low in losses, when it gets old, wet. and cracked, it causes more problems than it is worth. It is for this reason that coaxial cable is recommended in-dustry-wide for two-way radio communication and commercial TV signal distribution systems.

Modification. Referring to the drawing, saw off the entire boom section that contains the $6^{\prime \prime}(15.2-\mathrm{cm})$ elements in front of the corner reflector. Be careful to avoid damaging the longer element closest to the reflector (this element is connected to the antenna's cross-feed system) or any of the reflector elements.
Next. cut the longest pair of angled elements to a length of $20^{\circ \prime}(50.8 \mathrm{~cm})$ on each side of the boom. This 40" (101.6cm ) dipole is now cut for 140 and 420 MHz . Now. cut the shortest pair of angled elements to $16^{\prime \prime}(40.6 \mathrm{~cm})$ on each side of the boom. This $32^{\prime \prime}(81.2-\mathrm{cm})$ dipole is now cut for 170 and 510 MHz .

Once the longest and shortest elements are trimmed to size, the remaining elements can be proportionately trimmed so that the outline of the antenna will have a characteristic $V$ shape. You simply place a straightedge on each side of the antenna so that it touches the extreme ends of the cut elements and locate the cut points for the remaining elements. In the case of the Super Color Special and Model VU-90 antennas. the

## Eye-level Weight Watcher <br> Separate digital readout puts your exact weight right before your eyes.

Your present scale gives you a number for every five pounds - and a line for the pounds in between. To make matters worse, the needle's at your feet.
Our scale puts your weight where your eyes are-in bold, red, easy-to-read numbers. It's marvelous! You step on the scale and your weight's right there. A visual record of the pounds you shed

The readout unit mounts with either selfadhesive clips or screws. The color's soft white. The physical size of the scale unit is $10.5^{\prime \prime} \times 10.5^{\prime \prime} \times 2.5^{\prime \prime}$ and the digital readout unit is $4.75^{\prime \prime} \times 3^{\prime \prime} \times 1.25^{\prime \prime}$. Try it on a 15 -day money back guarantee. Call toll free lo charge it to any national credit card or send your check for $\$ 49.95$ plus $\$ 5.50$ shipping and handling to Douglas Dunhill. (III. residents add sales tax.) Complete with four AA batteries.
Watching your weight's never been easier or as nice.

Dept. 53-2378
Ten Douglas Dunhill Drive, Oak Forest, IL 60452 (c) Douglas Dunhill inc. 1979

third and second longest elements will be $17^{\prime \prime}(43.2-\mathrm{cm})$ and $18^{\prime \prime}(45.4-\mathrm{cm})$ long, respectively, on each side of the log periodic array's boom
Trim the longer corner reflector elements so that each of them is $16^{\prime \prime}$ long. Then lift the antenna to locate its new center of balance. Drill two new $1 / 4{ }^{\prime \prime}$ $(6.35-\mathrm{mm})$ holes. properly spaced. through the boom to accommodate the $U$ boll that fastens the antenna to its mast. Make certain that these holes are drilled to permit the antenna to be oriented so that its elements point up and down after mast mounting. Also, make certain that the U-bolt hardware does not touch the aluminum wire that crossconnects the elements

Mount the antenna on a $36^{\prime \prime}$ (0.91-m) length of $11 / 4^{\prime \prime}(31.8-\mathrm{mm})$ outer-diameter rigid PVC pipe Do not substitute a metal pipe because it will interfere with the signal path. The metal mast should be at least $\lambda / 4$ away from the longest antenna element. (Rigid PVC pipe can be obtained from any building supply house and many hardware stores.)

Mount the antenna and PVC pipe support on a rotator, following the cablerouting instructions faithfully. Connect the Balun transformer to the antenna and the coax feed line to the Balun. Then coal the connections with silicone adhesive to weatherproof them

How It Performs. We made comparison checks between the modified TV antenna and an excellent commercially available vht/uhf discone monitor antenna. Signals that were barely readable on vhf with the discone antenna came in substantially stronger with the modified beam antenna. More important was the fact that signals from the back of the antenna were noticeably reduced and those off to the sides were deeply attenuated with the beam, all of which contribute to a reduction in interference and an overall improvement in reception. The modified beam performed even better on uhf than it did on vhf. Signals improved from "barely-discernable" to "full-quieting.
Our experience with the modified beam makes it clear that this antenna is an excetlent choice for listeners who are plagued by strong nearby transmitters and experience weak incoming signals. The modified beam even has the added advantage that it works well on the 2-meter amateur radio band: just be careful to avoid pumping more than a few watts into the Balun to avoid overheating. Happy listening.

POPULAR ELECTRONICS

## BASIC programs for Ohm's law, resonance, and inductive

 formulas using a Level-1 machine with $4 K$ of RAM
## SIMPLE TRS-80 PROGRAMS SOLVE ELECTRONICS CALCULATIONS BY ROY BABYLON

THE FOLLOWING programs were designed to be run on a Level-1 TRS-80 microcomputer having 4 K of memory. All the programs are selfprompting when run and are also readily adaptable to any other BASIC. (The square-root subroutine can be eliminated if your particular BASIC has a built-in square-root function.)

Ohm's Law. This program, shown in Table 1, is fairly short and has no subroutines. Line 40 selects the unknown resistance, voltage, current or power. Lines 70 through 100 are used to deter-
mine the unknown resistance; lines 110 through 130 are for current, while lines 145 through 160 are used to determine the voltage. Once the current ( 1 ) and resistance ( $R$ ) have been determined, line 295 displays the wattage.

Resonance. The program shown in Table 2 can determine frequency of a tuned circuit when $C$ and $L$ are known, or can determine either $C$ or $L$ if the desired resonant frequency and one of these two elements are known. The program will also determine the $Q$ of a series or parallel tuned circuit, bandwidth
and/or the impedance. The square-root subroutine used in determining resonant frequency is called at line 220.

Inductive Formulas. Table 3 illustrates a program that will determine instantaneous voltage, inductance of a single-layer coil, inductive/resistive time constant, the values of series and/or parallel inductors, the $Q$ of a coil, inductive reactance and impedance of an inductive/resistive circuit. The only subroutine used (square root) is called at line 720, with this subroutine residing at line 30000 .

An expert tells how to "sweeten" instruments and achieve that special recorded "sound"

BY ETHAN WINER

- A growing number of audio enthusiasts are using equalizers
to shape a stereo system's frequency response, whether to "adjust" a room or for creative recording purposes.
- An equalizer is nothing more than a device to allow frequency response of an audio signal path to be adjusted in some way. Thus, conventional bass and treble controls qualify as charter members of the club. More often, however, the term implies equipment that is more complex and sophisticated, such as that used by a mixing engineer. Let's take a look at some of
the reasons equalization ( $E Q$ ) is useful and how its implementation
has developed into a high art.
- Standard bass and treble tone
controls are broadband devices that have greatest effect at the frequency extremes; that is, the highest highs and the lowest lows.

While this is fine for touching up reproduction, it is of virtually no help in correcting for narrowband colorations, which are often highly disturbing. For example, a peak in the response of an audio system in the low-to-middle treble region can produce a shrill or scratchy quality that a normal treble control cannot effectively tame. Turning down the control enough to eliminate the shrillness kills too much of the highest treble, robbing music of clarity and sparkle. Similarly, using a bass control to correct tubbiness or muddy bass response also falls short of success. Turning the control down to relieve such midbass exaggeration would simply remove the deepest frequencies so important to lifelike reproduction, while perhaps still allowing some muddiness to persist. There's got to be a better way-and there is.

Fig. 1. Layout of a typical front panel for an equalizer. Note that it has controls fortreble, midrange, and bass as well as a 3 -position low-cut filter.

Enter the Graphic Equalizer. The graphic equalizer has become very popular in recent years. It is called "graphic" because, as the front-panel sliders are adjusted, their positions give an approximate display of the resultant frequency response. Each of the five to ten or more frequency bands into which the audible spectrum is divided by these devices is adjustable via its own boost/cut control. Instead of broad adjustments of treble, bass, and maybe the midrange (presence), we now have independent control over the low bass, midbass and high bass, low midrange, etc.

If we attack that shrill midtreble emphasis with an octave-band graphic equalizer, we should be able, more or less, to correct for only the troublesome peak. We'll have to settle for "more or less" because it is highly unlikely that any response anomaly could correspond exactly to the adjustments of even a ten-band device. Therefore, many professional sound contractors, recording studios and audio enthusiasts seeking precise results use the even greater resolution afforded by $1 / 3$-octave equalization. The $1 / 3$-octave graphics usually have 27 or so bands, and can, when teamed up with the proper measuring equipment, be used to make just about any high-quality speaker system flat to within a dB or so over much of the audible range. But there's much more to $E Q$ than simply correcting nonideal loudspeakers or listening rooms.

EQ In the Studio. Now, let's look at the professional recording studio with its abundant knobs, lights, and buttons. This is where the multiple original tracks are adjusted in level and equalized before being mixed together to comprise the final two-track product. The key phrase is "before being mixed." Whereas the home listener can alter the program only in its entirety, the recording engineer can-and must-equalize sounds picked up by each microphone separately. The tool of choice for this ap-

plication is yet another equalizer referred to by many as the "console type." Virtually all professional mixing consoles use this sort of device, with one available for each mike or line input. Additional equalizers are often devoted to echo and reverb lines.
A typical front panel for such an equalizer (Fig. 1) shows that we're back to the bass-mid-and-treble format. But there are no less than five different frequency choices for treble, eight for midrange, and another five for bass. In addition, a 3 -position low-cut filter is provided, as is an in/out switch for instant comparison of "before" and "after." Here we have a device that can exercise control over fifteen different frequency ranges and also be made small enough to fit in quantity into a single mixing board. (A large console will have some 30 or more of these, so size is an important factor.) Though all 15 frequencies cannot be adjusted simultaneously as with the graphic, this rarely is needed in a "one-for-eachmike" situation. Besides, you can always "patch-in" a graphic if you absolutely have to.
The last control, the PEAK/SHELF switch, changes the basic shape of the response curve being created. This is shown in Fig. 2, where in both cases treble frequency has been set to 3.2 KHz and 12 dB of boost is applied. The upper curve represents the switch in the PEAK position while the lower curve shows a shelf. Notice that, while the treble peak affects mainly the specified frequency. there is still some influence on nearby frequencies, whether boosting or cutting. In the shelf position, the boost or cut reaches its maximum at that frequency and remains there for all higher frequencies. The same principle applies to the bass control. The boost or cut reaches maximum at the named frequency but instead continues downward thereafter. The midrange has no shelf capability, but more expensive consoles generally have a second, additional midrange control for added flexibility. Fig. 3 contains bass shelf cuts at four different frequencies. Fig. 4 illustrates the effect of varying the bandwidth of a midrange dip. Bandwidth? Well now we're talking about the "parametric equalizer," the most recent addition to the EQ machine family.

Parametric Power. In a sense, the parametric equalizer is the most powerful of the equalizer types, allowing continuous adjustment of all equalization parameters (hence the name). It is

Fig. 2. The top switch in Fig. 1 changes the basic shape of the response as shown here to a peak (top) or shelf (bottom).
structured similarly to the console equalizer, but there are differences worth elaborating. First, and probably most important, all controls of a parametric are continuously adjustable. Potentiometers, rather than discrete, switch-related resistors, are employed as the tuning elements, allowing a choice of virtually any center frequency. Boost and cut controls are also continuous and typically offer a range of $\pm 20 \mathrm{~dB}$, more than is characteristic of other equalizer lypes.
Another important difference is the inclusion of a bandwidth control. It was explained previously that in boosting or cutting a peak, the effect "spills over" to adjacent frequencies. How far away from the indicated center this influence
extends is determined by the setting of the bandwidth control. When set to NARRow, it allows only a small range of frequencies to be influenced. This is particularly useful for suppressing ringing or removing extraneous tones from, say, drums without changing the basic sound character. On the other side of the coin, this narrowband setting can be used to emphasize a single tone and can often effectively "purify" a muddy-sounding tom tom. Of course, this is not a substitute for proper tuning of the drums, but when all else fails.

Except when dealing with drums and perhaps some tuned percussion instruments like triangles or cowbells, narrowbandwidth boosts should usually be
avoided because unpleasant resonances or other bad effects may show up when the mix is heard on different speakers. In fact, most recording studios have alternate speaker systems available for making instant comparisons.

Broad-bandwidth settings accentuate a larger range of frequencies. Parametric equalizers are inherently peaking rather than shelving devices, but a wide setting can reasonably approximate a shelf. Do not confuse peaking with boosting, though. Peaking refers only to the shape of the curve, not to whether it is being boosted or attenuated.

All this newfound versatility, however, is not without some potential drawbacks. Probably the most obvious is the lack of precise repeatability. Since the operating controls are continuously variable, it may be difficult to recreate seltings exactly to perhaps undo something you later don't like. Another factor is noise. Parametric equalizer designs generally use more op amps per frequency band than do graphic and console types. This means that cumulative noise can be more of a problem, especially when large amounts of boost are used. Distortion can build up in a similar fashion, though the latest high-slew, low-noise FET input op amps are bringing both of these factors under better control. Still, most commercially available units have a switch to bypass each band or section if it's not needed

While studios have not unanimously traded in all their old equalizers for parametrics, many have added at least one or two. And some of the newer mixing boards are showing up with equalizers having a sweepable midrange band or a two-position switch for sharp or broad peak shape selection. So a few of the

Fig. 3. Responsecurres show changes for bass shelf cuts at four different frequencies.

AUGUST 1979
conveniences are added without having to go to a full parametric design.

Now that we've looked at the different types of devices and know how they operate, how can we use $E Q$ to best advantage? When and how would a professional recording engineer use it? Well, first we should note that equalization can be used in two basic ways: as a tool and for personal taste.

EQ As A Tool. If you reflect on the task of a recording engineer, the idea that he is going to run into problems in his work will not seem surprising. The difficulties encountered may lie in the areas of instrumental balances, equipment overload, signal-to-noise ratio, and frequency response, to name a few possibilities. When the problem can be traced to frequency response-and quite a few can-the equalizer becomes an extremely valuable tool.

For example, one problem that occurs regularly is caused by the "proximity effect," a bass boost that happens when using a directional microphone in closemiked situations. Here, the low filter would be your best bet. First, it will attenuate the excessive low-frequency signal before it enters the actual EQ circuitry, minimizing the chance of overload; second, it will leave the bass control free for other uses if needed. (If the mike has its own switchable low-cut filter built in, using that to keep the unwanted frequencies out of the preamp as well will give even more overload protection.)

Another proper occasion to use the low filter is when recording vocals closeup. Not only because of the proximity effect just mentioned, but also to minimize "popping" P's, which contain a lot of low-frequency energy. Moreover, rumble and low-frequency mud can enter
your recordings owing to extraneous vibrations such as walking on non-concrete floors, operating air conditioners, and the like.

Treble is often accentuated to increase clarity or to enhance the presence of a vocal or string part that might otherwise be lost in the mix. Horns, cymbals, acoustic guitars and many other instruments can also be greatly enhanced in this way, but the engineer must know where the formants (the most important characteristic frequencies for the various instruments) lie. Boosting high treble on an instrument with little output in that region will do nothing but add hiss. In fact, when dealing with such an instrument, it is often possible to make a substantial improvement in the signal-tonoise ratio by carefully reducing the unnecessary high-frequency bandwidth with treble control on each channel for frequencies beyond the range of interest. This is most effective when done in mixdown, as tape hiss will also be reduced. For this same reason, when treble boost is employed, it is usually best applied ahead of the recorder.

EQ can also help to correct for poor room acoustics. Recording live, even the most accurate mike may not capture that terrific sound you hear when you stand right next to the instrument. Closemiking may help, but in many cases this is impractical since many instruments do not radiate sound from a single point source.

Consider a grand piano, string bass, xylophone, or gong. All of these radiate sound from a large surface area, leaving no single mike position that would be close to all parts of the source. Such large instruments require a more distant microphone placement if a wellbalanced pickup is to be had. Unfortu-
nately, as the distance between source and mike increases, acoustics of the room begin to affect the sound. This isn't always bad-a good room might add a warmth and character unobtainable in any other manner. But when a close-up sound with lots of presence is desired, equalization in the form of treble boost or midrange cut can often do the trick.

Seasoning To Taste. While no one yet has found a definitive way to tell what sounds good and what doesn't, recording engineers have developed various techniques for emphasizing what they consider to be the more pleasant qualities of musical sounds. In fact, many engineers pride themselves on "getting their own sound." This is an area of taste, so naturally there are no hard, fast rules to apply. Some good starting points can be established, though, as follows. Generally speaking, you would boost treble for clarity or presence (the midrange can affect this too), and bass for fullness or punch. Sometimes it seems that no matter how much top or bottom you add, something is still not right. Often what is involved is one or more unpleasant resonances caused, as mentioned earlier, by either microphone chracteristics or placement, or even by bad qualities within the instrument itself, especially if it is out of adjustment or of low quality. Eliminating these midrange resonances will often improve the sound and may minimize a need to boost highs and/or lows.

To find these magic EQ settings, start by turning off all but the principal microphone that can pick up the instrument you're working with. If it's the snare drum, for example, shut off the tom and kick mikes. They'll interact later anyway, but the less you need to concern your-

Fig. 4. Response curves showing the effect of varying the bandwidth of a midrange dip.

The chart given below lists some common instruments with frequencies at which boost or cut can be effectively applied to cure various problems or obtain certain effects. Indicated frequencies are necessarily approximate, as no two instruments sound exactly alike. The column marked "comments" gives cautions or observations based on experience. They should be taken as guidelines rather than prescriptions, for every situation is different and every recordist has his own sonic goals

A few general hints may contribute to the effective use of equalization: (1) Your

## SPECIFIC INSTRUMENTS AND THEIR CHARACTERISTIC FREQUENCIES

memory is shorter than you think; return to a flat setting now and then to remind yourself where you began.
(2) Make side-by-side comparisons against commercial releases; this will help you in judging overall blend.
(3) You can tailor the sound of an instru-
ment only so far without losing its identily; every instrument can't be full, deed. bright. sparkly. etc., all at onse. !eave some 500 m for contrast.
(4) Take a break once in a while. Critical listening tends to numb one's senses after awhile. especially if you like to run monitors at high levels. Sounds may apoez: very different to you the next morning.
(5) Don't be afraid to experiment. If you can't find just what you want with equalization, try moving the mike a little; if that won't work. move the instrument. But. most of all. keep trying.

self with now, the better. Next, try boosting some different midrange frequencies, adding at least 10 or 15 dB , to make the changes obvious. Where you start will naturally depend on the instrument. Since physical resonances of instruments usually fall between, say, 100 Hz and 1 or 2 kHz , these frequencies are likely starting points. After determining which one sounds the worst, return to the flat setting momentarily to allow your ears to readjust, and then cut the chosen frequency in small steps until the AUGUST 1979
optimum point is reached. The same general plan can work for boosting, although then you'd be looking for frequencies that make the sound better when boosted.

When adding treble or bass, be sure the controls are doing what you expect them to. If you don't obtain an appreciable improvement, move on to a different frequency. Remember, a lot of boost at the extreme low end can route excessive infrasonic energy to the loudspeakers, which could damage them. Similar-
ly, too much ultrasonic content can damage tweeters and overload the tape deck. Even with VU meter indicators in the black, safety is not guaranteed; limited meter frequency response sometimes prevents them from giving a true picture. Also, VU meters tend to miss sharp transients from drums and other percussion instruments; the pointer simply cannot move fast enough. Preemphasis within the deck also can aggravate the situation, so be particularly careful at the slower tape speeds. $\diamond$

## BUILD A speaker Protection Circuit <br> BY MIKE ROGALSKI

AFTER LONG periods of listening to reproduced music played at a high volume level, it's not uncommon for one's hearing to become insensitive to average loud sounds. As a result, the listener often turns up the gain to compensate for this diminished sensory perception.

The best way to protect our hearing ability-and do a good turn for our speaker systems-is to put an upper limit on the decibel level our sound systems can generate. This is precisely what the automatic audio-over-load/speaker-protection circuit described here does.

There are, of course, many circuits that use zener diodes and SCRs to shunt power to dummy loads. Most act too fast, however. This causes important dynamics such as drum rolls, cymbal crashes, and trumpet blasts to get "crunched." A slow-acting threshold sensor that has built-in hysteresis and a comparator circuit would be excellent for providing automatic level limiting, but it requires a power supply. The speaker-protection system here, on the other hand, is far simpler in circuitry, self-powered, automatic in action, and connects directly between the power amplifier and the speaker system it is to protect. It is also inexpensive to build.

About the Circuit. The output from the power amplifier to the speakerprotection circuit is shown in Fig. 1. (The rectifier diodes should have a forward resistance of approximately 600 ohms to introduce minimal signal distortion.) The signal then goes to the normally-closed relay contacts and out to the speaker system.

At high signal levels, the charging circuit consisting of R1 and C1 generates sufficient voltage levels to energize K1 and open its contacts. When $K 1$ energizes, $R 2$, is connected in series with the speaker system to drop the sound level. Then, when the input signal level drops, K1 de-energizes
and its contacts automatically close, removing R2 from the circuit.

Construction. The simplicity of the protection circuit lends itself to just about any method of construction desired. For those who wish to use print-ed-circuit construction, an actual-size etching-and-drilling guide and compo-nents-placement diagram are given in Fig. 2. Once wired, this compact pc assembly can be permanently mounted inside the speaker system's enclosure or connected directly to the speaker terminals.

Relay $K 1$ should have a dc coil resistance of about 100 ohms and a dc pull-in rating of at least 2 volts less

than the required rms voltage cutout point of the speaker system. This allows for the voltage drop across the rectifier circuit. The diodes and capacitors should have twice the peak voltage rating of the signal passing through them. The components specified in Fig. 1 are for a 4- and an 8-watt unit and will protect a speaker system rated at 5 to 10 watts with a $20 \%$ derating factor for safety.
Resistor R1 can be bypassed to move the operating point of $K 1$ down to 4 watts.

Adjustment. Make certain that the common of each amplifier output circuit is connected to the common of the speaker protector and observe proper speaker phasing when connecting the device into your audio system. With a relay whose coil resistance is about 100 ohms, the circuit shown in Fig. 1 will cut out at 4,8 , or 12 watts if the value of $R 1$ is 0,50 , or 100 ohms, respectively. Since the circuit is basically a voltage divider, doubling the value of R1, shifts the rms point $50 \%$ higher. You can also experiment with the value of $R 2$ to obtain the low level desired.

# SPACE-AGE <br> ELECTRONIC PROJECTS <br> FOR 

BOATS part two

LAST MONTH, we showed you various ways to use the LM3914 dot/ bar display driver in instruments for your boat, new approaches to water-level detection, and a rudder-angle indicator. In this second and final part, concentration is on bilge-water warning systems, elec-trical-system transient protection, and a unique digital tachometer.

Bilge Alarm. There are a number of ways to provide bilge-water warning. One of the simplest is the float-actuatedswitch system shown in Fig. 10. Here, a sealed tube containing a reed switch is surrounded by a float with a built-in magnet. The float rides up and down the tube with increasing and decreasing water level, closing and opening the switch's contacts.
With the actuating switch assembly placed low in the bilge, the float lifts with rising water level. At some predetermined point, the contacts of the reed switch close and the alarm sounds or/ and an indicator light comes on. Alternatively, the system can be rigged to automatically turn on the bilge pump as well as sound an alert.

There is nothing electronic about the system shown in Fig. 10, but it is so sim-
ple that it is just about foolproof. While you can fabricate your own float switch if you wish, it is hardly worth the effort because all-plastic units for boats are available from marine hardware stores at low cost.

A second bilge alarm is shown in Fig. 11. Here, a pair of electrodes is sealed in an insulating housing that is mounted low in the bilge. A small screen surrounds the probe-like elements to prevent bridging by debris.

In fabricating the probe shown in Fig. 11. two small brass bolts are mounted on a small disc of insulating board and are connected through a pair of resistors to a water-tight cable that goes to the instrument panel. The disc fits one end of a $3 / 1 / 1$ ( 19.1 - mm ) plastic plumbing fitting. Then the whole rear of the assembly is filled with epoxy to seal in the probe ends, resistors, and cable connections. When potting is finished, there should be no place, except at the probe tips, where moisture can bridge the circuit.

When water bridges the probe lips, the SCR fires and actuates the alarm. The Sonalert alarm will continue to sound, even after the water level drops below the point where it bridges the probe tips, until the switch is opened. To
rearm the alarm, simply close the swilch.

A third type of bilge alarm is illustrated in Fig. 12. This system is designed for boats with multiple bilge spaces that are separated by watertight bulkheads. An audible alarm and a visual indicator to tell you which bilge has water in it are required in this system.
The sensors in this circuit are LM1830 fluid-detector ICs. When water bridges the probes. the output of the associated IC goes high and turns on the pair of transistors connected to it. Output connections to the transistor switches are arranged so that water entering any bilge space and bridging its probes will activate the Sonalert but will light only the LED labelled for that bilge. You can duplicate the circuit for each bilge to be protected. The only thing in common among the circuits is the Sonalert.

Shown in Fig. 12 is a method for marking the safety panel area where the LEDs are mounted. Using the layout shown, you know instantly which of the bilges is leaking (by its lighted LED) when the alarm sounds.

The transistors can be replaced by a DIP transistor array. provided the outputs can sink enough current to drive the Sonalert. You can use a high-power alarm sounder by replacing the Sonalert with a relay whose contacts can handle the bigger alarm's current. If you use this arrangement, be sure to install a proteclive diode across the relay's coil.

Tachometer. The circuit shown in Fig. 13 consists of a basic $0-10-2.4$-volt meter system and a frequency-lo-voltage ( $f / v$ ) converter. The voltmeler portion made up of IC1 and IC2 features 20 divisions, each represented by a LED. The IC3 f/v converter accepts va-rying-frequency pulses from the engine's ignition points and converts them into proportional dc voltages with conslant updating.

Using a system like that shown makes possible an economical solid-state alternative to the traditional analog meter. It is free from parallax errors and is much easier to read and interpret than the analog meter, too. At night, readability increases, and the red emission of the LEDs has little effect on night vision.

The two LED drivers are cascaded by connecting mode pin 9 of IC1 to pin 1 of IC2. Pin 9 of IC2 connects to pin 11 to produce dot operation. Internal ic operation requires R1 to be connected across LED9 (pin 11 of IC1) to obtain proper operation. Resistor R2 sets the 56

scale of IC1 to half the voltmeter range. Because 1.2 volts should be generated across it, this resistor should have a $1 \%$ or better tolerance. Also, since 2.4 volts is generated across it. R3 should be rated at $1 \%$ or better tolerance. These re-
sistors also program the ICs to deliver 10 mA to each LED.
A charge-pump frequency-to-voltage (f/v) converter. high-gain op-amp/comparator, and an uncommitted output transistor are contained in IC3 (Fig. 14).

A Schmitt-trigger device is used for the input. It features a built-in hysteresis to provide clean switching if noise is present on the input signal. In the 14 -pin DIP LM2917N version of the IC, an internal zener diode also maintains calibration stability.

In Fig. 13, R5, R6, and C1 condition the input signal from the points. A sta-ble-temperature-characteristic capacitor must be used for $C 2$, which is the timing capacitor for the charge pump. Potentiometer R9 serves as the discharge path and doubles as the scale calibration control. Charge-pump filtering is provided by C3. The uncommitted emitter of the internal output transistor is connected to R10.

The input signal for the voltmeter is taken from R10's wiper. This allows the oulput of the tach section to be matched to the voltmeter's full-scale range. (A)though this could be accomplished via R9, better linearity is possible when the full output of the tach circuit is used and then reduced in level to match the requirements of the voltmeter.) Biasing for the internal op amp is obtained with R7 and $D 2$.

There are a number of ways to assemble the tach. The LEDs can be arranged in a vertical column, with the highest rpm at the top, or you can opt for

PARTS LIST (Fig. 13)

[^1]

Fig. 12. Circuit above is an alarmsystem for boat with multiple bilge spaces. Visualand audible signals are used to indicate which bilge has water in it. LEDs are mounted in diagram as shown at right to show each area.

Fig. 13. Circuit for converting pulses from ignition points to voltages which activate LEDs from 1 to 20 to indicate speed.
the more familiar circular arrangement.
When assembling the project, it is best to slightly recess the LEDs behind a red filter to avoid effects of washout in brightlight. Use high-luminosity LEDs instead of the commonly available "standard" LEDs. Finally, to assure maximum contrast and eliminate reflections as much as possible, apply a coat of matte black paint on all surfaces behind the LEDs and the front panel or bezel into which the red filter is set.

Wiring is not critical. However, it is important that you observe the common ground point near pin 2 of $I C 1$.

There is a considerable variation in the range requirements for a tachometer for inboard boat engines. Commercial analog tachs are scaled for 6000 rpm and supplied with links to adapt them to all types of engines. With the tach described here, the top end of the range can be chosen to suit the requirements of any given engine.

A 4-cycle engine fires each cylinder once every two revolutions. An 8-cylinder engine running at 4000 rpm would fire $4 \times 4000$ or 16,000 times per minute. This is equivalent to a tach input frequency of 266.67 Hz . For a 6 -cylinder engine operating at 4000 rpm , there are three pulses per revolution, which is equivalent to an input frequency of 200 Hz . Note that this is a linear relationship and can be plotted as shown in Fig. 15.

Following is the calibration procedure for a 6-cylinder engine with LED2O indicating 4400 rpm . Apply 15 volts from a bench-type power supply to the power leads of the tach. Next, connect the output of a square-wave generator to the tach's input through a $0.1-\mu \mathrm{F}$ capacitor. Using a frequency counter, set the generator for a high-level output of 220 Hz . Set R9 near maximum resistance. Using a high-impedance voltmeter, connected belween pin 5 of IC1 and ground, adjust R10 for a 2.4 -volt reading. This should turn on LED20. Adjust R9 until LED19 extinguishes and LED2O is at full brilliance. There is some overlap buill into the dot drivers so that one LED fades out as the next LED comes on. Slowly reduce the frequency of the generator while observing both the tach display and frequency counter to check the linearity of the tach's scale. It will not be perfect, but it will be better than a quick glance at a standard analog meter.

The calibration procedure for an 8cylinder engine will be the same as that for the 6 -cylinder engine above. The only difference is that you start with a generator frequency of 293.3 Hz .

Fig. 16 Tachometer
add-on is used to identify critical cruising speed.

( $11-10(0)-\mu F, 12-V$ electrolytic RI 1(K)-ohm. 1/2-W revivor R2-10(K)-ohm, 1/2-W resistor R3 470-ohn. $1 / 2$-W revistor

Fig. 17. A serie's diode is used in the positive supply for reverse poltage protection as shom here.

If your finished tach has a tendency to flicker at low rpm, increase the value of C3. Do not overdo this because if the value is raised to $2 \mu \mathrm{~F}$. the flicker will be reduced, but at higher speeds there may be a tendency for adjacent LEDs to flicker back and forth as a low-frequency oscillation sets in. Of course, a rough running engine is going to produce lots of flicker, which can serve as a reminder to have your engine tuned. The value of $C 3$ is a compromise. Once you install the tach, it is a good idea to have it checked against a good-quality tachometer.

The circuit shown in Fig. 16 is a useful add-on for the tach. It can be used to identify the critical cruising rpm where fuel economy is at its best or as an overrpm warning. The LED in the string to which it is connected will flash on and off when the indicated rpm is reached. The flash range is quite narrow. Bear in mind, therefore, that this circuit may not be usable as an attention getter with a rough-running engine. The rpms would be traversing the flash point too rapidly for the circuit to go into action.

Transient Protection. Any mobile electrical system, including that in a boat, can suffer from voltage transients of many kinds. Some transients are capable of destroying solid-state components and systems. Hence, it pays to have adequate transient prolection.

There are simple ways to give a large measure of transient protection to home-built projects. GE's MOV transient protectors is one simple way. A second method is shown in Fig. 13, where $10-$ ohm resistor R4 and 18 -volt zener diode D1 protect the power input line. If the circuit is to take care of a blown regulator, where 18 volts may be on the line continuously, the division of dissipated power between the zener diode and resistor must be calculated. Once breakdown occurs, the circuit will be carrying well over 1 ampere of current. This means that the power (wattage) ratings of the resistor and diode must be calculated.

Reverse voltage protection is a simple matter of installing a series diode in the $+V$ line, with the diode's anode connected to the + input, as shown in Fig. 17. Each subsystem should be individually protected, both for transients and reverse voltages, to assure maximum security against failure. Of course, one heavy-duty zener-diode circuit can be used for an entire instrument group to handle steady-state overvoltage conditions, but smaller suppressor circuits should still be used on each board. $\diamond$

# Introducing... <br> The Solar Alarm Chronometer 

- Light Energized
- Electronic Quartz Accuracy
- 24 hour alarm

> A personal alarm and time system powered by light.

You can't wear a more accurate watch Plus this new LCD chronometer has a built in 24-hour alarm and personal reminder system. And you no longer have to worry about batteries failing because this watch is constantly being recharged by light. A true scientific break thru.

## Forget about losing time

The time base is a finely tuned quartz crystal, trimmed by the manufacturer electronically to an accuracy of 5 seconds per month. And the manufacturer stands behind this accuracy with a one year limited warranty plus a 5 year replacement warrant on the micro-rechargeable energy cells.
Who is the Manufacturer
U.I.T. has been the innovator in the digital watch industry for years. U.I.T. is the prime manufacturer, assembler and importer of LCD watches. U.I.T. has been the pioneers of solar powered watches where "light energy" recharges micro-energy cells contained in the watch. A system so efficient they are able to offer the unheard of 5 year warranty.

## Forget about batteries

The new solar-alarm is powered by microenergy cells which are constantly being recharged from available light. Not just solar light but ordinary room light. You never need to worry about batteries.

## Forget about changing technology

This solar-alarm watch uses all of the
latest technology in electronics and engineering. The programmed time measuring features include hours, minutes, and pulsating seconds plus the month and date displayed instantly with the touch of a button. The large liquid crystal display constantly shows the time in large easy to read numerals. A special night light command button illuminates the dial for night viewing.

## Forget about being late

The most unique function of this solar chronometer is the alarm system. The 24 hour alarm system is easy to set without disturbing the time function. And it sounds with a pleasant electronic beep precisely at the pre-set time. Your own personal alarm system will automatically beep you at the right time for "on-time" punctuality, so important with todays busy schedules. You may never be late again.
Test it for $2,592,000$ seconds
Take 30 full days ( $2,592,000$ seconds) to confirm the accuracy and utility of this fine timepiece. If you doubt the quality, merely return it for a full refund.
If you have been looking for that special opportunity to own a chronometer of the future here is your chance! Available in silver or gold tone with fashion flex band. All U.I.T. timepieces feature ultra-thin design, rugged shock proof engineering and water resistant construction. The solar-alarm watch is priced at $\$ 49.95$ each plus $\$ 2.50$ shipping \& handling. (IL. residents add $5 \%$ sales tax).

By Forrest M Mims

## IC INTERVAL TIMERS

AN INTERVAL timer is a circuit that provides an output pulse of predetermined width at periodic intervals. This can be readily accomplished using any one of several timer ICs available to today's electronic experimenter. Many IC timers, such as the well-known 555, are not only capable of such astable operation but can also function as monostable multivibrators or "one-shots.'

Figure 1 is a timing diagram comparing the operation of a monostable to that of an interval timer. Note that a one-shot timer is designed to activate an external device or circuit for or after a fixed period. An interval timer, on the other hand, provides uniform output pulses at an adjustable interval

You are probably already familiar with numerous applications for conventional one-shot timers. Common examples include automatic switches that extinguish the headlights of a car a minute or so after the ignition is turned off, delayedaction intrusion alarms, switch debouncers, kitchen and darkroom timers, etc.

Although the applications for interval timers are not as numerous, they include two that are particularly interesting: time-lapse photography and time-lapse sound recordings

You have probably seen many examples of time-lapse pho-tography-the opening of a flower, formation of clouds, construction of a building, etc. Time-lapse sound recordings can store periodic samples of data encoded as an audio tone as well as simply capture ambient sounds. In the latter category, an interesting possibility is to compress a 24 -hour history of the sounds at a busy street corner into a one-minute recording. Another is entertaining your family or friends at a party by sampling brief segments of a record, radio program or conversation and playing back the string of sound "snapshots."

Of course, time-lapse photography and sound recordings are not the only applications for interval timers. Before you've
finished reading this column, you will probably have thought of several more.

Basic 555 One-Shot. Although most experimenters have assembled either breadboard or permanent circuits that use a 555 timer, many do not fully understand how this IC works. For those of you in this category, the following paragraphs will provide a quick overview of the monostable operation of the 555. If you're already familiar with 555 basics, you can skip ahead to the next section.

Figure 2 is a simplified block diagram of a 555 connected as a monostable or one-shot timer. The key sections of the 555 are the two comparators, VC1 and VC2. They sense when the timing capacitor (C1) has charged or discharged to a predetermined level.

To understand how the 555 works, assume the circuit in Figure 2 is "off." This means the control flip-flop is reset and Q1 is on. Capacitor C1 is therefore short circuited by Q1 and cannot charge. The output of the circuit (pin 3) is low. A negative pulse applied to the TRIGGER input (pin 2) momentarily causes the output of comparator VC2 to go high, setting the control flip-flop. This cuts off Q1, which allows C1 to charge exponentially at a rate determined by the values of $C 1$ and R1. During this period, the output at pin 3 is high.

Notice the three series-connected 5000 -ohm resistors in the 555. These resistors form a voltage divider that biases the noninverting input of comparator VC2 at one-third of the supply voltage and that of comparator VC1 at two-thirds of the supply voltage. When the voltage across C1 reaches twothirds of the supply voltage, the output of comparator VC1 goes high and resets the control flip-flop. This turns Q1 on and shorts out C1. The output at pin 3 returns to ground and remains there until the entire timing cycle is repeated. This is

Fig. 1. Tiniling diagrams of the output waveforms generated by monostable multiribrator or one-shot (top) and interval timer (bottom).

Fig. 2. Simplified functional diagram displays inner workings of a 555 timer IC. External components R1 and C1 control timer's period.
accomplished by applying a new trigger pulse at pin 2 .
This explanation should give you some insight into the operation of the 555 in its monostable mode. It should now be obvious that you can easily select the time delay by the proper choice of components for R1 and C1. If long delays (more than several minutes) are to be obtained, it's important to use a component with extremely low leakage for $C 1$. Otherwise, the capacitor will never be able to charge as it should and the circuit will not function properly.

555 Interval Timer. A 555 monostable can function only as a single-delay timer. A reset pulse is required to initiate a new delay period. An interval timer, however, can be made by connecting the output of a 555 operated as a free-running (astable) oscillator to the TRIGGER input of a 555 monostable. The period of oscillation of the astable will determine the interval time. The $R C$ time constant of the monostable will determine the duration of the output pulse that follows each timing interval.

Figure 3 shows the schematic of a working dual- 555 interval timer. Interval times (determined by the values of R1 and $C 1$ ) of up to several minutes are achievable with the values shown. Note that the output pulse from the first 555 is directly coupled into the input of the 555 monostable. The output of the monostable is connected to a low-voltage relay coil through D1. Diode D2 shorts out the powerful inductive kick produced across the relay coil when current to it is interrupted, thereby protecting the 555's output stage from damage.

The values of R3 and C2 determine how long the relay is energized after each timing interval. Those specified keep the relay energized for almost exactly 5 seconds ( 4.98 seconds for the breadboard circuit I built). Change the value of R3 or C2 or both to obtain different times.
The relay contacts can be used to switch many different circuits or devices on or off. Figure 3, for example, shows the normally-off contacts connected to the switch jack of a tape recorder. This jack is commonly found adjacent to the microphone jack on many cassette recorders. It allows the recorder

Fig. 3. Interval timer employ.s one 555 as an astable multivibrator to trigger a second IC operating as a monostable. Relay K1 keys external circuit.

Fig. 4. This circuit, which employs a 556 dual timer, is functionally identical to the one shown in Fig. 3.
to be turned on and off remotely by means of a small switch such as one mounted on the case of the microphone.
If you want to connect the relay to a tape recorder, use an appropriate plug. You'll have to improvise when connecting the relay contacts to other equipment or circuits. (A few words of caution-never connect the relay to a circuit that exceeds the maximum ratings for the relay's contacts. Also, never switch ac line power with an unenclosed relay. Personally, 1 prefer to play it safe with low-voltage applications only.)

556 Interval Timer. The 556 is a pair of 555 timers on a single silicon chip. The circuit in Figure 3, as you might suspect, can be readily assembled with a single 556 dual timer rather than separate 555's. Figure 4 shows the functionally identical circuit.

XR-2240/555 Long-Duration Timer. Because of leakage in the timing capacitor, the maximum period of a 555 operated as an astable oscillator is usually limited to several
minutes. The XR-2240 (or XR-2340) is a specialized IC timer that incorporates a self-contained flip-flop divider chain to increase the length of the fundamental time delay by a factor of up to 255. Because the output of each flip-flop in the chain is directly accessible, many different time intervals can be selected without having to alter the values of the circuit's timing capacitor and resistor.

Figure 5 is the schematic of a long-duration, programmable interval timer made from an XR-2240 connected as an astable oscillator and a 555 operated as a monostable. Timing components R1 and C1 control the oscillation rate of the XR-2240. The values shown give an adjustable interval $T$ of up to about 100 seconds. The outputs at pins 1 through 8 allow you to select multiples of $T$ ranging from 1 to 128 . Therefore, selecting pin 8 will give you a time delay of up to $128 \times 100$ seconds or more than 200 minutes!

The selected output of the XR-2240 is inverted by Q1 and coupled through $C 4$ to the 555 monostable, a circuit essentially identical to the monostable in Figure 3. The timing period of the monostable is controlled by the time constant R6 C5.
The XR-2240/555 interval timer is far more versatile than the dual 555 or 556 version because intervals of several hours can easily be obtained. Calibrating the circuit, however, can pose problems if you attempt to perform the operation when output pin 8 is selected. Calibration is much easier if you select output pin 1. If, for example, you want a timing interval of one hour ( 3600 seconds), adjust R1 until the interval at pin 1 is 28.13 seconds. Pin 8 will then output a pulse at $128 \times 28.13$ seconds or every 3600 seconds.

Incidentally, it's possible to select various combinations of XR-2240 outputs to achieve any time interval of from $T$ to $255 T$ when the chip is operated in its triggered, monostable mode. However, this procedure does not give the desired results when the astable mode is used.

It might be possible to obtain the full versatility of the XR-2240 by operating the chip in its one-shot mode and triggering it externally. The XR-2240 would continue to trigger the 555 one-shot to provide the brief "on" time after each interval. The time delay would be selected by shorting combinations of outputs to a common bus. The delay would be the sum of the delays of the selected outputs. Thus, outputs $4 T, 8 T$ and $128 T$ will give a total delay of $4+8+128$ or $140 T$.

I'll leave the details to those readers who like challenges. See the XR-2240 data sheet for design tips.

Fig. 5. Long-duration, programmable interval timer employs XR-2240 as an astable and 555 as a monostable. Relay K1 keys external circuit.

## antenna length calculations

Q. I am writing with reference to your article, "Choosing a Mobile CB Antenna," which appeared in the April 1978 issue. In the article, it was stated that at CB frequencies, a vertical halfwave dipole would have a length of 5.2 meters. Using the formula $\lambda=c / f$, with $c=2.9971 \times 10^{8} \mathrm{~m} / \mathrm{s}$ (speed of light in air) and $f=27.0 \mathrm{MHz}$, I come up with $\lambda=11.10$ meters, or a halfwavelength of 5.55 meters. Working backwards, I find the frequency corresponding to a half-wavelength of 5.2 meters to be 28.818 MHz , which isn't even close to actual CB frequencies. Could you explain to me why this difference exists? I have searched through my technical references, but have been unable to come up with an answer. -Jim Sloot, Calgary, Alberta, Canada.
A. Your calculations are correct, but the length of a "half-wave" antenna is not exactly one half-wavelength. Rather, a resonant dipole has an electrical length of one half-wavelength. The length of conductor required for a resonant antenna depends on several factors, including the ratio of its length to its diameter. The smaller the ratio (the thicker the conductor), the shorter the antenna for a given electrical length. Practically speaking, the diameter of the conductor accounts for a 2 -to-5-percent shortening

The end effect also reduces antenna length. That is, the strain insulators and wire loops wound on the insulators (in the case of a dipole) contribute a small amount of capacitance, which lowers the resonant frequency. To compensate, the antenna must be shortened by a few percent.
Finally, your calculations are based on a frequency of 27.0 MHz . Generally, an antenna will best cover a range of frequencies when it is tuned to the center frequency. For the 40 -channel Citizens Band, which extends from 26.965 to 27.405 MHz , channel 19 at 27.185 MHz is the median frequency. That's 0.185

MHz above the frequency you used in your calculations and further explains the disparity between my statement and your result.

RFI
Q. I have amateur and CB radio equipment as well as an audio system. Whenever I'm recording an 8 track or cassette tape and using one of my rigs, my transmissions come through the stereo system and are recorded on the tape. All the components are well grounded, and l've inserted low-pass filters at the outputs of the transmitters. The problem still exists. What can I do to cure it? -Bill Columa, KA4DAP, Rocky Mount, NC.
A. The space we have here is far too small to permit a detailed discussion of the RFI problem, but what basically happens is this. At some point in the audio system r-f enters and is rectified (detected), giving up the information used to amplitude modulate it. The detected audio is then processed by the rest of the system, which cannot distinguish between it and the desired audio signals.
The key to solving an RFI problem is to locate the point of entry and treat it with shielding and/or filtering. I wrote a comprehensive article on the RFI problem for the May 1977 issue of our sister publication Stereo Review. That article contained a methodical, step-by-step procedure for eliminating RFI, and I suggest you either locate that issue or order a reprint to the article (ask for Reprint No. 21) at a cost of $\$ 1.50$ from Stereo Review Reprints, Box 278, Pratt Station, Brooklyn, NY 11205. Residents of CA, $\mathrm{CO}, \mathrm{DC}, \mathrm{FL}, \mathrm{IL}, \mathrm{MI}, \mathrm{MO}, \mathrm{NY}, \mathrm{TX}$, or VT must add applicable sales tax. P.S.-I don't get royalties on reprint sales!

[^2]
## Product Test Report

## Compucolor II Model 4 Personal Computer System

> Has full graphics and built-in floppydiskette drive

AMONG THE few small computing systems that provide color graphics is the Compucolor II from Compucolor Corp. (Address: 5965 Peachtree Corners East, Norcross, GA 30071; Tel: 404-449-5861). Several versions of this computer are available, offering a variety of optional RAM, keyboards, single and multiple disk drives, etc. These are basically two-package systems consisting of a $13^{\prime \prime}(33 \mathrm{~cm})$ diagonal color monitor and disk drive in one and a keyboard/computer system in the other package. The two are interconnected via a single $30^{\prime \prime}(76.2 \mathrm{~cm}$ ) long multiconductor flat ribbon cable.
We evaluated the Model 4 version of the Compucolor II, configured with 16 K of user-available RAM and a single $51 / 4^{\prime \prime}$ floppy-disk drive. The optional 101-key Model 101 Extended Keyboard was substituted for the Standard 72-key keyboard. In addition to the standard 72 keys, the Extended Keyboard has a separate four-function calculator-type cluster, and a cluster of editing keys. (There is also an optional Deluxe keyboard with AUGUST 1979

117 keys and offering extended plotting capabilities available at extra cost).
The keyboard/computer package measures $19^{\prime \prime}(48.3 \mathrm{~cm})$ wide by $7^{\prime \prime}(178$ mm ) deep and slopes from $4^{\prime \prime}(102 \mathrm{~mm})$ high at the rear to $2^{\prime \prime}(51 \mathrm{~mm})$ at the front. The monitor/disk drive package measures $18^{\prime \prime}$ wide by $15^{\prime \prime}$ deep by $13^{\prime \prime}$ high ( $457 \times 381 \times 330 \mathrm{~mm}$ ). Price of the Model 4 with a Standard Keyboard is $\$ 1695$, plus $\$ 135$ when substituting the Model 101 Extended Keyboard.

Technical Details. The computer is based on an 8080A operated with a $2-\mu \mathrm{s}$ cycle time. It can support up to 65 K of memory, and has on-board space for 32 K . There is 16 K of ROM in which are the operating system and BASIC, and sockets are provided for additional 8 K of ROM. The system is designed to use up to 480 I/O ports, 30 of which are implemented in the standard computer. This number includes an RS-232C serial port for printer or modem, with a broad selection of baud rates.

The graphics display features an 8 -
fact:
it's easy to upgrade your M95cartridge and gaindramatic freedom from distortion

One of the critically acclaimed advances introduced in Shure's incomparable V15 Type IV phono cartridge is its revolutionary and unique distortion-reducing Hyperelliptical diamond stylus.
The Hyperelliptical stylus contacts the groove in a "footprint" that is narrower than both the Biradial (Elliptical) and the longcontact shapes such as the Hyperbolic. The performance features of this new tip geometry are now available to owners of M95ED or M95G cartridges by simply upgrading either with a Model N95HE Hyperelliptical stylus.
You'll find the cost extraordinarily low-but the difference in sound will be immediately apparent. The new stylus takes only seconds to install with a simple, no-tools procedure.
The Hyperelliptical stylus is also available in a brand new, ultra-flat frequency response, high trackability cartridge: the M95HE. Write for free brochure (AL600).

CIRCLE NO. 47 ON FREEINFORMATION CARD
color selection on a $10^{\prime \prime}$ by $7^{\prime \prime}(254 \times 178$ mm ) usable screen area. The $128 \times 128$ graphics is refreshed at power-line frequency. Alphanumerics consist of 32 tines of 64 characters/line for small-size capital letters or 16 lines of 64 characters/line with large-size caps. Lowercase letters are not included, but 64 spe-
cial graphic symbols are.
Conventional 40-track diskettes are used with an average access time of 40 ms for 40 tracks, while average latency is 200 ms . Data transfer rate is 76.8 K bits per second, with a diskette storage capacity of 51.2 K bits per side (both sides usable)

The basic keyboard is standard ASCII four-level with 192 codes. It uses gold crossbar keyswitches of commercial quality. CPU reset and automatic diskette loading keys are included.

In software, a complete disk operating system as well as disk BASIC are in ROM. The BASIC is simlar to most other disk BASICs and has 32 statements and commands, 19 mathematical functions, nine string-manipulation functions, and 12 disk-file commands. Calculations are to five decimal places.

The operating system has 31 CON-TROL-plus-key commands, 31 ES-Cape-plus-key codes, and 12 graphicplot commands. There is also a full complement of CRT Terminal commands as well as full-function foreground/background color selection along with 15 plot commands. This wide variety of commands gives the user control over every possible function of the computer.

Most of the keys are assigned two functions. Switching from one function to the other is via the CAPS LOCk key. Some keys are used in conjunction with the CONTROL and Esc keys. Those keys that permit color changes are color coded with their respective colors.

A 50-pin bus connector (located on the rear) provides all addresses, data, clocks, etc., to allow the Compucolor to be extended with any upcoming peripherals. Also located on the rear apron is a connecter for RS-232C signals. This latter port can also be used for a printer or modem. Each connector is fully described in the manual.

A large loose-leaf-type "Programming and Reference Manual" is supplied with the system. This manual contains 10

## ATTENTION! Radio-Shack and Heath Kit Owners!

sections that cover full details for using the BASIC language (and covers programming examples), print formatting. and machine-level interfaces for the disk BASIC. The disk-manipulation system is spelled out in detail, as are all color and graphics techniques and the file control system (FCS).

The Manual concludes with seven appendixes that contain in-depth discussions of the disk BASIC, file control system, CRT commands, internal features of the computer, an ASCil value table, and the Compucolor alphanumeric and graphic character set, along with other documentation.

User Report. The Compucolor is a complete computer. Simply unpack the two sections, interconnect them via the flat ribbon cable, plug the line cord into an ac outlet and turn on the power. That's all there is to getting the system up and ready to go in either the operating system or BASIC.

To use a diskette, simply insert the diskette in the drive. close the drive door, and press the auto key on the keyboard. In just a couple of seconds, the disk "menu" pops up on the screen.

The graphics display was clean and sharp with bright colors. The overall quality of the graphics was excellent due to good convergence and the fact that the monitor bandwidth is better than that of a conventional color-TV receiver. One of the major advantages of the color monitor is that opitically disturbing moire patterns (from nearby TV transmitters on adjacent channels or local or mobile hams and CBers) are not seen onscreen. Also, this approach provides an apparent increase in bandwidth since the monitor is not bandwidth-limited by $r$-f or sound circuits. The Compucolor "Sampler" program on diskette demonstrates the system's graphics capability.

The keyboard was a dream to operate. It has a positive professional "feel" and operated flawlessly.

Having had experience with other BASICs, we found Compucolors version easy to use. It is a fast BASIC and is broad enough to easily adapt to programs written in other BASICs, except where unique symbols are used.

After working some of the programming examples given in the Manual, we typed in several game programs incorporating color graphics. This is quite easy to do, as a single keystroke can be used to change colors, flash symbols, invert and do other formerly difficult graphics "tricks." These keystrokes can
be written into the program.
We also adapted a couple of simple business programs to the color format, making them much easier to read and interpret. Credits and debits for example, are much easier to follow when they are color-coded.

The bottom line here is that the addition of color to a video display does make working and playing with a computer much more pleasant and exciting.

Compucolor is supporting its system with lots of software (diskettes), includ-
ing a large variety of color games, text editor, assembler, and several moneymanagement programs.

In our opinion, the Compucolor II is an excellent choice for a computer system to start and stay with for home use. It is very flexible, thanks to its built-in disk drive, and has sufficient on-board memory to handle just about any length programs. This is a lot of computer for the money. -Leslie Solomon, Technical Director

CIRCLE NO 104 GNFREE INFORMATIONCARD

A surprisingly low $\$ 69.95$. Surprising hecause vou get the type of performance vou've wanted hut expected to pay nuch more for.

## Quality, Performance and <br> Accuracy

The 2010A offers vou longeterm accuracs with a laser-trimmed resistor network, a stahle bandgap reference element, and single-chip LSI circuitry. With 31 ranges and 6 functions. you can measure AC or $[\mathrm{C}$ volts from $100 \mu \mathrm{~V}$ to 1000 V ; $A C$ and $D C$ current from $0.1 \mu .4$ all the way to 10 A ; resistance from $0.1 \Omega$ to 20 $\mathrm{M} \Omega$. Typical DCV and Ohms accurace is $0.1 \%$ $\pm 1$ digit. Easy-to-read $31 / 2$ digit $L E D$ 's with 9 mm numerals and automatic decimal point.

## Extra features for greater convenience and flexibility

## - Unique X10 multiplier switch gives you

 convenient selection of the next higher decade Hi-Low Power Ohms capability gives you three high-ohm ranges that supply enough voltage to turn on a semiconductor junction. You use the three low-ohm ranges for in-circuit resistance measurements.- Wide Frequency Response: 40 Hz to 40 kHz fandwidth lets you measure audio through ultrasonic AC signals.
- Touch-and-Hold Capahility (with optional prohe) lets you hold readings as long as vou wish so you can make measurements in hard-to-reach places without taking your eyes off the probe tip.
- And More: automatic polarity and zeroing; overrange indication; overload protection on all ranges.
This compact unit is powered by 4 "C" cells (not included) so that vou can take your lahquality benchtop unit anvwhere with you.

## Kit or Factory-Assembled

Either is a tremendous value. Complete kit only $\$ 69.95$; assemble it yourself with our easy-to-follow instructions. Or, for only $\$ 99.50$. Saberonics will ship your 2010A factoryassembled and calibrated.
Whether cou're a professional or a hobbyist (or hoth!): When quality, accuracy, and price count, you should check out the 2010A DMM for wourselt. Order one todav for a full 10 days to inspect it: if vou're not completelv satistied, merely return it in its original condition for a prompt and courteous refund of purchase price. ## WARC -79

THIS FALL, the World Administrative Radio Conference (WARC) in Geneva will reallocate the entire radio spectrum, in keeping with anticipated needs through the end of the century. Of prime concern to DX listeners is the proposed reallocation of the shortwave spectrum to allow more space for broadcasting.

Fixed (point-to-point) communication has largely switched to satellites in the past 15 years. This trend will no doubt continue. At the same time, the relatively small shortwave broadcast bands have become overloaded to about three times their capacity. This is why co- and adjacent-channel interference has become the rule rather than the exception. It would appear, then, that the natural solution would be to turn over a portion of the fixed bands to broadcasting. But it's not that simple. There are many other claimants to the hf spectrum (such as Amateur Radio), and different countries have different priorities.

For the past few years, the FCC has sponsored a series of meetings by the International Broadcasting Service Group, to help it determine exactily what should be the US position at WARC. In April, the IBSG issued its final proposal and disbanded, its mission completed.

The world is divided into three broad regions for allocation purposes. Region 1 includes Europe, Africa, the Mideast, and the USSR. Region 2 consists of North and South America. Region 3 is comprised of the rest of the world, which includes Asia and the Pacific.

The IBSG proposes that international broadcasting between 5.8 and 22 MHz should be expanded by $93 \%$ in Region 2 , and $80 \%$ elsewhere, very nearly a doubling of available inband space, from the present total of 2350 kilohertz to 3940 kilohertz.

Since Third World countries hold the balance of power at WARC, the US position also proposes a $60 \%$ expansion of bands for tropical broadcasting by adding five new tropical bands in the $3-10-14-\mathrm{MHz}$ range and making all tropical bands, new and old, exclusively for tropical instead of international broadcasting. No changes are proposed between 3.0 and 5.8 MHz , either in tropical or international bands. The five proposed new tropical bands, totalling an addition of 300 kHz are: 5850 to $5900 \mathrm{kHz}, 7500$ to $7550 \mathrm{kHz}, 9825$ to 9875 kHz , 11,500 to $11,550 \mathrm{kHz}$, and 13,900 to $14,000 \mathrm{kHz}$. These are adjacent, or almost adjacent, to existing or newly proposed international broadcasting bands, for the convenience of listeners, receiver designers, and existing transmitting equipment.

In the proposed new international broadcasting band allocations, all existing bands (except 25 MHz ) are expanded, and two totally new bands are added. These new bands would further relieve congestion on adjacent bands and make better use of prevailing maximum useable frequencies. This 70
expansion totals 1290 kilohertz, as follows:

| Proposed (kHz) | Present (kHz) |
| :--- | :--- |
| $5900-6200$ | $5950-6200$ |
| $7250-7500$ | $7100-7300$ (not Region 1) |
| $9375-9825$ | $9500-9775$ |
| $11550-12000$ | $11700-11975$ |
| $13600-13850$ | none |
| $15100-15700$ | $15100-15450$ |
| $17600-17900$ | $17700-17900$ |
| $19750-19990$ | none |
| $21450-21800$ | $21450-21750$ |
| $25850-26100$ | $25600-26100$ |

The US position calls for selective sharing between fixed services and broadcasting in all added band space. However, it is not considered likely such sharing will be adopted by the Conference this fall.

The US position also urges, but does not give a specific date for, adoption of single sideband for international broadcasting. But this change is not likely in the near future. Also being considered are power limits of 50 kW for domestic operations and either 250 or 500 kW for international operations. While this may seem excessive, it is realistic. There are already some instances of a full 1000 kW and even 1250 kW being used in some situations

Our thanks to Lawrence E. Magne, member of the IBSG, for supplying this information.

Moscow via Cuba. The USSR has long been the target of American broadcasts from such nearby countries as Greece, Germany, and Britain. Now, more than 20 years after the triumph of the socialist revolution in Cuba, Radio Moscow has begun transmitting in English to North America via Cuba.

We first noted the foregoing arrangement on April 22, Lenin's 109th birthday, as the "newscasts" reminded us every half hour.

The Moscow signals were and are the strongest on the bands during the daytime. This, combined with their steady strength even during ionospheric disturbances that block direct reception from the USSR, made it obvious that a relay was in use. Radio Moscow characteristically made no public announcement of the new relay, nor has it ever been publicly admitted that some of its other broadcasts to North America are relayed via Bulgaria.

Why wasn't the Cuban connection made use of long ago? Cuba has been making full use of its shortwave facilities, but there has always been a shortage of power and spare parts, and there has been no reliable way of feeding the Moscow audio to Cuba. Now, however, Cuba has a satellite link with Moscow and finds it advantageous to dedicate one of its POPULAR ELECTRONICS
transmitters to Soviet broadcasts to North America. In return, a Soviet transmitter is dedicated to Cuba's broadcasts to the Mediterranean area

Radio Moscow thus becomes the international broadcaster with the most hours per day beamed to North America, surpassing the BBC by far. And with this Cuban relay on one good frequency at a time, we may hope that Radio Moscow will no longer find it necessary to use a dozen different frequencies on direct broadcasts from the USSR.

Publications. For a list of club publications and services, send a legal-size SASE with $28 ¢$ postage to ANARC, 557 N . Madison Ave., Pasadena, CA 91101

FRENDX, the shortwave broadcast journal, provides a great deal of timely schedule, logging, and QSL information plus receiver reviews and nontechnical articles. Sample \$1, subscription \$13, from NASWA, Box 13, Liberty, IN 47353.
Review of International Broadcasting, a monthly listeners' magazine emphasizing free discussion of programming and issues affecting the DX listening hobby (an approach lacking in other publications) is $\$ 1$ a sample or $\$ 12$ a year from Glenn Hauser, Radio WUOT, Knoxville, TN 37916

The World in My Ears, is a new book by well-known New Zealand DX Iistener Arthur Cushen, who, despite blindness, has been very successful in shortwave, to the point of being knighted. For information, contact Cushen direct, at 212 Earn St., Invercargill, New Zealand.

August BBC World Service. Among the many fine BBC
programmes planned this month are these (dates and times GMT): "Play of the Week," August 5 at 0030 and 1130 presents the winning entry in the World Service Drama Competition. "On Their Majesties Most Secret Service," four programs on the history of British espionage, Saturdays at 1130, Tuesdays at 2030, Wednesdays at 0230. "The Art of the Whodunnit," on the history of detective fiction, Saturdays at 0815 and 1315, Sundays at 2015, Mondays at 0315. "Venice Pre served," week of August 20, Monday at 0945 and 2130, Thursday at 1430. Week of August 27 at same times, "Pompeii." Week of August 26. Sunday at 1830, Monday at 0100, Tuesday at 1345, "A Thurber Carnival." "Behind Every Great Man . . .," Saturdays at 0430, Mondays at 0815 and 2315 (Subject to change).

Updating Listings. The following changes and additions should be made in the "English Broadcasts" listings that appeared in the June issue:

6502 Operating System. EXOS (Extended Operating System) for 6502 computers comes in a 4 K 2708 PROM and has 20 commands including display, enter, math, memory test. find, fill, move, compare, speed change, load/dump a hex formatted MUST tape, verify, and several "go to" commands. The program is compatible with all MOS Technology TIM systems, or other 6502 computers. Price is $\$ 150$. Also available is DATE (Disassembler-Assembler Trace Editor). Source programs can be entered, assembled, edited, traced and disassembled. The trace mode executes the user program one instruction at a time, displays MPU registers, the instruction and the MOST mnemonics. $\$ 150$. Both programs $\$ 295$. CGRS Mi-
crotech, Box 368, Southhampton, PA 18966 (Tel: 215-757-0284)

Jolt Stuff. ERAC (Editor and Resident Assembler Controller) was designed for users of ROM version of the Jolt resident assembler (\$C900-CFFF). ERAC allows source text and object code to be placed anywhere in RAM Residing in 2 K starting at $\$ 0800$. 1000 or A800, ERAC is an extension of the RAP A paper tape is available for $\$ 5$, manual $\$ 4.50$, and source of $\$ 0800$ version is $\$ 12.50$. LEDIP (Line Editor Program) is a 1.1K line-oriented text editor that can be expanded. It will output source text suitable for usage with the PROM Jolt Resident assembler ( $\$ E 800-E F F F$ ). Paper tape is $\$ 2.75$ manual $\$ 3.25$, cross assembly $\$ 5$. For further information, send $\$ 1$ to the 6502 Program Exchange. 2920 Moana, Reno, NV 89509

8080/Z80 Macro Assembler. This 14 K assembler includes a linking loader, library manager and cross-reference facility and assembles over 1000 lines per minute. It supports the Intel standard macro facility and the number of nesting macros is limited only by memory. Code is assembled in relocatable modules. Conditionals may be nested to 255 levels. Other features include comment blocks, variable input radix from base-2 to base-16, titles and subtitles, variable page size octal or hex listings, PRINTX for printing
assembly or diagnostic messages, and PHASE/DEPHASE to allow code to reside in one area of memory but operate in another. It accepts both 8080 and $Z 80$ opcodes. Price is $\$ 200$ Microsoft, 10800 NE Eighth, Suite 819, Bellvue, WA 98004 (Tel: 206-455-8080)

TRS-80 Solar Package. The SUNGRAPH program calculates and plots the sun's local elevation and azimuth for any tocation on the Earth. It uses TRS-80 Level-II

BASIC, and requires 13 K storage. Options include graphs of elevation vs time of day, azimuth vs time of day, maximum elevation vs date and elevation at a specified azimuth and date. Save options allow the graph to be stored on cassette. Cassette is $\$ 49$, disk is \$75. Solartek, Box 298, Guilderland, NY, 12084

## - Computer Bits

By Leslie Solomon Technical Director

## WINDOWS IN THE CRT

THE MOST common way to communicate with a computer today is via a plug-in or a separate video terminal. The ordinary video terminal forms a single "window," in which all you can see is one piece of data at a time as it appears in sequential order on the screen. Recently, we had the opportunity to work with a very special graphics display system called the "Screensplitter" from Micro Diversions, Inc. (8455-D Tyco Rd., Vienna, VA 22180 Tel: 703-827-0888). This novel plug-in video module is not limited to a single window (see photo). Rather, the user can create, under software control, almost any number of data-display windows, each with its own independent display.

Individual windows in the Screensplitter can be sized, labelled, and framed as desired. Furthermore, frame and window can be made to flash, display in reverse video, clear, scroll, and use any
character as a blinking or nonblinking cursor. The window package is contained in an EPROM and has 20 usercallable functions. You can, for example, run a BASIC program and display each subroutine in its own window. Or you can display different data in different windows. You can even move the windows around at will.

If you are doing assembly-language programming, one window can be used as a real-time clock, another to display run time, and others to display register contents or anything else you desire. Debugging information can be contained in its own window. For game playing, you can create as many windows as required. Too, some windows can be dedicated strictly to graphics.

The Screensplitter does not preclude operation as a single window with 40 lines of 80 characters each. Bear in mind, however, that this dense a display

The Screensplitter cangenerate almost any number of independent "windous" contingent on the needs of the user.
requires a video monitor with at least a $10-\mathrm{MHz}$ bandwidth

The Screensplitter occupies a single $\mathrm{S}-100$ bus slot. It contains its own 4 K of RAM that is memory mapped into the address space so that it can be accessed if you wish to use the window package.

Pascal Microengine. This new computer contains 64 K of RAM, two RS-232C ports, two parallel ports, and a floppy-disk controller with DMA. It features self-test diagnostics, Pascal compiler, BASIC compiler, file manager, screen-oriented editor, debugger, and graphics package. Available options include a floppy-disk subsystem, printer, and terminal. Cost at this writing is \$1995. Address: Computer Interface Technology, 2080 South Grand, Grand Center, Santa Ana, CA (Tel: 714-979-9920).

Pet S-100 Interface. The Betsi Interface/Motherboard contains all logic required for interfacing S-100 boards to the Pet microcomputer. It connects directly to the Pet's expansion connector and has four S-100 slots. It does not interfere with the Pet's parallel or IEEE ports. The board also contains a dynamic memory controller that permits use of a 32K RAM board. There are also sockets and decoding circuitry for 8 K of 2716 PROM. Price is $\$ 119.00$ for the kit, which includes one S-100 connector, or \$165.00 assembled and with four S-100 connectors. Address: Forethought Products, P.O. Box 8066, Coburg. OR 97401 (Tel: 503-485-8575).
S.100 Video Board. The new ALTR-2480 is a 24 -line by 80 -character S-10C-bus video display board. It features upper- and lower-case characters plus graphics. The system also has byte mapping ( 4 K by eight), built-in read/ write refresh, 2716 user-programmable EPROM, external/internal sync, normal/inverse/blink control, 500-ns access time, and direct drive for a CRT monitor. Using "Transparent Memory, the CPU can access the refresh memory at any time, the display is glitch-free, and the CPU is never interrupted. No reliance is placed on the peculiar characteristics of a particular CPU. A multiplexing technique permits nonconflicting access by both CRT controller and CPU. Price is \$295.00. Address: Matrox Electronic Systems, Ltd., 2795 Bates Rd., Montreal, Quebec, Canada H3S 1B5 (Tel: 514-481-6838/735-1182).
(continued on page 76)

You're up and running with video graphics for just $\$ 99.95$ then use low cost add-ons to create your own personal system that rivals home computers sold tor 5-times ELF II's low price!

## pre recorded tape casselles.

ELF II Gives You The Power To Make Things Happen! Expanded. ELF II can give you more power to make things happen in the real world than heavily advertised home computers that sell for a lot more money. Thanks to an ongoing tommiltment to develop the RCA 1802 for home computer uss, the ELF II products-being introduced by Netronics-keep you right on the outer tringe of today's small computar lechnology. It s a pariect computer for engineering, business, industriet, scientific and personal applications.
Plug in the GIANI BDARD 10 racord and play back programs, edit and debug programs, communicate with remote devices and make things happen in the outside world. Add Kluge (prototyping) Board and you can use ELF il to solve speciaz problems such as operating a complex alarm system or controling printing press. Add at Rain Boards to write longer programs, sore mone information and solve more sophisticated problems.
ELF II add -ons already include the ELF II Light Pon and the amating ELF-BUG Monitor-two extremely recent breakthroughs that have not yet been duplicated any other manulacturer
The ELF-BUG Monitor lets you debug programs with lightening speed because the key to debugging is to know what's inside the registers of the mictoproces sor. And, with the ELF BUG Monitor. instead of single stapping through your programs, you can now display the entire contents of the registers on yout iv screen. You find out mmediatiy what's going on and can make any necessay changes.
 V screen with just a wave of the "magic wand. Netronics has also infroduced the ELF II Color Graphics \& Music System-more breakthroughs that EIF II

## ELF II Tiny BASIC

Ultimately, ELF II understands only machine language-the fundamental coding equired by all computers. But, to simplify your rel. • nship with ELF II. we ve introduced an ELF II Tiny BASIC that makes communicating with ELF II a reeze.
Tiny BASIC saves you the time of having to code your individual instructions in machine language for ELF II. Instead, you simply type instiuctions on a keyboard -PRINT, RUN, LDAD, ETC. Your Tiny BASIC program automatically translares hem into machine language for ELF II. Then it ranslates ELF if's output back into simple words and symbols for you.
Now Available! Text Editor, Assembler,
Disassembler And A New Video Display Board!
The Text Editor gives you word processing ability and the ability to edrt programs or text while it is displayed on your video monitor. Lines and charac lers may be quickly inserted, deleted ar changed. Add a printer and ELF II ca type letters lor you-error tree-plus print names and addresses from your malling list!
ELF II's Assambles translates assembly language programs into hexidecimal machine code for ELF II use. The Assembler features mnemonic abbreviations ther man nomerics so har ine Anshuchons an your prograns read - thes is a big heip in catching errors.
ELF II's Disassambler takes machine code programs and produtes assembly anguage source listings. This helps you understand the programs you ar The with ELF II Yide Di.
The new ELF II Vidob Dimp eard lets you generate a sharp, protessional 32 or 64 character by 16 line upper and lower case display on your TV screen or ideo monitor-dramatically improving your unexpanded $\$ 99.95 \mathrm{ELF}$ II. When Yiu

Ask Not What Your Computer Can Do
But WHAT CAN IT DO FOR YOU?
Don't be trapped into buying an expensive dinosaur, simply beeause you can afford it. ELF il is more advenced and more fun to use thon big name computers thor cost i fot more monay. With Elf 1 you loern to wriz amd

## COMPUTER BITS

(continued from page 75)
S.100 Extender Board. A 7-segment display logic probe and a pulsecatcher LED, whose brightness corresponds to the duty cycle of the pulse stream, are used in the new TB-2 Extender Board kit from Mullen. The board features a general-purpose "kluge" area for circuit development. This section is provided with its own on-board 5-volt, 1ampere regulator that also powers the logic probe. Other features include power supply links for current measurement. labelled S-100-bus edge connector, and gold-plated connector contacts. Price is $\$ 35.00$. Address: Mullen Computer Products, P.O. Box 6214, Hayward, CA 94545 (Tel: 415-783-2866).
$\mathbf{S . 1 0 0}$ to IEEE Interface. The P\&T 488 Interface Board permits the broad spectrum of S-100-bus computers to directly interface with instruments and peripherals that operate on the IEEE 488-1975 Standard Digital Interface for Programmable Instrumentation. The board comes with 488 cable assembly. Software is distributed as source code in machine-readable form. An integral "Bitwiggler" tape interface is used for reading software with a conventional cassette tape recorder. Price is $\$ 250.00$ in kit, $\$ 325.00$ in wired form. Address Pickles \& Trout, P.O. Box 1206, Goleta, CA 93017 (Tel: 805-967-9563).

New Printers In Town. The Model DP-8000 hard-copy printer from Anadex prints 80 -character lines at 112 character/second (84 lines/minute). Printing is bidirectional, via sprocket feed. Alphanumerics are formed from a $9 \times 7$ dot matrix. The complete 96-character ASCII set is available. Basic ASCII inputs include RS-232C, 20/60-mA current loop, and parallel-bit/serial character, the last synchronous at high strobe rates. Three data lines of FIFO buffer storage are available, and data can be accepted continuously or in bursts. Serial ASCII is adjustable to 9600 baud. Up to 1000 characters/second can be fed into the input. Address: Anadex, Inc., 9825 DeSoto Ave., Chatsworth, CA 91311 (Tel: 213-998-8010).

Bowmar's Model TP-3150 thermal printer requires no ribbons or ink. It has an 18 -character capacity and uses a $5 \times$ 5 solid-state dot-matrix print head. Print direction and character rotation are user

state scope basics
The incoming waveform is applied directly to pin 5 of the LM3914, where its instantaneous amplitude is detected by a voltage divider/comparator chain. Decoding logic then drives one of the LM3914 outputs low.

Any LED in the row connected to the selected output is then eligible to glow. The remaining requirement is a positive voltage at the LED's anode. This is obtained from a horizontal sweep circuit made from a 4011 quad NAND gate and a 4017 Johnson counter.

The 4011 performs two important functions, one of which is to provide a stream of clock pulses. This is accomplished by two gates connected as a free-running or astable oscillator. The frequency of oscillation

## A "MATCHBOX" LED OSCILLOSCOPE

REGULAR readers of the Experimenter's Corner are by now familiar with the design of simple solid-state oscilloscopes that employ an array of LEDs for a screen. Thanks to the new LM3914 dot/ bar display driver, the design of such a scope can be simplified considerably. The result is a scope small enough to fit inside a pocket matchbox!
Figure 1 is the schematic diagram of a compact LED scope that uses only three 1 Cs and consumes only 15 mA . Operation of the circuit is fairly straightforward, especially if you're already familiar with solid-

Fig. 1. Schematic diagram of matchbox LED oscilloscope.

BY FORREST M. MIMS

Fig. 2. Photograph of the wrapped-wire prototype LED oscilloscope assembled on a small piece of perforated board about $1.2^{\prime \prime} \times 1.2^{\prime \prime}$.

## Project of the Month continued

Wire-Wrapped prototype scope that I assembled on a perforated board measuring $1.2^{\prime \prime} \times 1.9^{\prime \prime}$ (about $3 \mathrm{~cm} \times 5 \mathrm{~cm}$ ). Notice that pins 9 and 10 of the LM 3914 extend over the lower end of the socket. The small capacitor installed in the two unused pin positions of the 4011 socket is C1. The overrange LED is installed below the $5 \times 7$ LED array. Components R1, R4 and S1 are attached to the circuit board with cyanoacrylate adhesive. I used a miniature Micro Switch ${ }^{\text {TM }}$ pushbutton switch as St because , had one on hand, but any other spsl switch is suitable

Some typical display patterns I have obtained are shown in Fig. 3. Often, the displayed pattern will bear little resemblance to the actual wave. Sometimes it's easier to visually integrate the approximate shape of a wave by switcning off the automatic trigger and adjusting R4 until the waveform slowly parades across the display

For some interesting visual effects, try connecting a radio or audio amplifier to the

Fig. 3. Some typical display patterns obtained on a 35-element LED scope. Sometimes, the pattern bears little resemblance to the actual wave.
input of the scope. Music and voice signals will stimulate a dynamic, miniaturized light show. For best results, leave the trigger switch off.

Finally. remember that it's relatively easy to expand the scope's display. You
can add a second $5 \times 7$ display or make a $10 \times 10$ display from individual LEDs or 10-element LED bars. If you're really ambitious, you can add additional LM3914's and 4017's and make a scope having $20 \times$ 20 or more LEDs.

Energy shortages tell us we have to change our driving style.

AUGUST 1979

Now! It doesn't mean we have to go back to horse and buggy days. But it does mean we have to make
every drop of gas give us the most go for our money. Anyone with horse sense knows that a well-tuned car gets better mileage and in times of fuel shortages, better mileage means a lot. The Mark Ten B Capacitive Discharge System keeps your car in better tune so it burns less gas. Using Mark Ten B is more than horse sense. It's the
smart move under the hood, helping a nation survive an energy crisis and keeping you on the road. Delta Mark Ten. The best way to go.

## Radio Shack: No. 1 Parts Place Low Prices and New Items Everyday!

Top-quality devices, fully functional, carefully inspected. Guaranteed to meet all specifications, both electrically and mechanically. All are made by well-known American manufacturers, and all have to pass manufacturer's quality control procedures. These are not rejects, not fallouts, not seconds. In fact, there are none better on the market! Always count on Radio Shack for the finest quality electronic parts

## ABOUT YOUR SUBSCRIPTION <br> Your subscription to Pofular Electronics is maintained on one of the world's most modern, efficien <br> 

 computer systems, and if you're like $99 \%$ of our subscribers, you'll never have any reason to complain about your subscription service.We have found that when complaints do arise, the majority of them occur because people have written their names or addresses differently at different times. For example, it your subscription were listed under "William Jones, Cedar Lane, Middletown, Arizona," and you were to renew it as "Bill 'Jones, Cedar Lane, Middletown, Arizona,' ' our computer would think that two separate subscriptions were involved, and it would start sending you two copies of Popular Electronics each month. Other examples of combinations of names that would confuse the computer would include: John Henry Smith and Henry Smith; and Mrs. Joseph Jones and Mary Jones. Minor differences in addresses can also lead to difficulties. For example, to the computer, 100 Second St. is not the same as 100 2nd St.
So, please, hhen you write us about your subscription, be sure to enclose the mailing label from the cover of the magazine-or else copy your name and address exactly as they appear on the mailing label. This will greatly reduce any chance of error, and we will be able to service your request much more quickly.

H8 EXTENDER BOARD KIT
Brand new from Mullen Computer Products. This kit really takes the hassle out of testing or troubleshooting the popular Heath H8 computer. includes jumper links in supply lines for insertion
of fuses. Ammeters. current limiters, etc. $\$ \mathbf{3 9}$

## MA 1003 CLOCK MODULE

GM deletes "standard" radios in a settlement of the auto sound antitrust suit filed against it in March by members of the Custom Automotive Sound Association (CASA). Under terms of the settlement, General Motors will offer the delete option on the standard radios of all of its recently introduced X-body cars. Moreover, GM will permit dealers to exchange a Delco radio in these cars for credit against purchase of any GM part. (Former policy restricted exchange credit only toward purchase of another Delco radio.) GM also agreed not to standardize Delco radios in any additional models through the end of the 1983 model year. Thereafter, if GM intends to extend radio standardization, it will furnish CASA with at least four months notice.

A home energy-saving system has been developed by William Lamb (No. Hollywood, CA), pioneer in the development of silicon solar cells. It consists of a lightweight panel of 36 cells that are capable of developing 16 volts to charge a 12 -volt storage battery at a 1.5 -ampere/hr rate. Enough power is available from a single panel system to operate a low-power \(12^{\prime \prime}\) monochrome TV receiver. The glass surface of each cell is toughened and backed by a special chemical compound that makes it practically impervious to hammer blows and all kinds of weather. Virtually mainte-nance-free, the system costs nothing to operate. Also, its modular design permits quick expansion of the system at any time. Price of a 36 -cell system is \(\$ 325\).

Microwave-oven market growth could be hampered unless frequencies near 10 GHz are allocated for cooking, according to Litton Microwave Cooking. As a result, Litton will try to bypass a recent \(F C C\) ruling by taking its case to the World Administrative Radio Conference (WARC) to be held in Geneva in September. The FCC, currently considering a proposal for a common-carrier data network based in part on local \(10-\mathrm{GHz}\) radio facilities, said microwave-oven use in those bands is "incompatible with existing and planned services for both bands." Resolutions adopted at WARC will be submitted to participating governments for
approval. If the U.S. Senate approves WARC resolutions including the change Litton seeks, it would overturn the FCC ruling, since Senate approval would have treaty status.

A computer marathon record is claimed by a group of Holy Cross high-school students in San Antonio, TX. The 311 students who took part in \(8 \frac{1}{2}\)-day around-the-clock training sessions believe their accomplishment deserves mention in record books. Instructor Dennis Doose suggested the training marathon after students voluntarily began staying after class to use the school's TRS-80 microcomputer. Radio Shack, manufacturer of the TRS-80, agreed to lend the school 22 additional microcomputers for the event.

A talking Language Translator, utilizing speech synthesis and offering solid-state modules for various languages, was announced by Texas Instruments. Designed as an aid in communicating in a foreign country and for language students in learning to pronounce a foreign language, it is programmed with a vocabulary of words and phrases selected for everyday use. The translator has the ability to form thousands of spoken phrases by linking together its spoken vocabulary words. Each module will contain about 1000 words of which half will be spoken and displayed and half will be displayed only. Prices will be about \(\$ 250\) for the Language Translator and \(\$ 50\) for each language module.

The deaf can read TV dialog with a new device soon to be marketed by Sears, Roebuck and Co. Next year, \(A B C-T V, N B C-T V\), and Public Service Broadcasting will be airing about 20 hours of programs with special encoding. When decoded, dialog will appear on-screen in caption form with the aid of the decoding device. Captioning information will not appear on the screen if no decoder is used. For the past eight years, the department of Health, Education and Welfare (HEW) has paid for the research that has culminated in the development of captioned programs.

You don＇t waste a second on＂mechanics＂with A P All－Circuit Evaluators．

You figure out the circuit you want， then plug it in for testing．You decide to improve your layout，and you make your moves as quickly as you think them up．There＇s just no faster or easier way to build and test
circuits and circuit ideas． But just because breadboarding is now such a cinch，don＇t get the idea that you don＇t have electronic integrity．Our solderless plug－in tie points are made of a special non－ corroding alloy．Use them as often as you like．
How many tie points do you need？ Our smallest ACE has 728，our
largest has 3，648．And all of them accept all DIP sizes．
Everything is quality all the way． You can even see the difference in our harder，shinier plastic matrix． See for yourself．Phone（toll－free） 800－321－9668 for the address of your nearby A P Products dealer．And ask for our complete A P catalog， The Faster and Easier Book．
