The Holophone Mini will enable VJs and consumers to record surround sound in real-time from a single microphone, and playback their movies in true 5.1. First generation products will likely be stand-alone devices that will hook up to camcorders and be entirely compatible with both tape and digital storage. Next generation products will integrate directly into the camcorder itself. Future plans call for a Holophone Mini specifically designed for use with computers and specialty products for personal communications. All products are being designed for compatibility with standard consumer audio formats (Dolby, DTS, and Circle Surround).

With DVD firmly established as the standard for enjoying feature films in our homes and DVD-AR available soon for VJs to record their own 5.1 surround soundtracks.

Weil es der Kunde wünscht, wird alles patentiert und mit großen Worten vermarktet. Bei kleinsten Abmessungen sind hier 6 Mikrofone mit Kugelcharakteristik an einem Schrumpfkopf-Ei angebracht. Das ist ziemlich akustischer Unsinn. Nur weil's praktisch aussieht - überdeckt dieses die "Ahnungslosigkeit" der Käufer. Wer glaubt denn, dass das Ding "True 5.1 Surround Sound" aufnimmt?
