Abstract

The collection of field data is crucial to deepen the knowledge about the distribution and abundance of organisms. Since the lichen diversity of the North Macedonian mountains still is rather poorly investigated, this thesis seeks to provide further insights thereto, especially focusing on Korab, Shar Planina, Jakupica, Pelister, Kajmakchalan and Voras. All these mountains are over 2500 m a.s.l., except Voras. A collecting trip was carried out in summer 2017 with an emphasis on hilltop positions taking into consideration the alpine belts and additional sites along the way to the summits. The fieldwork resulted in an output of 1200 samples. 386 taxa were identified whereof 101 taxa are new lichen records and 8 are new lichenicolous fungi for North Macedonia. The amount of lichens known from North Macedonia has risen to 785 taxa (including 6 subspecies, 17 varieties and 2 forma) and the number of lichenicolous fung to 32.

New lichen records: *Acarospora peliscypha*, *Allocetraria madreporeiformis*, *Amandinea punctata* f. *muscicola*, *Anaptychia setifera*, *Arthonia mediella*, *Arthrorhaphis alpina*, *A. citronella*, *Aspicilia caesiocinerea*, *A. simoensis*, *A. supertegens*, *Bacidia bagliettoana*, *Bellemerea cinereorufescens*, *B. sanguinea*, *Biatora beckhausii*, *Bilimbia microcarpa*, *Bryobilimbia hypnorum*, *Buellia disciformis*, *Caloplaca brachyspora*, *C. cerinelloides*, *C. herbidella*, *C. tetraspora*, *Candelariella faginea*, *C. plumbea*, *Carbonea vorticosa*, *Catillaria picila*, *Cephalophysis leucospila*, *Cetraria sepincola*, *Chaenotheca trichialis*, *Cladonia borealis*, *C. mitis*, *C. pleurota*, *Cliostomum corrugatum*, *Coenogonium pineti*, *Dacampia hookeri*, *Dermatocarpon arnoldianum*, *Diplotomma lutosum*, *Epilichen scabrosus*, *Euopsis pulvinata*, *Gyalecta jenensis*, *Gyalolechia epiphyta*, *Koerberiella wimmeriana*, *Lecanora cadubriae*, *L. circumborealis*, *L. epanora*, *L. impudens*, *L. printzenii*, *L. rupicola* subsp. *subplanata*, *L. sarcopidoides*, *L. symmicta*, *Lecidea berengeriana*, *L. diducens*, *L. sarcogynoides*, *L. speirodes*, *Lecidella elaeochroma* var. *flavicans*, *L. flavosorediata*, *L. wulfenii*, *Lecidoma demissum*, *Lepra excludens*, *L. alpine*, *L. borealis*, *L. celata*, *L. elobata*, *L. granulata*, *Leptogium cyanescens*, *Lopadium pezizoideum*, *Micarea misella*, *Miriquidica intrudens*, *Mycobilimbia tetramera*, *Ochrolechia androgyna*, *O. upsalensis*, *Parmeliopsis hyperopta*, *Peltigera lepidophora*, *P. membranacea*, *Phaeorrhiza nimbosa*, *Placynthiella icmalea*, *Placynthium dolichoteron*, *Polysporina urceolata*, *Porpidia crustulata*, *Protoparmelia badia* var. *cinereobadia*, *Protoparmeliopsis peltata*, *Pseudevernia furfuracea* var. *ceratea*, *Psorinia conglomerata*, *Psoroma tenue*, *Pycnora praestabilis*, *Pyrenula nitidella*, *Rhizocarpon badioatrum*, *R. ferax*, *R. lecanorinum*, *R. macrosporum*, *R. postumum*, *Rinodina exigua*, *R. mniaroeiza*, *R. orculata*, *R. roscida*, *Ropalospora viridis*, *Sarcogyne hypophaea*, *Tetramelias chloroleucus*, *Thelidium pyrenophorum*, *Toninia nordlandica*, *T. rosulata*, *Trapeliopsis granulosa*, *Umbilicaria maculata*, *U. subpolyphylla*, *Varicellaria lactea*, *V. transfugiens* and *Xylographa pallens*.

New lichenicolous fungi records: *Carbonea supersparsa*, *Cercidospora epipolytropa*, *Intralichen christiansenii*, *Lichenoconium erodens*, *Lichenothelia rugosa*, *Muellerella pygmaea* var. *athallina*, *Nigropuncta rugulosa*, *Stigmidium schaereri*

Zusammenfassung

Die Erhebung von Felddaten ist für das Wissen über das Vorkommen und die Verbreitung von Organismen von grundlegender Bedeutung. Um den Mangel an Informationen über die Flechten der nordmazedonischen Gebirge zu verringern, wurden die Gebirgsstücke Korab, Shar Planina, Jakupica, Pelister, Kajmakchalan und Voras als Exkursionsziele ausgewählt. Mit Ausnahme des Voras erheben sich alle genannten Gebirge auf mehr als 2500 Meter. Die Sammelexkursion wurde im Sommer 2017 durchgeführt. Der Schwerpunkt der Feldarbeit lag in den Gipfellagen unter besonderer Berücksichtigung der alpinen Höhenstufe und zusätzlichen ausgewählten Standorten am Weg zu den Gipfelregionen. Etwa 1 200 Belege wurden gesammelt. 386 Taxa wurden bestimmt. Darunter sind 101 neue Nachweise von Flechten und 8 von lichenicolen Pilzen. Damit erhöht sich die Zahl, der aus Nordmazedonien bekannten Flechten, auf 785 Taxa (mit 6 Unterarten, 17 Varietäten, und 2 Formen) und die an lichenicolen Pilzen auf 32 Taxa.

Neue Flechtennachweise *Acarospora peliscypha*, *Allocetraria madreporiformis*, *Amandinea punctata* f. *muscicola*, *Anaptychia setifera*, *Arthonia mediella*, *Arthrorrhaphis alpina*, *A. citronella*, *Aspicilia caesiocinerea*, *A. simoensis*, *A. supertegens*, *Bacidia bagliettoana*, *Bellemerea cinereorufescens*, *B. sanguinea*, *Biatora beckhausii*, *Bilimbia microcarpa*, *Bryobilimbia hypnorum*, *Buellia disciformis*, *Caloplaca brachyspora*, *C. cerinelloides*, *C. herbidella*, *C. tetraspora*, *Candelariella faginea*, *C. plumbea*, *Carbonea vorticosa*, *Catillaria picila*, *Cephalophysis leucospila*, *Cetraria sepinctola*, *Chaenotheca trichialis*, *Cladonia borealis*, *C. mitis*, *C. pleurota*, *Cliostomum corrugatum*, *Coenogonium pineti*, *Dacampia hookeri*, *Dermatocarpon arnoldianum*, *Diplotomma lutosum*, *Epilichen scabrosus*, *Euopsis pulvinata*, *Gyalecta jenensis*, *Gyalolechia epiphyta*, *Koerberiella wimmeriana*, *Lecanora cadubriae*, *L. circumborealis*, *L. epanora*, *L. impudens*, *L. printzenii*, *L. rupicola* subsp. *subplanata*, *L. sarcopidoides*, *L. symmicta*, *Lecidea berengeriana*, *L. diducens*, *L. sarcogynoides*, *L. speirodes*, *Lecidella elaeochroma* var. *flavicans*, *L. flavosorediata*, *L. wulfenii*, *Lecidoma demissum*, *Lepra excludens*, *L. alpine*, *L. borealis*, *L. celata*, *L. elobata*, *L. granulata*, *Leptogium cyanescens*, *Lopadium pezizoideum*, *Micarea misella*, *Miriquidica intrudens*, *Mycobilimbia tetramera*, *Ochrolechia androgyna*, *O. upsaliensis*, *Parmeliopsis hyperopta*, *Peltigera lepidophora*, *P. membranacea*, *Phaeorrhiza nimbosa*, *Placynthiella icmalea*, *Placynthium dolichoteron*, *Polysporina urceolata*, *Porpidia crustulata*, *Protoparmelia badia* var. *cinereobadia*, *Protoparmeliopsis peltata*, *Pseudevernia furfuracea* var. *ceratea*, *Psorinia conglomerata*, *Psoroma tenue*, *Pycnora praestabilis*, *Pyrenula nitidella*, *Rhizocarpon radioatum*, *R. ferox*, *R. lecanorinum*, *R. macrosporum*, *R. postuum*, *Rinodina exigua*, *R. mniaroeiza*, *R. orculata*, *R. roscida*, *Ropalospora viridis*, *Sarcogyne hypophaea*, *Tetramelias chloroleucus*, *Thelidium pyrenophorum*, *Toninia nordlandica*, *T. rosulata*, *Trapeliopsis granulosa*, *Umbilicaria maculata*, *U. subpolyphylla*, *Varicellaria lactea*, *V. transfigiens* und *Xylographa pallens*.

Neu nachgewiesene lichenicole Pilze: *Carbonea supersparsa*, *Cercidospora epipolytropa*, *Intralichen christiansenii*, *Lichenoconium erodens*, *Lichenothelia rugosa*, *Muellerella pygmaea* var. *athallina*, *Nigropuncta rugulosa*, *Stigmidium schaeereri*

Introduction

History and Politics

Surrounded by Kosovo and Serbia in the north, Bulgaria in the east, Greece in the South and Albania in the West, North Macedonia is located on the south-central Balkan. Apart from the Republic of North Macedonia, shown in Figure 1 (DEUTSCHE WELLE 2018) – labelled as Macedonia, highlighted with blue colour – the name Macedonia traditionally refers to a geographical region that includes the Republic of North Macedonia (DANFORTH, L. 2019a).

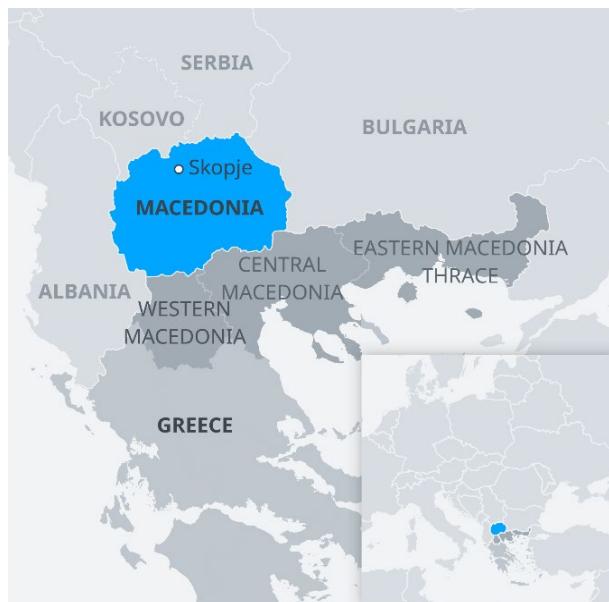

Figure 1 Macedonia (now North Macedonia) is shown in blue. Shown in grey are other parts of the region, traditionally called Macedonia. Figure by Deutsche Welle, www.dw.com, 2018

Figure 2 Different concepts of Macedonia over time. Defined by a yellow border, the modern approach of the region of Macedonia. Figure by Deutsche Welle, www.dw.com, 2018

The region of Macedonia in a modern approach comprises parts of Bulgaria, Greece and the Republic of North Macedonia, pointed out with a yellow border in Figure 2 (DEUTSCHE WELLE 2018). About 40 percent of the area belong to North Macedonia yet almost 50 percent to

Greece. Historically the name Macedonia refers to the ancient kingdom of Macedonia in the 4th century BC. Later rulers changed frequently; it was part of the Roman, Byzantine, Bulgarian, Serbian and Ottoman Empire, often united in one province. After the Russo-Turkish War in 1878, Bulgaria, Greek and Serbia were claiming the territory. A time of partition and wars followed on the Balkan Peninsula. With the collapse of Yugoslavia, the Republic of Macedonia was established, only including the northern part of the region of Macedonia. Due to disagreements with Greece, the new republic had to accept the provisional designation as “the former Yugoslav Republic of Macedonia”, short FYROM, to join the United Nations (DANFORTH, L. 2019b).

If not indicated otherwise in this thesis, the name Macedonia refers to the Republic of North Macedonia.

This 27-year old name dispute finally came to an end in January 2019 when Prime Minister Zoran Zaev achieved a two-thirds majority to change the name to Republic of North Macedonia. This eventually might enable Macedonia to join the European Union and the NATO (BBC NEWS. 2019). As the Ministry of Foreign Affairs announced on their webpage, a full-fledged membership in the EU and a NATO membership are amongst the main priorities of the country (MINISTRY OF FOREIGN AFFAIRS, REPUBLIC OF NORTH MACEDONIA 2019).

Since 2005, Macedonia has the status of an EU candidate and before May 2020 the European Council will ‘revert to the issue of enlargement’ (GENERAL SECRETARIAT OF THE EUROPEAN COUNCIL 2019).

Geography

People

Macedonia comprises a total area of 25,713 square kilometres. Its exact location in Southern Europe is described above in Figure 1. In 2019 the population of Macedonia was estimated at about 2,083 million by the World Population Review. About 25 percent of the population live in Skopje, the capital city of the country. Other big cities (more than 70,000 people) are Bitola, Kumanovo, Prilep and Tetevo. The population density has been calculated to be about 81 inhabitants per square kilometre. Macedonians form the largest ethnic group, followed by Albanians and Roma. Most people belong to the Macedonian Orthodox Church but a considerable number of 33% are Muslims (WORLD POPULATION REVIEW 2019).

Landscape

Macedonia's geography can be seen in Figure 3 (MELOVSKI et al. 2013). South to West it extends from Anishte (north of Kriva Palanka) to Chengino Kale (east of Berovo) to Markova Noga (east shore of Prespa Lake) and Kestenjar (southwest of Debar) (MELOVSKI et al. 2013).

The relief of Macedonia is characterized by mountains, gorges, valleys and plains. Beside the highest mountain, Golem Korab, which towers 2,752 meters above sea level, Titov Vrv, Pelister, Solunski Glava and Kajmakchalan are four more peaks with 2,500 meters above sea level. Another eight reach 2,000 meters. An overview of Macedonian mountains is given in Figure 4 (MILEVSKI 2015). Pelagonia, the largest plain in the south of the country, extends over 1,357 square kilometers (MELOVSKI et al. 2013).

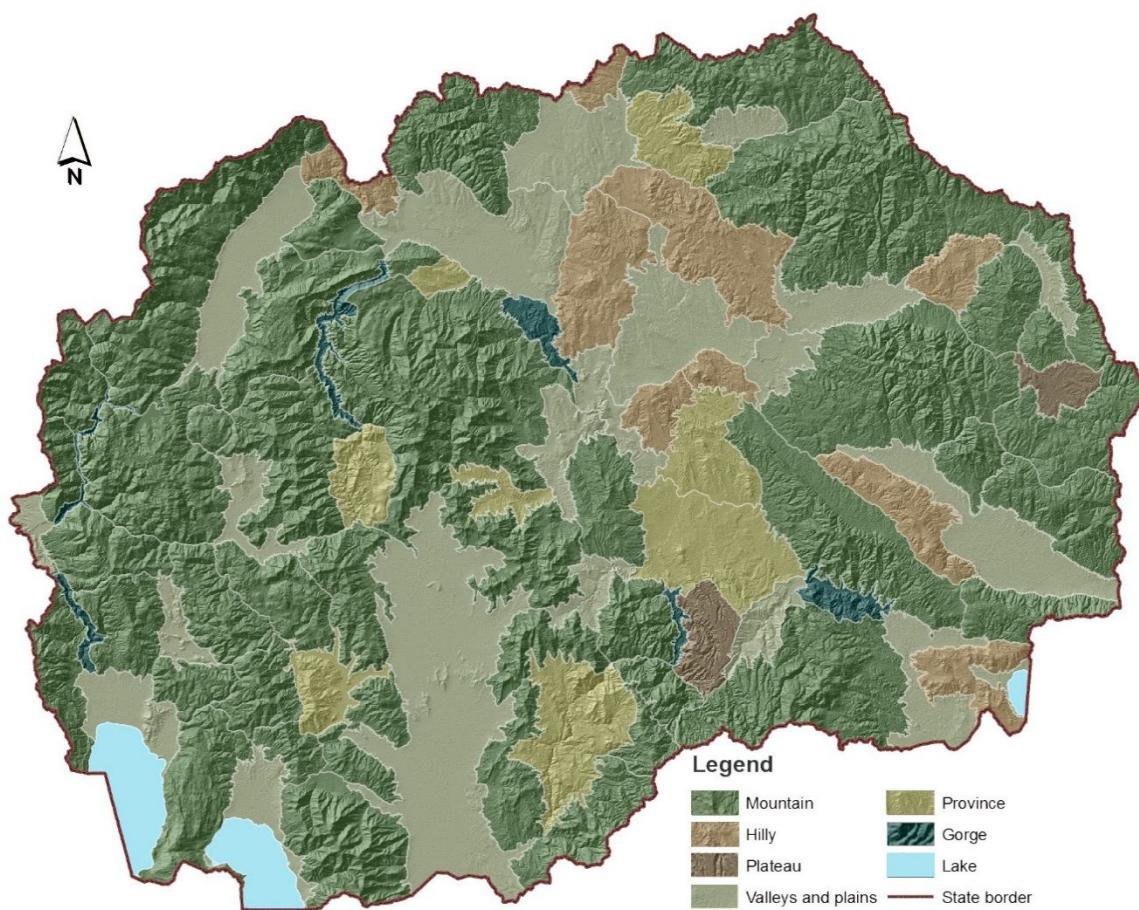

Figure 3 Overview of Macedonian geomorphology. Figure by MELOVSKI, et al. (2013) out of Macedonian Journal of Ecology and Environment, Vol. 15.

An overview is given in Figure 3 showing Macedonia, divided into six geomorphological types. These 6 types are mountains (covering most of the area), valleys and plains, province, hilly regions, plateaus and gorges (MELOVSKI et al. 2013).

The Vardar River is the biggest water drainage system in Macedonia. About 90% of the counties' water flows with Vardar into the Aegean Sea. The remaining 10 percent empty into Lake Doiran, the Aegean via other rivers or the Adriatic Sea via Crni Drim River (DANFORTH, L. 2019b).

Geology

In Macedonia four main tectonic zones, the Serbo-Macedonian Massif, the Vardar zone, the Palagonian Massif and the West-Macedonian zone are to be found and were most active in the Alpine orogeny. An overview of these four zones is given in Figure 4 (MILEVSKI 2015). Ongoing geological activities are indicated by frequently occurring earthquakes (DANFORTH, L. 2019a).

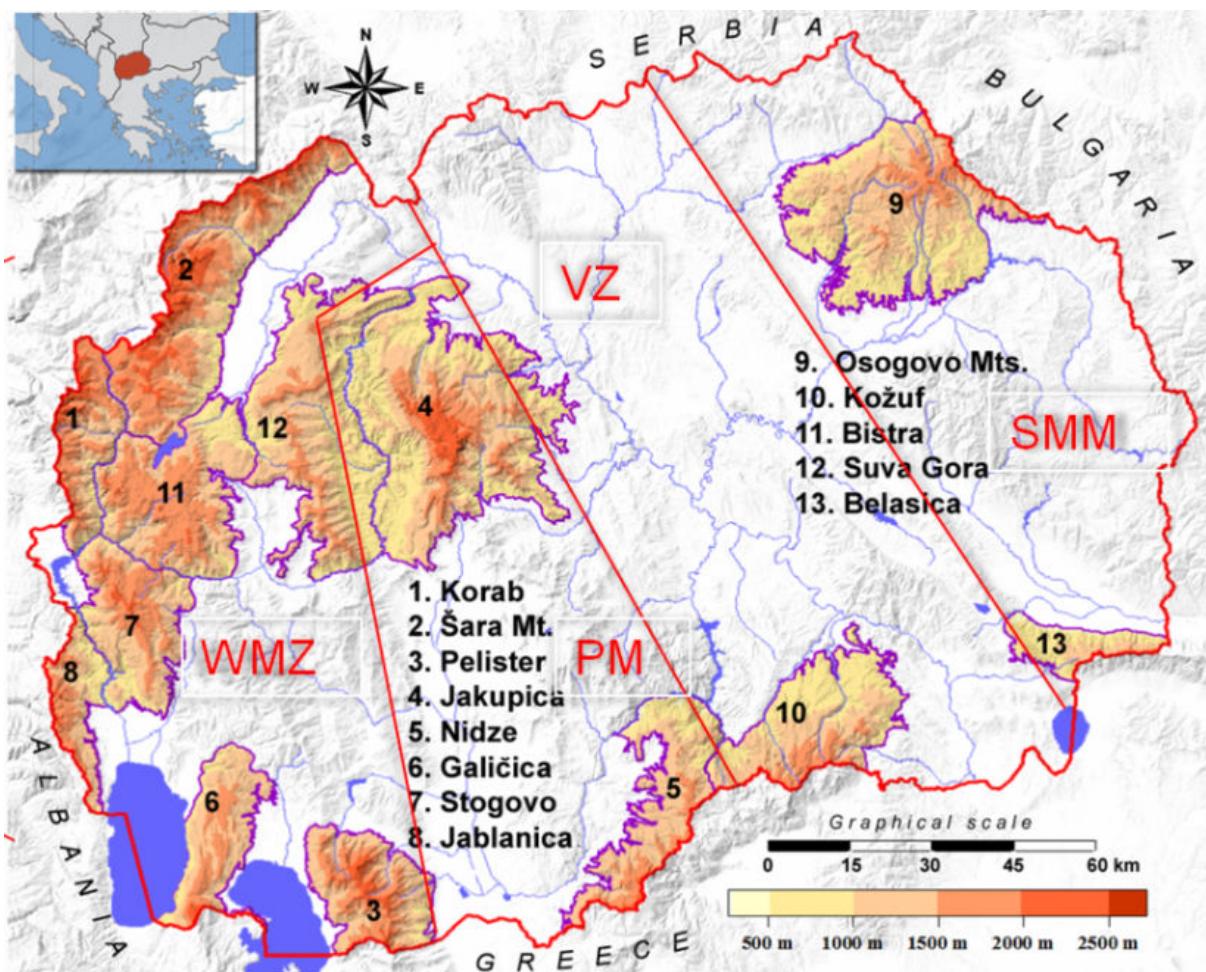

Figure 4 Macedonian Mountains above 2,000 meters height and division of tectonic zones. Figure by Milevski (2015) out of Geographical Reviews Vol. 48.

Serbo-Macedonian Massif

The Serbo-Macedonian Massif is a region of old lithological complexes such as gneisses, mica- and green-schists and amphibolites. Its formation has been connected to intense volcanic activity. Best remnants of paleovolcanic landscapes can be found in the northeast of Macedonia at Kratovo-Zletovo paleovolcanic area and even preserved top calderas on Plavica and Lesovo. The Serbo-Macedonian Massif, located between the Dinarides and the Carpatho-Balkanides is considered to be a fragment of the Rhodopian Massif (MILEVSKI 2015). During the Carbon and Perm, parts of the Massif were covered by the sea while it was mostly dry land during other geological eras (MELOVSKI et al. 2013).

Vardar zone

The Vardar Zone is a very long lineament reaching from Belgrade to Thessaloniki. This zone includes many fragments of other zones and complexes (MILEVSKI 2015). Parts of this zone were covered by sea water during Carbon, Perm, Mesozoic and Paleogene (MELOVSKI et al. 2013).

West-Macedonian zone

This area is characterized by predominantly carbonaceous formations on the tops and volcanic and sedimentary formations below. 10% of Macedonia's surface consists of carbonate rocks. Most of these carbonate rocks can be found in this zone and the Pelagonian Massive. Therefore, huge karst areas can be found on Galičica Mountain, for example. The West-Macdeonian zone includes most of the Macedonian highest mountain massifs (Korab, Šara, Pelister, ...). Hence glaciers existed on many mountains during the Würm ice age and glacial landforms are consequently prevalent. For example, small U-shaped valleys on Korab Mountain or Šara still testify to the glacial erosion. On Shar Planina about 40 lakes of glacial origin occur while Ohrid and Prespa Lake are two remnants of tectonic activity but not glacial relics. Both were tectonically formed during the Aegean crustal extension (MILEVSKI 2015).

Climate

The Climate in Macedonia can be differentiated into three main zones. These are a modified Mediterranean, a moderate continental and a mountainous climate. In all three zones, most precipitation occurs during autumn and winter. The Mediterranean climate dominates the south of Vardar valley but has an influence even on the Skopje plain or the Debar and Ohrid-Struga valley. In this zone, summers are warm and winters are mild. While snow hardly falls in this area, winters are colder in the moderate-continental climate and rain and snow occur frequently. Among others, Prespa and Pelagonia are dominated by this climate regime. Areas above 1,000 meters largely have long and cold winters and short and chilly summers, as it is typical for a mountainous climate. Here snow accounts for most of the precipitation (MELOVSKI et al. 2013). An overview on climate differences between these three climate regimes is given in Figure 5 (CLIMATE-DATA.ORG. no date). The graphs were taken from climate-data.org web page and jointed to make them comparable. From left to right, Dorjan (modified Mediterranean climate), Prilep (moderate continental climate) and Mavrovo (mountainous climate) are given. Lines and bigger numbers were inserted to make the data legible.

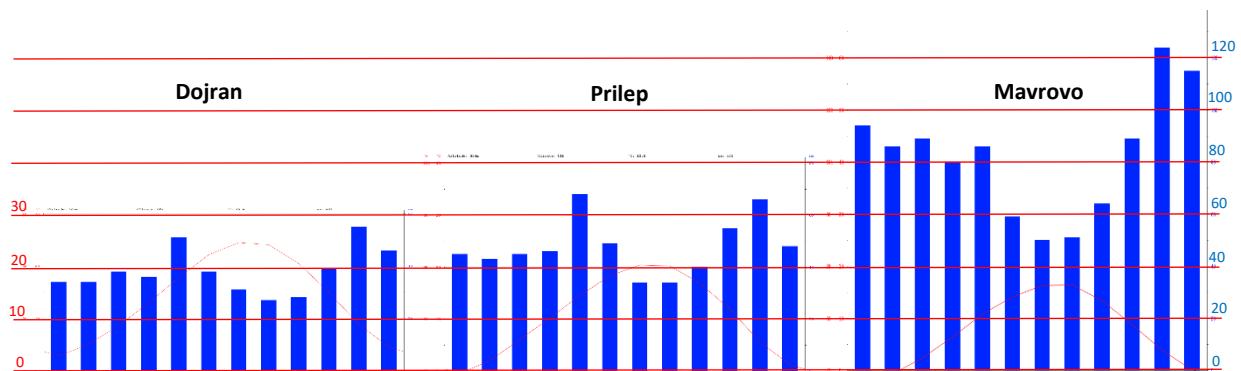

Figure 5 Comparison of 3 climate graphs From left to right: Dorjan (alt.: 204m, av. °C: 13.9, prec.: 457mm, modified Mediterranean climate), Prilep (alt.: 656m, av. °C: 10.6, prec.: 573mm, moderate continental climate) and Mavrovo (alt.: 1,247m, av. °C: 7.5, prec.: 987mm mountainous climate). Figure modified from climate-data.org, no date.

In Macedonia average temperatures from 20°C in July to 0°C in January result in a 11°C average annual temperature. Precipitation ranges from 1,400 mm in western parts of Macedonia to less than 500 mm in central Macedonia. Summer droughts with more than 30 days without rain occur every year (MELOVSKI et al. 2013).

For the future the Centre for Atmospheric Research at the University of Nova Gorica predict a substantial increase in summer temperatures while precipitation during summer will decrease considerably. In winter a modest decrease in temperatures will occur with no changes in precipitation (BERGANT 2006).

Pelagonian Massif

Metamorphic crystalline rocks, gneiss, mica-schists and marbles have been forming the Palagonian Massif, a relic of the Precambrian crust. Karstification and karst landforms occur on Jakupica Mountain and some others (MILEVSKI 2015). The Pelagonian Massif was covered by water during Mesozoic (MELOVSKI et al. 2013).

Vegetation and Biodiversity

Unlike many other European countries, Macedonia still offers many natural and semi-natural habitats. Since about 37% of the Macedonian area is covered by forests, it is especially them which contribute to the Macedonian habitat diversity. Some examples of natural habitats are pseudomaquis, thermophilous oak belts, mesophilous oak, beech and conifer belts and arctic tundra-like habitats. Wetlands are lost due to melioration activities, except for some Areas like Monospitovo or Blechishta (MELOVSKI et al. 2013).

A comprehensive compilation of the Macedonian diversity is provided in the National Strategy for Nature Protection by MARKOSKI et al. (2018) published by the Ministry of Environment and Physical Planning – Republic of Macedonia. This report, apart from giving information on the current situation of nature protection in Macedonia, should set guidelines for the decade between 2017 and 2027.

Species and endemism

With more than 30 vegetation classes, 60 vegetation orders, 90 alliances and 300 plant associations the Macedonian country, is home to about 3.200 vascular plants. Moreover, there are 2.000 algae species, 2.000 fungi, 500 moss taxa, 13.000 invertebrate and about 550 vertebrate taxa to be found. Particularly endemic species play a major role in nature conservation. Among these endemic species, there are about 120 endemic vascular plants. Compared to the number of other species, the 450 species of lichens found in this study is relatively low. There will be a focus on this topic in the next chapter. Many high mountains, gorges, lowland belts and steppe-like areas are mentioned to be the most important centres of (sub)endemic angiosperm plants (MARKOSKI et al. 2018).

National parks

The beginning of protecting natural resources can be traced back to 1948. Back then, the first national park protected parts of the Pelister Mountain. One year later, Mavrovo national park was proclaimed and in 1958 Galičica followed. Those three national parks still exist and cover about 4.5% of the surface of Macedonia nowadays, although an area of 15% is sought (MARKOSKI et al. 2018).

Threats to biodiversity

Beginning after World War II, dewatering swamps and expansion of agricultural land have become the biggest threats for biodiversity. Subsequently, an expansion of the industry sector became more and more of a problem. Not only mining and the deposition of tailings, but also landfills with hazardous waste destroyed big areas. Re-cultivation, however, was mostly absent. Another threat is the uncontrolled and discontinuous urbanisation in Macedonia. Due to the rising number of people and the considerably greater need for industry, the energy sector and the intensive development of the transport sector have caused environmental destruction (MARKOSKI et al. 2018).

Lichenological history

The first compilation of lichens in Macedonia is from 1953 when KUŠAN (1953) reported 185 lichen species back then. The currently known lichen biota of the country comprises 675 species based on the evaluation of 147 published sources (MAYRHOFER et al. 2016) and additions based on fieldwork as well as the evaluation of ten further publications (MALÍČEK & MAYRHOFER 2017).

Due to extensive fieldwork conducted by Murat Murati in the seventies, the Šar Planina mountain range is the most extensively investigated region of the country with 384 species (PAVLETIĆ & MURATI 1977; MURATI 1979, 1984, 1985; KOBALD 2016; MALÍČEK & MAYRHOFER 2017). 95 species are only known from the subalpine and alpine belts of the Kosovar side of the mountain range which are partly outlined in MAYRHOFER, et al. (2016). A similar diversity of 381 species from the same belts of the Prokletije mountain range of Montenegro and Kosovo is reported by STRASSER et al. (2015).

Several papers containing lichen records have been published since the last additions. Considering these papers (BALABANOVA et al. 2010, 2012, 2014; HUNECK & LISICKÁ 1990; KUŠAN

1932; MALIČEK et al. 2017; MURATI & JUSUFI 2004; OBERMAYER 2017; STEINER & PEVELING 1984; TSCHERMAK-WOESS 1995; WIDMER et al. 2012) seven new taxa for Macedonia have been documented and mentioned. These are the lichens: *Lecanora allophana* (Ach.) Nyl f. *sorediata* Vain. (MALIČEK et al. 2017); *Physcia biziana* (A.Massal.) Zahlbr. (HUNECK & LISICKÁ 1990); *Chaenotheca phaeocephala* (Turner) Th.Fr., *Hypotrachyna revoluta* (Flörke) Hale, *Usnea dasopoga* (Ach.) Nyl. (MURATI & JUSUFI 2004), and the lichenicolous fungi: *Tremella anaptychia* J.C.Zamora & Diederich (ZAMORA et al. 2017), *Telogalla olivieri* (Vouaux) Nik.Hoffm. & Hafellner (HAFELLNER & MAYRHOFER, in press).

Species which are already documented for Macedonia are not listed. Furthermore, two of the species out of my collection have been published. This applies to *Vulpicida pinastri* (Scop.) J.-E.Mattsson & M.J.Lai (KALTENBÖCK et al. 2018) and *Calicium pinicola* (Tibell) M.Prieto & Wedin (OBERMAYER 2017)

Methods

Collecting

In order to further improve the knowledge about lichen diversity in Macedonia, six different mountain ranges have been chosen for detailed investigations. These areas include Mokra Planina with the highest peak Solunska Glava (2540 m), Šar Planina with peaks around Titov Vrv (2748 m), Korab mountain range with Golem Korab (2764 m), Pelister Mountain with Pelister (2601 m), Kajmakchalan (2524 m) and Kožuf mountain (2171 m). Stops between these sampling points resulted in a few further collecting points. A detailed description of all sampling points will be given.

Between July 15th and August 7th, 2017, about 1200 samples were collected, spread on 35 sampling sites. One more sampling was carried out on October 5th on a fieldtrip to Pelister Mountain, in the course of the “Fungal Conservation in a Changing Europe” meeting in Ohrid.

Locations

As suggested by MELOVSKI et al.(2013), locations will be structured and assigned to the regional divisions, described in this paper. Figure 6 provides an overview of the six chosen sampling areas, not including the few additional stops mentioned before. The borders for regional divisions were taken from the webpage of the MACEDONIAN JOURNAL OF ECOLOGY AND ENVIRONMENT (2019). The map was generated with ArcGIS, an Esri product, and a standard basemap was used for the background. The same data and procedures were used for all following maps.

The locations will be listed approximately in the same order as visited.

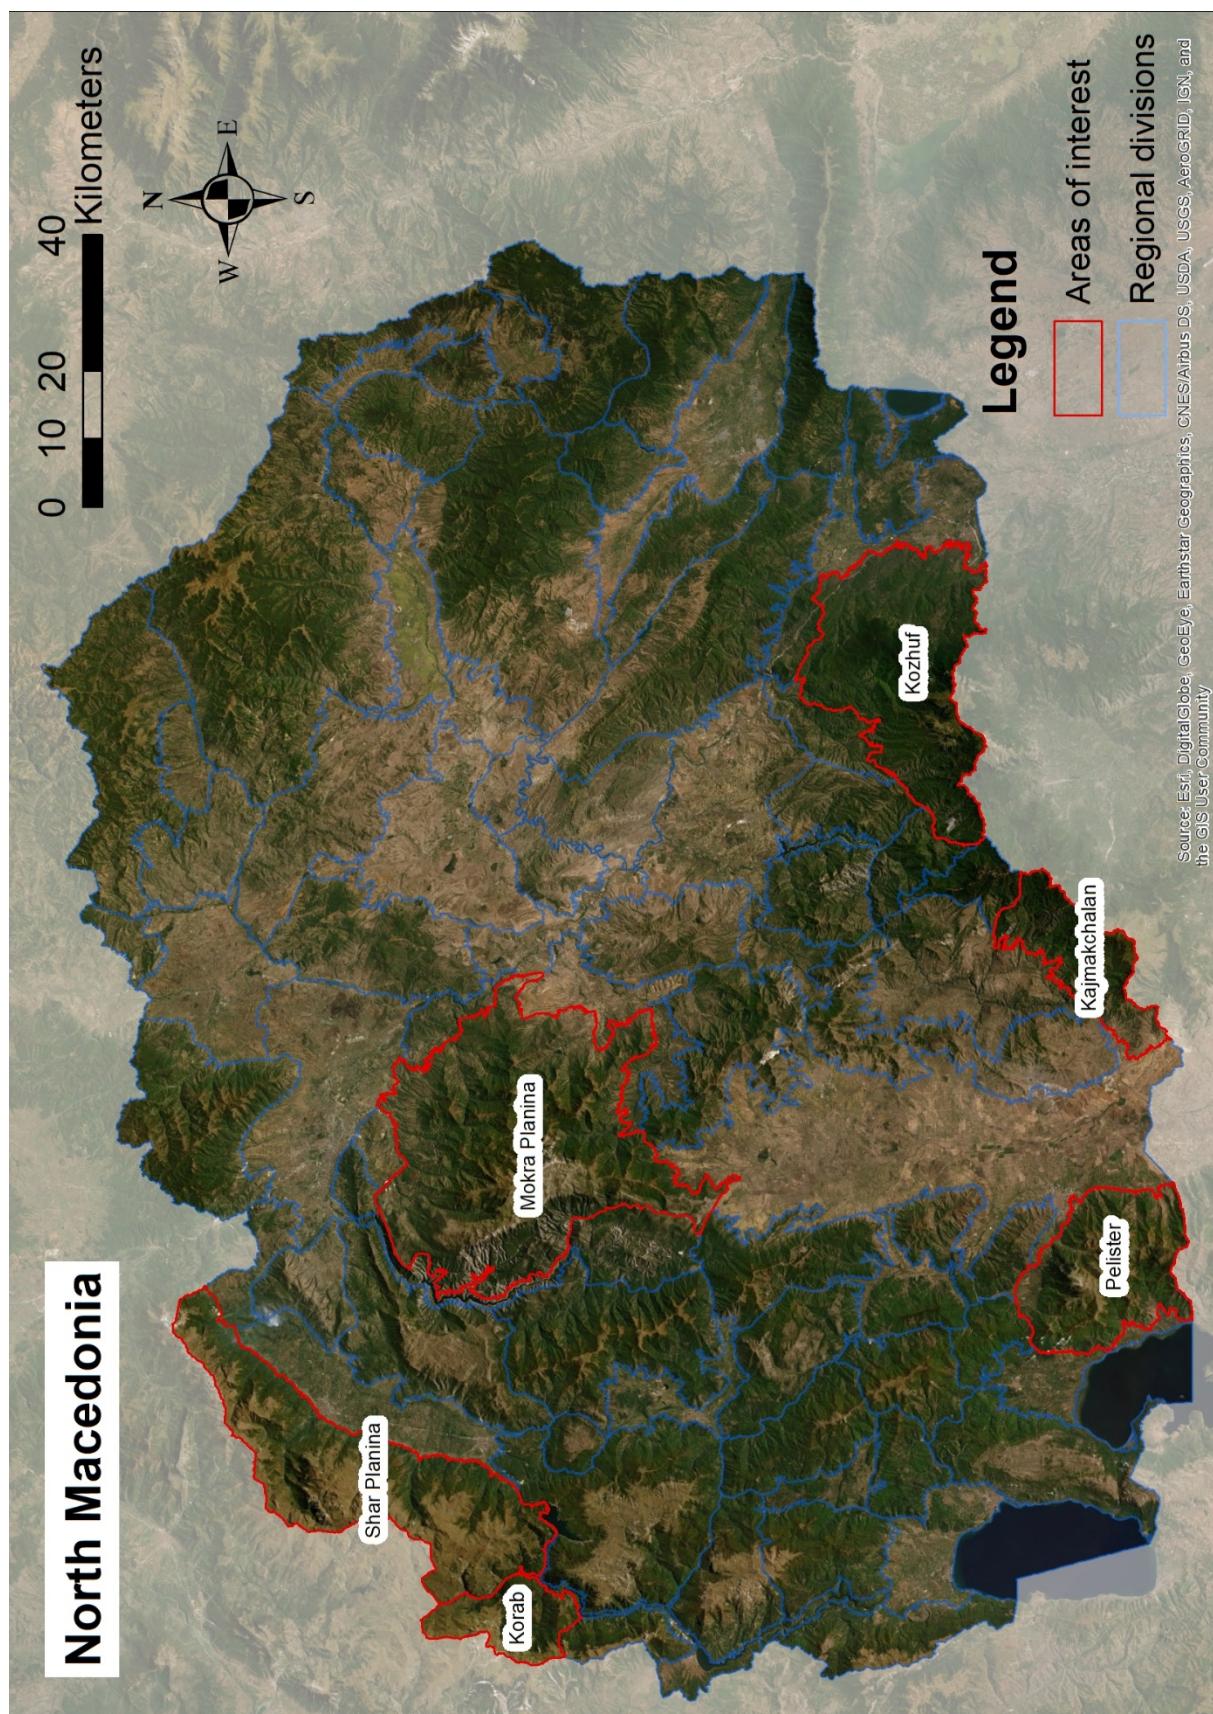

Figure 6 Location of the six chosen sampling areas. Borders of regional division (MELOVSKI, et al. 2013) are added. The background is an ArcGIS standard base map of Esri.

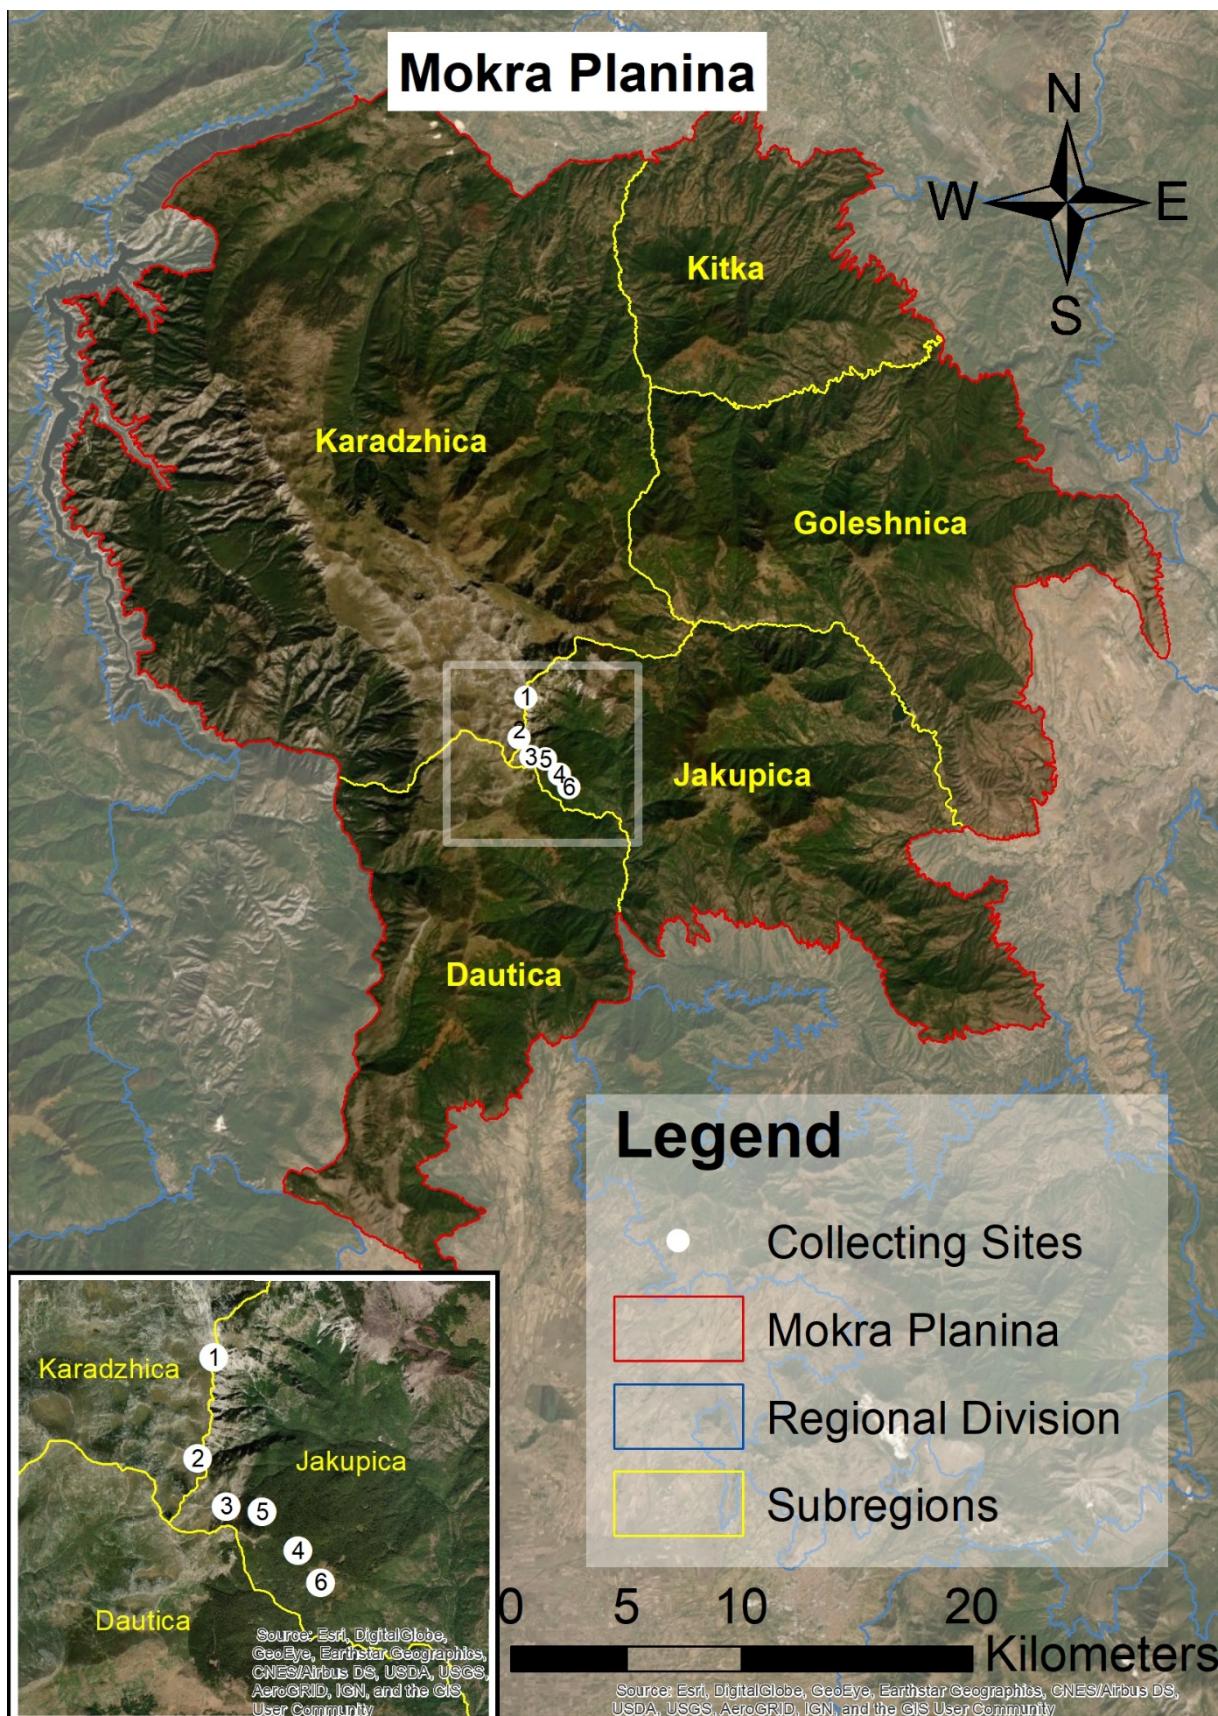

Figure 7 Mokra Planina: This map shows the area of Mokra Planina according to MELOVSKI et al. (2013). Subregions are added and sampling points are given. A more detailed map is added to locate sampling sites referring to the subregions.

Mokra Planina

Mokra Planina is a term used for five mountains in the centre of Macedonia which are all ridges of the Mokra Planina massif. These five mountains are: Karadzhica, Kitka, Goleshnica, Jakubica and Dautica. The highest peak is Solunska Glava at 2540 meters. The summit can be seen in Figure 8 and the location of Mokra Planina is shown in Figure 6. The total area is about 1,330 square kilometres and is divided into subregions, named after the five mountain ridges. The locations of the subregions can be seen in Figure 7 (MELOVSKI et al. 2013). A more detailed description of the two subregions with main emphasis will follow.

Karadzhica

The biggest subregion is Karadzhica. Its location in the northwest of the Mokra Planina can be seen in Figure 7. With an area of around 560 square kilometres, this is the biggest subunit. Together with Jakupica, it shares the peak of Solunska Glava. (2540 m a.s.l.). The geology of the area includes large carbonaceous masses (marbles) with siliceous rocks such as gneisses, and granites in between. Mountain climate is dominant in this region. Only northern and western slopes have a moderate Mediterranean influence. The region is mostly used for sheep pastures, but a considerable part is under protection due to its high conservation value (MELOVSKI et al. 2013).

Mok1

The first two sampling spots, Mok1 and Mok2, are located along the border of Karadzhica and Jakupica but are still on the Karadzhica side. Mok1 is located about 400 meters below and southwards of the peak of Solunska Glava (2540 m a.s.l.) since the peak itself is inaccessible due to a military station. A picture of the collecting site is shown in Figure 8. The sampling site

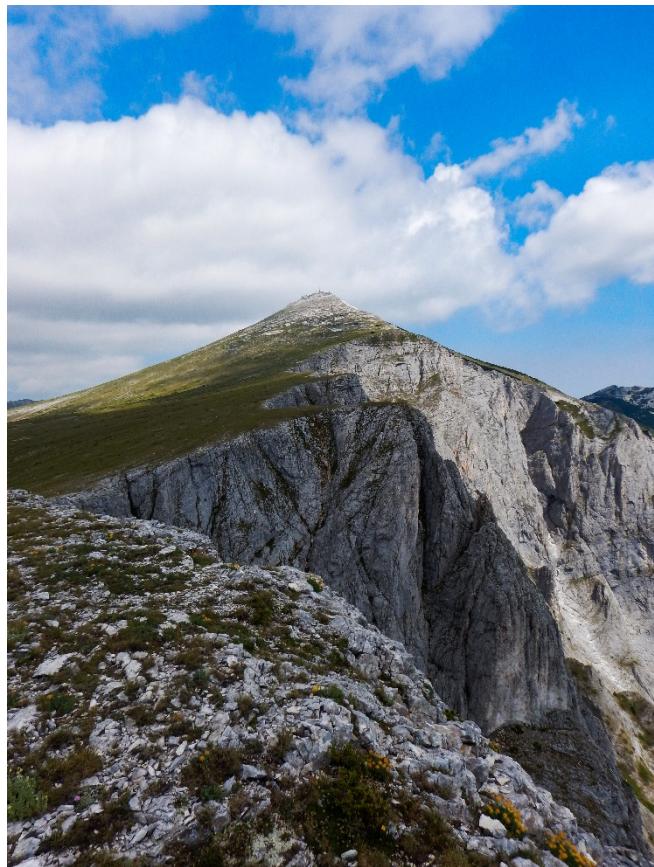

Figure 8 Solunska Glava in the background, the highest peak in the Mokra Planina massif at the border between the two subregions Karadzhica and Jakupica.

can be seen in the background of the picture closer to the peak. In this area, alpine grasslands with interspersed marble rocks occurred.

Collecting date:

July 15th, 2017

Elevation: 2350 m a.s.l.+/- 50 m

Bedrock:

carbonaceous bedrock, marbles

Makro Exposition: S – SW

Coordinates:

41° 41' 57" N 21° 24' 13" E

Radius: 200 m

Substrates:

mosses, soil, dwarf shrubs, rocks

Mok2

This sampling site is located along the path from Cheples to the peak of Solunska Glava shortly after reaching the plateau. A picture of the site is given in Figure 9. The surroundings of the boulder were similar to Mok1 but with isolated *Pinus mugo* appearing.

Collecting date:

July 15th, 2017

Elevation: 2150 m a.s.l.+/-30 m

Radius: 100 m

Bedrock:

carbonaceous bedrock, marbles

Figure 9 Picture of the collecting site Mok2. A big marble boulder, lying on the edge of the plateau.

Coordinates:

41° 41' 0" N 21° 24' 1" E

Makro Exposition: no specifics

Substrates:

mosses, soil, rocks

Jakupica

Jakupica mountain is located southeast of Karadzhica. Both share Solunska Glava (2540 m a.s.l.) as their highest peak. The Bedrock is composed by carbonaceous rocks (Precambrian marbles). While moderate continental climate is dominating lower parts, mountainous and even alpine climate occur on higher elevations. Although this area is of high conservation value, no protection exists (MELOVSKI et al. 2013).

Mok3

The sampling site is located next to the hiking path from Cheples to the summit of Solunska Glava and is widely dominated by *Pinus mugo*. Along this path from about 1800 up to 2000 m a.s.l. these mountain pine belts occur. A picture is given in Figure 10.

Collecting date:

July 15th, 2017

Elevation: 1900 m a.s.l. +-30 m

Radius: 50 m

Bedrock:

carbonaceous bedrock, marbles

Makro Exposition: E

Figure 12 Korab mountain: This map shows the area of Korab mountain according to MELOVSKI et al. (2013). In addition, the area of Radika Gorge and Bistra with one Sampling side each are displayed.

Korab mountain range

Korab mountain belongs to de Shara-Korab massif in the northwest of the country (Figure 6) bordering with Kosovo and Albania. According to MELOVSKI et al. (2013) it is the only Macedonian mountain with alpine landscape. The highest peak of the country, Golem Korab, with 2764 m a.s.l. is located here. Limestone and other calcareous rocks alternate with silicate formations such as schists or granites. Glacial relicts such as glacial lakes occur. The climate varies depending on the elevation from continental to mountainous and alpine (MELOVSKI et al. 2013). Flocks of sheep can be found all over the mountain and contribute to the typical picture on Korab shown in Figure 13.

The location of the sampling sites is given in Figure 12.

Kor1

Kor1 is situated on the summit of Golem Korab, at 2764 m a.s.l. It is the highest point in Macedonia and therefore also the highest sampling location. On the top of Korab mountain, carbonaceous rocks like limestone dominate. Some spots with calcareous schists and other siliceous rocks are interspersed. A picture of the summit area is given in Figure 14.

Collecting date:

July 20th, 2017

Elevation: 2735 m a.s.l. +-30 m

Coordinates:

41° 47' 21" N 20° 32' 49" E

Radius: 150 m

Methods

Locations - Korab mountain range

Radika Gorge

The region of Radika Gorge is embedded between high mountains. The northern part of the gorge receives the highest amount of precipitation in Macedonia. This extraordinarily humid part is located between Korab, Shar Planina and Bistra. Southern areas of the gorge are under moderate Mediterranean influence. Figure 12 shows Radika Gorge within yellow borders (MELOVSKI et al. 2013). The sampling site in this region was added due to the necessity of a break and not primary included.

Rad1

The sampling point Rad1 is located on the way up to the police station at Strezimir. It is used for picnicking and leisure activities by locals. It is right next to a small river. Trees are fully covered by lichens, indicating a high level of humidity. Numerous trees of *Acer monspessulanum* grow along the river.

Collecting date:

July 23rd, 2017

Coordinates:

41° 43' 55" N 20° 40' 13" E

Elevation: 920 m a.s.l. +- 30 m

Radius: 20 m

Bedrock:

varbonaceous bedrock

Substrates:

Acer monspessulanum

Makro Exposition: no specific

Bistra

Another region close to Korab and Shar Planina is Bistra, a high mountain marble-limestone plateau. Continental and mountainous climate is most prevalent (MELOVSKI et al. 2013). The big artificial Mavrovo Lake is located in this area. The location can be seen in Figure 12. The sampling site in this region was added due to the necessity of a break and not primary included.

Bis1

Bis1 is located on the north-eastern side of Mavrovo Lake. It is at an area for hiking trips with benches and tables. The climate of this location is noticeably influenced by the big waterbody of the lake. Artificial substrates such as timber were used for the collection work.

Collecting date:

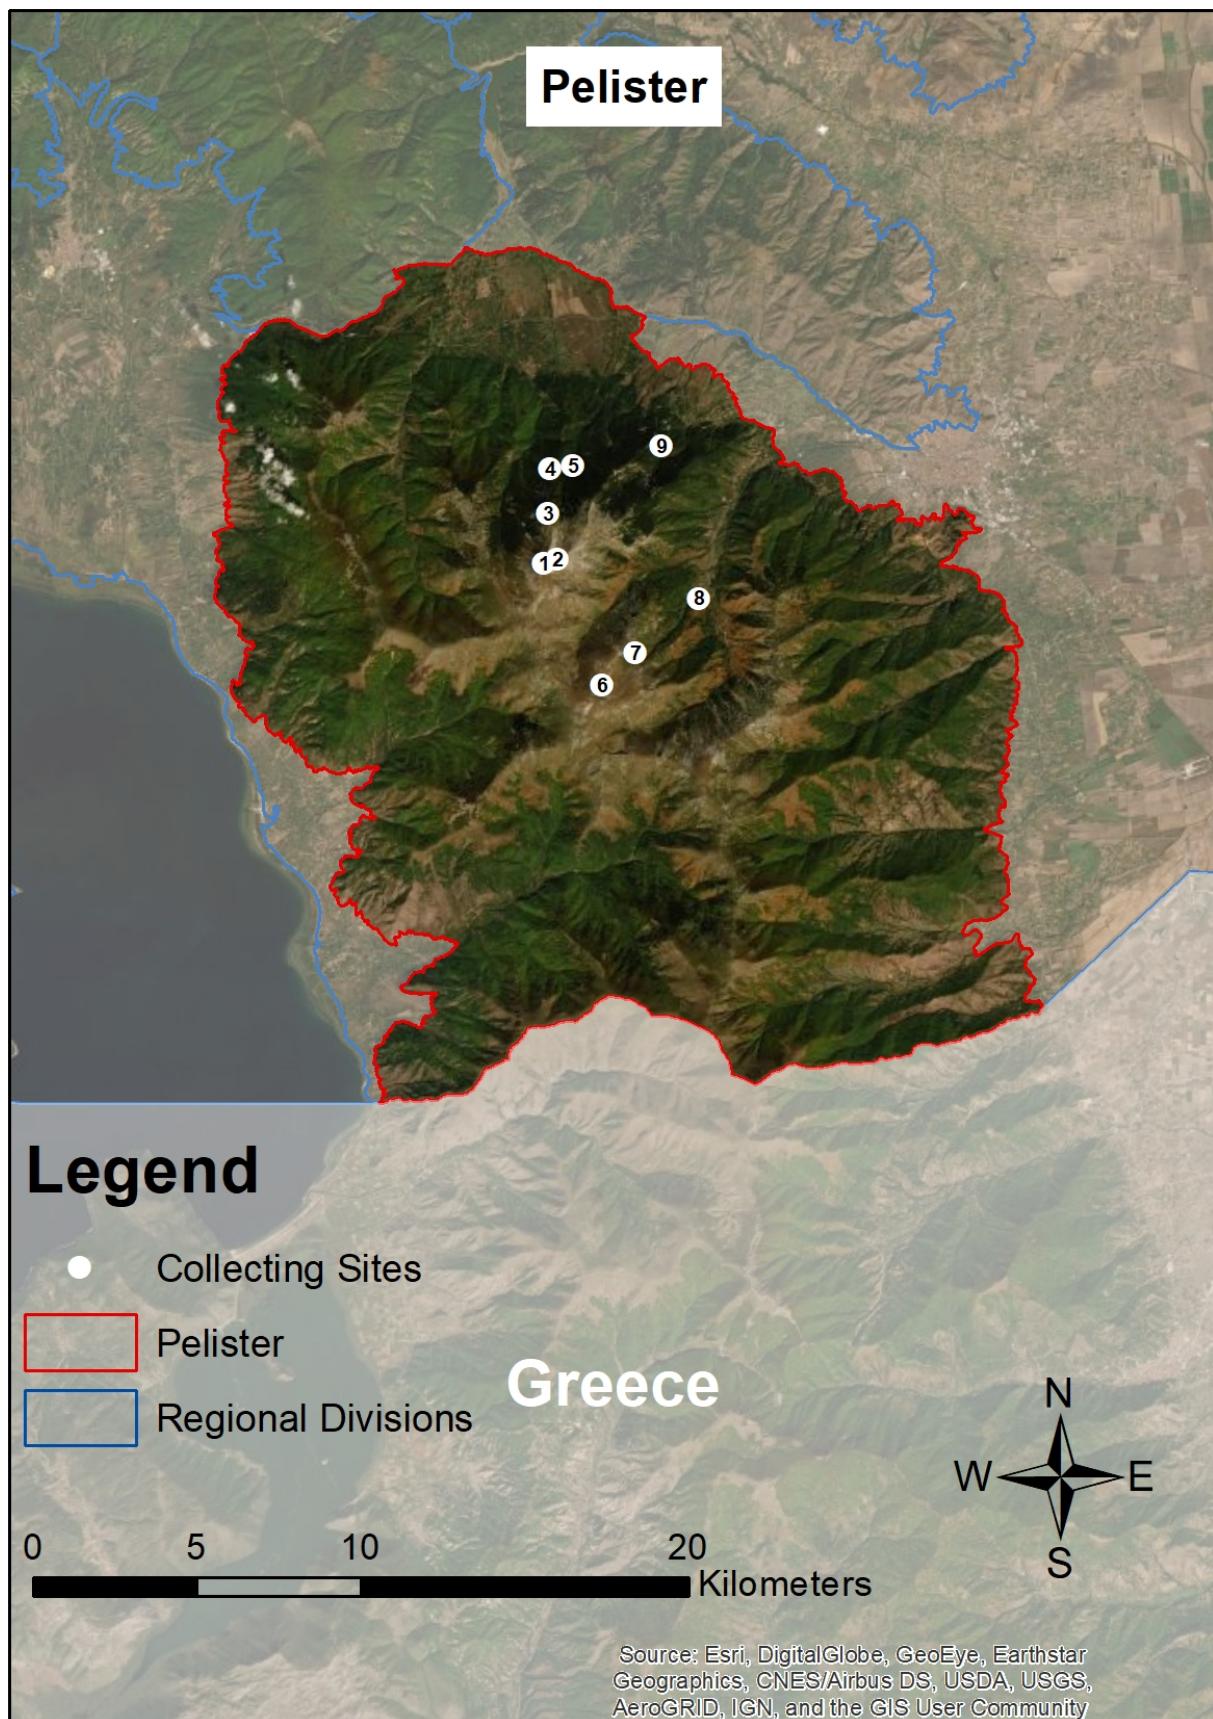

Figure 21 Pelister: This map shows the region of Pelister according to MELOVSKI et al. (2013). All sampling points are added to the map.

Pelister Mountain

Pelister Mountain, or synonymously Baba Mountain, is located in the South of Macedonia on the eastern side of Prespa Lake. Its exact location can be seen in Figure 6. Southern parts of the mountain belong to Greece. With its summit at 2601 m a.s.l. it is one out of 5 Macedonian mountains with a height of more than 2500. The bedrock of the whole mountain is almost entirely siliceous, mainly granites and Palaeozoic schists. A mountainous climate regime is dominant and only the highest parts have an alpine influence. Pelister is also hosting one of the Macedonian national parks, proclaimed in 1949 to protect its well-developed Macedonian pine forests with *Pinus peuce* (MELOVSKI et al. 2013).

An overview of all sampling locations on Pelister mountain is given in Figure 21.

Pe/1

Pel1 is located at the top of Pelister on the northern and western side of the radio station. Pictures of both locations are given in Figure 22. The bedrock of the mountain top consists of schists and granites. Additionally, artificial substrates such as timber, concrete or rubber do occur.

Collecting date:

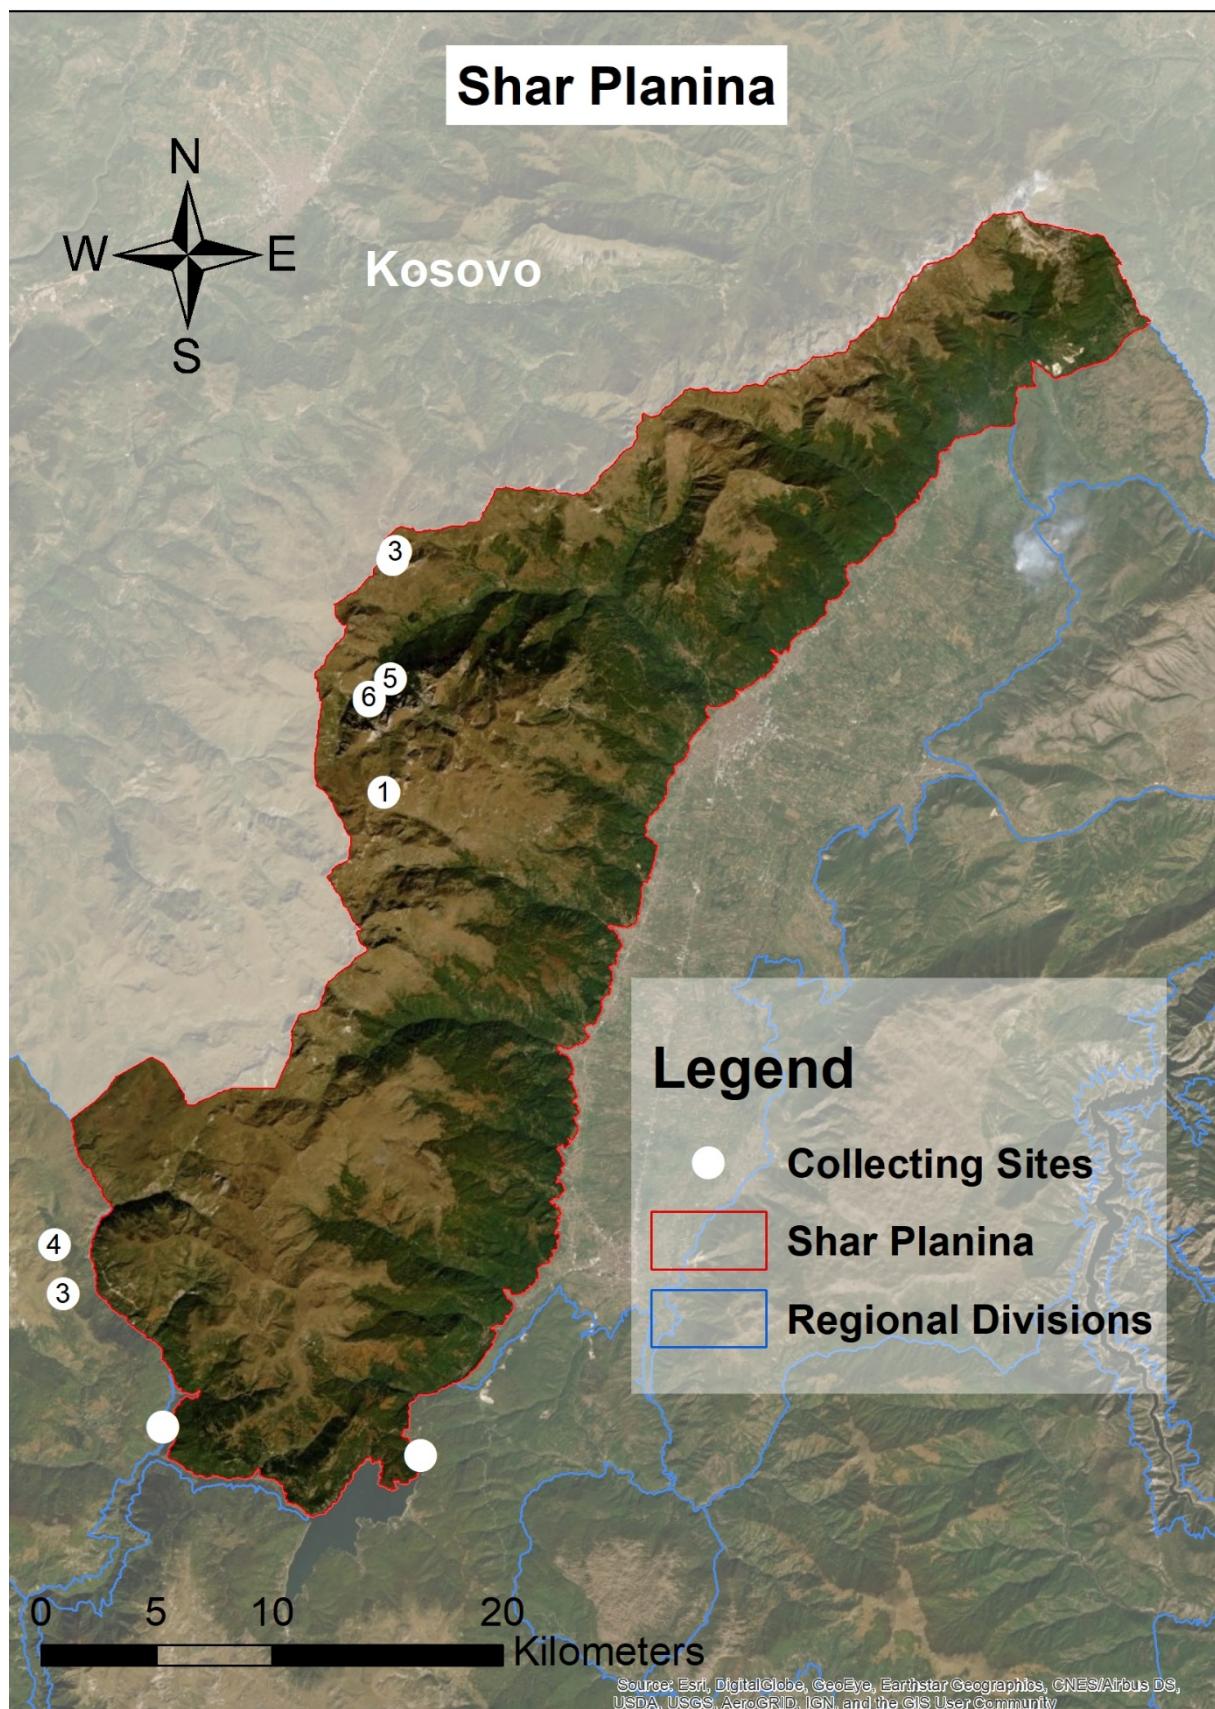

Figure 29 Shar Planina: This map shows the region of Shar Planina according to MELOVSKI et al. (2013). All sampling points are added to the map. Additional sampling sites on Korab Mountain, Radika Gorge and Bistra are visible, indicating the small geographical distance. Sha2 is not distinguishable from Sha 3 but slightly towards south-southwest. Sampling site number 4 is hidden under number 6 and is located a bit more southern.

Shar Planina

Shar Planina, or synonymously called Šar Planina or Shar Mountain, is located along the north western border of Macedonia. The exact position can be seen in Figure 6. Shar Planina is the second highest mountain in Macedonia after Korab. The Shar Planina mountain range is in fact the longest and largest of Macedonia with its highest peak Titov Vrv with 2748 m a.s.l. Shar mountain is geologically and geomorphologically very diverse. Silicate formations such as schist and granites abundantly occur, while smaller areas are formed by calcareous rocks, mainly limestone. The landscape is strewn with glacial relics such as glacial lakes and valleys. The climate varies from continental to alpine depending on the elevation (MELOVSKI et al. 2013).

An overview of sampling sites on Shar Planina is given in Figure 29. Sampling points visible on the map from Korab mountain indicate how near these to mountains are.

Sha1

Sha1 sampling site is located on mountain ridges along the southern parts of the valley shown in Figure 30. The picture provides a view at the sampling site towards Titov Vrv, the highest mountain of Shar Planina. The valley visible is on an elevation of about 2200 m a.s.l.

Figure 30 View from Sha1 sampling side to the north. Titov Vrv, the highest mountain of Shar Planina is visible in the middle.

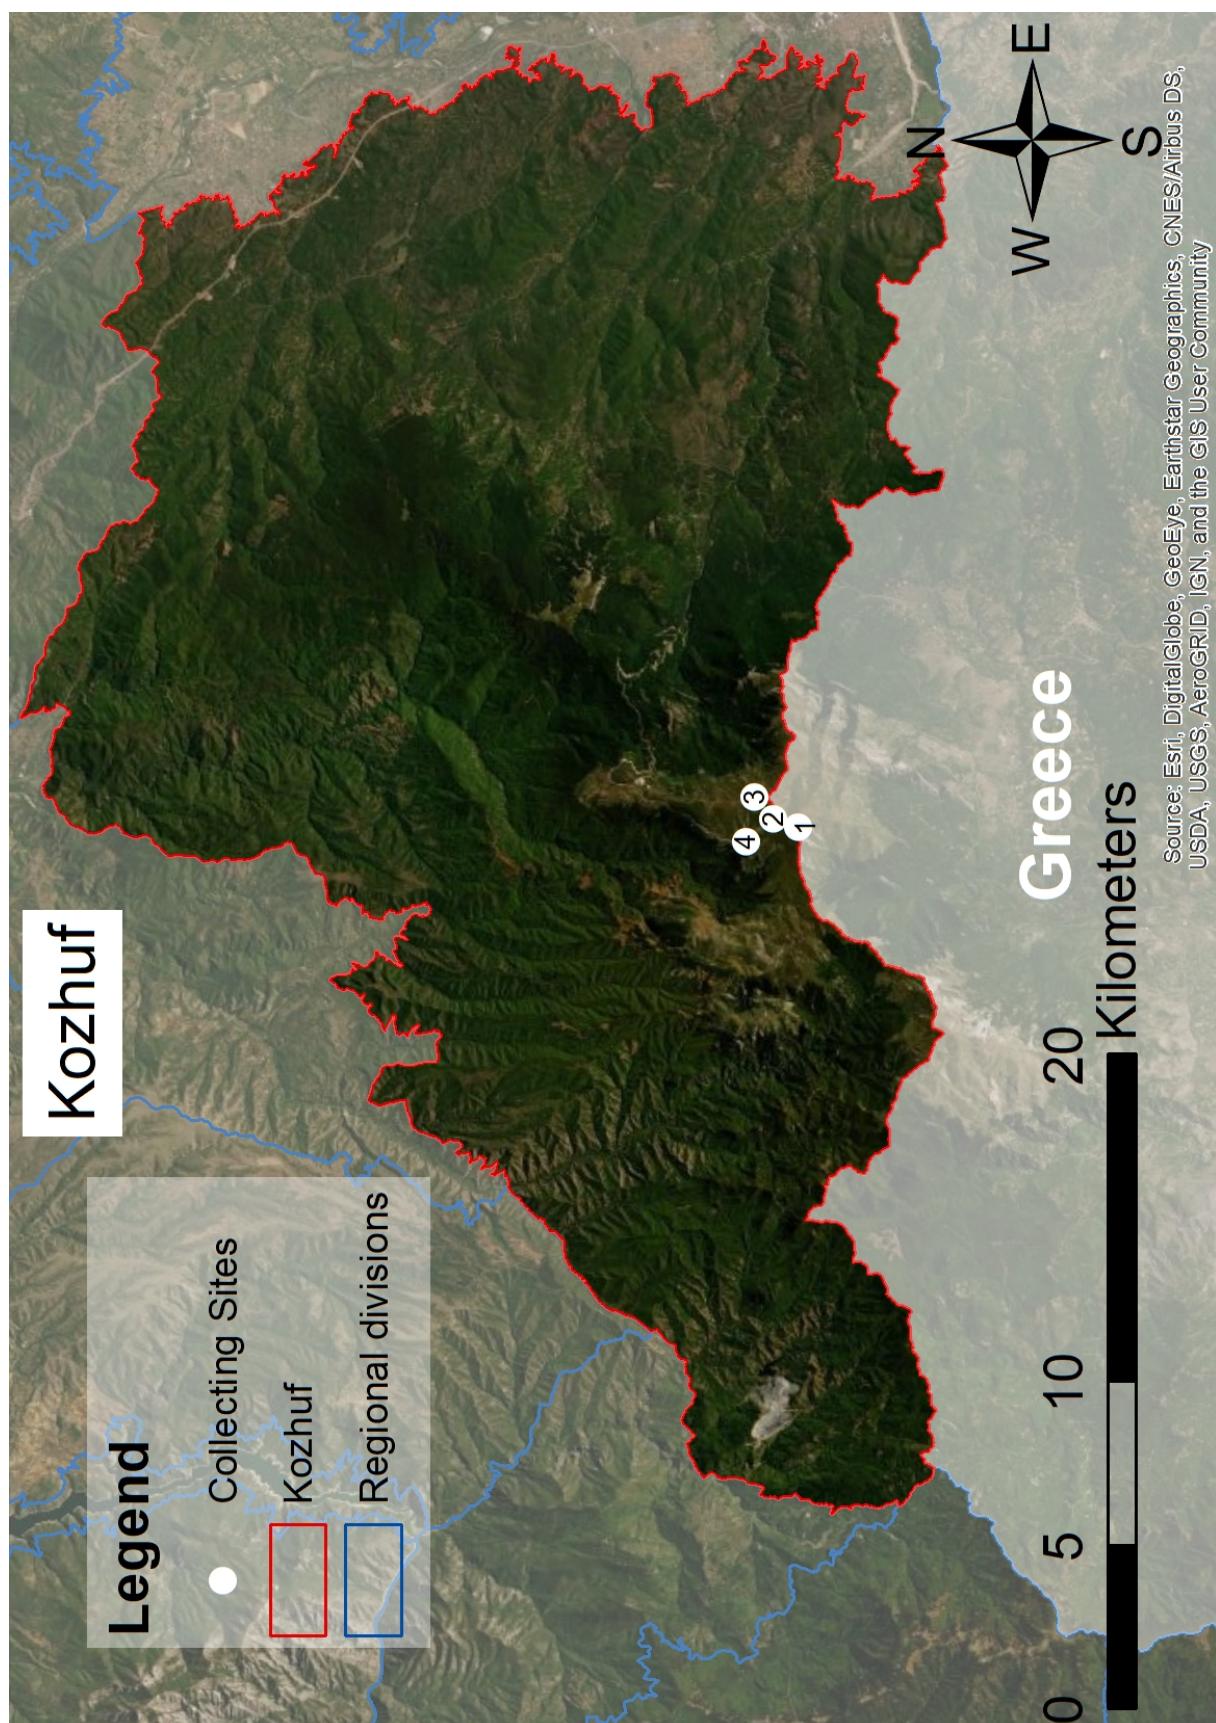

Figure 34 Kozhuf: This map shows the region of Kozhuf according to MELOVSKI et al. (2013). All sampling points are added to the map.

Kozhuf Mountain

Kozhuf or Kožuf mountain is located in the southeast of Macedonia between Skopje and Thessaloniki. Its exact position is shown in Figure 6. Kozhuf, though lower than other mountains investigated in this study, points out remarkable features. The geology of the mountain is very complex for large areas with carbonaceous bedrock such as marbles and limestone, various siliceous rocks such as gabbro as well as diabases and volcanic deposits occur. The climate is can be described as Mediterranean at lower elevations yet as mild to harsh mountainous at higher elevations (MELOVSKI et al. 2013).

An overview of the sampling plots on Kozhuf is given in Figure 34.

Figure 35 View from the top of Kozhuf mountain at 2171 m a.s.l. The collecting site is in the foreground on the right-hand side of the picture.

Koz1

This collecting site is located on the top of Kozhuf mountain on 2171 m a.s.l. Different bedrocks form the summit, including limestone, schists, calcareous schists and other siliceous rocks. One part of the sampling site can be seen in the right-hand corner of Figure 35. The sampling site only covers the Macedonian part of the Mountain since Kozhuf is at the border to Greece, shown in Figure 34.

Collecting date:

July 30th, 2017

Elevation: 2150 m a.s.l. +-20 m

Bedrock:

mixed bedrock of carbonaceous and siliceous compounds, limestone, schists, other siliceous rocks

Makro Exposition: E

Mariovo

The region of Mariovo is located north of Kajmakchalan. It is a large hilly plateau with an average elevation of about 760 m a.s.l. (MELOVSKI et al. 2013)

Mar1

This sampling site is located next to the road from Makovo to Budimici. The area in this location is rather dry and hot. Some dying trees serve as substrate for lichens.

Collecting date:

July 29th, 2017

Elevation: 700 m a.s.l. +-50 m

Radius: 50 m

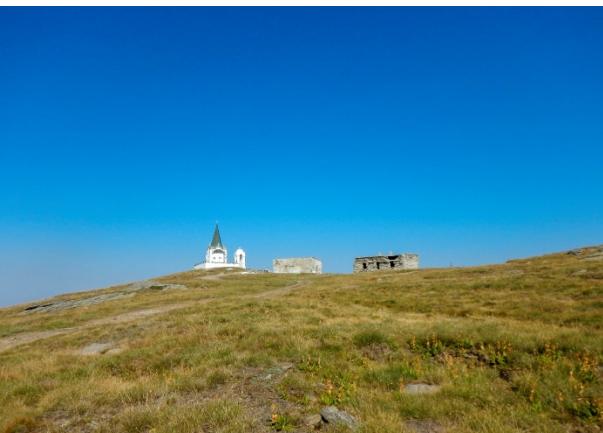

Figure 40 Small chapel on the summit of Kajmakchalan.

Coordinates:

40° 55' 52" N 21° 47' 15" E

Radius: 300 m

Substrates:

rocks, soil, mosses, artificial substrates

Identification

Identification of the collected samples was primarily carried out with WIRTH et al. (2013). Additionally, other books such as POELT and VĚZDA, (1977;1981), the NORDIC LICHEN FLORA VOL. 2 & 3 (2002, 2007) and SMITH et al. (2009) were used. Furthermore, special articles for different groups (e.g. *Xylographa*: SPRIBILLE et al. (2014), *Usnea*: RANDLANE et al. (2009), *Lepraria*: SAAG et al. (2009))

Some critical or unknown species were given to experts to confirm our results or for further identification. If others confirmed identifications or identified species it is written in the results.

List of people contributing to the results, their institution and the species group:

Institute of Biology, University of Graz:

Josef Hafellner (lichenicolous fungi, unknown samples of different groups), Walter Obermayer (*Arthrorrhaphis*, *Bryoria*), Fernando Fernandez Mendoza (*Cetraria*, *Caloplaca variabilis* group), Martin Grube (*Arthonia*), Adriana Atanassova (*Physconia*).

Institute of Botany, The Czech Academy of Sciences

Jan Vondrák (*Caloplaca* s.l.), Jiří Malíček (*Lecanora*, unknown samples of different groups), Zdeněk Palice (*Biatora*).

Faculty of Biology, Altai State University

Evgeny Davydov (*Umbilicaria*)

University of Vienna

Othmar Breuss (Pyrenocarpeous lichens)

Department of Ecology, Czech University of Life Sciences Prague

Kerry Kent Knudsen (*Acarospora*)

**Department of Vegetal Biology,
Complutense University of Madrid**

Ana Rosa Burgaz (*Cladonia*)

University of Alberta

Toby Spribille (*Xylographa*)

Conservatoire et Jardin botaniques de la Ville de Genève

Philippe Clerc (*Usnea*)

Ludwig-Maximilians-University of Munich

Philipp Resl (*Xylographa*)

TLC

To support identification of unknown species or to verify assumptions, standardized thin-layer chromatography (TLC) was used, following WHITE & JAMES (1985) and ORANGE et al. (2010) and was carried out with the technical support of Peter Kosnik.

Nomenclature

The nomenclature used for the species list follows Nimis et al. (2018). If not included in this list, applicable for Mediterranean species, NIMIS (2016) was used. Nomenclature of species not included in either follows MycoBANK (2019)

List of substrates and abbreviations

sil	siliceous rocks	xyl	lignum
cal	calciferous rocks	art	artificial substrates (rubber)
int	intermediate rocks	-par	parasitic on other lichens
ter-sil	siliceous soil	-aqu	temporary submerged
ter-cal	calciferous soil	* top left	new record for Macedonia
ter-int	intermediate soil	** top left	new record due to this fieldwork but published
bry	bryophytes		
deb	plant debris		
cor	bark		

Results

As the outcome of the fieldwork undertaken in 2017, some 1,200 samples were collected. Identification work revealed 385 taxa. These included 363 species 1 subspecies, 6 varieties and 2 forms of lichens, 11 species of lichenicolous fungi and 1 non lichenised species, typically reported by lichenologists. Furthermore, 10 samples (5 species) from the GZU herbarium collected in the seventies by J. Hafellner, H. Mayrhofer, J. Poelt were added to the list. This samples are yet unpublished and were taken from Shar Planina.

One species from GZU herbarium, collected on Galičica mountain, has not been published so far but is new for Macedonia and therefore listed as well.

Conclusion

During the fieldwork in summer 2017 sampling was carried out on 36 locations on 6 Macedonian mountains. The chosen mountains are the five Macedonian mountains higher than 2500 meters – Korab Mountain (2764 m a.s.l.), Shar Planina (2748 m a.s.l.), Pelister Mountain (2601 m a.s.l.), Mokra Planina (2540 m a.s.l.), Kajmakchalan (2521 m a.s.l.) – and Kozhuf Mountain (2171 m a.s.l.) in the east of the country. The collection work resulted in over 1,200 samples and revealed 386 taxa including 114 new records for Macedonia. This confirms the assumption that the subalpine and alpine areas in Macedonia are still poorly investigated. The same conclusion was drawn by her Strasser (2012), who focused on the Prokletije mountain range in Montenegro. Their work resulted in 313 lichenized and 21 lichenicolous fungi whereof 68 species were new records for Montenegro.

The total number of species reported for Macedonia now increases to 785 lichens taxa (inc.:6 subsp., 17 var. and 2 f.) and 32 species of lichenicolous fungi, which is a considerable share of all lichens known from the Balkan peninsular, regarding the small size of Macedonia. All over the peninsular slightly more than 2,000 taxa are known (MAYRHOFER, pers. comm.).

Especially the eastern parts of Macedonia have been little investigated but offer interesting habitats and substrates as mentioned in the introduction. These might be ideal areas for future projects.

All in all, this considerable output of new records consolidates the assumption that there are still many species to be discovered. Therefore, further investigations are crucial to deepen the knowledge on the lichen diversity in these areas.

Acknowledgements

An erster Stelle möchte ich mich von ganzem Herzen bei meinem Betreuer, Helmut Mayrhofer, bedanken! Lieber Helmut, vielen Dank für die Geduld, die du für mich aufgebracht hast, für deine so umfangreiche Unterstützung, für die vielen, vielen Stunden, die du dir für mich Zeit genommen hast und für alles, was du mir beigebracht hast. Es war eine wunderbare Zeit, von Beginn an und bis zum Schluss, die ich auf keinen Fall missen möchte. Einen besseren Betreuer hätte ich mir nicht wünschen können. Ich freue mich auf weitere Zusammenarbeit.

Außerdem möchte ich mich herzlich bei Josef Hafellner bedanken, für die immer sehr rasche und ausführliche Unterstützung und ich würde mich freuen, auch mit weiteren Proben kommen zu dürfen.

I want to say thank you to all the people who supported this thesis with knowledge, with time and with help. A big thank you to Jan Vondrák for his support, his time, his knowledge and his great hospitality. Thank you to Jiří Malíček for a lot of help with identification work. Thank you to Kerry Kent Knudsen, Othmar Breuss, Evgeny Davydov, Toby Spribile, Ana Rosa Burgaz, Philippe Clerc and Philipp Resl for additional support with critical samples.

Vielen Dank auch an Walter Obermayer, Fernando Fernandez, Martin Grube und Adriana Atanassova für eure Hilfe. Besonderer Dank auch an Peter Kosnik für die große Unterstützung.

Ich möchte auch allen anderen Institutsmitgliedern danken, für die schönen Jahre als Student und studentischer Mitarbeiter hier im Haus. Ich habe mich immer sehr wohlgeföhlt, konnte immer mit Fragen oder Anliegen zu euch kommen und der Spaß kam auch nie zu kurz.

Ein ganz großes Dankeschön geht auch an meine Freunde, die mich im Studium begleitet haben. Für die schöne Zeit bei den Übungen, den Exkursionen und den Stunden übers Studium hinaus. Besonderen Dank auch an die Unterstützer, die mit Unterlagen mein Lernen bereichert haben. Ebenso ein großes Dankeschön an die Dissertanten für die lustige Zeit, die hinter uns liegt und die, die noch kommt. Vielen Dank auch ins Kellerlabor für die Unterstützung, die ich dort immer erhalten habe!

Abschließend möchte ich mich noch bei meiner Familie sehr herzlich bedanken, für all die Unterstützung, die ich von dieser Seite immer erhalten habe und die mir das alles auch so ermöglicht hat!
