PREFACE

During the summer of 1906 I was employed by the Department of Botany of the University of Missouri to collect plants in Colorado for the Herbarium of the University. I spent, therefore, a period of two months and a half in this work. I arrived at Boulder, Colorado, June eighteenth, and departed thence September third. All the collecting was done in Boulder County, and the greater part of it within a radius of five miles from the city of Boulder. I collected altogether about 1,036 species of flowering plants and ferns. The vernal plants, of course, had blossomed before my arrival, but except for these the flora of Boulder is fairly well shown in the collection.

In the list of plants here given there have been included all that are known to occur in Boulder County; but inasmuch as the boundary between Grand and Boulder Counties lies along the summits of the main range of mountains it is impossible often to tell in what county a given plant has been collected. Similarly Long's Peak lies partly in Larimer County and partly in Boulder County. In all cases in which plants have been cited from a mountain lying partly in Boulder County, these have been included in the list, unless a definite locality in the other county is given. Plants admitted to the list because of the citations given in Rydberg's Flora of Colorado

are ascribed to Rydberg; it is of course understood that this ascription does not imply that these plants were collected by Rydberg in the localities named, but merely that by examination of the plants or otherwise he is satisfied that they occur in those places. In the case of plants collected by myself I have added the collection number, so that these can be identified at any time. I may add that besides the set of Boulder plants in the Herbarium of the University of Missouri, there is a duplicate set in the Herbarium of the Michigan Agricultural College; there is also a set in my own possession. The Herbarium of the Missouri Botanical Garden has an incomplete set. As the numbers are the same for all plants of the same species, the identification of any of these plants can be made out from the number given in the list.

In the introduction I have sought to present what knowledge I have of the distribution of plants in Boulder County. I have tried to present them in their natural plant-societies. I saw, however, too little of the montane, subalpine, and the alpine floras to be able to give a comprehensive account of these, and it must be remembered that I did not see the vernal facies of any portion of the vegetation.

As to nomenclature I have followed, except where plainly deficient in the light of later investigation, that of Rydberg's Flora of Colorado. While I feel that in the case of both genera and species there has been an over-multiplication—as for instance the splitting up of such a natural group as the pines into several genera, yet at the time of the preparation of this Flora the only convenient guide was Rydberg's work.

It is to Professor T. D. A. Cockerell of the University of Colorado to whom I am most indebted for assistance in this work. Remote both from the vegetation itself and from an

adequate library, I could not have carried on the work at all without his cheerful coöperation. He has examined every page of the manuscript, and I owe much to his apt suggestions and kindly criticism. My thanks are also due to Professor Francis Ramaley for his kindness in examining the proof-sheets, and to Professor J. Henderson who has perused the article on the physiography. Both have given me notes of much value.

INTRODUCTION

I. PHYSIOGRAPHY

Boulder, Colorado, lies nestling close to the Rocky Mountains just north of the 40th parallel. There the foothills are strikingly beautiful and high, and only twenty miles away Arapahoe Peak, clasping to its bosom the best glacier of the southern Rockies, gleams whitely in full view, while twenty-four miles to the northwest towers jaggedly Long's Peak, 14,271 ft. high, the highest point in Boulder County, and one of the highest peaks of the Rocky Mountains. Away to the eastward the plain stretches unbrokenly, save for an occasional butte, till lost to vision. There is then room for a great diversity of vegetation, ranging from the semi-desert plants of the arid plains to the arctic plants that grow at the wasting edge of the perpetual snow.

The Continental Divide, which, due west of Boulder, touches its easternmost point in North America, is only from twenty to twenty-four miles away. It rises as a vast snow-covered wall of rock to an average height of from 11,000 to 12,000 feet; the highest points in the Divide in this region are Long's Peak, 14,271 ft., Mt. Audubon, 13,173 ft., Mt. Baldy, 11,470 ft., Arapahoe Peak, 13,520 ft., and James' Peak, 13,283 ft. Due west of Boulder Arapahoe Pass crosses the Divide at an altitude of 12,000 feet. It will be seen, therefore, that there is an almost impassable barrier between the vegetation of the Pacific slope and that of

the Atlantic. Since this barrier is almost everywhere above timberline, only a few Pacific species are found on the Atlantic side of the slope within the region about Boulder. Perhaps the most interesting exception is the occurrence of one of the orchids, *Piperia Unalaschensis* (Spreng.) Rydb., a few individuals of which I found in the foot-hills near Boulder, and which is not known to occur elsewhere east of the mountains of Utah, it having its main range from Alaska to California.

All the streams of Boulder County flow ultimately into the South Fork of the Platte river, and thence into the Missouri and the Mississippi. Boulder creek, the chief stream of the region, and one of the headwaters of the Platte, is fed from the snows of the Divide, especially between Arapahoe and James' Peaks. Just over the other side of the Divide are some of the headwaters of Grand river, which flows into the Colorado, and thence into the Gulf of California.

All the main streams in Boulder County have their sources in the wasting snows of the Main Range. These have cut gorges, in most cases over a thousand feet deep, into the elevated plateau between the main range and the foot-hills proper, and by means of these deep valleys have transformed this plateau into what are now really mountain masses, having an average altitude of about 8,000 feet, the eastern and western slopes of which are long longitudinal valleys, and the northern and southern ones the precipitous gorges cut by the streams. Between Boulder and the Main Range there are about four of these mountain ridges, the first, or that of the foot-hills proper, rising to a height of from 7,000 to 8,600 feet, the others slightly lower, having an altitude of about 7,500 to 8,000 feet. Among these Sugarloaf Mountain stands out prominently as an isolated peak a thousand feet higher, it being a por-

phyry dike, and thus weathering more slowly than the granitic peaks. This whole elevated plateau, cut by streams into what now appear as definite mountain ridges, we shall call the foot-hills, although the foot-hills proper are the ridges of sandstone at the edge of this granite plateau. The flora, however, is the same, save for a few ferns and other rock-plants which are confined to certain kinds of rocks, some to the limestones, others to the sandstones, still others to the granite.

The main range of mountains as well as the high plateau at its base is composed of granite, granite-porphyry, and granite-gneiss, gray or reddish in color. Dikes are frequent, either of pegmatite or of felsitic porphyry. When the uplift or uplifts occurred, which made the Rocky Mountains, the sedimentary rocks resting upon the basement of granite, were tilted until they stood nearly on end. The jagged crags of the foot-hills proper are, then, the ends of these sedimentary layers. Thus it happens, too, that the oldest beds lie next the granite, while the younger underlie the plains.

The oldest and lowest, that is, the one lying directly upon, or rather against the granite, is a layer of quartzite 550 feet thick, and of Algonkin age. This, however, is absent in front of Boulder and occurs in but two places in the county.

The next, and of Pennsylvanian (Carboniferous) age, is the red Fountain sandstone, 500 to 1,500 feet thick. In the immediate vicinity of Boulder it lies directly upon the granite. On the east slope of Green Mountain it hangs in five triangular blocks of about 500 feet in thickness at an angle of about 52° . These, called the Flat-irons, are each about 1,000 feet high and about 1,500 feet wide; the third Flat-iron, however, rises to an altitude of nearly 8,000 feet, or about 2,000 feet above the mesa. At

Boulder Cañon the red sandstone walls are vertical. These perpendicular sandstone crags are the most striking feature of the scenery of the foot-hills.

Lying next to the Fountain sandstone, and also of Pennsylvanian age, is the creamy Lyons sandstone, which is quarried in large amounts. It has a maximum thickness of almost 300 feet.

Next in order, and still of Pennsylvanian age, is the Lykins formation, about 800 feet thick and consisting of sandstones, sandy shales, and a little limestone. It is easily weathered and is consequently thickly covered with waste.

The Morrison formation occurs next, and consists of sandstone, clays, and limestone, and is a little less than 600 feet thick. It is of Jurassic age.

Then come various Cretaceous beds, the first of which, the "Dakota," is a firm sandstone of about 350 feet in thickness. Its resistance to weathering causes the characteristic hogback of the foot-hills, consisting of one, two, or even three distinct combs, or crags.

Then follow in succession the Benton shales, 500 feet thick; the Niobrara shales and limestones, 400 feet thick; the Pierre shales, 5,000 feet thick; the Fox Hills shales, 1,300 feet thick; and the Laramie beds, which are coal-bearing and about 115 feet thick. Lastly are the Quaternary deposits of alluvium and terrace gravels. The various shales have weathered and eroded rapidly and underlie the plain, while the more resistant beds next the granite persist as crags, while the high mesas at the base of the foot-hills are shale outliers left by stream-erosion and are really stream terraces.

The soil of the region, outside of the alluvium and terrace gravels, is granitic in the mountains, while in the foot-hills it is apt to be brick-red from the detritus of the red

sandstones. The soft Lykins formation yields a very red soil. The Jurassic and Cretaceous rocks have layers of sand and clay.

II. CLIMATE AND RAINFALL*

The climate of Boulder, however enjoyable it may be to human beings, can hardly be said to be highly favorable to plant-life. At least this is true of the foot-hills, the mesas, and the plains. The Main Range, however, is well watered, but here the high elevation and the low temperature repress plant-life. The montane and subalpine slopes have a dense vegetation, and yet even here the shallow soil and the rapid run-off of the water cause portions of them to have the aspect of deserts. A subalpine meadow has an opulent luxuriance; an adjoining slope may be gray with sage brush. In part the apparent thinness of vegetation in the mountains may be due to the superabundance of naked rock. In many portions of the Rockies the greater part of the surface has no soil whatever, and only a cranny-and-crevice vegetation is possible. The Rocky Mountains are new; their rocks are sharp and jagged; even lichens are rare on their surfaces. About Eldora and Arapahoe Peak, however, the rocks are beautifully rounded by glacial action.

In the summer of 1906 there were rains almost daily, many of them soaking rains, but their distribution was uneven and capricious. In general the rainfall decreases as the distance from the snowy range increases. The alpine and subalpine

*For the climatology of the region, consult the article by Professor Ramaley on the Climatology of the Mesas near Boulder, Univ. of Colo. Studies, 6, 19-35, also, the paper by Ramaley and Robbins on Redrock lake near Ward, Univ. of Colo. Studies, 6, 138-147.

regions receive most; the foot-hills less; the mesas receive some from every shower; the plains for five or six miles get a portion of the larger showers; but beyond that for several hundred miles good rains are very few. The summer of 1906 was exceptional,* for even the plains about Boulder seemed to receive more water than do many parts of the eastern United States in midsummer. When I left Boulder the third of September, the native vegetation for five or six miles out on the plain was as green as a prevailingly gray vegetation well can be; there was no sign of drouth, while when I reached Missouri and Iowa, the pastures were parched.

In fact what I shall remember most about Colorado is its exuberance of water. It courses down all the mountain cañons, roaring and bubbling and dashing into foam. Springs are frequent and of a pureness and coolness that make them perfect. On the plains everywhere that one goes, a ditch full to the brim runs beside one. From the top of Green Mountain a hundred lakes may be seen gleaming on the plain. It is plainly a land of abundant rain and water.

And yet why this feverish haste to irrigate the fields, why these ditches, these sluices, these storage-reservoirs? Why is land with a water-right worth several hundred dollars an acre, and land without one but five dollars? And why, to ask a still deeper question, why does nearly every kind of native plant have some means of conserving water, or some contrivance for preventing too rapid transpiration? Why do desert plants meet one at every hand: cacti, yuccae, sages, and xerophytic grasses? No, this region cannot be a land of abundant rain and water, in spite of the fact that I have never

*In 1906 the greatest rainfall was recorded (26.17 inches), while 1901 was the driest year (13.67 inches).

seen so much anywhere else, nor anywhere else have had such drenchings to the skin. It is a semi-arid land, parched and thirsty. And the farmer, whom I saw flooding his land the morning after an all night's pouring rain, knew from long experience that there could not be too much water. The rapid drainage, the light dry air, the fierce light of the high elevation, the hot sun, the soil unfitted for the retention of water, all these things parch and wither our cultural plants, for while the native vegetation has organs for storing water and for diminishing transpiration, the cultivated plants have none of these. Nevertheless for the native vegetation in 1906 there was ample water-supply; it grew with an almost incredible luxuriance, so much so that I found the measurements given in the manuals were often valueless for my purpose, as many of my plants were taller and larger than the books say that they grow. I was told that after the first of July there would be no botanizing as everything on the plains and foot-hills would dry up; but I remained till September first and the plants did not dry up, and I was able to collect over a thousand species in about two months and a half.

The following table, which I use by the kind permission of Professor Ramaley, will furnish the data requisite to an understanding of the temperature and rainfall of the region. The data holds true only for the city of Boulder.

Highest recorded temperature is 97 degrees, July 15, 1902.

Lowest recorded temperature is -20 degrees, January 8, 1902, and again February 20, 1905.

Greatest rainfall recorded, 26.17 inches, 1906.

Smallest rainfall recorded, 13.67 inches, 1901.

III ZONES OF VEGETATION*

There are six great zones of vegetation about Boulder, which, proceeding from east to west, are: A. The Zone of

*These zones of vegetation are practically those of Robbins (*Climatology and Vegetation in Colorado*, Bot. Gaz., 49, 256-280), who recognized (1) plains, (2) eastern lower foothills and mesas, (3) eastern upper foothills, 6,000 to 8,000 feet, (4) montane zone, (5) subalpine zone, (6) alpine zone. Professor Ramaley, however, would unite the mesas and foothills into one zone (*Univ. of Colo. Studies*, 5, 50-51).

the Plains, **CAMPESTRES**; B. The Zone of the Mesas, **MENSALES**; C. The Zone of the Foot-hills and Mountain Plateau, **SUBMONTANAE**; fourth, The Zone of the Lower Mountain Slopes, **MONTANAE**; fifth, The Zone of the Subalpine Mountain Slopes, **SUBALPESTRES**; sixth, The Zone of the Alpine Summits, **ALPESTRES**. Of these the Plains Flora, the Foot-hill Flora, the Montane Flora, the Subalpine Flora, and the Alpine Flora are primary, while that of the Mesas is a transition from the Flora of the Plains to the Flora of the Foot-hills. The Alpine corresponds to the Arctic Circumpolar vegetation, the Subalpine to the Hudsonian, the Montane to the Canadian, the Foot-hill and the Mesa to the Upper Transition, and that of the Plains to the Lower Transition with some Upper Sonoran forms.

A. **CAMPESTRES**

The plains are not so arid about Boulder as they are farther east. In fact after riding for hundreds of miles through a desert of dried up grass, it is with a feeling of inutterable joy that one sees this narrow ribbon of green from six to twelve miles wide at the foot of the mountains. This greenness and freshness is due mainly to two causes: First, this strip receives more rain than does the rest of the Great Plains. The clouds do not quite rain out before reaching the plains. These rains are, however, capricious. The clouds are narrow. The southern part of Boulder may receive a thorough drenching, the northern part may not have a drop. One Sunday there was a cloud-burst in Sunshine Cañon, farms and bridges were washed away; from three to five feet of water came dashing through the main street of Boulder, while it scarcely sprinkled where I was a half mile to the south. The second cause is the abundant irrigation.

The Plains Flora falls into five main societies: The Aquatic (**Aquatiles**); The Palustrous (**Palustres**); The Riparian (**Ripariae**); The Prairie Meadow, the plains flora proper, (**Campanales**); and the Alkali Flat (**Alkalinae**).

a. **Aquatiles.** The Aquatic Flora is found in lakes and streams. It consists of submerged or floating aquatics—pond-weeds, duckweeds, water-milfoils, hornworts, water starworts, besides various algae. It is seen best in Owen's lake and Boulder lake, which while about twenty feet deep, are very brackish. The slower streams also have aquatic plants, as do likewise the aqueous nuclei of swamps and swales. The following is a list of typical species:

<i>Potamogeton lonchites</i>	<i>L. minor</i>
<i>P. heterophyllum</i>	<i>Ceratophyllum demersum</i>
<i>P. foliosus</i>	<i>Callitricha palustris</i>
<i>P. pectinatus</i>	<i>C. bifida</i>
<i>P. Spirillus</i>	<i>Myriophyllum spicatum</i>
<i>Zanichellia palustris</i>	<i>Limosella aquatica</i>
<i>Lemna gibba</i>	

All the above species occur in the eastern United States.

b. **Palustres.** The Palustrous, or Swamp Flora is found in bogs, in swales, along ditches, and about the miry margins of ponds and lakes and streams. It consists of rushes, bulrushes, sedges, swamp grasses, sweet flags, cat-tails, stick-tights, swamp asters, water peppers, and various other plants. I have included here the whole subaquatic flora, since the formation is so slight that it is best treated as a whole without separation into amphibious, limose, paludose, and uliginose societies. The following are characteristic species:

<i>Equisetum arvense</i>	<i>Typha latifolia</i>
<i>E. laevigatum</i>	<i>Alisma Plantago</i>

<i>Sagittaria arifolia</i>	<i>R. salicifolius</i>
<i>Homalocenchrus oryzoides</i>	<i>Persicaria lapathifolia</i>
<i>Phalaris arundinacea</i>	<i>P. emersa.</i>
<i>Muhlenbergia racemosa</i>	<i>P. punctata</i>
<i>Alopecurus aristulatus</i>	<i>Crunocallis Chamissoi</i>
<i>Spartina cynosuroides</i>	<i>Ranunculus sceleratus</i>
<i>Poa triflora</i>	<i>eremogenes</i>
<i>Panicularia nervata</i>	<i>R. Macounii</i>
<i>P. Americana</i>	<i>Halerpestes Cymbalaria</i>
<i>P. borealis</i>	<i>Nasturtium</i>
<i>Cyperus inflexus</i>	<i>Nasturtium-aquaticum</i>
<i>Scirpus Americanus</i>	<i>Radicula calycina</i>
<i>S. lacustris</i>	<i>R. hispida</i>
<i>S. atrovirens pallidus</i>	<i>Hypericum majus</i>
<i>Eleocharis palustris</i>	<i>Lythrum alatum</i>
<i>E. glaucescens</i>	<i>Epilobium adenocaulon</i>
<i>E. acicularis</i>	<i>Cicuta occidentalis</i>
<i>E. acuminata</i>	<i>Berula erecta</i>
<i>Carex vulpinoidea</i>	<i>Verbena hastata</i>
<i>C. stipata</i>	<i>Phyla cuneifolia</i>
<i>C. stricta</i>	<i>Teucrium occidentale</i>
<i>C. lanuginosa</i>	<i>Scutellaria galericulata</i>
<i>Acorus Calamus</i>	<i>Prunella vulgaris</i>
<i>Heteranthera limosa</i>	<i>Stachys scopolorum</i>
<i>Juncus Balticus montanus</i>	<i>Lycopus lucidus</i>
<i>J. longistylis</i>	<i>L. Americanus</i>
<i>J. nodosus</i>	<i>Mentha spicata</i>
<i>J. Torreyi</i>	<i>M. Penardi</i>
<i>J. marginatus</i>	<i>Mimulus Geyeri</i>
<i>Iris Missouriensis</i>	<i>M. floribundus</i>
<i>Rumex occidentalis</i>	<i>Gratiola Virginiana</i>

<i>Lobelia syphilitica</i>	A. <i>Osterhoutii</i>
<i>Ludoviciana</i>	<i>Bidens vulgata</i>
<i>Iva xanthifolia</i>	B. <i>glaucescens</i>
<i>I. axillaris</i>	<i>Helenium montanum</i>
<i>Ambrosia trifida</i>	<i>Lactuca pulchella</i>
<i>Xanthium commune</i>	<i>L. spicata</i>
<i>Aster caeruleascens</i>	

It will be noted that all but a very few of the above species are common palustrous species of the eastern United States.

c. **Ripariae.** The Riparian Flora occurs along the banks of streams. It consists of trees, shrubs, and herbs. There are no trees nor shrubs proper on the Great Plains, except those that grow along the streams. Here occur various cottonwoods, box-elders, and willows. The herbs are partly marsh herbs and partly plants from the plains, especially grasses. The following are typical riparian species:

<i>Equisetum laevigatum</i>	<i>Betula fontinalis</i> (only near the foot-hills)
<i>Eatonia robusta</i>	
<i>Agropyron riparium</i>	<i>Urtica gracilis</i>
<i>Elymus Canadensis</i>	<i>Cardamine vallicola</i>
<i>E. robustus</i>	<i>Rulac Negundo</i>
<i>Populus Sargentii</i>	<i>R. Texanum</i>
<i>P. acuminata</i>	<i>Vitis vulpina</i>
<i>P. angustifolia</i>	<i>Pesedera vitacea</i>
<i>Salix amygdaloides</i>	<i>Solidago Pitcheri</i>
<i>S. exigua</i>	<i>S. Canadensis</i>
<i>S. luteosericea</i>	

d. **Campanales.** The Prairie Flora is that which is proper to the greater part of the plains region. In aspect it is a vast meadow, above which now and then a yucca rises with

its bayonet-like leaves and its large cluster of flowers. But this aspect changes according to the season of the year, nor is it uniform at any season. As various plants come into bloom, so is it tinged red or purple, white or yellow; here it is an upland meadow of broom-grasses with purplish leaves; there it is dark green with meadow-grasses; yonder it is white and hoar with sages. In early summer it is red, or purple, or blue with loco-weeds, beard-tongues, and thistles, yellow with golden asters, orange with cone-flowers and gaillardias, or white with Mexican poppies. In midsummer the psoraleas are numerous; here and there are large clumps of lupines; the tall porcupine grasses abound, and sunflowers rear their heads of gold. In late summer it is yellow with gumweeds of all kinds, with golden-rods and rabbit-brushes, or purple with blazing-stars and turkey-foot grasses. In autumn the gray sages put forth their inconspicuous flowers, the late composites ripen their achenes and whiten the landscape with their pappus. But the chief plants of this formation are those not seen—the little buffalo and mesquite grasses only a few inches high, but forming the turf of these vast plains. There are no shrubs proper in this flora. At most there are a few undershrubs and suffrutescent plants, such as roses, yuccas, and the like. It should be added that the vegetation of the moister portions of the plains differs, especially in aspect and also somewhat in species, from that of the drier portions; but while it is possible to distinguish these two elements of the flora in the extreme cases of moistness and dryness, yet in the greater part of the area the two vegetations mingle inextricably. I shall, however, arrange the plants typical of the Great Plains into two classes, **Humidae** and **Aridae**, although the two classes occur quite commonly together:

i. **Humidae.**

<i>Andropogon furcatus</i>	<i>Sophia intermedia</i>
<i>Panicum virgatum</i>	<i>Potentilla Hippiana</i>
<i>Agrostis alba</i>	<i>Drymocallis arguta</i>
<i>A. asperifolia</i>	<i>Rosa pratincola</i>
<i>Bouteloua oligostachya</i>	<i>Lupinus decumbens</i>
<i>Bulbilis dactyloides</i>	<i>L. decumbens argentatus</i>
<i>Koeleria cristata</i>	<i>Astragalus goniatus</i>
<i>Poa pratensis</i>	<i>Homalobus Salidae</i>
<i>P. triflora</i>	<i>Aragallus Lambertii</i>
<i>P. interior</i>	<i>A. patens</i>
<i>P. pseudopratensis</i>	<i>Psoralea tenuiflora</i>
<i>Festuca elatior</i>	<i>P. argophylla</i>
<i>Bromus marginatus latior</i>	<i>Petalostemon oligophyllus</i>
<i>B. Pumpellianus</i>	<i>P. purpureus</i>
<i>Agropyron pseudorepens</i>	<i>P. pubescens</i>
<i>A. occidentale</i>	<i>Poinsettia dentata</i>
<i>Hordeum jubatum</i>	<i>Malvastrum dissectum</i>
<i>Elymus Macounii</i>	<i>Oenothera strigosa</i>
<i>Carex marcida</i>	<i>Anogra rhizomata</i>
<i>C. scoparia</i>	<i>A. coronopifolia</i>
<i>C. athrostachya</i>	<i>Gaura parviflora</i>
<i>C. pratensis</i>	<i>G. coccinea</i>
<i>C. festucacea</i>	<i>G. glabra</i>
<i>Juncus interior</i>	<i>Asclepias speciosa</i>
<i>J. Arizonicus</i>	<i>Lithospermum canescens</i>
<i>J. confusus</i>	<i>Onosmodium occidentale</i>
<i>J. Dudleyi</i>	<i>Verbena bracteosa</i>
<i>Sisyrinchium angustifolium</i>	<i>V. ambrosifolia</i>
<i>Argemone intermedia</i>	<i>Salvia lanceolata</i>
<i>A. hispida</i>	<i>Physalis lanceolata</i>

<i>P. Virginiana</i>	<i>E. flagellaris</i>
<i>Androcera rostrata</i>	<i>Ratibida columnaris</i>
<i>Pentstemon unilateralis</i>	<i>Helianthus lenticularis</i>
<i>Gerardia Besseyana</i>	<i>H. grosseserratus</i>
<i>Grindelia serrulata</i>	<i>Gaillardia aristata</i>
<i>G. perennis</i>	<i>Artemisia gnaphalodes</i>
<i>Oligoneuron canescens</i>	<i>Cirsium megacephalum</i>
<i>Aster commutatus</i>	<i>C. ochrocentrum</i>
<i>Erigeron divergens</i>	<i>Agoseris glauca</i>

ii. Aridae.

<i>Schizachyrium scoparium</i>	<i>P. confusa</i>
<i>Andropogon chrysocomus</i>	<i>Festuca octoflora</i>
<i>Chrysopogon nutans</i>	<i>Agropyron molle</i>
<i>Aristida fasciculata</i>	<i>Hordeum pusillum</i>
<i>A. longiseta</i>	<i>Sitanion longifolium</i>
<i>Stipa comata</i>	<i>S. brevifolium</i>
<i>S. viridula</i>	<i>Elymus brachystachys</i>
<i>S. Nelsonii</i>	<i>Carex Douglasii</i>
<i>Muhlenbergia cuspidata</i>	<i>C. siccata</i>
<i>Sporobolus airoides</i>	<i>C. straminea</i>
<i>S. cryptandrus</i>	<i>Yucca glauca</i>
<i>S. heterolepis</i>	<i>Eriogonum effusum</i>
<i>S. asperifolius</i>	<i>Paronychia Jamesii</i>
<i>Agrostis hiemalis</i>	<i>Allionia linearis</i>
<i>Merathrepta spicata</i>	<i>Delphinium Penardii</i>
<i>Bouteloua hirsuta</i>	<i>Stanleya glauca</i>
<i>B. oligostachya</i>	<i>Kylophacos Shortianus</i>
<i>Munroa squarrosa</i>	<i>Amorpha nana</i>
<i>Eragrostis pectinacea</i>	<i>Psoralea tenuiflora</i>
<i>Poa crocata</i>	<i>Linum Lewisii</i>
<i>P. juncifolia</i>	

<i>Chamaesyce Fendleri</i>	<i>Gutierrezia longifolia</i>
<i>C. serpyllifolia</i>	<i>G. scoparia</i>
<i>Tithymalus Arkansanus</i>	<i>Chrysopsis villosa</i>
<i>Acerates viridiflora</i>	<i>C. hispida</i>
<i>A. angustifolia</i>	<i>Chrysothamnus pulcherrimus</i>
<i>Asclepias pumila</i>	<i>Sideranthus annuus</i>
<i>Evolvulus Nuttallianus</i>	<i>S. spinulosus</i>
<i>Lappula occidentalis</i>	<i>Solidago glaberrima</i>
<i>L. cupulata</i>	<i>S. nana</i>
<i>Cryptanthe crassisepala</i>	<i>Townsendia exscapa</i>
<i>Lithospermum breviflorum</i>	<i>Aster exiguis</i>
<i>Monarda pectinata</i>	<i>A. crassulus</i>
<i>Hedeoma hispida</i>	<i>A. polyccephalus</i>
<i>Physalis rotundata</i>	<i>Erigeron ramosus</i>
<i>Quincula lobata</i>	<i>Wyomingia cana</i>
<i>Pentstemon secundiflorus</i>	<i>Helianthus petiolaris</i>
<i>P. gracilis</i>	<i>H. pumilus</i>
<i>P. humilis</i>	<i>Thelesperma gracile</i>
<i>Orthocarpus luteus</i>	<i>Boebera papposa</i>
<i>Plantago Purshii</i>	<i>Artemisia dracunculoides</i>
<i>Ambrosia psilostachya</i>	<i>A. Brittonii</i>
<i>Gaertneria tomentosa</i>	<i>Senecio Riddellii</i>
<i>Kuhnia Hitchcockii</i>	<i>S. multicapitatus</i>
<i>K. glutinosa</i>	<i>S. spartioides</i>
<i>Laciaria punctata</i>	<i>Cirsium undulatum</i>

e. **Alkalinae.** The best examples of the Flora of the Alkali Flats occur in the vicinity of Owen's lake and Boulder lake, where large tracts are white as snow with alkali. The plants are mainly succulent chenopods, but a few other plants also occur. The following species are characteristic:

<i>Distichlis stricta</i>	<i>Polygonum buxiforme</i>
<i>Puccinellia airoides</i>	<i>Chenopodium rubrum</i>

<i>Monolepis Nuttalliana</i>	<i>Iva axillaris</i>
<i>Atriplex carnosa</i>	<i>Chrysothamnus graveolens</i>
<i>A. argentea</i>	<i>C. pulcherrimus</i>
<i>Dondia depressa</i>	<i>Solidago gilvocanescens</i>
<i>Sophora sericea</i>	

B. MENSALES*

The Flora of the Mesas is a transitional flora; the mesas have most of the plants of the plains and in addition many of the plants of the foot-hills. There are, however, a considerable number of species, which are peculiar to the mesas. These mesas are flat tablelands rising abruptly a hundred feet or so above the plains in successive terraces. The altitude of the plains in Boulder County is from 5,000 to 5,500 feet. The lowest mesa, at an altitude of about 5,600 feet, has the flora of the plains, but at the next mesa, at an altitude of 5,700 feet, the flora begins to change, and from then on to the foot of the crags, 6,000 feet, the plains plants gradually tend to disappear and the foot-hill flora to come in. The highest mesas are so filled with waste from landslips from the crags, that they may be said to be an integral part of the foot-hills. And so, too, the streams have made deep cañons through the mesas, the flora of which is not so very unlike that of the cañons of the foot-hills. West of Marshall there is a high bog on the mesa, but as its plants differ in no wise from the bog plants of the plains, it will be dismissed with this notice.

Six plant-societies are to be found upon the mesas: a. The meadow (**Pratenses**), which differs little from the plains meadow, although certain mountain species, such as the Mari-

posa lily, the painted cups, and the wool-joints are present. b. The cactus mesa (**Spinosae**). c. The Yucca mesa (**Ensi-formes**). d. The wooded mesa (**Sylvestres**). e. The brush mesa (**Arbustales**). f. The mesa cañon (**Vallicolae**).

a. **Pratenses.** The flora of the mesa meadow is composed of an admixture of plants both from the plains and the foot-hills. Typical plants are:

<i>Sorghastrum nutans</i>	<i>Calochortus Gunnisonii</i>
<i>Stipa comata</i>	<i>Comandra pallida</i>
<i>S. viridula</i>	<i>Eriogonum alatum</i>
<i>Bouteloua hirsuta</i>	<i>E. flavum</i>
<i>B. oligostachya</i>	<i>E. umbellatum</i>
<i>Atheropogon curtipendulus</i>	<i>Polygonum Douglasii</i>
<i>Koeleria cristata</i>	<i>Silene antirrhina</i>
<i>Poa triflora</i>	<i>Lychnis Drummondii</i>
<i>P. interior</i>	<i>Delphinium Penardii</i>
<i>P. pseudopratensis</i>	<i>D. camporum</i>
<i>P. juncifolia</i>	<i>D. Nelsonii</i>
<i>P. confusa</i>	<i>Anemone cylindrica</i>
<i>Festuca octoflora</i>	<i>Pulsatilla hirsutissima</i>
<i>Agropyron tenerum</i>	<i>Argemone intermedia</i>
<i>A. pseudorepens</i>	<i>Potentilla effusa</i>
<i>Elymus brachystachys</i>	<i>Drymocallis fissa</i>
<i>E. villiflorus</i>	<i>Lupinus Plattensis</i>
<i>Carex marcida</i>	<i>L. decumbens</i>
<i>C. pratensis</i>	<i>Geoprumnon succulentum</i>
<i>C. straminea</i>	<i>Astragalus nitidus</i>
<i>C. straminiformis</i>	<i>A. goniatus</i>
<i>C. Pennsylvanica vespertina</i>	<i>Tium Drummondii</i>
<i>C. umbellata brevirostris</i>	<i>Aragallus Lambertii</i>
<i>Tradescantia Universitatis</i>	<i>A. sericeus</i>
<i>Yucca glauca</i>	<i>Psoralea tenuiflora</i>

<i>P. argophylla</i>	<i>P. gracilis</i>
<i>Geranium Fremontii</i>	<i>P. humilis</i>
<i>Linum Lewisii</i>	<i>Castilleja linariaefolia</i>
<i>Tithymalus philorus</i>	<i>Campanula petiolata</i>
<i>Nuttallia multiflora</i>	<i>Gutierrezia longifolia</i>
<i>N. stricta</i>	<i>G. scoparia</i>
<i>Epilobium paniculatum</i>	<i>Chrysopsis resinolens</i>
<i>Gayophytum intermedium</i>	<i>Solidago pallida</i>
<i>Meriolix serrulata</i>	<i>Townsendia grandiflora</i>
<i>Gaura parviflora</i>	<i>Rudbeckia flava</i>
<i>Gilia candida</i>	<i>Ratibida columnaris</i>
<i>G. pinnatifida</i>	<i>Helianthus subrhomboideus</i>
<i>G. sinuata</i>	<i>Gaillardia aristata</i>
<i>Collomia linearis</i>	<i>Artemisia dracunculoides</i>
<i>Phacelia heterophylla</i>	<i>A. Forwoodii</i>
<i>Oreocarya virgata</i>	<i>A. frigida</i>
<i>Mertensia linearis</i>	<i>A. Brittonii</i>
<i>M. lanceolata</i>	<i>Senecio Plattensis</i>
<i>Pentstemon unilateralis</i>	<i>S. Nelsonii</i>
<i>P. secundiflorus</i>	<i>S. Fendleri</i>

b. **Spinosae.** The vegetation of the cactus mesa consists of a few species of cacti, of the prickly *Ceanothus Fendleri*, and a few other xerophytic plants and undershrubs. The principal cacti are:

<i>Echinocereus viridiflorus</i>	<i>O. polyacantha</i>
<i>Opuntia mesacantha</i>	<i>O. fragilis</i>
<i>O. rhodantha</i>	<i>O. Greenei</i>

c. **Ensiformes.** The best example of the Yucca mesa occurs near the entrance of Bear Cañon. There the ground is practically denuded, and only sparse clumps of Yuccas and

bunch-grasses occupy the ground. The two species of importance are *Yucca glauca* and *Eriocoma cuspidata*.

d. *Sylvestres*. A good example of the wooded mesa lies immediately back of the Chautauqua grounds. There the bull pine has descended from the foot-hills and taken possession of the mesa. Besides the bull pine, *Pinus scopulorum*, the low juniper, *Juniperus Sibirica*, is of rare occurrence. Of herbs the most noteworthy is *Arnica pedunculata*, which is frequent under the pines. I found also only there *Centunculus minimus*, perhaps the only known station of this plant in Colorado, since it is not included in Rydberg's Flora of Colorado. It is growing with *Linaria Canadensis*, which is likewise an eastern plant.

e. *Arbustales*. The brush mesa assumes various forms. Ordinarily some one species is in control. Occasionally it consists of various haws, as at the entrance of Gregory Cañon, or of a thicket of juneberries, wax-currants, and skunk-bushes. South of Bluebell Cañon is a mesa covered with the peculiar mountain mahogany. Wild cherries and plums are frequent, and the hackberry occasional in these shrubby thickets. The principal species are:

<i>Celtis reticulata</i>	<i>C. erythropoda</i>
<i>Ribes pumilum</i>	<i>Prunus Americana</i>
<i>R. longifolium</i>	<i>P. melanocarpa</i>
<i>Oreobatus deliciosus</i>	<i>Toxicodendron Rydbergii</i>
<i>Batidea laetissima</i>	<i>Schmaltzia trilobata</i>
<i>Cercocarpus parvifolium</i>	<i>Ceanothus Fendleri</i>
<i>Rosa Sayi</i>	<i>C. mollissimus</i>
<i>Amelanchier oreophila</i>	<i>C. subsericeus</i>
<i>Crataegus occidentalis</i>	<i>Symporicarpos occidentalis</i>
<i>C. Coloradensis</i>	

Of herbs the vetches and vetchlings are the most important:

Vicia sparsifolia

V. producta

V. dissitifolia

Lathyrus leucanthus

V. oregana

f. *Vallicolae.* The mesa cañon has a bewildering diversity of floral elements, now consisting of thickets of haws with extremely vicious thorns, wild briars, the long-beaked hazel, and dwarf maples, now with a fontinal vegetation strikingly like our own Carolinian. One little gulch at the base of Flagstaff Hill has a vegetation composed quite wholly of eastern plants. Here occur *Phragmites Phragmites*, *Sanguisorba Marilandica*, *Steironema ciliatum*, *Veronica Americana*, *Eupatorium maculatum*, and a form of *Aplos Aplos*, the last of which was not known to occur west of eastern Kansas previous to this collection. Since the streams have cut deeply into the surface, the cañon of the mesa resembles greatly the cañon of the foot-hills. There are riparian, rupestrine, clivose, and fontinal elements compressed within the space of a few feet. Mountain forms follow these streams often for some distance into the plain. And yet the facies of the flora is distinctly eastern. Here are haws, hazels, maples, grapes, wild cherries, willows, cottonwoods, dogwoods, nine-barks. The herbs, too, have an eastern look—sweet cicelies, false Solomon's seals, water-leafs, fragile ferns, avens, bog-orchids. It is true that a closer examination reveals the fact that many of these plants belong to species which are strictly western, yet the fact remains that there is little in the vegetation that impresses as strange, one who is familiar only with the eastern flora, while all about him in plain, mesa, foot-hill, and mountain are utterly unfamiliar types of vegetation. So in this narrow

zone of gulches and cañons is alone to be found the exact analogue of the Carolinian flora. The following are the important species:

<i>Filix fragilis</i>	<i>Oreobatus deliciosus</i>
<i>Phragmites</i>	<i>Phragmites</i>
<i>Carex festiva</i>	<i>Potentilla Pennsylvanica</i>
<i>Allium Nuttallii</i>	<i>strigosa</i>
<i>A. Geyeri</i>	<i>Geum scopulorum</i>
<i>A. reticulatum</i>	<i>Rosa Sayi</i>
<i>Vagnera stellata</i>	<i>Amelanchier oreophila</i>
<i>Nemexia lasioneuron</i>	<i>Crataegus Coloradensis</i>
<i>Limnorchis viridiflora</i>	<i>C. occidentalis</i>
<i>L. laxiflora</i>	<i>C. erythropoda</i>
<i>Corallorrhiza Corallorrhiza</i>	<i>C. Doddsii</i>
<i>Populus Sargentii</i>	<i>C. Coloradooides</i>
<i>P. acuminata</i>	<i>Prunus Americana</i>
<i>P. angustifolia</i>	<i>P. Pennsylvanica</i>
<i>Corylus rostrata</i>	<i>P. melanocarpa</i>
<i>Parietaria Pennsylvanica</i>	<i>Thermopsis divaricarpa</i>
<i>P. obtusa</i>	<i>Amorpha fruticosa</i>
<i>Humulus lupulus Neo-</i>	<i>Vicia oregana</i>
<i>Mexicanus</i>	<i>V. producta</i>
<i>Cerastium occidentale</i>	<i>Aplos Apios Boulderensis</i>
<i>Ranunculus abortivus</i>	<i>Geranium Parryi</i>
<i>Thalictrum purpurascens</i>	<i>Toxicodendron Rydbergii</i>
<i>Sedum stenopetalum</i>	<i>Acer glabrum</i>
<i>Heuchera parvifolia</i>	<i>Rulac Negundo</i>
<i>Ribes pumilum</i>	<i>R. Texanum</i>
<i>R. longifolium</i>	<i>Vitis vulpina</i>
<i>Opulaster intermedius</i>	<i>Pesedera vitacea</i>
<i>O. Ramaleyi</i>	<i>Calceolaria linearis</i>
	<i>Circaeа alpina</i>

<i>Aralia nudicaulis</i>	<i>Mertensia lanceolata</i>
<i>Svida stolonifera</i>	<i>Dracocephalum parviflorum</i>
<i>Sanicula Marilandica</i>	<i>Mimulus Hallii</i>
<i>Osmorrhiza longistylis</i>	<i>Veronica Americana</i>
<i>O. obtusa</i>	<i>Galium Vaillantii</i>
<i>Ligusticum Porteri</i>	<i>G. boreale</i>
<i>Heracleum lanatum</i>	<i>G. flaviflorum</i>
<i>Steironema ciliatum</i>	<i>Viburnum Lentago</i>
<i>Collomia linearis</i>	<i>Ambrosia trifida</i>
<i>Hydrophyllum Fendleri</i>	<i>Eupatorium maculatum</i>
<i>Macrocalyx Nyctelea</i>	

C. SUBMONTANAE

The Foot-hill Flora covers not only the true foot-hills of the sandstone crags, but also the lower part of the mountain plateau. The flora is rich but monotonous. In most places the vegetation is thin; it is mainly a forest, but the trees are strewn but sparsely over the steep slopes. The amount of naked rock is very great. The altitude ranges from 5,800 to 8,600 feet. Some of the main streams, such as Boulder creek, have cut down to about 5,500 feet. Directly west of Boulder, and lying between Boulder and Gregory Cañons, is Flagstaff Hill with an altitude of about 6,500 feet. Southwest of Boulder is Green Mountain, lying between Gregory and Bear Cañons and having an altitude of 8,100 feet. South of Green Mountain is Bear Mountain, which attains a height of 8,600 feet, and is the loftiest peak in the first range of foot-hills in the vicinity of Boulder.

The Foot-hill Flora merges rather abruptly into that of the mesas at the foot of the crags, and melts insensibly into the Subalpine Flora as it approaches the Main Range. It reaches its maximum development between an altitude of 6,500 and

7,000 feet. Below 6,500 feet there occur still many species belonging to the Great Plains; above 7,000 feet there is a rapid thinning out of species, and subalpine species become occasional, although it is not rare for such species in cold situations to go down to the 6,000 foot level. Yet at the summit of Green Mountain (8,100 feet) I found the flora still consisting in the main of the genuine foot-hill species. The Foot-hill Flora may be gathered into four main societies: a. The wooded slope (*Sylvestres*). b. The foot-hill meadow (*Pratenses*). c. The foot-hill cañon (*Vallicolae*). d. The crevice and cranny vegetation of the rocks (*Rimosae*).

a. *Sylvestres*.* The wooded slope society consists quite purely of bull pine and Douglas spruce, with now and then a few trees of other species of pine, and spruce, and fir. The trees stand usually at wide intervals, oftenest in rows, where some fault in the rock enables them to get a secure foothold. Occasionally on the north slopes, which are moister than any other, the trees stand in such close formation that it is almost impossible to make one's way through them. Ordinarily it is the Douglas spruce that behaves in this way, since the bull pine prefers a more open formation. Often two rather dis-

*Young (Bot. Gaz. **44**, 321-352) finds the following forest associations about Boulder: 1. *Populus occidentalis*—*Salix fluviatilis*, riparian upon the plains, but extending somewhat up the cañons. 2. *Populus angustifolia*—*Salix Nuttallii*, riparian in the foothills. 3. *Pinus scopulorum*, *sylvan* on the dry slopes of the foothills. 4. *Pinus Murrayana*, *sylvan* on the dry mountain sides. 5. *Abies flexilis*, dry mountain slopes up to timber line. 6. *Pseudotsuga*—*Picea Engelmanni*, lower cañons (submontane and montane). 7. *Picea Engelmanni*—*Abies lasiocarpa*, upper cañons (high montane and subalpine to timber line). 8. Aspen society, throughout (north slopes at low altitudes, all slopes higher altitudes).

tinct forms of forest are discernible, the one of bull pine, the other of Douglas spruce; at other times the two are mixed. The Douglas spruce is at its best in moist ravines, and ascends to timber-line on the mountains, while the bull pine seldom gets above 9,000 feet. The following are characteristic species:

<i>Botrychium Virginianum</i>	<i>Atragene occidentalis</i>
<i>Pteridium aquilinum</i>	<i>Ranunculus abortivus</i>
<i>pubescens</i>	<i>R. micrantha</i>
<i>Pinus scopulorum</i>	<i>Cyrtorrhyncha ranunculina</i>
<i>P. Murrayana</i> (rare)	<i>Odostemon repens</i>
<i>Apinus flexilis</i> (rare)	<i>Erysimum Cockerellianum</i>
<i>Picea Parryana</i>	<i>Bosseckia parviflora</i>
<i>Pseudotsuga mucronata</i>	<i>Oreobatus deliciosus</i>
<i>Oryzopsis micrantha</i>	<i>Batidea laetissima</i>
<i>Muhlenbergia gracilis</i>	<i>Potentilla Hippiana</i>
<i>Melica bella</i>	<i>Amelanchier oreophila</i>
<i>Carex Deweyana</i>	<i>Sorbus scopulina</i> (rare)
<i>Toxicoscordion falcatum</i>	<i>Thermopsis divaricarpa</i>
<i>Vagnera racemosa</i>	<i>T. pinetorum</i>
<i>V. amplexicaulis</i>	<i>Tium alpinum</i>
<i>Piperia Unalaschensis</i>	<i>Homalobus tenella</i>
<i>Peramium ophioides</i>	<i>H. decumbens</i>
<i>Populus tremuloides</i>	<i>Lathyrus leucanthus</i>
<i>Betula papyrifera</i>	<i>Xanthoxalis stricta</i>
<i>Andrewsii</i>	<i>Ceanothus velutinus</i>
<i>Chenopodium Fremontii</i>	<i>Viola vallicola</i>
<i>Blitum capitatum</i>	<i>V. Canadensis Rydbergii</i>
<i>Actaea arguta</i>	<i>Lepargyraea Canadensis</i>

<i>Sambucus microbotrys</i>	<i>Hieracium albiflorum</i>
<i>Linnaea Americana</i>	<i>H. Fendleri</i>
<i>Symporicarpos occidentalis</i>	<i>Agoseris rostrata</i>

b. **Pratenses.** The foot-hill meadow is not very unlike the mesa meadow; the species are in part the same, but there is no sharp line between the flora of the foot-hill forest and the foot-hill meadow, on account of the openness of the former. Only where the forest is dense enough to have a truly sylvan floor, are the light-loving plants absent. The foot-hill meadow society includes various grasses and certain herbs, such as painted-cups, fleabanes, Mariposa lilies, anemones, gaillardias, and the like. The following are the characteristic grasses and sedges:

<i>Stipa comata</i>	B. <i>Pumpellianus</i>
<i>S. viridula</i>	<i>Agropyron Vaseyi</i>
<i>S. Nelsonii</i>	A. <i>Richardsoni</i>
<i>S. Scribneri</i>	A. <i>violaceum</i>
<i>Calamagrostis purpurascens</i>	A. <i>pseudorepens</i>
<i>Koeleria cristata</i>	<i>Elymus ambiguus</i>
<i>Poa platyphylla</i>	E. <i>strigosus</i>
<i>P. crocata</i>	E. <i>villiflorus</i>
<i>P. longiligula</i>	<i>Carex marcida</i>
<i>P. longipedunculata</i>	C. <i>Douglasii</i>
<i>Festuca brachyphylla</i>	C. <i>festiva</i>
<i>F. confinis</i>	C. <i>petasata</i>
<i>Bromus lanatipes</i>	C. <i>pratensis</i>
<i>B. Richardsonii</i>	C. <i>siccata</i>

c. **Vallicolae.** The foot-hill cañon society consists of dense thickets of hazel, dwarf birch, willows, dogwoods, alders, and the like. About springs and along small rills is found a brief fontinal vegetation, the most delicate of all the plant-groups—mosses, liverworts, ferns, tway-blades, adder's-mouths, twisted-stalks, mountain lilies, shooting stars, cresses, sedges, and bog-orchids. The foot-hill cañon flora differs from

the mesa cañon principally in the absence of the chaparral element, the haws and wild plums being absent. Most of the remaining shrubs and arborescent plants are identical—the dwarf maple, the birch, the dogwood, the beaked hazel, the wild cherries, and the cottonwoods. The following are the chief species:

<i>Equisetum laevigatum</i>	<i>Populus Sargentii</i>
<i>Cinna latifolia</i>	<i>P. angustifolia</i>
<i>Avena striata</i>	<i>Salix caudata</i>
<i>Eatonia Pennsylvanica</i>	<i>S. perrostrata</i>
<i>Poa triflora</i>	<i>S. Bebbiana</i>
<i>Panicularia nervata</i>	<i>Betula fontinalis</i>
<i>P. Holmii</i>	<i>Alnus tenuifolia</i>
<i>Carex tenella</i>	<i>Corylus rostrata</i>
<i>C. Hoodii</i>	<i>Crunocallis Chamissoi</i>
<i>C. festiva</i>	<i>Clematis ligusticifolia</i>
<i>C. aurea</i>	<i>Ranunculus reptans</i>
<i>Juncus Balticus montanus</i>	<i>R. abortivus</i>
<i>Juncoides parviflorum</i>	<i>Thalictrum Fendleri</i>
<i>Allium Geyeri</i>	<i>Thlaspi Nuttallii</i>
<i>A. reticulatum</i>	<i>T. Coloradense</i>
<i>Lilium Philadelphicum</i> montanum	<i>Draba streptocarpa</i>
<i>Vagnera stellata</i>	<i>Ribes Purpusi</i>
<i>Streptopus amplexifolius</i>	<i>Opulaster intermedius</i>
<i>Disporum majus</i>	<i>O. Ramaleyi</i>
<i>Limnorchis viridiflora</i>	<i>O. glabratus</i>
<i>L. laxiflora</i>	<i>O. monogynus</i>
<i>Ibidium Romanzoffianum</i> strictum	<i>Rubus triflorus</i>
<i>Ophrys borealis</i>	<i>Fragaria bracteata</i>
<i>Acroanthus monophylla</i>	<i>Geum strictum</i>
	<i>G. Oregonense</i>
	<i>Rosa Macounii</i>

<i>R. Fendleri</i>	<i>Mertensia punctata</i>
<i>R. aciculata</i>	<i>M. viridula</i>
<i>R. Maximiliani</i>	<i>M. lanceolata</i>
<i>Prunus Pennsylvanica</i>	<i>Collinsia tenella</i>

d. **Rimosae.** The crevice and cranny vegetation of the rocks consists of lichens, rupestrine ferns, alum roots, orpines, selaginellas, and many shrubs, such as the Jamesia, the wax-currant, juneberries, flowering raspberries, salmonberries, roses, and gooseberries. The Rocky Mountain red cedar stands often in grotesquely gnarled and twisted forms at the verges of the crags. It may be remarked that this flora is of prime importance, since so large a portion of the region consists of naked rock. In fact the foot-hill flora in general is more or less rupestrine in character. There is gathered here only the strictly rock-loving vegetation. These are typical species :

<i>Polypodium hesperium</i>	<i>W. oregana</i>
<i>Dryopteris Filix-mas</i>	<i>Filix fragilis</i>
<i>Woodsia scopulina</i>	<i>Cryptogramma acrostichoides</i>

<i>Cheilanthes Féei</i>	<i>Edwinia Americana</i>

D. MONTANAE

The Montane Flora begins at about the 8,000 foot level, though, as we have seen, on the isolated peaks of the first range of foot-hills the Foot-hill Flora still largely persists even to the summits, or some 600 feet higher. The Montane Flora extends upward to the approximate altitude of 10,000 feet. It is for the most part a forest of lodgepole pine. The zone includes the slopes of the main range below 10,000 feet, and also the higher portions of the adjacent mountain plateau. Some of its characteristic species, indeed, tend to spread throughout the mountain plateau, and in cold valleys may even go as low as 6,000 feet. The montane as also the subalpine slopes have abundant rainfall, showers occurring nearly every afternoon. At least this was true of the summer of 1906. The ground is often boggy and springy, and cold with snow water. On north and east slopes the snow remains in the higher and deeper valleys till midsummer;

hence the flowering season is short. In a period of about six weeks, from the middle of July to the first of September, the main part of the vegetation in these cool valleys is brought to perfection. Species, which on the mesas had bloomed before my arrival on the eighteenth of June, I found just in blossom at Eldora on the mountainsides August thirty-first.

I saw too little of the Montane Flora, since I spent only six days in collections, where it occurs, to be able to separate it definitely into plant-societies. But the chief types as I saw it at Ward, Eldora, and Glacier lake, will be briefly described. In the Montane Subzone there are, perhaps, six tolerably distinct types of vegetation-association: a. The montane forest (**Sylvales**). b. The montane bog (**Paludosae**). c. The montane lake (**Lacustres**). d. The arid brush slope (**Arbustales**). e. The montane meadow (**Pratenses**). f. The montane stream (**Amnicolae**).

a. **Sylvales.** The montane sylva consists of a close forest of lodgepole pine interspersed with some bull pine and Rocky Mountain white pine, as well as with the various spruces and firs. The spruces and firs occur principally in the valleys, while on the barren ridges, the pines assume a scrub-like form. On these ridges occur many peculiar species of dwarf herbs—golden rods, asters, fleabanes, cat's-feet, actinellas, groundsels. A few of the more characteristic species of the montane sylva are the following:

<i>Pinus scopulorum</i>	<i>Pseudotsuga mucronata</i>
<i>P. Murrayana</i>	<i>Abies lasiocarpa</i>
<i>Apinus flexilis</i>	<i>Calamagrostis purpurascens</i>
<i>Picea Engelmanni</i>	<i>Trisetum subspicatum</i>
<i>P. Parryana</i>	<i>Avena striata</i>

<i>Poa longipedunculata</i>	<i>Symporicarpos oreophilus</i>
<i>Agropyron Arizonicum</i>	<i>Chrysopsis Bakeri</i>
<i>A. andinum</i>	<i>Oreochrysum Parryi</i>
<i>A. violaceum</i>	<i>Solidago decumbens</i>
<i>Carex Geyeri</i>	<i>S. oreophila</i>
<i>Cytherea bulbosa</i>	<i>Eucephalus Engelmannii</i>
<i>Populus tremuloides</i>	<i>Aster Underwoodii</i>
<i>Aquilegia coerulea</i>	<i>A. Porteri</i>
<i>Delphinium occidentalis</i>	<i>A. Andrewsii</i>
<i>Erysimum Cockerellianum</i>	<i>Erigeron multifidus</i>
<i>Draba streptocarpa</i>	<i>E. trifidus</i>
<i>D. aurea</i>	<i>E. glandulosus</i>
<i>Ribes lenticum</i>	<i>E. superbus</i>
<i>Potentilla concinna</i>	<i>E. macranthus</i>
<i>Fragaria glauca</i>	<i>E. speciosus</i>
<i>Thermopsis divaricarpa</i>	<i>E. subtrinervis</i>
<i>Tium alpinum</i>	<i>E. eximius</i>
<i>Atelophragma elegans</i>	<i>Antennaria concinna</i>
<i>Aragallus deflexus</i>	<i>A. parvifolia</i>
<i>Conioselinum scopulorum</i>	<i>A. aprica</i>
<i>Eutoca sericea</i>	<i>Anaphalis subalpina</i>
<i>Pentstemon oreophilus</i>	<i>Tetraneuris lanigera</i>
<i>P. alpinus</i>	<i>Artemisia silvicola</i>
<i>Castilleja integra</i>	<i>Senecio pudicus</i>
<i>C. confusa</i>	<i>S. lanatifolius</i>
<i>C. lauta</i>	<i>S. ambrosioides</i>
<i>C. lancifolia</i>	<i>Cirsium Coloradense</i>
<i>C. sulphurea</i>	<i>Hieracium albiflorum</i>
<i>Pedicularis racemosa</i>	<i>Agoseris Leontodon</i>
<i>P. Grayi</i>	<i>A. humilis</i>

b. **Paludosae.** The montane bog is characterized by the presence of the quaking aspen and other Hudsonian plants.

The aspen, however, is not confined to the bogs, but forms groves in slight depressions throughout the mountains, and occurs on Green Mountain not much, if any, above 6,000 feet. The aspen occurs in the drier portions of the bogs along with other uliginose plants. The bog vegetation is very rich in species. A fine specimen of the montane bog is found just west of Eldora at an elevation of 8,600 feet. The following are characteristic species:

<i>Muhlenbergia simplex</i>	<i>Betula glandulosa</i>
<i>M. filiformis</i>	<i>Rumex densiflorus</i>
<i>Phleum alpinum</i>	<i>Polygonum confertiflorum</i>
<i>Cinna latifolia</i>	<i>Alsine longifolia</i>
<i>Trisetum montanum</i>	<i>Aconitum Columbianum</i>
<i>T. subspicatum</i>	<i>A. insigne</i>
<i>Merathrepta intermedia</i>	<i>A. ochroleucum</i>
<i>Poa reflexa</i>	<i>Ranunculus cardiophyllus</i>
<i>P. Vaseyana</i>	<i>R. inamoenus</i>
<i>Carex canescens</i>	<i>R. micropetalus</i>
<i>C. occidentalis</i>	<i>R. pedatifidus</i>
<i>C. ebenea</i>	<i>Pectiantia pentandra</i>
<i>C. Goodenovii</i>	<i>Micranthes arguta</i>
<i>C. utriculata</i>	<i>Parnassia fimbriata</i>
<i>Juncus Saximontanus</i>	<i>Dasiphora fruticosa</i>
<i>Juncoides parviflorum</i>	<i>Sidalcea candida</i>
<i>Limnorchis stricta</i>	<i>Viola palustris</i>
<i>L. borealis</i>	<i>V. pallens</i>
<i>Ibidium strictum</i>	<i>Epilobium adenocaulon</i>
<i>Populus tremuloides</i>	<i>E. rubescens</i>
<i>Salix Scouleriana</i>	<i>E. anagallidifolium</i>
<i>S. brachycarpa</i>	<i>Oxypolis Fendleri</i>
<i>S. glaucops</i>	<i>Dodecatheon philoscia</i>
<i>S. chlorophylla</i>	<i>Anthopogon barbellatus</i>

<i>Amarella plebeja</i>	<i>E. jucundus</i>
<i>Pleurogyne fontana</i>	<i>Gnaphalium palustre</i>
<i>Allocarya scopulorum</i>	<i>Artemisia biennis</i>
<i>Mimulus puberulus</i>	<i>Senecio triangularis</i>
<i>Veronica Wormskjoldii</i>	<i>S. admirabilis</i>
<i>Elephantella Groenlandica</i>	<i>S. cymbalariaoides</i>
<i>Erigeron minor</i>	<i>Crepis denticulata</i>
<i>E. lonchophyllus</i>	

c. **Lacustres.*** The montane lacustrine and marginal vegetation I saw only at Glacier lake. Besides some aquatic grasses, notably *Deschampsia caespitosa*, there occur the floating bur-reed, *Sparganium angustifolium*, the white water-crowfoot, *Batrachium flaccidum*, and the aquatic mudwort, *Limosella aquatica*. The yellow pond-lily, *Nymphaea polysepala*, grows also in some of these high lakes.

d. **Arbustales.** The arid brush slope vegetation consists quite wholly of the true sage-brush, *Artemisia tridentata*. This community is rare in the region, and I have seen it only between Glacier lake and Eldora near Bluebird mine.

e. **Pratenses.** The montane meadow is truly a paradise of flowers. It is not uncommon to see acre upon acre of meadow glorious with purple and blue and red and yellow and white and scarlet. Never have I seen flowers anywhere else in such profusion nor with such gorgeous hues—monkshoods, larkspurs, louseworts, milk-vetches, locoweeds, squawweeds, death-camasses, grasses, rushes, sedges, and blue-eyed grasses. The following species are typical:

<i>Sisyrinchium alpestre</i>	<i>Arnica subplumosa</i>
<i>S. angustifolium</i>	<i>Senecio scopulinus</i>
<i>Delphinium occidentale</i>	<i>S. chloranthus</i>
<i>Aconitum porrectum</i>	<i>S. pseudauraeus</i>
<i>A. Columbianum</i>	<i>Agoseris parviflora</i>
<i>A. insigne</i>	<i>A. laciniata</i>
<i>A. ochroleucum</i>	<i>A. humilis</i>

There is, of course, a montane rupestrine society, *Rupestres*, but I am too little acquainted with it to be able to give an adequate account of it. I, however, noted the

austromontane saxifrage, *Leptasea austromontana*, and the glandular phacelia, *Phacelia glandulosa*. There is also a brief campestrian vegetation about Eldora, reproducing, in other species, the facies of the Great Plains, **Campestres**; I may instance as species: *Grindelia subalpina*, *G. Eldorae*, *Chrysanthemus Parryi*, and *C. elegans*.

f. **Amnicolae.** The montane stream vegetation is seen at its best about small rills. Along the larger streams it assumes a typical riparian aspect, much like that of the cañon society of the foot-hills along the large streams. Since the water in these streams is very cold inasmuch as they are fed from the wasting snows of the alpine valleys, the montane vegetation can scarcely be distinguished from the true subalpine vegetation of the streams. The list of species will, therefore, be deferred until the subalpine stream vegetation is reached.

E. SUBALPESTRES

The Subalpine zone extends from about the 10000 foot level to timberline, and hence coincides with the upper slopes of the Main Range. It is in the main a forest of Engelmann spruce, with occasional high meadows and bogs. Lakes, too, are numerous.

I have personal knowledge of only two formations: a. The subalpine forest (**Sylvales**). b. The subalpine stream (**Amnicolae**).

a. **Ses. Ival.** The subalpine forest consists mainly of Engelmann spruce, *Picea Engelmanni*, and balsam fir, *Abies lasiocarpa*. I have but a very slight knowledge of the herbs characterizing this formation, but I noticed along the Arapahoe Trail the following species, which I had not seen in the mon-

tane forest: *Eriogonum subalpinum*, *Arnica Parryi*, and *Senecio atratus*. A large number of the montane sylvan species were observed.

b. *Amnicolae*. The subalpine stream vegetation is very luxuriant. It has on the one hand a very close affinity with the montane stream vegetation, and on the other with that of the wet alpine tundra. Not only does the snow linger late in these high valleys, the water of the streams is also very cold. In the list that follows the montane species are included as well:

<i>Poa platyphylla</i>	<i>Cardamine cordifolia</i>
<i>P. alpina</i>	<i>C. incana</i>
<i>Carex Goodenovii</i>	<i>Clementsia rhodantha</i>
<i>Populus balsamifera</i>	<i>Pectianthia pentandra</i>
<i>P. angustifolia</i>	<i>Micranthes arguta</i>
<i>Salix caudata</i>	<i>Parnassia fimbriata</i>
<i>S. Scouleriana</i>	<i>Sidalcea candida</i>
<i>Betula fontinalis</i>	<i>Oxypolis Fendleri</i>
<i>Alnus tenuifolia</i>	<i>Primula Parryi</i>
<i>Bistorta bistortoides</i>	<i>Swertia palustris</i>
<i>Alsine Baicalensis</i>	<i>Polemonium robustum</i>
<i>Caltha leptosepala</i>	<i>Mertensia polypylla</i>
<i>Trollius albiflorus</i>	<i>Mimulus Langsdorffii</i>
<i>Anemone Canadensis</i>	<i>M. puberulus</i>
<i>Ranunculus reptans</i>	<i>Helianthella quinquenervis</i>
<i>R. inamoenus</i>	<i>Senecio triangularis</i>
<i>R. micropetalus</i>	

I am almost wholly unacquainted with the remaining subalpine formations, such as the lacustrine, palustrous, rupes-trine, the subalpine summit and high ridge floras. I saw a

little of these at Ward and on the high slopes above Bloomerville, and on Arapahoe Peak just below timberline, but I am unable to give any clear account of the vegetation.*

F. ALPESTRES†

Between 11,000 and 12,000 feet' tree-growth ceases abruptly. The spruces and firs bend and hug the ground. The willows branch and fork underground and rise to the height of but a few inches. The precise altitude of the timberline depends somewhat on the exposure, and differs, therefore, from peak to peak, but 11,500 feet is, perhaps, on an average the lower limit of the alpine zone. I am acquainted with this zone only on Arapahoe Peak, where I spent one day, September first, and collected some 110 species, most of them above timberline. The total number of species known to reach an altitude of 12,000 feet, or above, in Colorado is 386.‡

The alpine flora may be conveniently gathered into two societies: a. The wet alpine tundra (*Tundrales*). b. The dry rock-desert (*Alpinae*) of the summits.

a. *Tundrales*. The wet tundra occupies the region of cold water-soaked soil. The water from the wasting snows collects in depressions, streams are formed, and along these the

†Consult for the Alpine Flora Cooper's Alpine vegetation in the vicinity of Long's Peak, Colorado (Bot. Gaz., 45, 319-337). He recognizes three plant formations: 1. The dry meadow. 2. The wet meadow. 3. The Krummholtz. The latter, while striking enough, is rather but the upper level of the spruce forest, striving to persist in Alpine conditions.

‡For a list of these see the article by Cockerell on the Alpine Flora of Colorado (Am. Nat., 40, 86-873).

vegetation clings. Often the streams flow concealed under the dwarf spruces and firs, their existence there being known only by their roaring underneath. Parry's primrose, saxifrages, globeflowers, white cowslips, gentians, red elephants, several sedges, grasses, and rushes are examples of the wet tundra vegetation. The Krummholtz of spruce and fir at the timberline consists chiefly of Engelmann spruce, *Picea Engelmanni*, and balsam fir, *Abies lasiocarpa*. The wet tundra continues down to the lower edge of the alpine zone, whence it descends and coalesces with the subalpine stream vegetation. The following are characteristic species:

<i>Lycopodium annotinum</i>	<i>Trollius albiflorus</i>
<i>Picea Engelmanni</i>	<i>Ranunculus pedatifidus</i>
<i>Abies lasiocarpa</i>	<i>R. alpeophilus</i>
<i>Alopecurus occidentalis</i>	<i>Thlaspi Coloradense</i>
<i>Trisetum majus</i>	<i>Draba Fladnizensis</i>
<i>Poa reflexa</i>	<i>Clementsia rhodantha</i>

<i>P. alpicola</i>	<i>Saxifraga debilis</i>
<i>P. alpina</i>	<i>Micranthes arguta</i>
<i>Carex festiva</i>	<i>Viola Canadensis Neo-Mexicanus</i>
<i>C. ebenea</i>	<i>Angelica Grayi</i>
<i>C. bella</i>	<i>Pseudocymopterus tenuifolius</i>
<i>Juncus Drummondii</i>	<i>Kalmia microphylla</i>
<i>Juncoides spicatum</i>	<i>Primula Parryi</i>
<i>Salix glauca</i>	<i>Androsace subumbellata</i>
<i>S. chlorophylla</i>	<i>A. diffusa</i>
<i>Bistorta bistortoides</i>	<i>Anthopogon elegans</i>
<i>B. vivipara</i>	<i>A. barbellatus</i>
<i>Alsine Baicalensis</i>	
<i>Caltha leptosepala</i>	

<i>Amarella monantha</i>	<i>Erigeron jucundus</i>
<i>A. plebeja Holmii</i>	<i>E. salsuginosus</i>
<i>Swertia palustris</i>	<i>E. superbus</i>
<i>Mertensia polyphylla</i>	<i>Senecio carthamoides</i>
<i>Veronica Wormskjoldia</i>	<i>S. blitoides</i>
<i>Castilleja Arapahoensis</i>	<i>S. pseudoaureus</i>
<i>Elephantella Groenlandica</i>	<i>Hieracium gracile</i>
<i>Pedicularis Parryi</i>	

b. *Alpineae.* The dry rock-desert lies mingled with or above the wet tundra and extends to the summit, wherever there is soil not covered with snow. The vegetation suffers from extreme exposure, and grows close to the ground, seldom, unless sheltered by rocks, rising more than an inch or two in height. In sheltered places under rocks, even at this extreme altitude, I found several beautiful clusters of the blue columbine, the state flower of Colorado, with stems twelve to eighteen inches high, and with blossoms two inches across. The wooly-headed thistle, too, was found of the same height. But in general the vegetation is much dwarfed. Next to the wet tundra the Krummholtz of spruce and fir still persists, under which I detected some fine specimens of club-moss; but farther up there is no shrubby vegetation except the underground willows. The vegetation grows in little rounded tussocks, and consists of the alpine catch-fly, rock-primrose scarcely half an inch high, sibbaldia, dryas, alpine clovers, dwarf sedges, grasses, and rushes, and, last of all, the little yellow saxifrages and the snowflowers, which are often blossoming at the snow-line. Now and then on the high exposed ridges the beautiful rydbergia rises five or six inches above the mountain turf, its stems and leaves and large yellow flowers swathed in dense wool. For what must be the tribulations of this

alpine vegetation at the line of perpetual snow, with the alternate freezing by night and thawing by day, with the keen light, and bleak winds, and the fierce fury of the storms? And yet the alpine flora is exquisitely beautiful. It shares the fascination of its sublime mountain home, to which it lends the only touch of delicate grace. I append a list of alpine summit species, most of which I found on Arapahoe Peak or are known to grow there:

IV. SPECIAL CLASSES OF PLANTS

Independent of the five great zones of vegetation are two special classes of plants: A. The saprophytic and parasitic plants (**SAPROPHYTICALES ET PARASITICALES**). B. The plants which largely owe their presence to human agency (**ANTHROPOPHYTICALES**). These consist of the various cultural plants, of weeds, and of escapees.

A. SAPROPHYTICALES ET PARASITICALES

Besides the saprophytic and parasitic fungi there are a few phanerogams, which are destitute of chlorophyl and are true saprophytes or parasites. The following are known to occur in the region:

Corallorrhiza Corallorrhiza (saprophytic in rich soil)

C. multiflora (saprophytic in rich soil)

Razoumofskya Americana (parasitic on lodgepole pine)

R. cryptopoda (parasitic on bull pine)

Pterospora Andromedea (parasitic on the roots of bull pine)

Cuscuta curta (parasitic on *Iva xanthifolia* and other coarse herbs)

C. indecora (parasitic on *Thermopsis pinetorum* and other legumes)

Thalesia fasciculata (parasitic on *Artemisia frigida* and other Composites)

There are also a few root-parasites with green foliage, notably *Comandra pallida*, *Gerardia Besseyana*, and the Castillejas.

B. ANTHROPOPHYTICALES

Only three kinds of anthropophytic plants need concern us here: a. Forage plants (**Faenales**), which have become

thoroughly naturalized. b. Weeds (**Ruderales**). c. Cultural and ornamental plants that have escaped (**Fugitivae**).

a. **Faenales.** Most of the common forage grasses and clovers have become thoroughly established about Boulder. I have noted the following:

<i>Phleum pratense</i>	<i>Festuca elatior</i>
<i>Agrostis alba</i>	<i>Lolium Italicum</i>
<i>Dactylis glomerata</i>	<i>Trifolium pratense</i>
<i>Poa pratensis</i>	<i>T. repens</i>
<i>P. compressa</i>	<i>T. hybridum</i>
<i>P. trivialis</i>	<i>Medica sativa</i>

b. **Ruderales.** In the appended list of weeds only those that have been introduced from elsewhere, or, if native, are also common weeds in many parts of the United States, have been included. However, many native species, such as the various gum-weeds and spурges, must often be bad weeds in cultivated grounds. But to do justice to the ruderal aspects of the native flora would require much special study, such as one is unable to make in the course of a few weeks, and especially one who is unfamiliar with agriculture as carried on in Colorado. I noted the following weeds:

<i>Syntherisma sanguinale</i>	<i>B. secalinus</i>
<i>Panicum capillare</i>	<i>B. hordeaceus</i>
<i>Echinochloa Crus-galli</i>	<i>B. tectorum</i>
<i>Chaetochloa glauca</i>	<i>Rumex Acetosella</i>
<i>C. viridis</i>	<i>R. crispus</i>
<i>Cenchrus Carolinianus</i>	<i>R. obtusifolius</i>
<i>Avena fatua</i>	<i>Polygonum erectum</i>
<i>Eragrostis major</i>	<i>P. aviculare</i>
<i>Poa annua</i>	<i>Persicaria Persicaria</i>
<i>Bromus brizaeformis</i>	<i>Tiniaria Convolvulus</i>

<i>Chenopodium leptophyllum</i>	<i>Mentha spicata</i>
<i>C. album</i>	<i>Physalis Virginiana</i>
<i>C. hybridum</i>	<i>P. heterophylla</i>
<i>C. Botrys</i>	<i>Datura Stramonium</i>
<i>Salsola Tragus</i>	<i>D. Tatula</i>
<i>Amaranthus retroflexus</i>	<i>Verbascum Thapsus</i>
<i>A. blitoides</i>	<i>V. Blattaria</i>
<i>A. graecizens</i>	<i>Veronica serpyllifolia</i>
<i>Mollugo verticillata</i>	<i>V. Byzantina</i>
<i>Portulaca oleracea</i>	<i>Plantago major</i>
<i>P. retusa</i>	<i>P. lanceolata</i>
<i>Alsine media</i>	<i>Micrampelis lobata</i>
<i>Silene antirrhina</i>	<i>Iva xanthifolia</i>
<i>S. noctiflora</i>	<i>I. axillaris</i>
<i>Vaccaria Vaccaria</i>	<i>Ambrosia trifida</i>
<i>Thlaspi arvense</i>	<i>A. artemisifolia</i>
<i>Bursa Bursa-pastoris</i>	<i>A. psilostachya</i>
<i>Sisymbrium officinale</i>	<i>Xanthium commune</i>
<i>Brassica juncea</i>	<i>Erigeron ramosus</i>
<i>B. nigra</i>	<i>Leptilon Canadense</i>
<i>Camelina sativa</i>	<i>Helianthus petiolaris</i>
<i>Tridophyllum Monspeliensis</i>	<i>Bidens vulgata</i>
<i>Medicago Lupulina</i>	<i>Boebera papposa</i>
<i>Melilotus alba</i>	<i>Anthemis Cotula</i>
<i>M. officinale</i>	<i>Tragopogon pratensis</i>
<i>Erodium cicutarium</i>	<i>T. porrifolius</i>
<i>Malva rotundifolia</i>	<i>Cichorium Intybus</i>
<i>Pastinaca sativa</i>	<i>Taraxacum Taraxacum</i>
<i>Convolvulus arvensis</i>	<i>Lactuca integrata</i>
<i>Nepeta Cataria</i>	<i>Sonchus arvense</i>
<i>Glecoma hederacea</i>	<i>S. asper</i>
<i>Leonurus Cardiaca</i>	

c. **Fugitivae.** I noted the following escapes:

<i>Chaetochloa Italica</i>	<i>Brassica campestris</i>
<i>Avena sativa</i>	<i>Koniga maritima</i>
<i>Triticum vulgare</i>	<i>Raphanus sativus</i>
<i>Hordeum sativum</i>	<i>Ribes vulgare</i>
<i>hexastichon</i>	<i>Althaea rosea</i>
<i>Asparagus officinale</i>	<i>Carum Carvi</i>
<i>Atriplex hortensis</i>	<i>Pharbitis purpurea</i>
<i>Saponaria officinalis</i>	<i>Lycopsis arvensis</i>
<i>Delphinium Ajacis</i>	<i>Lycium vulgare</i>
<i>Papaver Argemone</i>	<i>Lycopersicon Lycopersicon</i>
<i>Armoracia Armoracia</i>

FLORA OF BOULDER, COLORADO, AND VICINITY

Subkingdom I. PTERIDOPHYTA. Fern-worts.

Order 1. OPHIOGLOSSALES.

Family 1. OPHIOGLOSSACEAE Presl. Adder's-tongue family.

1. BOTRYCHIUM Swartz. MOONWORT.

1. **B. Virginianum** (L.) Swartz. VIRGINIA GRAPE-FERN.

Forested slopes of Green Mt., above 7000 ft.; very scarce, only two or three plants discovered (Daniels, 606).*

LABRADOR to BRITISH COLUMBIA; FLORIDA to TEXAS and WASHINGTON.

Order 2. FILICALES.

Family 2. POLYPODIACEAE R. Br. Polypody family.

2. POLYPODIUM L. POLYPODY.

2. **P. hesperium** Maxon. WESTERN POLYPODY.

On a single rock in a cañon on the north slope of Green Mt., 7500 ft. (Daniels, 605).

MONTANA to BRITISH COLUMBIA and WASHINGTON; COLORADO to ARIZONA.

3. DRYOPTERIS Adans. SHIELD-FERN.

3. **D. Filix-mas** (L.) Schott [*Aspidium Filix-mas* (L.) Swartz]. MALE-FERN.

Summit of South Boulder Peak; Bear Cañon; high cañons of Green Mt.; Boulder Cañon near Falls; apparently quite

* See preface for explanation of numbers.

evenly, but not abundantly distributed throughout in moist rocky cañons, 6000-8600 ft. (Daniels, 555).

Nova Scotia and Michigan to Alaska; New Mexico and Colorado to California.

4. **WOODSIA** R. Br.

4. **W. scopolina** D. C. Eaton. CLIFF WOODSIA.

The most abundant fern of the foot-hills and lower mountainsides, occurring wherever rocks are exposed to the surface, 5700-8100 ft. (Daniels, 156).

Michigan to British Columbia; Colorado and Arizona to California.

5. **W. Oregana** D. C. Eaton. MOUNTAIN WOODSIA.

With the preceding, but much scarcer, and ranging to the timberline or above, 5600-11000 ft. (Daniels, 361). Long's Peak (Coulter in Wabash College Herb.).

Michigan to British Columbia; Colorado and Arizona to California.

5. **FILIX** Adans. BLADDER-FERN.

6. **F. fragilis** (L.) Underw. [*Cystopteris fragilis* Bernh.]. FRAGILE-FERN.

Throughout on the moister rocks; apparently the only fern of the plains region, 5100-13000 ft. (Daniels, 23).

Almost cosmopolitan.

6. **PTERIDIUM** Scop. BRACKEN.

7. **P. aquilinum pubescens** Underw. HAIRY BRAKE.

Cañons of Green Mt., and gulches at the foot of the Flat-irons; Bear Cañon; local, but abundant where found, 5800-10000 ft. (Daniels, 277).

Montana and Colorado to Arizona and California.

7. **CRYPTOGRAMMA** R. Br. PARSLEY-FERN.

8. **C. acrostichoides** R. Br. ROCK PARSLEY-FERN.

High ridges of rock, descending on Green Mt. to about 6500 ft., thence to above 11000 ft. (Daniels, 271).

Michigan to Alaska; Colorado to California.

8. CHEILANTHES Swartz. LIP-FERN.

9. **C. Féei** Moore [*C. gracilis* Mett.; *C. lanuginosa* Nutt.].
WOOLLY LIP-FERN.

Growing with *Asplenium Andrewsii* A. Nelson on the south face of a white sandstone (alkaline) cliff extending along Boulder creek for a mile or more (Andrews, in Nelson, Proc. of the Biol. Soc. of Wash., 17, 175).

ILLINOIS and MINNESOTA to BRITISH COLUMBIA; MISSOURI to TEXAS and ARIZONA.

10. **C. Fendleri** Hook. FENDLER'S LIP-FERN.

Dry rocks, Boulder, 5900-8500 ft. (Rydberg).

COLORADO and TEXAS to CALIFORNIA.

9. ASPLENIUM L. SPLEENWORT.

11. **A. Trichomanes** L. MAIDEN-HAIR SPLEENWORT.

Limestone rocks, South Boulder Cañon, 5400-7000 ft. (Rydberg).

NORTH AMERICA: EUROPE: ASIA: SOUTH AFRICA: PACIFIC ISLANDS.

12. **A. Andrewsii** A. Nelson. ANDREWS'S SPLEENWORT.

Growing abundantly in crevices with *Cheilanthes Féei* Moore (Andrews, in Nelson, loc. cit. pp. 174-175).

Known only from the type locality as above.

10. BELVISIA Mirb. GRASS-FERN.

13. **B. septentrionalis** (L.) Mirb. [*Asplenium septentrio-nalis* (L.) Hoffm.] NORTHERN GRASS-FERN.

Bald ridges of Green Mt.; south slope of Bear Mt.; South Boulder Cañon, 6000-7000 ft. (Daniels, 358).

SOUTH DAKOTA to MONTANA; NEW MEXICO to ARIZONA.

Order 3. EQUISETALES.

Family 3. EQUISETACEAE Michx. Horsetail family.

11. EQUISETUM L. HORSETAIL.

14. E. arvense L. FIELD HORSETAIL.

Swales and shores of streams; sandy moist meadows, 5100-10000 ft. (Daniels, 260).

NORTH AMERICA: EUROPE: ASIA.

WYOMING to NEW MEXICO and ARIZONA.

570. **A. Arapahoensis** Daniels. Nov. spec. ARAPAHOE YELLOW MOUNTAIN AVENS.

Plant 20-30 cm. high, the stems (about three in number) puberulent, becoming softly hairy or villous above; basal leaves ascending, about 1 dm. long and 3 cm. wide, pinnate, the lower pinnae narrowly falcate, entire, the others mainly ovate in outline, deeply cut into 2-7 cuneate lobes, but with occasional little, simple pinnae interspersed with the larger ones; leaves puberulent or glabrate, the margins softly ciliate with white hairs; rhachis about 3 mm. broad, the base of the petiole about 1 cm. broad, becoming chaffy and sheathing the stems; lower half of stem leafless, the upper half bearing two leaves, 2½-3 cm. long, pinnately parted into about 10 narrow lobes, the lowermost broad, stipule-like, and sheathing the stem; peduncles softly hairy, 3-4 in number, subtended by leaves closely resembling the two stem leaves, but smaller, the peduncles themselves occasionally bearing 1 or 2 bracts, simple or 2-5 pinnately incised; flowers 2-2½ cm. wide, bright yellow, the petals broadly obovate, five in number; sepals and bractlets villous at base, 5 each, spreading, becoming erect in fruit or the tips reflexed in age; sepals broadly triangular, about twice as high as the narrower bractlets; stamens numerous; styles included in fruit, glabrate; achenes softly villous with white hairs. Foliage, stems, sepals and bractlets purple-tinged.

The plant differs from *A. turbinata* (Rydb.) Greene, in its larger size, its softly hairy upper portion, its 3-4 flowered stems, its broader sepals, which are much longer than the bractlets, and in its larger flowers. This is probably the

Geum Rossii humilis of Coulter's Manual, but genuine *G. Rossii humilis* T. & G. comes no nearer than Unalaska, the type locality. *A. turbinata* (Rydb.) Greene is a low plant, 7-15 cm. high, usually 1-flowered.

At timberline, Arapahoe Peak, 11500 ft. (Daniels, 906).

231. HOLODISCUS Max. MEADOWSWEET.

262. APIOS Moench. GROUND NUT.

653. *A. Apios Boulderensis* Daniels. Nov. var. **BOULDER GROUND NUT.**

Differing from the typical eastern plant chiefly in the somewhat larger, thinner long-acuminate leaflets, which are nine as well as seven in number, the somewhat smaller brownish deep-violet flowers, which are densely granular under a lens. No pods were secured, nor tubers from the rootstock, only one vine being discovered, which it did not seem wise to uproot for fear of exterminating the plant in the only locality known for the ground nut in the Rocky Mountains.

One vine in a gulch at the foot of Flagstaff Hill, Aug. 18, 1906, 5900-6000 ft. (Daniels, 799).

The species ranges from NEW BRUNSWICK to ONTARIO; FLORIDA to LOUISIANA and EASTERN KANSAS.

APPENDIX A.

Tidestrom in the Am. Midl. Nat. 2, 35, has described as a new species this aspen under the name of *P. aurea* Tidestrom, with the remark that it forms forests throughout Colorado, Utah, and adjoining territory. But the differences relied upon to separate it from Michaux's species seem to me to be at most varietal, and hence I prefer to call the Colorado tree *P. tremuloides aurea* (Tidestrom) Daniels. See page 98.
