 Hauptstraße 5, 04509 Neukyhna, Germany, www.vielepilze.de
Key to *Psathyrella*

Updates:

17.01.12 (many additions and modifications, drawings included), 25.02.12 (D 19 ff. changed, F 8/8* changed), 22.03.12 (D 21/21*, B 3/3*, B 4/4* changed), 23.03.12 (C 7 *P. piluliformis* replaced by *P. carinthiaca*), 13.04.12 (parts F + G strongly modified), 23.04.12 (*P. bivelata* integrated)

Introduction:

The key includes most of the previously described *Psathyrella* species from Europe, in addition, some of which have since been transferred to other genera. Not included are currently *P. excelsa*, *P. langei*, *P. radicellata*, *P. violaceopallens* and *P. wavereniana*.

The dichotomous pairs are based predominantly on microscopic characteristics, to edit material also can be present for which no field notes. Only as an exception habitual or ecological characteristics of differentiation are used. However, it is certain that the difference between these clearly (e. g. tiny vs. large species; growing on sandy soil vs. dung). Measurements are rounded in the key part or for the benefit of the characteristic compared with the species descriptions slightly weighted differently.

It is essential to key out some species more than once, because they show a considerable variability (e. g. *P. senex*) or may represent collective species (e. g. *P. corrugis*). However, it is not possible to consider each extreme (e. g. very large fruitbodys, unusual shape of cystidia, abnormally spores). Should also be noted that various features are developmentally variable (e. g. colored underlining of lamellae edge, thickened cell walls). To verify the determination must be used a detailed description.

Also, it's often to try alternative routes.

Notes on the features:

When the **spores measure** waives the average values, since even the absolute would be relevant. It should be noted that both minimum and maximum may be exceeded occasionally (e. g. with interspersed 2-spored basidia). Done in this case, an orientation to the majority. The same applies to the determination of the **spore shape and colour**.

A missing or existing **germ pore** is a useful feature, though not without problems. Are indispensable, fully mature spores under examination in potassium hydroxide (KOH) due to the better contrast is recommended.

To assess the frequency and distribution of **cheilocystidia** often several preparations from different sections of lamellae are required. Close to the cap often dominate sphaeropedunculate or clavate marginal cells, may occur near the stem spread to the lamellae caulocystidia. The latter are not intended relevant characteristic.

The decision whether **pleurocystidia** happen is to cut down only after a thorough search. Often pleurocystidia are very rare and only found close to the lamellae edge.

The details of **cap diameter** and **velum** to give an idea of the habit of the fruitbody. Also, the **habitat** occasionally valuable or even allow clear conclusions. Other supplementary information is provided only when deemed appropriate (e. g. distinct pink colour of the hat during drying, presence of a pseudorhiza).

Used abbreviations:

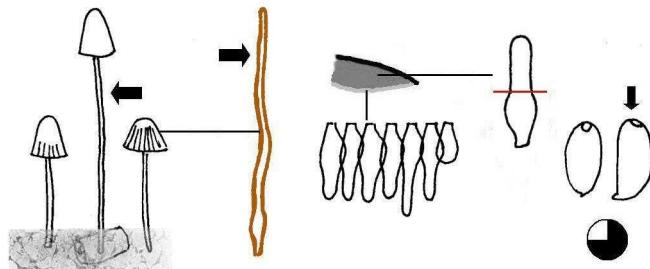

C. = cap, Ch. = cheilocystidia, L. = lamellae, Pl. = pleurocystidia, P. = *Psathyrella*., Sp. = spores, St. = stipe, Syn. = synonym(s)

Used symbols:

Sp. hyaline	Sp. very bright	Sp. moderately bright	Sp. dark	Sp. black	L.edge white	L.edge coloured	L.edge white, coloured underlined

- C. 20-40 mm broad. Veil scanty. Sp. 13-15 x 7-8. Pl. 63-75 x 13-21 μm . Ch. 37-63 x 13-20(23) μm , densely packed. Cystidia often with granules. Soil, *Fagus* forest.

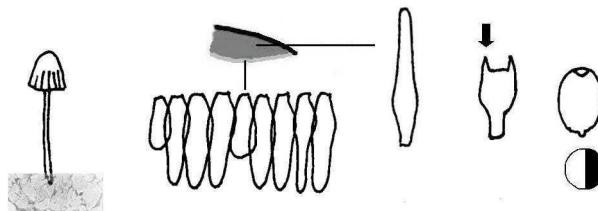

P. macrocystidiata ARNOLDS

6* Spores shorter.

7

7 (6) Pleurocystidia mostly slender fusiform, never subcapitate.

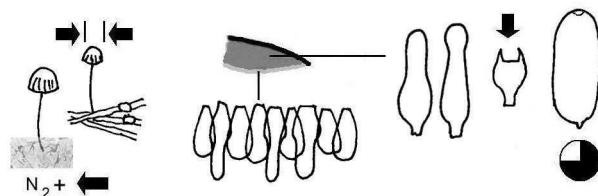

C. up to 11 mm broad. Veil scanty. Sp. 8-9(10) x (5)5,5-6,5 µm. Pl. 32,5-50(60) x 7,5-12,5 µm. Ch. 20-35(45) x 7,5-10(12,5) µm, often closely packed. Soil, leaf litter.

P. perpusilla KITS V. WAV.

7* Pleurocystidia mostly utriform, often subcapitate.

C. 3-10 mm broad. Veil scanty. Sp. (10)11-11,5(12,5) x 5,5-6,5 µm. Pl. 30-40 x 10-17,5 µm. Ch. 27,5-40 x 7,5-15 µm. Dead grass, hay, straw, dung. 2-spored form of *P. romagnesii*.

P. romagnesii KITS V. WAV.
(Syn.: *P. waverenii* ARNOLDS)

8 (4) Germ pore always or predominately distinctly visible.

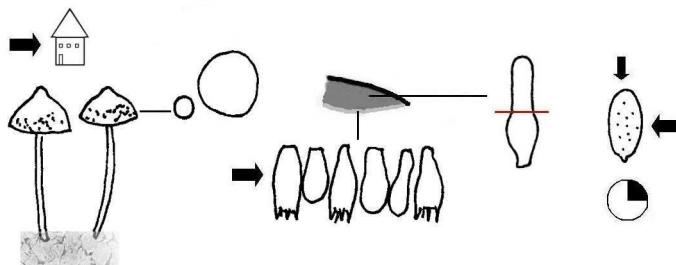

Part C

8* Germ pore absent or not distinctly visible.

Part D

9 (2) Veil consisting of globose elements, spores punctate.

C. 20-30 mm broad. Veil distinctly, grey to greyish brown. Sp. 4,5-6,15(6,8) x 2,5-3,2(3,4) µm. Ch. not differentiated or shape like basidioles. On soil in a subtropical greenhouse; Spain.

P. ornatispora M. VILLARREAL & ESTEVE-RAVENTÓS

9* Not so.

10

10 (9) Germ pore absent or only very indistinctly visible.

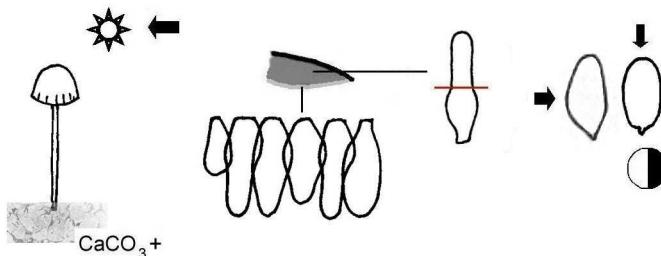

11

10* Germ pore always distinctly visible.

14

11 (10) Spores often limoniform.

C. 5-15 mm broad. Veil scanty. Sp. 6,5-9 x 4,5-6 μm . Ch. 30-46 x 12-15 μm , closely packed. Calcareous soil.

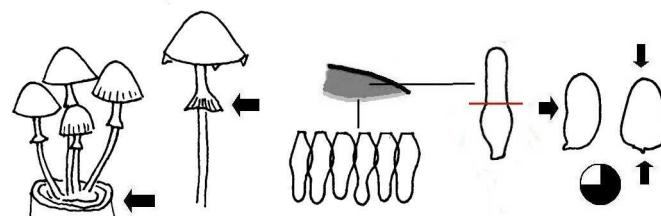

P. submicrospora HEYKOOP & G. MORENO

11' Spores never limoniform.

12

12 (11) Spores in water not strikingly pale.

C. up to 80(100) mm broad. Veil scanty. Stipe with annulus. Sp. (7)8-10 x 4,5-6,5 μm . Ch. 25-40 x 7,5-12,5 μm , closely packed. Caespitose on or around stumps.

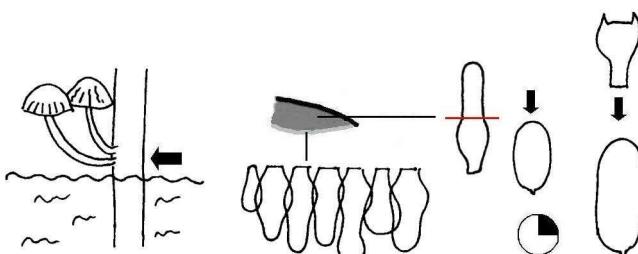

P. leucotephra (BERK. & BROOME) P. D. ORTON

12* Spores in water strikingly pale.

13

13 (12) Spores in water very pale brownish.

C. 5-15 mm broad. Veil scanty. Sp. 9-12,5(13) x (5)5,5-8(8,5) μm , lager if 2-spored basidia present. Ch. 25-40(50) x 7,5-15(17,5) μm . On aquatic plant (especially *Typha* and *Phragmites*) just above the water.

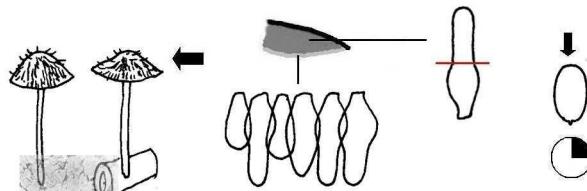

P. typhae (KALCHBR.) A. PEARSON & DENNIS

(Syn.: *P. subaustralis* A. H. SM.)

13* Spores in water very pale yellowish.

C. 25-53 mm broad. Veil distinctly. Sp. 9-11,5(12,5) x 5,5-7 μm . Ch. 30-45 x 12,5-17,5 μm . Stumps, dead wood.

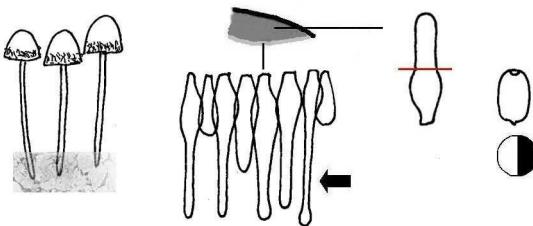

P. melanthina (FR.) ROMAGN.

(Syn.: *P. agaves* (MAIRE) KONR. & MAUBL.)

14 (10) Cheilocystidia up to 100 μm long.

C. 10-30 mm broad. Veil distinctly. Sp. 7-9 x 4,5-5,8 μm . Ch. (40)45-100 μm , often subcapitata. Soil, between grass.

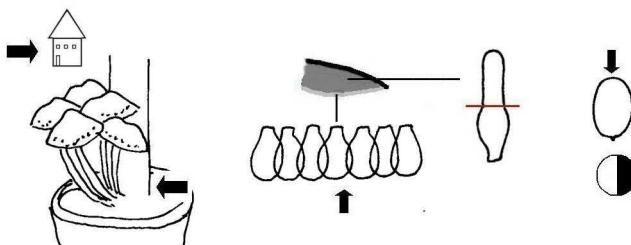

P. longicystidiata HEYKOOP & G. MORENO

14* **Cheilocystidia shorter.**

15

15 (14) **Spores in KOH pale.**

C. up to 20 mm broad. Veil scanty. Sp. 6,3-8 x 4-5(5,5) µm. Ch. very rare, utriform; clavate marginal cells dominating. Only in buildings, caespitose on wood, especially Yucca palm.

P. lacuum HUIJSMAN

15* **Spores in KOH dark (brown).**

16

16 (15) **Clamps absent.**

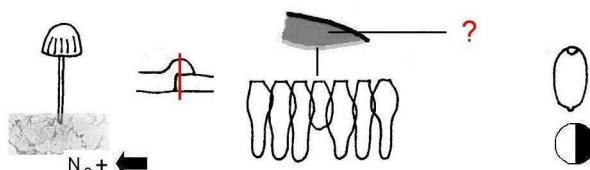

17

16* **Clamps present.**

18

17 (16) **Habit like Galerina.**

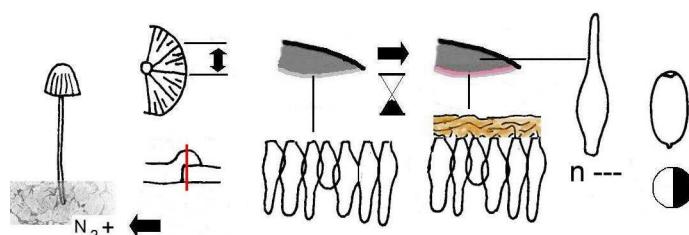

C. (1)4-12 mm breit. Veil scanty. Sp. 9-10,5 x 5,5-6 µm. Pl. absent or extremely rare. Ch. 24-31 x 9-12 µm. Nitrogen-rich soil.

P. citerinii ESSARTIER

17* **Habit like Mycena.**

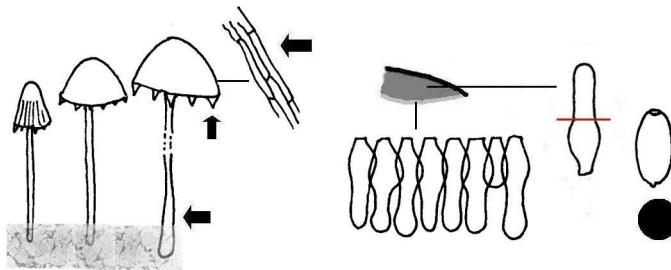

C. up to 20 mm broad. Veil scanty. L. distant. Sp. 8-11,5(12,5) x 4,4-5,5 µm. Pl. absent or extremely rare. Ch. 15-45(55) x 6-16(20) µm. Nitrogen-rich soil.

P. effibulata ÖRSTADIUS & E. LUDWIG

18 (16) **Spores in KOH dark blackish brown.**

C. up to 40(60) mm broad. Veil young distinctly, a longer time as denticles on the edge of the cap. Sp. 10,5-15(15,5) x 6-8(9) µm. Ch. 25-47,5(60) x 7,5-17,5 µm, closely packed. Soil, pieces of wood.

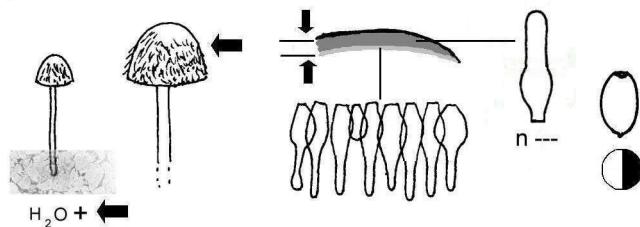

***Coprinopsis marcescibilis* (BRITZELM.) ÖRSTADIUS & E. LARSS.**
(Syn.: *P. marcescibilis* (BRITZELM.) SING., *P. delicate* A. H. SM.,
P. elwhae A. H. SM., *P. involuta* (ROMAGN.) M. M. MOSER)

18* Spores in KOH brown. 19

19 (18) Cheilocystidia lageniform, top small.

C. up to 35 mm broad. Veil densely. L. narrow. Sp. 8-10(12) x 4,5-5,5(6) µm. Ch. 25-40(55) x 10-15 µm, z.T. with crystals. Pl. absent or extremely rare. Wet soil, pieces of wood.

***P. canocephala* (KAUFFM.) A. H. SM.**
(Syn.: *P. lanuginosa* A. H. SM.)

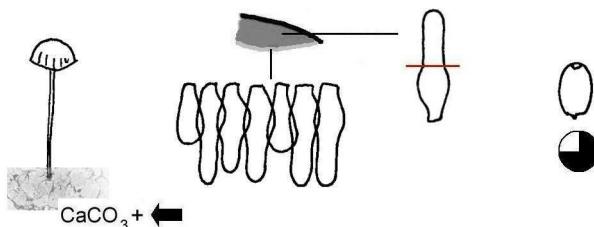

19* Cheilocystidia utriform, clavat or cylindrical, top broadly obtuse. 20

20 (19) Spores up to 8(9) µm long. 21

20* Spores longer. 22

21 (20) Spores 6,5-8 x 4-4,5(5) µm.

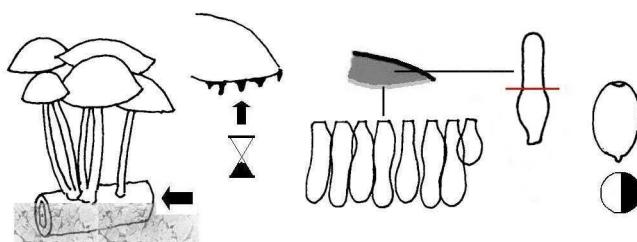

C. up to 20 mm broad. Veil scanty. Ch. 25-42,5 x 10-20 µm. Soil, pieces of wood.

***P. microsporoides* HEYKOOP & G. MORENO**
(Syn.: *P. badiophylla* var. *microspora* Kits v. Wav.)

21* Spores 6,5-9 x (3,5)4-5(5,5) µm.

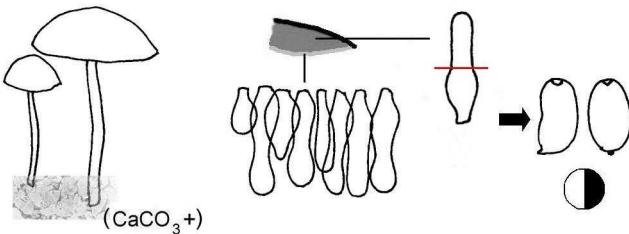

C. up to 70(90) mm broad. Veil young distinctly. Ch. (25)30-70(90) x 10-20 µm, closely packed. (Mostly) caespitose on or near wood. Collective species, morphological not separable.

| 4* | Spores up to 15(16) μm long.
C. up to 40 mm broad, distinctly wrinkled, strikingly reddish tinted. Veil mostly distinctly. Sp. (11,5)12,5-15,5(16) x 7-8(9) μm , germ pore weakly eccentric. Pl. 52,5-100 x 12,5-30 μm . Ch. 35-75 x 10-25 μm , closely packed. Cystidia often with deposits, in NH4OH sometimes pale greenish. Soil, pieces of wood. | |
|----|--|--|

***P. bipellis* (QUEL.) A. H. SM.**

(Syn.: *P. barlae* (BRES.) A. H. SM., *P. brooksi* A. H. SM., *P. odorata* (PECK) SACC.)

- | | | |
|---|---|--|
| 5 | (3) Spores rough.
C. up to 70 mm broad. Veil distinctly. Sp. 7-8,5(9) x 3,5-4,5(5) μm . Pl. (20)25-50(60) x 9-15 μm . Ch. 22,5-35(45) x 10-12,5 μm , very rarely. Leaf litter in deciduous forest. | |
|---|---|--|

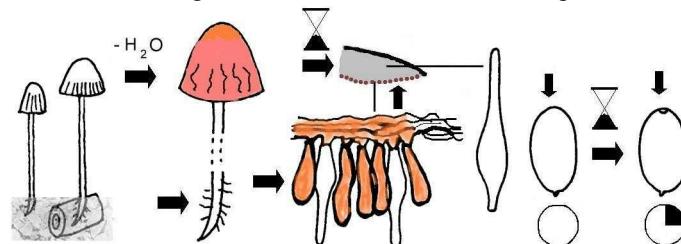

P. pseudocasca (ROMAGN.) ex KITS V. WAV.

5* Spores smooth.

6

6 (5) Spores for a long time hyalin.

C. 7-30 mm broad, during drying strikingly pink. L. pale. Veil absent. Sp. 12-14,5 x 6-7 µm. Pl. 38-67 x 11-17 µm. Ch. 32-61 x 7,5-14 µm, frequently, lamellae edge with dots, consisting of thickwalled clavat cells. Soil, pieces of wood.

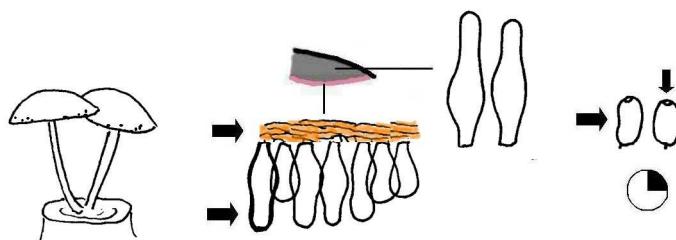

P. amarescens ARNOLDS

6* Spores otherwise.

7

7 (6) Spores 5-6 x 3-3,7 µm.

C. 25-40 mm breit. Veil scanty. L. edge reddish underlined. Pl. 30-45 x 8-13,7 µm. Ch. 17-37 x 8-12 µm, partly with slightly thickened walls. Stumps of *Picea*.

Psathyrella carinthiaca P. VOTO

7* Spores larger.

8

8 (7) Spores in front view partly triangular or strikingly round.

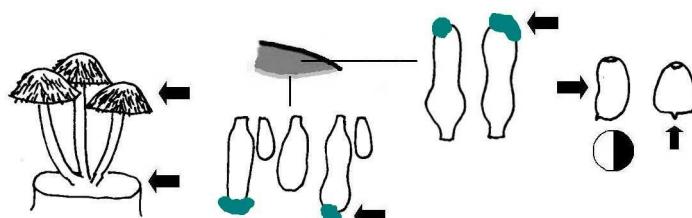

9

8* Spores in front view elliptical or ovoid.

11

9 (8) Cystidia often with deposits, blueish green in NH₄OH; on wood.

C. up to 50(70) mm broad. Veil strongly developed, fibrils ochraceous to brown. Sp. 6,5-8,5(10) x 4,5-6 µm, triangular and strongly phaseoliform. Pl. (35)47,5-70 x 9-22,5 µm. Ch. 30-55 x 8-20 µm. Dead wood of *Populus* (and *Fagus*).

P. sylvestris (GILLET) KONR. & MAUBL.

(Syn.: *P. populina* (BRITZELM.) KITS V. WAV., *P. hispida* HEINEM.?, *P. lepidotoides* A. H. SM.?)

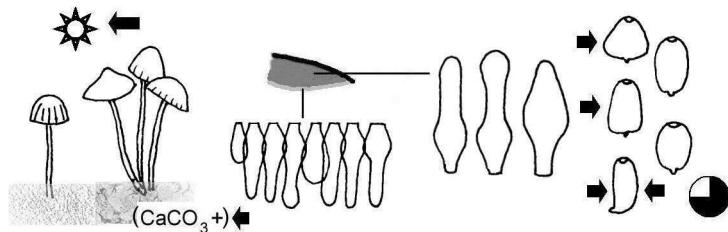

9* Cystidia without such deposits; soil.

10

10 (9) Cheilocystidia mostly lageniform.

C. up to 30(45) mm broad. Veil scanty. Sp. 7-10(11) x 4,5-7,5 x 4,5-6,5(7) µm,

triangular (sometimes only few) or roundly. Pl. 30-50(60) x 10-15(17,5) μm , without or with always colourless deposits. Ch. (20)25-45 x 7,5-15 μm , closely packed. Calcereous soil, meadows.

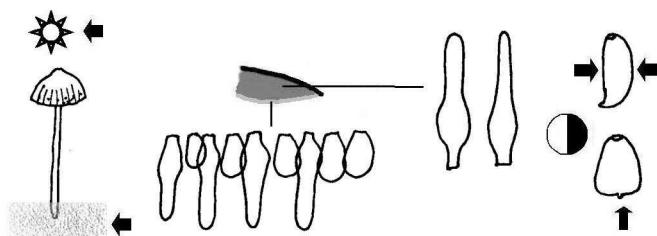

P. panaeoloides (MAIRE) SVRCEK ex ARNOLDS
(Syn.: *P. ovatispora* A. H. SM.)

10*

Cheilocystidia mostly lageniform.

C. up to 20 mm broad. Veil scanty. Sp. 7-9 x 4,5-5,5 μm . Pl. 35-60 x 9-15 μm . Ch. 30-45 x 7,5-15 μm . Sandy soil, dunes.

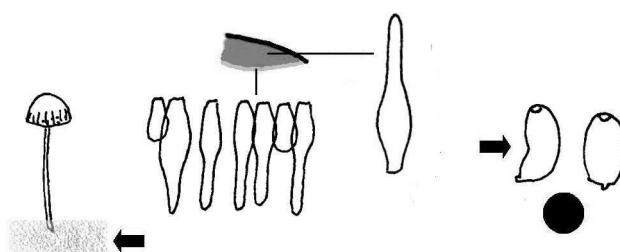

P. seymourensis A. H. SM.

11 (8) Spores very strikingly phaseoliform.
(see also *P. cotonea*). 12

11* Spores at most slightly phaseoliform. 15

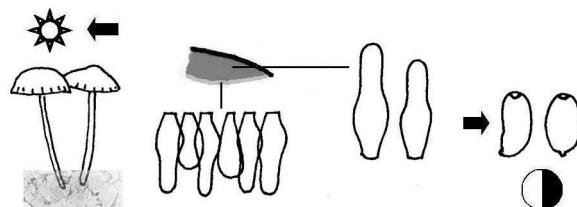

12 (11) Pleurocystidia lageniform, top narrow.
C. 10-25 mm broad. Veil scanty. Sp. (8,5)9-11(12,5) x 5-6(7) μm . Pl. 35-60 x 8-13(15) μm . Ch. 25-40 x 8-20 μm , closely packed. Dunes, sandy soil.

P. flexispora T. J. WALLACE & P. D. ORTON

12* Pleurocystidia utriform, top +/- broadly obtuse. 13

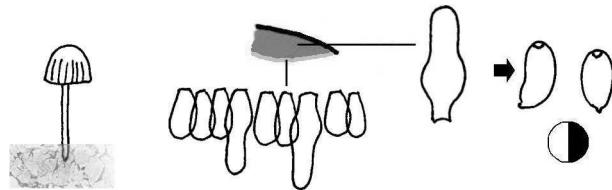

13 (12) Spores up to 11,5(12,5) μm long.
C. up to 28(35) mm broad. Veil scanty. Sp. 9,7-11,5(12,5) x 5,2-6(6,5) μm , mostly phaseoliform. Pl. 35-65 x (10)12-20 μm . Ch. 25-54 x 10-18 μm . Observed on a cornfield.

P. agraria ENDERLE (ad. int.)

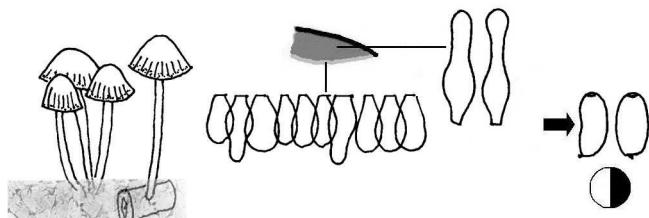

13* Spores up to 10 μm long. 14

14 (13) Spores 8-10 x 5-6 μm .
C. up to 18 mm broad. Veil scanty or absent. Pl. 30-50 x 10-12,5(20) μm . Ch. 27-35 x 7,5-10(12) μm , rare. Soil.

P. phaseolispora ARNOLDS

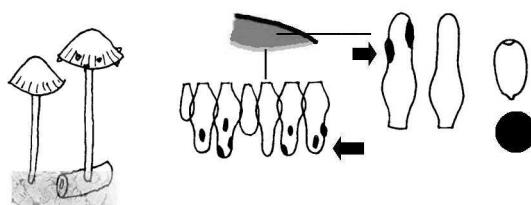

- 14* **Spores (6,5)7-9,5(10) x 4,5-5,5(6) µm.**
C. up to 50 mm broad. Veil distinctly. Pl. 32,5-55(70) x 9-15(17,5) µm. Ch. 27,5-40(60) x 9-15 µm, rare. Solitary and caespitose, soil.

P. fatua (FR.) KONR. & MAUBL.

P. clivensis (BERK. & BROOME) P. D. ORTON

10*

Clamps absent.

C. 3-12 mm broad. Veil scanty. Sp. 4,4-10 x 3,8-6 µm. Pl. 30-45 x 7,5-9 µm. Ch. 30-42 x 7-9 µm. Costal dunes.

P. liciosa CONTU & PACIONI

11 (9) Pleurocystidia often mucronat.

12

11* Pleurocystidia otherwise.

13

12 (11) Pleurocystidia often with curved extention.

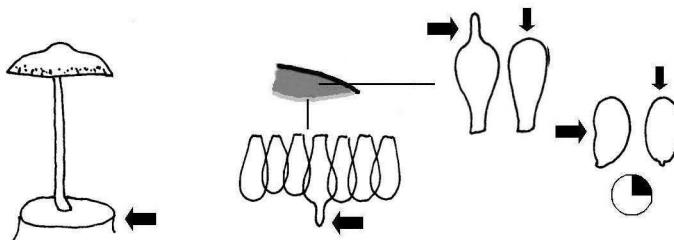

P. umbrina KITS V. WAV.

(see B 5)

12*

Pleurocystidia often with straight extention.

C. up to 70(90) mm broad. Veil scanty. Sp. 7-8 x 4-4,5 µm. Pl. 20-27,5(37) x 7,5-11(12,5) µm. Ch. 25-35 x 7,5-13 µm, mucronat, infrequently. Clavate marginal cells dominating. Solitary and caespitose on tree stumps (also conifers).

P. mucrocystis A. H. SM.

(Syn.: *Psathyrella chondrodermoides* ROMAGN.)

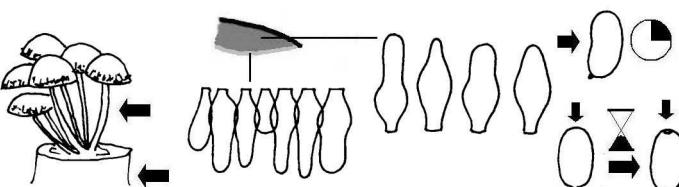

13 (9) Spores 6,5-8,5(9) x 3,5-5 µm.

P. cortinarioides P. D. ORTON
(see B 5*)

13*

Spores 5-6,5(7,5) x 3-3,5(5) µm.

C. up to 80 mm broad. Veil scanty. Germ pore sometimes visible but always tiny. Pl. 37,5-70 x 7,5-17,5 µm, versiform, sometimes mucronat. Ch. 22,5-57,5 x 7,5-22,5 µm. Dead wood.

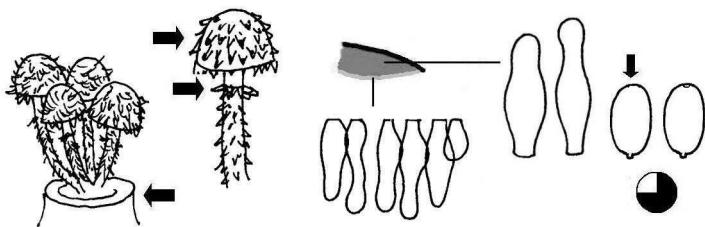

P. piluliformis (BULL.: FR.) P. D. ORTON

(Syn.: *P. alaskaensis* A. H. SM., *P. deceptiva* A. H. SM., *P. hydrophila* (BULL.) MAIRE, *P. hydrophiloides* KITS V. WAV., *P. ogemawensis* A. H. SM., *P. subpapillata* (P. KARST.) ROMAGN.)

14 (8) Veil very strongly developed.

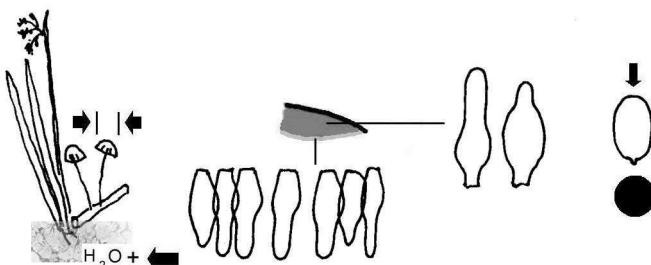

C. up to 75 mm broad. St. often with annular zone. Sp. 9-12,5(13) x (4,5)6-7,5 µm, germ pore absent or tiny. Pl. 40-70(75) x (12,5)15-20(25) µm. Ch. 35-75(95) x 7,5-20 µm, closely packed. Caespitose on stumps of conifers.

P. caput-medusae (FR.) KONR. & MAUBL.

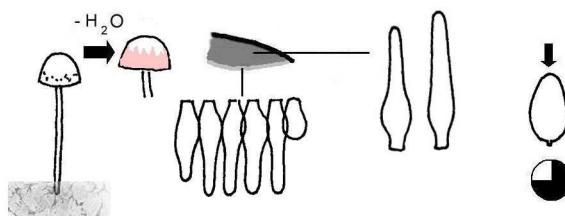

(Syn.: *P. gruberi* A. H. SM.?, *P. pseudocotonea* A. H. SM., *P. annulata* A. H. SM.?)

- 14* Veil not very strongly developed or absent. 15
- 15 (14) Cheilocystidia mostly closely packed. 16
- 15* Cheilocystidia distractred, only partly closely packed. 18
- 16 (15) Tiny species.
C. up to 4 mm broad. Veil scanty. Sp. 6-7,5 x 3,5-4 µm. Pl. 23-51 x 7,5-16 µm. Ch. 20-45 x 5,5-15 µm. Between *Juncus effusus*.

P. scheppingensis ARNOLDS

- 16* Larger species. 17
- 17 (16) Spores up to 8 x 4,5 µm.
C. up to 45 mm broad, during drying often pinkish. Veil distinctly. Sp. 6,5-8 x 3,6-4,5 µm, often limoniform. Pl. (30)35-55(60) x 8-14 µm. Ch. (25)27,5- 45(50) x 7,5-10(12,5) µm. Soil (coniferous forest).

P. atomatoides (PECK) A. H. SM.

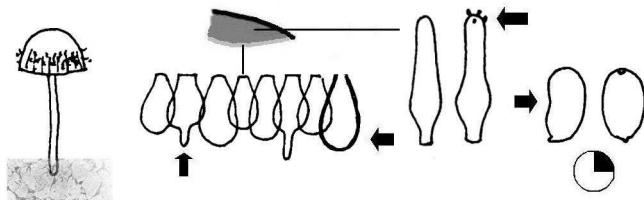

(Syn.: *P. caespitosa* WEHOLT, *P. rannochii* KITS. V. WAV.)

- 17* Spores up to 12,5 x 7 µm.
***P. magnispora* HEYKOOP & G. MORENO**
(see B 8)

- 18 (15) Pleurocystidia with deposits, in NH₄OH blueish green.

***P. cernua* (VAHL: FR.) G. HIRSCH**
(see B 14)

- 18* Pleurocystidia without deposits. 19
- 19 (18) Cheilocystidia mucronat. 20
- 19* Cheilocystidia not mucronat. 21
- 20 (19) Spores up to 10 µm long.
C. up to 30 mm broad. Veil scanty. Sp. 7-10 x 4,5-5,5(6) µm, germ pore absent or tiny. Pl. 25-75 x 9-16 µm, sometimes with granules. Ch. 30-50 x 7,5-17 µm, rare, mucronat. Soil.

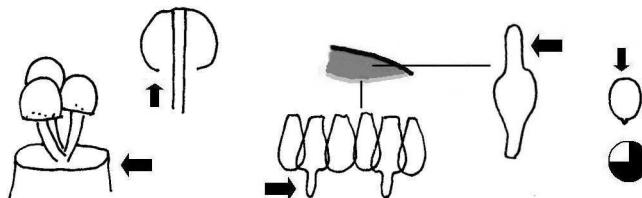

P. obtusata (PERS.: FR.) A. H. SM.
(Syn.: *P. tubariooides* A. H. SM.?; *P. vyrnwyensis* KITS V. WAV.)

20*

Spores up to 6 µm long.

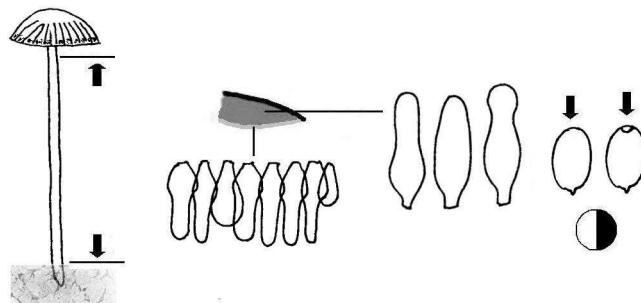

C. up to 25 mm broad, margin encurved. Veil scanty. Sp. 4,6-5,6(6) x 3,6-4,1 µm. Pl. on average 40 x 10 µm. Ch. 10-30 x 5-15 µm. Fresh mushroom with sweetish odour. Stumps of *Quercus*.

P. obscurotristis ENDERLE & M. WILHELM

21 (19) **Spores up to 5,5(6) µm broad.**

C. up to 40(50) mm broad. Veil scanty to distinctly. St. often disproportionately long. Sp. 7-9,5(10) x (4)4,5-5,5(6) µm, germ pore absent to distinct. Pl. (25)30-60(70) x 10-17,5(20) µm. Ch. 20-60(70) x (6)10-17,5(20) µm. Soil, pieces of wood.

P. senex (PECK) A. H. SM.
(Syn.: *P. badia* KITS. V. WAV., *P. capitatocystis* KITS V. WAV., *P. communis* A. H. SM., *P. distans* A. H. SM., *P. fallax* A. H. SM., *P. friesii* KITS V. WAV., *P. fusca* (SCHUM.) A. PEARS. ss. WAV., *P. fulvescens* var. *brevicystis* KITS V. WAV.)

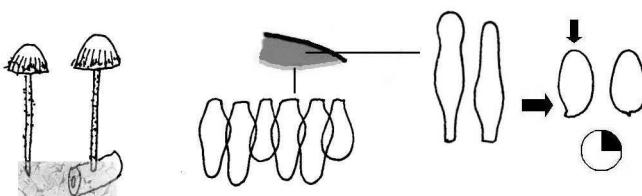

21*

Spores up to 4,5 µm broad.

22

22 (21) **Spores very bright.**

C. 10-18 mm broad. Veil strongly developed. Sp. 7-8(9) x 3,5-4,5 µm. Pl. 35-50 x 12,5-17,5 µm. Ch. 30-40 x 7,5-15 µm. Soil.

P. kitsiana ÖRSTADIUS
(Syn.: *P. obtusata* var. *abberans* KITS V. WAV., *P. umbrina* var. *utriformis* KITS. V. WAV., *P. rhombispora* KEIZER & ARNOLDS?)

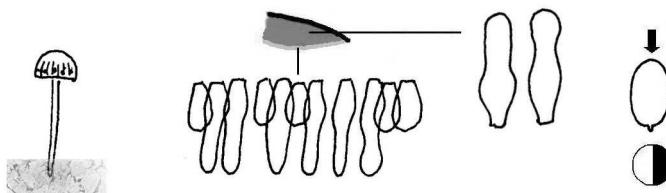

22*

Spores somewhat darker.

23

23 (22) Spores in water reddish brown.

C. up to 19 mm broad. Veil distinctly. Sp. 7-8 x 4-4,5 µm. Pl. 30-50(55) x 12,5-15(17,5) µm. Ch. 27,5-45 x 7,5-15 µm. Soil.

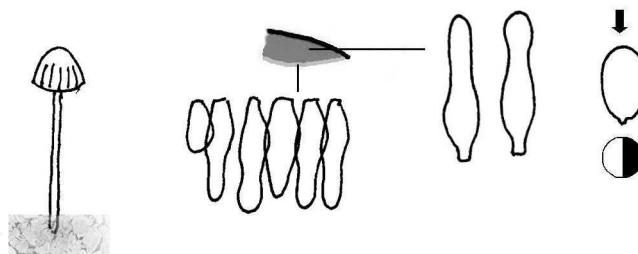

P. dennyensis KITS. v. WAV.

23*

Spores in water orange brown.

C. up to 32 mm broad. Veil scanty. Sp. 7-8,5 x 4-4,5 µm. Pl. (30)35-45(50) x (7,5)9-13 µm. Ch. 25-45 x 7,5-12,5 µm. Soil.

P. romseyensis KITS. v. WAV.

Part E

(Part C)

1 Veil consisting of globose elements.

2

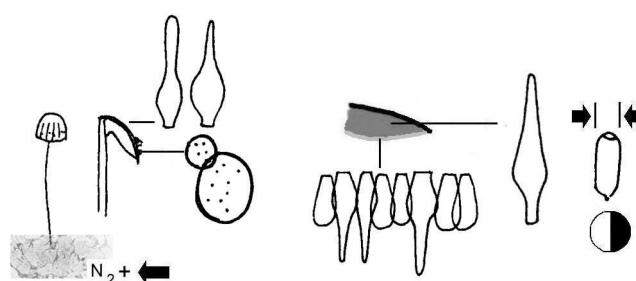

1* Veil otherwise.

4

2 (1) Pleocystidia present.

C. up to 20 mm broad. Sp. 5,8-7,4 x 3-3,7 µm. Pl. 20-30 x 4-9,5 µm.

Pileocystidia 50 x 11 µm. Clamps only in the mycelium. Dung, especially wild boar.

P. tenuicula (P. KARST.) ÖRSTADIUS & HUHTINEN

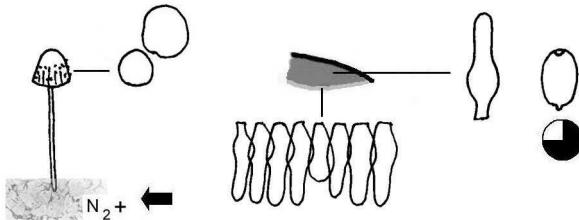

(Syn.: *P. berolinensis* E. GERHARDT, *P. minima* PECK, *P. granulosa* ARNOLDS?, *Psathyrella coprinoides* A. DELANNOY, CHIAFFI, CORTECOUSSE & EYSSARTIER?, *Coprinus parvulus* ULJÉ & KEIZER)

2* Pleocystidia absent.

3

3 (2) Pleurocystidia broadly obtuse at top.

C. up to 14 mm broad. Veil distinctly. Sp. 7,5-9(9,5) x 4-5,5 µm. Pl. 20-37,5 x 7,5-12 µm. Ch. 18-36 x 6-12 µm, closely packed. Dung.

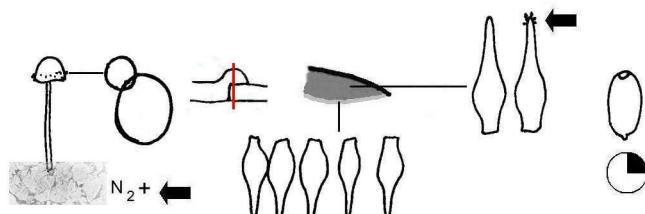

P. sphaerocystis P. D. ORTON

3*

Pleurocystidia narrow at top.

C. up to 8 mm broad, Veil scanty. Sp. 7,8-8,5(9) x 3,5-4,5 µm. Pl. 26-28 x 7,5-8,5 µm. Ch. 18-27 x 7,5-9,5 µm. Cow dung.

C. 3-6 mm broad. Veil scanty up to distinctly. Sp. 8-9 x 4,5-5,5 µm. Pl. 25-45(60) x 8-14 µm. Ch. 25-40 x 8-14 µm. Cow dung.

P. fimeseda ÖRSTADIUS & E. LARSSON
(see B 11*)

- 8 (5) Pleurocystidia utriform.**
C. up to 45 mm broad. Veil scanty. Fresh mushroom with sweetish odour. Sp. 5,5-6,5 x 3-3,5 µm. Pl. 40-52 x 10-17,5 µm. Ch. 30-40 x 10-15 µm, closely packed. Caespitose on wood of conifers.

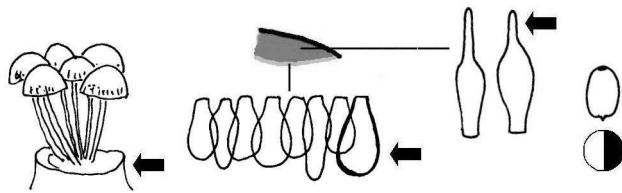

P. fragrans A. H. Sm.

(= *P. piluliformis* (BULL.: FR.) P. D. ORTON?)

8*

Pleurocystidia lageniform.

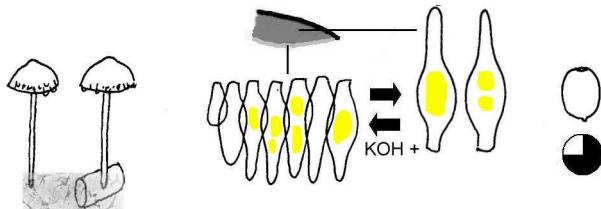

C. up to 45(50) mm broad. Veil scanty. Sp. 5,5-6 x 3-3,5 µm. Pl. 32,5-45 x 10-15(17,5) µm. Ch. (15)20-35(40) x 7,5-15 µm, very scattered. Around stumps.

P. laevissima (ROMAGN.) SING.

9 (6) Cystidia with a large oily inclusion (in KOH yellow).

C. up to 50(75) mm broad. Veil scanty to distinctly. Sp. (6,5)7-9(9,5) x 4,5-5,5(6) µm. Pl. 40-85 x 10-20 µm. Ch. 27,5-65 x 10-17,5 µm, closely packed.
Soil, pieces of wood, stumps.

P. gossypina (BUL.: FR.) A. PEARS. & DENNIS

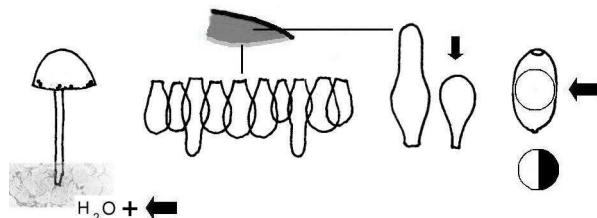

(Syn.: *P. delineata* A. H. SM., *P. xanthocystis* P. D. ORTON)

9* Cystidia otherwise.

10

10 (9) Spores with a large, circulary oil drop.

C. 5-20 mm broad. Veil scanty. Sp. 8-10,5 x 5-6,2 µm. Pl. (30)36-52 x 6,8-19 µm, utriform, beside many sphaeropedunculate cells. Ch. 22-40(50) x 6,8-19 µm, scattered, clavate marginal cells up to 30(40) x 13,5(20) µm, frequently. Muddy or wet soil.

P. ephemera A. H. SM.

10* Spores not so.

11

11 (10) Cheilocystidia often (sub-) capitat.

P. senex (PECK) A. H. SM.
(see D 21)

11* Cheilocystidia mostly not (sub-) capitat.

12

12 (11) Cheilocystidia not rarely, but not closely packed.

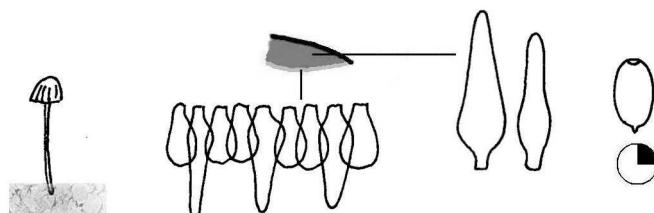

13

12* Cheilocystidia frequently, mostly closely packed.

Part H

13 (12) Lamellae edge never pigmented.

C. up to 9 mm broad. Veil scanty. Sp. 9-10 x 4,5-5,5 µm. Pl. 45-70 x 12,5 - 17,5(20), top often forked. Ch. 35-50(55) x 10-16 µm. Soil.

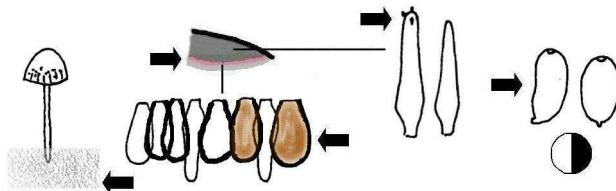

P. minutissima KITS v. WAV.

13* Lamellae edge at least partly pigmented.

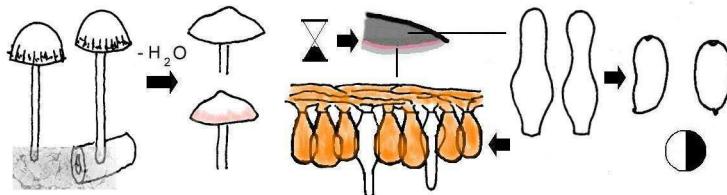

14

- 14 (13) Clavate marginal cells often thickwalled and brownish. 15
 14* Clavate marginal cells not or only very rarely so. 16
 15 (14) Spores 7-9 x 4,5-5,5 μm .
 C. up to 20 mm broad. Veil scanty. Pl. 47,5-65 x 18-21 μm , utriform or sublageniform, at top often with deposits. Ch. 30-45 x 9-12,5 μm , not frequently. Dunes, sandy soil.

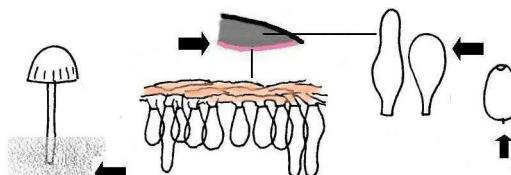

P. dunensis KITS V. WAV.

- 15* Spores 6,5-7(8) x (4)4,5(5) μm .
 C. up to 60 mm broad, during drying often slightly pinkish. Veil scanty. Pl. 37-60 x 12,5-17 μm , utriform, sometimes subcapitatum. Ch. 30-48 x 12-17 μm . Soil, pieces of wood.

P. pseudocorrugis (ROMAGN.) BON SS. ROMAGN.
 (Syn.: *P. borgensis* KITS V. WAV.)

- 16 (14) On sandy soil, dunes.
 C. up to 25 mm broad. Veil scanty. Sp. 8-10,5(12) x 4,5-6,5(7) μm . Pl. 35,5-52,5 x 10-16,5 μm , utriform, fusiform or lageniform, spheropedunculate cells also present. Ch. 24,5-50 x 9,5-15 μm , distractored.

P. dunarum KITS V. WAV.

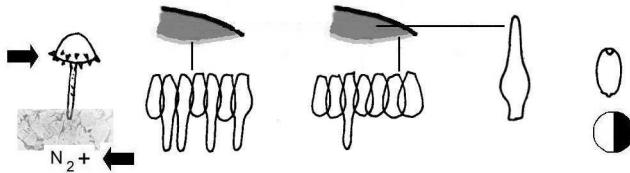

- 16* On dung.
P. scatophila ÖRSTADIUS & E. LARSSON
 (see B 10)

26* **Cheilocystidia predominantly lageniform.**

29

27 (26) **Pileipellis as cutis.**

C. up to 35(50) mm broad. Veil scanty to distinctly. Sp. (8)9-11(12) x 5-6,5 µm. Pl. (35)47,5-70(90) x 15-25 µm. Ch. (30)35-60(65) x 10-25 µm. Caespitose on hardwood stumps.

Coprinopsis pannuciooides (J. E. LANGE) ÖRSTADIUS & E. LARSSON
(Syn.: *P. cuspitata* A. H. SM., *P. pannuciooides* (J. E. Lange) M. M. Moser)

27* **Pileipellis as hymeniderm.**

28

28 (27) **Clavate marginal cells strikingly large (up to 50 x 25 µm); on wet soil.**

P. almerensis KITS V. WAV.
(see F 18)

28* **Clavate marginal cells not strikingly large; not on wet soil.**

P. fagetophila ÖRSTADIUS & ENDERLE

(see G 16*)

29 (26) Stipe with a short pseudorhiza.

P. pellucidipes (ROMAGN.) GALLANT ex M. M. MOSER
(see G 27)

29* Stipe without a Pseudorhiza.

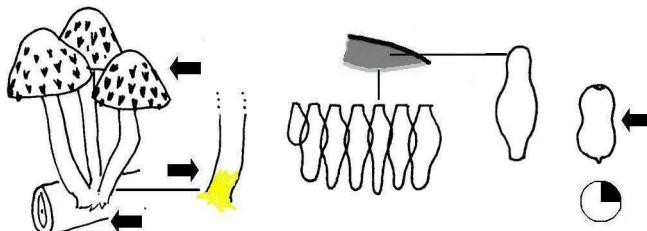

P. dicrani (A. E. JANSEN) KITS V. WAV.
(see G 16)

Part H

(Part E)

1 Spores median often constricted.

C. up to 75(100) mm broad. Veil distinctly, scaly. Stem at the base usually yellowish. Sp. (6)6,5-8(9) x 3,5-4,5 μm . Pl. (32,5)35-50(75) x 10-17,5 μm . Ch. 30-65 x (7,5)10-15, polymorph. Solitary and caespitose, soil.

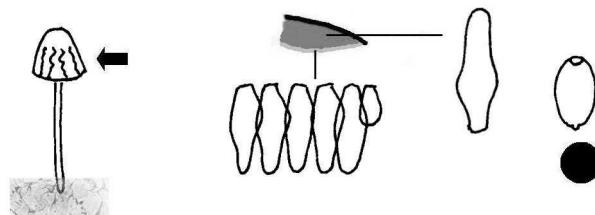

***P. cotonea* (QUÉL.) KONR. & MAUBL.**

(Syn.: *P. alboalutacea* A. H. SM., *P. duchesnayensis* A. H. SM., *P. insignis* A. H. SM., *P. lacrymabunda* (Fr.) M. M. MOSER ss. A. H. SM., *P. olivaceopallida* A. H. SM., *P. subvolvata* A. H. SM.)

1* Spores otherwise. 2

2 (1) Spores up to 6 μm broad.

C. up to 20(30) mm broad, wrinkled. Veil scanty. Sp. (7,5)8,5-9(10) x 5-6 μm . Pl. (28)38-65 x 12-19 μm . Ch. 15-43 x 8-15 μm . Soil.

***P. reticulata* (ROMAGN.) M. M. MOSER**

(Syn.: *P. romagnesiana* BON)

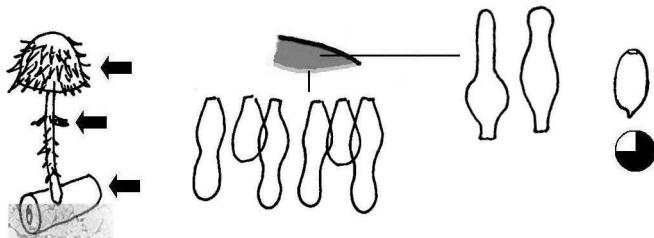

2* Spores maximally 5(5,5) μm broad. 3

3 (2) Pleurocystidia with often constricted apex. 4

3* Pleurocystidia without often constricted apex. 6

4 (3) Cheilocystidia lageniform.

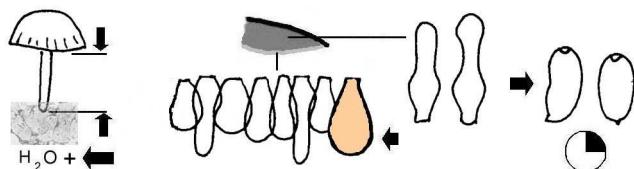

C. 10-50 mm broad. Veil strongly developed. St. often with annulus. Sp. (6)6,5-9(10) x 4-4,5(5) μm . Pl. 40-50 x 15-18 μm . Ch. 30-55 x 12-15 μm . Fresh mushroom with sweetish odour. Dead wood, bark chips, soil.

P. suavissima AYER
(Syn.: *P. sacchariolens* ENDERLE)

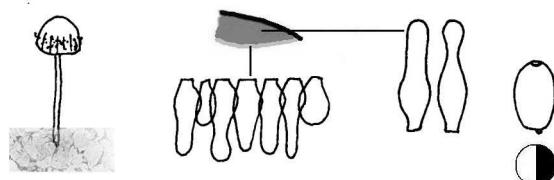

4* **Cheilocystidia utriform.** 5

- 5 (4) **Spores (6,5)7-8(9) x 4-5(5,5) µm.**
C. 10-50 mm broad. Veil scanty to distinctly. Stem usually strikingly short. Pl. (37,5)40-70 x 10-20 µm. Ch. (22,5)27,5-60 x (7,5)10-17,5(20) µm. Larger clavate marginal cells often brownish. Muddy or wet soil.

P. noli-tangere (FR.) A. PEARSON & DENNIS

5* **Spores up to 7,5 µm long.**
C. up to 16 mm broad. Veil scanty. Sp. 6,2-7,5 x 3,7-4,5 µm. Pl. 33-57,5 x 9,5-17,5 µm. Ch. 22-40(50) x 8-15 µm. Soil.

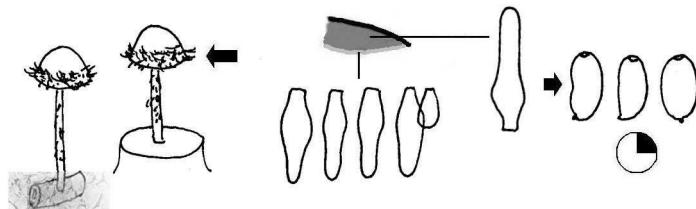

P. mookensis KITS V. WAV.

6 (3) **Spores up to 8(9) µm long.** 7

6* **Spores up to 10(10,5) µm long.** 9

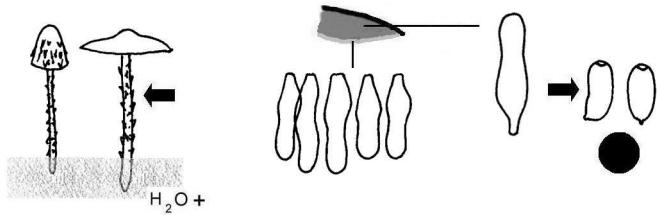

- 7 (6) **Spores pale reddish yellow.**
C. up to 35 mm broad. Veil strongly developed, cells up to 300 µm long. Sp. 6-8 x 3,5-5 µm. Pl. 30-80 x 6-14 µm. Ch. 25-60 x 6-15 µm. Dead wood, stumps (*Fagus*).

P. squamosa (P. KARST) M. M. MOSER ex A. H. SM.
(Syn.: *P. artemisiae* var. *microspora* KITS V. WAV.)

7* **Spores distinctly darker.** 8

- 8 (7) **Spores up to 3,5(4) µm broad, black.**
H. up to 50 mm broad, Veil strongly developed. Stem with scales. Sp. 7-8,5 x 3-3,5(4) µm. Pl. 30-50 x 7-14 µm. Ch. 30-50 x 7-14 µm. Sandy soil, floodplain forest with *Alnus*; Switzerland.

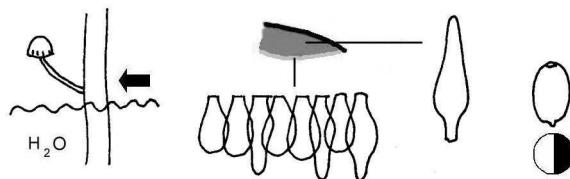

P. immaculata HORAK & GRIESER

- 8* **Spores up to 5 µm broad, brown.**
C. up to 20 mm broad. Veil scanty. Sp. 6,5-9 x 3,5-5 µm. Pl. 25-48 x 7-14 µm.
Ch. 15-40 x 6-14 µm. Wet soil.

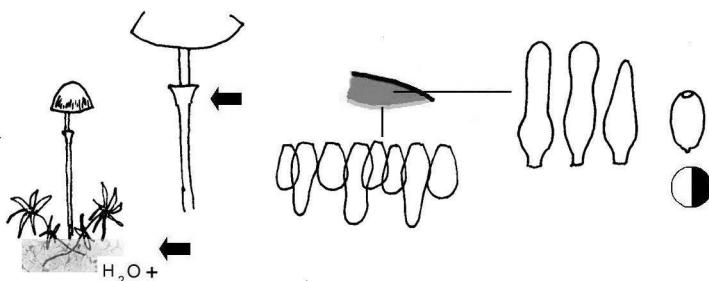

P. rubiginosa A. H. SM.

- 9 (6) **On Phragmites and Scirpus just above the water.**
C. up to 10 mm broad. Veil scanty. Sp. 8-10 x 5,5-6 µm. Pl. 37,5-52,5 x 10-15 µm. Ch. 35-50 x 11-15 µm.

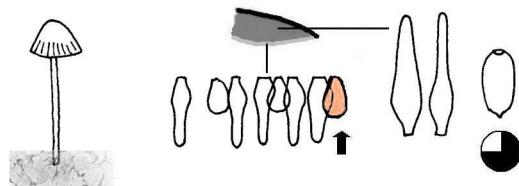

P. basii KITS V. WAV.

- 9* **Other habitat.** 10
10 (9) **Stem with annulus.**
C. up to 30 mm broad. Veil scanty. Sp. 8-10 x 4,5-5,5(6) µm. Pl. 45-67,5 x 12,5-17,5 µm. Ch. 27,5-50 x 10-17,5 µm. Between Sphagnum (and other moss).

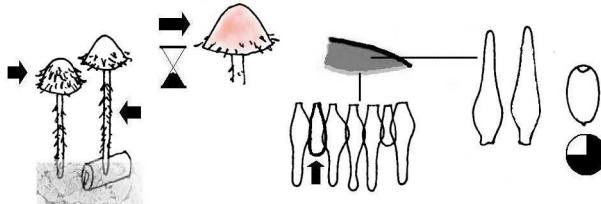

P. sphagnicola (MAIRE) J. FAVRE

- 10* **Stem without annulus.** 11
11 (10) **Sphaeropedunculate marginal cells partly thickwalled.** 12
11* **Sphaeropedunculate marginal cells always thinwalled and colourless.** 13
12 (11) **Large sphaeropedunculate marginal cells thickwalled and brownish.**
C. up to 30(45) mm broad. Veil scanty. Sp. 7-10(10,5) x 4-5(5,5) µm. Pl. 35-60(88) x 8-15(17,5) µm, fusiform. Ch. 25-45 x 7,5-13(15) µm. Soil, stumps.

P. fulvescens (ROMAGN.) M. M. MOSER

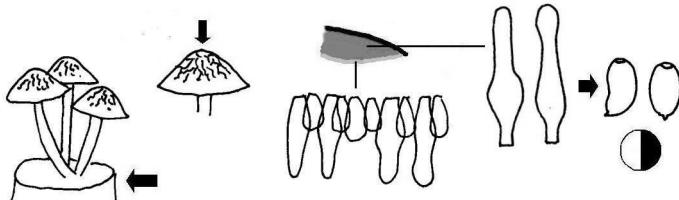

- 12* **Large sphaeropedunculate marginal cells thickwalled and colourless.**
C. up to 45 mm broad, during the drying mostly pinkish. Veil distinctly. Sp. 8-10(10,5) x (4)4,5-5,5(6) µm. Pl. 35-55(65) x 10-17,5 µm. Ch. 20-55 x 7,5-15 µm. Soil.

P. impexa (ROMAGN.) BON

13 (11) Spores at base mostly truncated.

C. up to 50(75) mm broad, distinctly wrinkled. Veil scanty to distinctly. Sp. 6,5-8(9) x 3,5-4,5(5) µm. Pl. 40-90 x 12,5-17,5 µm, fusiform to utriform. Ch. 30-60 x (9)10-13(15) µm. Cystidia some times subcapitata. Stumps of conifers.

P. pertinax (FR.) ÖRSTADIUS

(Syn.: *Psathyrella chondroderma* (BERK. & BROOME) A. H. SM.)

13* Spores not so.

P. senex (PECK) A. H. SM.

(see D 21)
