

# A List of *Eucalyptus* Leaf Fungi and their Potential Importance to South African Forestry\*

P.W. Crous<sup>1</sup>, P.S. Knox-Davies<sup>1</sup> and M.J. Wingfield<sup>2</sup>

## SYNOPSIS

Fungi reported from *Eucalyptus* leaves are tabulated, giving their host species and world geographic distribution. A brief evaluation is made of the status of the fungi, and also of recent trends in *Eucalyptus* leaf pathology.

## INTRODUCTION

Most of the approximately 600 *Eucalyptus* spp. and varieties are endemic to Australia and Papua New Guinea (Pryor, 1976). *Eucalyptus* spp. have been planted in more than 50 % of all newly afforested areas in South Africa, with *Eucalyptus grandis* Hill: Maid. covering almost 80 % of this area (Department of Environment Affairs, 1987).

More foliar parasites have been recorded on *Eucalyptus* than on any other tree genus (Marks, Fuhrer and Walters, 1982). In 1975 Gibson published a list of pathogens causing leaf and stem disorders of this host. Since then, there has been no complete review of *Eucalyptus* leaf diseases. Many new fungi have been recorded from *Eucalyptus* leaves in recent years, and the lack of a current compilation makes studying these fungi difficult.

Despite the growing importance of *Eucalyptus* spp. to South African forestry, very little is known about the diseases affecting this host locally. Only a few eucalypt leaf pathogens have been recorded (Dodge, 1950; Dodge *et al.*, 1953; Lundquist and Baxter, 1985). Of these, *Mycosphaerella* leaf blotch has had a significant impact on forestry in South Africa. This fungus has caused serious defoliation of *E. nitens* (Deane *et al.* Maid. and *E. globulus* Labill., and

only New South Wales provenances of *E. nitens* can safely be used (Lundquist and Purnell, 1987).

Recent examination of *Eucalyptus* stands in various parts of South Africa have shown the presence of numerous previously unreported and undescribed pathogens. The potential impact that these fungi will have on the forest industry is unknown. Field observations suggest that these pathogens are generally more important on young trees. Because the local trend is to harvest eucalypt stands at short rotations, foliar diseases are likely to be of considerable importance in the future.

The aim of this paper is therefore to list all the fungi so far recorded on *Eucalyptus* leaves, with information on their taxonomic position, geographic distribution and reference sources. An attempt is also made to separate pathogens from saprophytes based on current knowledge of these fungi (*Tables 1* and *2*). It is hoped that this will form a basis for further detailed studies of fungi occurring on leaves of *Eucalyptus*.

\* Part of an M.Sc. Agric. thesis submitted by the first author to the University of Stellenbosch, Stellenbosch 7600.

Synonym: <i>Cylindrosporium samuelii</i> Hansf.	New Zealand, West Germany	<i>E. cephalocarpa</i> , <i>E. dalrympleana</i> , <i>E. globulus</i> , <i>E. gunii</i> , <i>E. maidenii</i> , and others (see references)	Leaf spots, malformation of leaves and shoots	Boesewinkel, 1981; Glasscock & Rosser, 1957; Gorter, 1988; Pady, 1972; Yarwood & 1957; Yarwood & Gardner, 1974
<i>Septoria mortolensis</i> Penz. & Sacc.	Argentina, Australia, Brazil, Britain, Denmark, Italy, New Zealand, Poland, Portugal, South Africa, S. America	<i>E. ovata</i> , <i>E. nitens</i> , and others (see references)	Leaf spots, malformation of leaves and shoots	Dick, 1982; Gadgil & Dick, 1983; Swart, 1988
<i>Septoria normae</i> Heather	New Zealand	<i>E. cephalocarpa</i> , <i>E. dalrympleana</i> , <i>E. globulus</i> , <i>E. ovata</i> , <i>E. nitens</i> , and others (see references)	Pale yellow leaf spots that turn brown and necrotic	
<i>Sonderhenia eucalypticola</i> (Davis) Swart & Walker (see <i>Mycosphaerella walkeri</i> )	Mauritius	<i>Eucalyptus</i> spp*	Circular lesions, up to 10 mm long and 5 mm in diameter	Sutton, 1971a
<i>Sonderhenia eucalyptorum</i> (Hansf.) Swart & Walker (see <i>Mycosphaerella swartii</i> )	Australia	<i>E. tessellaris</i>	Leaf spots	Alcorn, 1973
<i>Sphaerotheca aphanis</i> (Wallr.) Braun	S. Africa	<i>E. camaldulensis</i>	Leaf spots	Marasas, 1966
Synonyms: <i>S. alchemillae</i> (Grev.) Junell; <i>S. macularis</i> (Wallr. & Fr.) Lind; <i>Oidium fragariae</i> Harz.	New Zealand	<i>E. delegatensis</i> , <i>E. regnans</i> , <i>E. fastigata</i> , <i>E. sieberi</i>	Leaf spots 2–18 mm in diameter	Dick, 1982; Gadgil & Dick, 1983
<i>Sphaerotheca pannosa</i> (Wallr. Fr.) Lév.	Fiji, New Zealand	<i>E. delegatensis</i> , <i>E. regnans</i> , <i>E. sieberi</i> , <i>E. globulus</i>	Lesions up to 5 mm in diameter	Dick, 1982; Park & Keane, 1982a; Sutton & Ganapathi, 1978
Synonyms: <i>Aephitomorpha pannosa</i> Wallr.; <i>Erysiphe pannosa</i> (Wallr.) Fr.; <i>Oidium leucoconium</i> Desm.; <i>Oidium eucalypti</i> Rostr.				
<i>Stagonospora delegatensis</i> (see <i>Mycosphaerella delegatensis</i> )				
<i>Stagonospora pulcherrima</i> (Gadgil & Dick) Swart				
Synonym: <i>Septoria pulcherrima</i> Gadgil & Dick				
<i>Staninwardia breviuscula</i> Sutton				
<i>Stigmina eucalypti</i> Alcorn				
<i>Thyridula eucalypti</i> (see <i>Aulographina eucalypti</i> )				
<i>Thyriopsis sphaerospora</i> Marasas				
<i>Trimmastroma bifarium</i> Gadgil & Dick				
<i>Trimmastroma excentricum</i> Sutton & Ganapathi

<i>Zopheromyces fasciatus</i> Sutton & Hodges	Brazil	<i>E. robusta, E. saligna</i>	Sutton & Hodges, 1976b	On leaf litter

## DISCUSSION

Very little is known about the pathogenicity of fungi occurring on eucalypt leaves. Many fungi thought to be saprophytes might later be shown to be pathogenic under certain conditions. Increasingly intensive nursery practices, including close spacing and mist-spraying will cause foliage pathogens of eucalypts to become more important in the future. Growing reliance on clonal propagation, with the resulting uniform genetic base, is another cause for concern.

Some leaf-infecting fungi appear to be new pathogens of eucalypts. In South America, for instance, *Puccinia psidii* Winter (the guava rust fungus) is common on wild *Eugenia jambos* L. and has caused extensive losses on a South African provenance of *E. grandis* (Dianese, Moraes and Silva, 1984). In India, Upad-

hyay and Bordoloi (1974) reported a leaf rust on *E. citriodora* Hook., caused by a *Melampsora* sp. Neither of these rusts has been recorded on *Eucalyptus* spp. in Australia or Papua New Guinea, the centre of origin of *Eucalyptus*. Similarly, the rose powdery mildew fungus *Sphaerotheca pannosa* (Wallr. : Fr.) Lev. (= *Oidium eucalypti* Rostr.) has adapted to infect *Eucalyptus* spp. in New Zealand (Boesewinkel, 1981), and in South Africa. Other pathogens not occurring on eucalypts in their centre of origin might therefore be expected to appear on this host in future.

There might still be other, as yet unrecorded pathogens of *Eucalyptus* spp. in South Africa. Intensive surveys of *Eucalyptus* plantations in representative parts of the country are therefore required to evaluate the status of leaf pathogens. Attention will also have to be given to aspects of their biology and pathogenicity.
