Antioq. 5. 1947; Moldenke, Phytologia 2: 142 & 159. 1948; Moldenke, Known Geogr. Distrib. Verbenac. 10, 23, 25, 31, 32, 34, 36--42, 44--58, 61, 64, 66--68, 70, 71, 73, 89, 97, 99, 109, 110, 115--120, 122, 124, 125, 128--130, 144, 163, & 195. 1949; Moldenke, Phytologia 3: 172--173. 1949; Moldenke, Phytologia 3: 276. 1950; Stellfeld, Trib. Farmac. 19 (10): 171. 1951; Moldenke, Phytologia 3: 423--424. 1951.

Footnote 2 on page 62 of my monograph in Fedde, Repert. 41: 1--76 (1936) is incorrect. According to Bot. Zeitung 3: 587 [Aug. 29, 1845], pages 1--192 of Walpers, Repertorium, volume 4, were issued in 1845, not 1844 nor 1846. This fact was verified for me by the late Dr. John H. Barnhart.

In regard to the date of publication of Jaubert & Spach, Illustr. Pl. Orient. 5: pl. 453--455, a letter from W. T. Stearn dated November 12, 1936, states: "Internal evidence (cf. pp. 105--110) indicates that they must have been published before November 1856; they were stamped at the British Museum, Bloomsbury, on 3 April 1856; as the British Museum subscribed to the work, parts would be received there within a month or two of their publication in Paris; accordingly it seems fairly safe to accept them as being published during the first quarter of 1856."

On page 2, line 19, of my monograph, the word "Front." is a typographic error for "Frond."

The common names "Drehling", "Eisenhart", and "velvet bur" are recorded for the genus. The genus Priva is placed in the Labiatae, section Verbeneae, by H. G. L. Reichenbach in Mössler, Handb. Gewächsk., ed. 1, 1: xxxvi (1827) and ed. 3, 1: lxxv. 1833; also by him in his Conspect. Reg. Veg. 1: 117 (1828) where he lists as synonyms Phryma Forsk. and Tortula Roxb. under Priva Adans. Streptium Roxb. is given as a valid genus.

It is worthy of note here that the "Phryma carolinensis Walt." sometimes found in literature and on herbarium sheets is actually a synonym of Styloodon carneus (Medic.) Moldenke.

Explanation of the abbreviations employed for the names of herbaria in this and subsequent notes will be found in my booklet entitled "A list showing the location of the principal collections of Verbenaceae and Avicenniaceae", pp. 1--3 (1942) and its Supplement 1, pp. 1--2 (1947) and in Phytologia 3: 179--180 (1949), 3: 321 & 382 (1950), 3: 491 (1951), and 4: 295 (1953).

#### PRIVA ADHAERENS (Forsk.) Chiov.

Literature: Forsk., Fl. Aegypt.-arab. cxv. 1774; Forsk., Descr. Pl. Fl. Aegypt.-arab. 114. 1775; Vahl, Symb. Bot. 3: 6. 1794; Mirbel, Hist. Nat. Pl., ed. 2, 15: 233. 1805; Pers., Syn. Pl. 2: 138--139. 1806; A. L. Juss., Ann. Mus. Hist. Nat. Paris 7: 70. 1806; Poir. in Lam., Encycl. Méth. Bot. 8: 844. 1808; Steud., Nom. Bot., ed. 1, 874. 1821; E. Mey., Comm. Pl. Afr. Austr. 275. 1837; Schau. in A. DC., Prodr. 11: 553--554 & 556. 1847; Jaub. & Spach, Ill. Pl. Orient. 5: [59], pl. 455. 1856;

Hook. f. & Jacks., Ind. Kew. 2: 628. 1894; Chiov., Bull. Soc. Bot. Ital. 115. 1923; Kobuski, Ann. Mo. Bot. Gard. 13: 9. 1926; Alston in Trimen, Handb. Fl. Ceylon 6: 231. 1931; Moldenke in Fedde, Repert. 41: 39--42. 1936; Moldenke, Prelim. Alph. List Invalid Names 36, 38, 40, 43, 46, & 54. 1940; Moldenke, Alph. List Invalid Names 36, 39, 40, 43, 47, & 57. 1942; Moldenke, Phytologia 2: 111. 1944; Moldenke, Known Geogr. Distrib. Verbenac. 109, 110, 117, 118, 122, 124, & 195. 1949.

The name Priva dentata has been erroneously applied to specimens of Verbena supina L. in some herbaria. Fries states that P. adhaerens grows one-half meter tall in woods.

#### PRIVA AFRICANA Moldenke

Literature: Moldenke in Fedde, Repert. 41: 36--37. 1936; Moldenke, Known Geogr. Distrib. Verbenac. 122 & 195. 1949.

Codd & Dyer describe the species as a shrublet, one foot tall, with mauve flowers, growing on limestone formations. It has been collected in anthesis in February and December.

Additional citations: UNION OF SOUTH AFRICA: Transvaal: Codd & Dyer 3886 (N); Pole-Evans 1964 (Af--22700); F. A. Rogers 22507 (N--fragment of type); Thode A.1758 (N--photo, Na--25138, Z--photo); Van Dam s.n. [Dec. 1924] (N).

#### PRIVA ARMATA S. Wats.

Literature: S. Wats., Proc. Amer. Acad. 25: 160. 1890; Moldenke in Fedde, Repert. 41: 50--52. 1936; Moldenke, Known Geogr. Distrib. Verbenac. 31 & 195. 1949.

The species has been collected in valleys, in anthesis and in fruit during July.

Additional citations: MEXICO: Nuevo Leon: Pringle 1931 (Br--isotype, Cb--isotype, Ed--isotype, F--109393--isotype, Me--isotype, Mu--1414--isotype, Mu--1416--isotype, Ob--isotype, Pa--isotype, Us--isotype, Vt--isotype, Vu--isotype), 2674 (F--263110, Io--38716, Me, Me).

#### PRIVA ASPERA H.B.K.

Literature: H.B.K., Nov. Gen. & Sp. Pl. 2: 278. 1818;

Schrad., Ind. Sem. Hort. Götting. 1831; Schrad., Linnaea 8, Litteratur-Bericht 24. 1833; Mart. & Gal., Bull. Acad. Roy. Brux. 11 (2): 324. 1844; Schau. in A. Ins. Mar. Pac. 1: 250. 1890; Kobuski, Ann. Mo. Bot. Gard. 13: 20. 1926; Junell, Symb. Bot. Upsal. 4: 39--42, fig. 76 a & b. 1934; Moldenke in Fedde, Repert. 41: 54--57. 1936; Standl., Field Mus. Publ. Bot. 18: 1012. 1938; Moldenke, Prelim. Alph. List Invalid Names 7, 38, & 39. 1940; Gentry, Carnegie Inst. Wash. Publ. 527: 223--224 & 306. 1942; Moldenke, Alph. List Invalid Names 6 & 39. 1942; Moldenke, Phytologia 2: 111. 1944; Moldenke, Known Geogr. Distrib. Verbenac. 31, 36, 38, 39, 163, & 195. 1949; Matuda, Am. Midl. Nat. 44: 576. 1950.

Additional synonyms are Priva aspera DC. ex Moldenke, Prelim. Alph. List Invalid Names 38, in syn. 1940; Priva orizaba Wats. ex Moldenke, op. cit. 39, in syn. 1940; Priva rugosa A. DC. ex Moldenke, op. cit., 39, in syn. 1940.

The type collection of Priva aspera is Humboldt & Bonpland 4323 at Paris, sometimes referred to as Herb. Bonpland 4323. The species has been collected in anthesis and in fruit in January, February, and from July through December. The Bourgeau 2950 collection is a mixture, at least in some herbaria, of this species and Lantana achyranthifolia Desf. The Collector undesignated s.n. in the DeCandolle Herbarium at Geneva was erroneously determined as Antirrhinum sp.; Hahn 289 was determined as Basella sp.; Pringle 287 and Türckheim II.1628 were previously determined by herbarium workers as "P. echinata Juss.", M. E. Jones 7323 and Edw. Palmer 1999 as "P. hispida", M. E. Jones s.n. as "P. orizaba Wats.", Brener 17215 as P. lappulacea (L.) Pers., and J. R. Johnston 1613 as P. mexicana (L.) Pers.

The Tonduz s.n. [Herb. Instit. Physico-geogr. Nat. Costaric. 8207] cited by me on page 57 of my monograph as from "Province undetermined" in Costa Rica, is actually from San José.

Drawings of cross-sections of the ovary of this species are seen in the Junell reference cited above. The species has been collected at altitudes of 1200 to 1950 meters; in Chihuahua it has been found at 7000 feet. Galeotti describes it as "rare", with reddish-white or rose flowers. Gentry, in the reference cited above, says that the species inhabits hillslopes and canyon-bottoms in the oak forest and lower pine zones, at altitudes of 4000 to 5000 feet. He describes it as an infrequent shrub-like perennial herb with a woody base and long, slender, arching branches when growing on the slopes or else rank and completely herbaceous when growing in moist bottoms, 1 to 2 meters tall, with lavender flowers blooming in summer. He also found it among pines in small gullies in the Transition and Upper Sonoran zones, where, he says, it is a shrub 1 to 2 meters tall, with thick hollow stems.

Hinton describes the species as 1 to 3 meters tall, with pink or red flowers, growing in woods, on barrancas or llanos, in arroyos, and along stone fences. He records the vernacular names "salvia alta" and "pengua", and says the plant is medicinal. Stanford found it on mountains with luxuriant vegetation and describes the flowers as blue. This collection was mis-identified as P. mexicana (L.) Pers. by I. M. Johnston. Purpus found the plant on moist rocky slopes; Standley on brushy slopes and in damp or wet thickets, calling it a large, erect, ascending, or decumbent herb with shiny black fruit and pale-purple or blue flowers. Shreve found it growing in open shrubbery. The Muellers describe the flowers as white, with purple on the inside of the upper lip. Sharp collected the species at the edge of a bluff and describes it as an herb 3 to 5 feet tall, with pink flowers.

Some specimens of Galeotti 792, type collection of P. tracheliooides Mart. & Gal., bear printed labels indicating that they were collected in Oaxaca; others state in longhand that they are from near Morelia in Michoacán. It is probable that the latter is correct for all the specimens of this collection.

The Hawaiian material, such as St. John, Baker, Coulter, Fosberg, & Yuncker 12717, distributed as Priva aspera is actually Salvia occidentalis Sw. Dr. Fosberg, in a letter to me dated January 30, 1939, tells me that the name Priva aspera first appeared in the literature on Hawaiian botany in Mann's Enumeration of Hawaiian Plants, page 194 (1867) and was based on Mann & Brigham 74, which I have seen and which is Salvia occidentalis. It later appeared in Wawra's account in Flora 58: 252 (1875), Hillebrand's Flora of the Hawaiian Islands, page 341 (1888), and in Drake's Ill. Fl. Ins. Mar. Pac. 1: 259 (1890). Wawra's specimen is preserved in Vienna. The Schultes & Reko 528, from Mexico, distributed as Priva aspera, is also Salvia occidentalis, as is likewise the J. F. G. Stokes s.n. collected at Koali in January, 1912.

#### PRIVA BAHIENSIS P. DC.

Literature: Schau. in A. DC., Prodr. 11: 533. 1847; Schau. in Mart., Fl. Bras. 9: 179--180 & 307, pl. 50. 1851; Briq. in Engl. & Prantl, Nat. Pflanzenfam. 4 (3a): 155. 1895; Moldenke in Fedde, Repert. 41: 48--50. 1936; Moldenke, Known Geogr. Distrib. Verbenac. 89, 99, & 195. 1949.

On page 48 of my monograph I erroneously accredit this binomial to "A. DC." Actually, it was first proposed by the older Augustin Pyramus de Candolle and so should be accredited to "P. DC.", the abbreviation usually employed for this man.

The species has been said to inhabit fields. It has been collected in anthesis in January and June, and in fruit in June. Schery describes it as an herb 3 dm. tall, with lavender flowers, growing on red sandy soil in xerophytic "caatinga".

Additional citations: BRAZIL: Bahia: Blanchet 745 (Dc), 1027 [Macbride photos 7857] (Dc--cotype, Kr--photo of cotype, P--cotype); Martius 2195 (Mu--435--cotype), s.n. (Mu--436--cotype, Mu--437--cotype, Mu--438--cotype, Mu--439--cotype); Salzmann 438 (Dc), s.n. [1831] (Ed--cotype); Schery 491 (N). Pernambuco: Pickel 561 [Herb. Inst. Bot. São Paulo 20098] (Sp), 2616 (Mi). State undetermined: Herb. Rio de Janeiro 32276 (Ja). ILLUSTRATION:

TIONS: Mart., Fl. Bras. 9: pl. 50. 1851 (B).

PRIVA BOLIVIANA Moldenke

Literature: Moldenke, Phytologia 3: 172--173. 1949; Moldenke, Phytologia 3: 289. 1950.

Rojas describes the species as suffrutescent, 3--4 dm. tall, with blue-lilac flowers. Peredo says it is 4 to 8 dm. tall, with violet flowers. It has been collected at altitudes of 350 meters, blooming in January and March.

Additional citations: BOLIVIA: Santa Cruz: Peredo s.n. [29. I.47] (N--type, N--isotype, Ug--isotype). PARAGUAY: T. Rojas 7249 (N).

PRIVA CORDIFOLIA (L. f.) Druce

Literature: L. f., Suppl. 287. 1781; Roxb., Pl. Coromand. 2: 25, pl. 146. 1798; Willd., Sp. Pl. 3: 359. 1801; Rottl., Gesell. Naturforsch. Freunde Berlin, Neue Schrift. 4: 222. 1803; A. L. Mysore Univ. 11 (2): 48. 1950; Santapau, Pl. Saurashtra 31. 1953.

An additional synonym is Verbena forskaelaei Vahl ex Rottl., Gesell. Naturforsch. Freunde Berlin, Neue Schrift. 4: 222. 1803.

I have examined the type specimen of Buchnera cordifolia L. f. It is sheet number 2 under Buchnera in the Linnean Herbarium and is labeled "cordifolia" in the handwriting of Linnaeus and "König 77" in the hand of the younger Linné. On the reverse side is the following diagnosis in the hand of the younger man: "Buchnera Tanschaurense - foliis oppositis cordatis dentatis seminibus nuciformibus echinatis. Habitat ad marginas hortorum raras in India. König".

The Vahl specimen cited below was originally identified as "Verbena forskalei Vahl" and "Priva dentata Pers." Zahlbrückner in the reference cited above cites Krook s.n. [Penthaler 1776] as "P. leptostachya Juss.", but this collection is actually the type collection of P. cordifolia var. australis Moldenke. The synonymous binomial P. leptostachya ascribed by me on page 42 of my monograph to "Juss." should actually be accredited to "A. L. Juss."

The Vinzent s.n. from Rusk County, Texas, and Herb. Harvey

s.n. [Texas, 1853; Dudley Herb. 297538], distributed as this species, are actually Phryma leptostachya L., while the Meebold 12826 from Natal, also distributed as "Priva leptostachya Juss.", is actually Verbena litoralis H.B.K.

Wight states that P. cordifolia is found "In rubbish near tanks under the shade of trees. I first met with this plant at Samulcotta, perhaps in the same place that Roxburgh first saw it. Since then I found it at Frualore near Sanpore and a few other places. It may however be considered a rare plant." Razi records it from Mysore and calls it a therophyte (according to the Raunkiaer classification of life-forms). Govindu records it from Bangalore and says that it blooms there from August to October. It has also been collected in anthesis in January and July. Bulkley records the vernacular name of "watray cheddy".

#### PRIVA CORDIFOLIA var. ABEYSSINICA (Jaub. & Spach) Moldenke

Literature: Jaub. & Spach, Ill. Pl. Orient. 5: [57]--58, pl. 453 & 454. 1856; Briq. in Engl. & Prantl, Nat. Pflanzenfam. 4 (3a): 153, fig. 59E. 1895; Moldenke in Fedde, Repert. 41: 45--47. 1936; Moldenke, Prelim. Alph. List Invalid Names 38. 1940; Moldenke, Alph. List Invalid Names 39. 1942; Moldenke, Phytologia 2: 111. 1944; Moldenke, Known Geogr. Distrib. Verbenac. 109, 110, 116--120, 122, 124, & 195. 1949.

Herb. to 1 m. tall; stems erect, mostly branching, sharply tetragonal, strigillose-puberulent or becoming subglabrate in age, brown or purplish in drying, rather leafy; nodes annulate, often decussately contracted; branchlets similar to the stems in all respects but usually more densely strigillose; principal internodes 3.5--9.5 cm. long; leaves decussate-opposite, numerous; petioles slender, 0.5--4.1 cm. long, strigillose-pubescent or puberulent; blades chartaceous, dark-green above, somewhat lighter beneath, ovate, 2--9.5 cm. long, 1.3--7.5 cm. wide, ab-

ruptly acute at the apex, rather coarsely serrate from the widest part to the apex with rather large acute teeth, subtruncate or subcordate at the base, with the very center usually slightly prolonged into the petiole, usually rather densely strigillose or substrigose above, densely strigillose and also puberulent beneath; midrib slender, slightly prominulous beneath, visible above; secondaries very slender, 4 or 5 per side, ascending, not much arcuate, prominulous beneath, usually not visible above; vein and veinlet reticulation delicate, indiscernible above, often obscure beneath; inflorescence terminal, terminating the stems and branchlets, spicate during anthesis, racemiform in fruit, many-flowered, 9.5--36 cm. long, 0.6--2 cm. wide; peduncles continuous with the stems or branchlets and similar to them in all respects, 1.5--3.7 cm. long, but usually more densely strigillose; rachis similar to the peduncle in all respects, the flowers distinctly spiral-alternate, but often pseudo-secund; prophylla linear-subulate, 1--4 mm. long, strigillose, one subtending each flower; pedicels obsolete in anthesis or to 1 mm. long and puberulent-strigillose, in fruit elongated to 3 mm. and wide-spreading, often pseudo-secund; calyx tubular, regular, about 6 mm. long and 3.3 mm. wide, usually widest below the middle, densely short-tomentose on the outer surface with uncinate hairs about 0.1 mm. long and interspersed among them scattered straight hairs about 0.5 mm. long, 5-ribbed, its rim 5-toothed, with narrowly triangular teeth about 0.5 mm. long and 0.3 mm. wide at the base; corolla rosy-white or white with 3 mauve stripes, hypocrateriform, zygomorphic, glabrous on the outer surface, its tube broadly cylindric, curvate, venose, decidedly twisted, about 11.4 mm. long on the abaxial and 13 mm. long on the axial side, about 2.8 mm. wide at the base, ampliate to 3.6 mm. below the apex, somewhat pilose with scattered hairs within, its limb 2-lipped, 5-parted, the central abaxial lobe about 2 mm. long and 3.1 mm. wide, the two lateral abaxial lobes each about 2 mm. long and 2.6 mm. wide, and the two axial lobes each about 1.8 mm. long and 2.6 mm. wide, all the lobes broadly elliptic-lingulate and rounded; fertile stamens 4, didynamous, included, the upper pair inserted about 8.3 mm. and the lower pair about 6.2 mm. above the base of the corolla-tube; filaments filiform, about 1.3 mm. long, pilose throughout; anthers ovate, about 0.6 mm. long and 0.3 mm. wide, dorsifixed at about the middle, the thecae only slightly divergent at the base; staminode obsolete; pistil included; style capillary, twisted, about 6.2 mm. long, glabrous, somewhat widened at the base, very much ampliate at the apex and 2-lobed, the front lobe erect, about 0.2 mm. long, and stigmatiferous, the rear lobe very obscure and tooth-like; ovary oblong, about 1.3 mm. long and 0.5 mm. wide, obscurely 4-lobed at the apex, glabrous, 4-celled, 4-ovulate; fruiting-calyx thin-membranous, inflated, enclosing the fruit and very shortly rostrate at the apex, 5.5--7 mm. long, 7--8 mm. wide, densely hirsutulous throughout on the outer surface with uncinate whitish hairs, sometimes interspersed with longer straight hairs, glabrous within; schizocarp flattened, oblate,

composed of two exactly similar closely joined dry 2-celled cocci, each mature coccus about 4 mm. long and 3 mm. wide, the dorsal surface and sides densely short-puberulent, the dorsal surface echinate with two parallel longitudinal marginal rows of straight sharp spines, each spine plainly separate to the base and 0.4--1 mm. long, the area between the rows of spines scrobiculate-reticulate or sometimes also more or less verruculose, the sides scribiculate-reticulate on the half adjoining the rows of spines, the remainder transversely parallel-ridged with long slender ridges, the commissural surface deeply excavated and widely thin-margined, the apex of the margins usually involute and not ridged.

The variety has been collected at altitudes of 3000 to 5000 feet in Eritrea. It inhabits rocky places and has been collected in anthesis in January and May. The binomials Zapania arabica Poir. and Tamonea arabica Mirb. are sometimes considered as synonymous with this variety, but actually these names are based on the Verbena forskålæi of Vahl and are thus synonyms of Priva adhaerens (Forsk.) Chiov.

The Forbes s.n. cited below has leaves that are strangely small for this variety; Pappi 3873 has cocci with hardly any central cavity; Bachmann 1153 has characters that point toward P. meyeri Jaub. & Spach. The Schimper 153 collection was misidentified as Scrophularia arguta Sol. at Berlin.

#### PRIVA CORDIFOLIA var. AUSTRALIS Moldenke

Literature: Moldenke in Fedde, Repert. 41: 47. 1936; Moldenke, Known Geogr. Distrib. Verbenac., [ed. 1], 52 & 99. 1942;

[ed. 2], 122 & 195. 1949.

The Van Dam specimen cited below was originally identified as var. abyssinica (Jaub. & Spach) Moldenke.

Additional citations: UNION OF SOUTH AFRICA: Transvaal: Breyer s.n. [II.1918] (N); T. J. Jenkins 6701 (Tm); Leendertz 333 (Tm--8549); Meeuse 9123 (Z), 9177 (Z), 9216 (Z); Obermeyer 1011 (Tm--31584); Van Dam s.n. [III.1920] (N).

#### PRIVA CORDIFOLIA var. FLABELLIFORMIS Moldenke

Literature: Moldenke in Fedde, Repert. 41: 47--48. 1936; Loes. in Mildbr., Wiss. Ergebni. Deutsch. Zent.-Afr.-Exp. 1907-1908, 2: 281. 1911; Moldenke, Known Geogr. Distrib. Verbenac. [ed. 1], 49, 50, & 99. 1942; Robyns, Fl. Spermat. Parc Nat. Albert 2: 139. 1947; Moldenke, Known Geogr. Distrib. Verbenac. [ed. 2], 115--117, 119, 120, & 195. 1949.

Robyns in the reference cited above gives "P. leptostachya Juss." as a synonym of this variety, but actually it is a synonym of the typical form of the species. The variety is referred to as P. leptostachya also by Loesener in the reference cited above.

The species is said by collectors to grow on forest floors, at forest edges, along roadsides, in savannas and grassy savannas, and among granite rocks. Brass describes it as common on grassy beaches. It has been found at altitudes 800 to 1290 meters. It has been collected in anthesis and fruit from January to May, in July, and from September to November. Sturgeon describes the plant as 2 feet tall; Robyns says it grows to half a meter tall, while Brass found it one meter tall. The flowers are described as white to mauve or rosy-white.

PRIVA GRANDIFLORA (Ort.) Moldenke

Literature: Ort., Hort. Matr. Dec. 2. 1797; Mart. & Gal., Bull. Acad. Roy. Brux. 11 (2): 323. 1844; Schau. in A. DC., Prodr. 11: 555. 1847; S. Wats., Proc. Amer. Acad. 18: 135. 1883; Kobuski, Ann. Mo. Bot. Gard. 13: 17. 1926; Perry, Ann. Mo. Bot. Gard. 20: 342. 1933; Moldenke in Fedde, Repert. 41: 14--17. 1936; Moldenke, Prelim. Alph. List Invalid Names 39, 43, & 48. 1940; Moldenke, Known Geogr. Distrib. Verbenac. [ed. 1], 18, 74, & 99. 1942; Moldenke, Alph. List Invalid Names 39, 44, & 50. 1942; Moldenke, Phytologia 2: 111. 1944; Moldenke, Phytologia 2: 142. 1946; Moldenke, Alph. List Invalid Names Suppl. 1: 19 & 24. 1947; Moldenke, Known Geogr. Distrib. Verbenac. [ed. 2], 31, 163, & 195. 1949.

Synonymy: Verbena grandiflora Ort., Hort. Matr. Dec. 2. 1797. Verbena rhinanthifolia Mart. & Gal., Bull. Acad. Roy. Brux. 11 (2): 323. 1844. Priva tuberosa S. Wats., Proc. Amer. Acad. 18: 135. 1883. Priva rhinanthifolia (Mart. & Gal.) B. L. Robinson ex Kobuski, Ann. Mo. Bot. Gard. 13: 17. 1926. Tozzia mexicana Schaffner ex Moldenke in Fedde, Repert. 41: 14, in syn. 1936. Priva rhibanthifolia (Mart. & Gal.) Griff. ex Moldenke in Fedde, Repert. 41: 14, in syn. 1936; Moldenke, Prelim. Alph. List Invalid Names 39, in syn. 1940. Verbena tuberosa Sessé & Moc. ex Moldenke, Prelim. Alph. List Invalid Names 49, in syn. 1940 [not V. tuberosa R. Graham].

In my monograph I used the name Priva rhinanthifolia for this species because I did not then know of the earlier specific epithet of Ortega. The original description by Ortega of his Verbena grandiflora says of the leaves "Folia sessilia, ovato-oblonga, superne dentata, denticulis remotis; venoso-lineata, scabra, undulata". Perry in the reference cited above says of this plant of Ortega: "Although the description is inadequate for positive identification, the phrase 'Semina saepius duo' would seem to indicate that the species does not belong in the genus Verbena." The specimen from the Botanical Garden at Madrid, cited below, settles the identity of the plant in question.

The Rusby 321 and Bourgeau 357 cited by me on page 15 of my monograph as from the state of México are actually from the Federal District. The Herb. Prager 18636 cited below was mis-identified as "Verbena littoralis Humb.", the Bourgeau 357 at Stock-

holm as "Lantana sp.", and Shreve 9179 as "Verbena sp."

The flowers are described by collectors as lavender, rose, or lilac-pink. The species has been found in anthesis from June to September and in fruit from July to September. The flowers on Balls 4923 are 2 cm. long and 1.5 cm. wide even when dried. The species is said by collectors to inhabit rich moist soil of open woodlands, oak woods, open grasslands, dry ditch banks, grassy hills, calcareous soil, and hillsides under oaks, and to be found in grass by cornfields and on bare hills, at altitudes from 2100 meters to 8000 feet. The Pringle 1549 and 4147 collections show the underground tubers very well, especially on the University of Vermont specimens. Balls describes the species as prostrate, spreading, with stems to 18 inches long, tuberous-rooted, forming loose mats to 18 inches across, with pale-mauve flowers to half an inch across, with a light center and with wavy margins on the petals and somewhat hairy leaves, growing on dry open hills among grasses and scattered shrubs and in open sandy stretches among grass, etc., on the edge of old lava flows.

Priva lappulacea L., in herb.

Several statements in my monograph need correction, as follows: on page 25 the binomial Priva echinata is accredited to "Juss." -- since there are two botanists with this surname who have worked in the Verbenaceae, the name should be accredited to "A. L. Juss." The Karwinski s.n. from Hazda de Sumatoc, cited on page 33 from "State undetermined", is probably from Sumate, Hidalgo, Mexico, according to a letter from my good friend Dr. Maximino Martínez. The André K.1568, cited on page 34 from "Province undetermined", is probably from Guaytacama, Chimborazo, Ecuador, according to information contained in a letter to me from the Ecuadorian Embassy dated September 17, 1945. The Gaumer & sons 1702 and 1702 bis, cited on page 32 from Yucatán, are actually from Quintana Roo, Mexico. The United Fruit Co. 71 cited on page 33 from "Province undetermined", is from Limón, Costa Rica. The Cowell 245, cited on the same page from an undetermined province, proves to be from the Canal Zone, Panama. Britton, Britton, & Shafer 3, cited on page 30 from Matanzas, is actually from Havana, Cuba. The Collector undesigned 311, cited on page 34, is actually Focke 311 according to Pulle in

the reference cited above. The "Hinton 5901" cited on page 32 appears to be an error for Hinton 5801 and was collected in Guerrero, Mexico. H. H. Rusby 698, cited on page 34 as from "State undetermined", is actually from La Paz, Bolivia.

The Ledru 6, cited below, is the type collection of Priva echinata A. L. Juss. Lanjouw & Uitten, in their reference cited above, speak of an Aublet specimen of P. lappulacea in Herb. Denaiffel 1: 18, which I have not as yet seen. A cross-section of the ovary of this species is to be seen in Junell, Symb. Bot. Upsal. 4: fig. 75 (1934). Darlington & Janaki Ammal, in their reference cited above, report the haploid chromosome number as 6. The Ciferri 16, cited below, is host for Micropuccinia lantanae (Farl.) Arth. & Jacks.; the same fungus is on the leaves of Gutierrez Villegas & Barkley 17C073B.

The species has apparently been collected in anthesis and in fruit in every month of the year except April, growing at altitudes from sea-level to 1230 meters. Besides the colors given on page 28 of my monograph for the corolla, the following are recorded by collectors: pink, pale-lavender, purple, blue, pale-blue, and whitish-blue. White-flowered specimens are represented by the following collections: Fawcett 8058; Fosberg 22133; Hinton 4360, 13941, and 13975; Howard & Howard 9486; Peck 293b; Wedel 2834; Ll. Williams 11006; and Worth, Morrison, & Horton 8611. Gentry describes the flowers of his number 4828 as lavender with a white tube, while Camp says for his plant that the corolla-tube is white and the lobes are pale-lavender with purple veins.

Wedel describes the plant as a "shrub 2 1/2 feet tall", while Woodson, Allen, & Seifert say the plant on Taboga Island is 1.5-2 meters tall! Small & Carter call it a diffuse herb, which, by the way, is the only form in which I have personally seen it. Leavenworth says it is an herb with lavender flowers and a woody taproot, growing in brown-gray loam over limestone on rocky semi-desert mountains. Standley says it is an ascending or suberect herb 2-3 feet tall. Gentry reports the species from valley margins, canyon slopes, and milpa clearings in the short-tree forest zone of Mexico, at altitudes of 1000 to 3000 feet. He says it is a colonial perennial herb one meter or less tall, with light-purple or pale-blue flowers, visited by Sphex wasps, blooming during the summer. C. F. Baker describes it as only 1 to 2 feet tall. Peck describes it as "spreading and freely branching, with small, white, very deciduous [=caducous] flowers," while Schipp says it is a "tall annual herb to 3 feet tall and half inch in diameter, occasional in swampy places among low brush near the seacoast, with light-blue flowers". Runyon says that in Texas it is an annual plant with purple inodorous flowers, growing in shade on fertile, black, alluvial soil in thickets and along resecas, at altitudes of about 10 meters, scattered through Cameron County. Standley says that in Honduras it is a decumbent herb 2 to 3 feet tall, with pale-purple corol-

las, common in wet fields.

Box in his Flora of Antigua (mss.) says it is a weed in cultivated lands and waste places, occasional to frequent locally, in the lowlands of Antigua. He cites a Wullschlägel s.n. and Box 1021 from that island. Britton & Brace in Field Mus. Publ. Bot. 2: 179 state that the species is an introduced weed in the Bahamas. It is mentioned by Debora Ramirez Cantu in her reference cited above as growing at Ayutla and Raboso, near Matamoras, Tamaulipas, Mexico. Lundell reports it from various parts of Petén, Guatemala, in his Veg. Petén, pp. 75, 109, & 183. It is said to be tolerant of shade, and in addition to the habitats listed on page 27 of my monograph, collectors have found it in hammocks, sandy soil along roadsides, dry arroyos, dry or occupied clearings, open places, thickets, waste places near habitations, rough pastures, dry ground in shade by springs, sandy soil between dunes, weedy flats, and low wet palm areas in swamps, on wooded slopes, llanos, platanals, open banks, canyon floors, limestone rock, and barrancas, along trails and riversides, and in streets.

Britton & Wilson record the common name "bur-vervain" from Puerto Rico, and Britton & Millspaugh the names "bur-vervain" and "cat's-tongue" from the Bahamas; Daniel calls it "cadillito" in Colombia, while Brenes, in Costa Rica, calls it "pegajosa". In Cuba Brother León records the name "globito", while in El Salvador Calderón & Standley list "mozote", "mozote de gallina", "mozote de pollo", and "cola de alacrán". In Venezuela Saer says it is known as "cadillito" and "pegajosa". Quentin reports the name "collant", while Van Wijk lists "styptic bur", "velvet bur", and "Sonderähre". On the Tres Marias Islands, according to Howell, it is known as "yerba buena del campo", while in Cuba Roig reports the names "amor seco" and "farolito". Runyon and Rovirosa both report the name "cadillo de bolsa". Standley reports "mozotillo", and a name in Java is said to be "voekoe voekoe tolman".

Matuda 4821 was originally mis-identified as Priva aspera H.B.K. The Afzelius s.n., cited below, was originally mis-identified as "Priva leptostachya Juss.", while the Duchassaing s.n. from Panama and the Leprieur s.n. from Cayenne were labeled "Ghinia verbenacea". Sagot s.n. from Kourou was originally distributed as "Tamonea verbenacea Sw.". The Harris s.n. from Jamaica was identified by someone as Heliotropium indicum L., while Tate 581 was mis-named Periloma origanoides Kunth by Dr. Rusby.

The Brown & West specimen and two A. S. Rhoads specimens distributed as "Priva echinata" and "P. lappulacea" at the University of Florida are actually Schobera angiosperma (Murr.) Britton. The Vogl 313 and G. F. Gaumer 1704, distributed as Priva lappulacea, and the Gaumer & sons 364, in part, distributed as "Priva echinata", are both actually Salvia occidentalis Sw., as are also the Dahl s.n., Herb. Gasström s.n., Herb. Mus. Stockholm s.n., and Swartz s.n. in the Stockholm herbarium.

The original description of Linnaeus on which this species is based reads as follows:

"6. VERBENA diandra, calycibus subrotundis erectiusculis, seminibus echinatis. lappulacea.

Scorodinia floribus spicatis purpurascens pentapetaloidibus, Sloan. jam. 66.

Blairia Houst. Amm. herb. 277.

Habitat in Jamaica."

In the Linnean Herbarium specimen number "4" under genus 35, Verbena, is labeled "mexicana" in Linnaeus' handwriting, and is clearly what we now call Priva mexicana (L.) Pers., although the actual type specimen of this taxon is probably in the Dillenius Herbarium at Oxford University. Specimen number "5" in that same genus is labeled "lappulacea" in the handwriting of Solander and bears the notation "Br" [=Browne; Patrick Browne's herbarium was purchased for Linnaeus in 1758]. It is the true Priva lappulacea (L.) Pers. as we know it today. Specimen number "6", pinned together with number "5", is labeled "lappulacea" in Linnaeus' own handwriting and bears a notation "Br" [=Browne] and "Rolander" [Rolander collected in Surinam after 1754]. This specimen, however, is not even verbenaceous, but is Salvia occidentalis Sw.

In the Sloane Herbarium at the British Museum is preserved the type specimen of Scorodinia floribus spicatis purpurascens pentapetaloidibus of Sloane [Cat. 66 (1696) and Hist.

Jamaic. 1: 174, pl. 110, fig. 1 (1707)]. This type material consists of two distinct collections, both referred to on the margin of Sloane's original copy of his Hist. Jamaica. The first is in volume 3, page 58, of the bound herbarium. This collection bears a label with the name "Scorodinia floribus, etc." in Sloane's handwriting and it also has mounted with it a copy of the plate (no. 110, fig. 1) which matches it perfectly to the minutest detail. The specimen is Teucrium inflatum Sw. The second collection is on page 59 of the same bound volume. It bears only a small label of Sloane's, reading "Eadem cum praeced.?" I am arbitrarily designating this second specimen as the type since it, and it alone, of this original material cited by Linnaeus, is what has been known as Priva lappulacea ever since the genus Priva was established. In this connection, see also Dr. Epling's notes in Journ. Bot. 1929: 12 (1929) and my own in Fedde, Repert. 48: 98--100 (1940).
