

often uninucleate, broadly elliptic,  $10-12 \mu \times 6-8 \mu$ , usually with an oblique apiculus at one end.

Pileus 4-8 cm. broad; stem 8-12 cm. long, 8-16 mm. thick.

Under oak trees. Claremont, California. January. C. F. Baker.

This species is allied to *Amanita calyptata* Peck, from which it is distinguished by its smaller size, darker color with no greenish tints, and by its slight evanescent annulus. Its habitat also is under or near oak trees, while that species occurs under or near fir trees.

Pileus carneus, convexus, demum subplanus, margine striatus, in centro veli universalis candidi fragmto magno aut fragmentis parvis adhaerentibus tectus, ochraceus, cremeus, griseo-brunneus vel plumbeus, carne alba, sapore miti; lamellae subconfertae, inaequales, sinuatae, adnexae, albae; stipes subaequalis, cavus, albus, ad apicem striatus, annulo levi mox evanescere vel inconspicuo; sporaee saepe uninucleatae, late ellipsoideae,  $10-12 \mu \times 6-8 \mu$ , vulgo basi apiculatae.

Pileus 4-8 cm. latus; stipes 8-12 cm. longus, 8-16 cm. crassus.

### ***Amanita ocreata***

Pileus fleshy, convex or nearly plane, glabrous, even on the margin, white, flesh white; lamellae close, unequal, broadly sinuate, white; stem equal, solid, glabrous or slightly fibrillose below the annulus, minutely floccose above, white, the annulus thin, membranaceous, the volva white, soft, deep with an entire free margin; spores subglobose or elliptic,  $10-12 \mu \times 8-10 \mu$ .

Pileus 4-6 cm. broad; stem 8-10 cm. long, 1-2 cm. thick.

Under oak trees. Claremont, California. January. C. F. Baker.

Pileus carnosus, convexus vel subplanus, glaber, margine levis, candidus, carne alba; lamellae confertae, inaequales, late sinuatae, albae; stipes aequalis, solidus, glaber vel leviter fibrillosus infra annulum, supra minute floccosus, candidus, annulo tenui, membranaceo; volva mollis, candida, margine integro, libero; sporaee subglobosae vel ellipsoideae,  $10-12 \mu \times 8-10 \mu$ .

Pileus 4-6 cm. latus; stipes 8-10 cm. longus, 1-2 cm. crassus.

### ***Armillaria subannulata***

Pileus thick, fleshy, convex or broadly convex, subviscid, fibrillose, alutaceous, darker in the center where it is adorned with reddish brown fibrils, margin even, flesh white, odor and taste farinaceous; lamellae close, adnexed, white, sometimes becoming

brown on the edges; stem equal, solid, subradicating, reddish brown, white at the top, veil thick, soft, white, evanescent; spores elliptic,  $10-12\ \mu \times 8-9\ \mu$ .

Pileus 10-11 cm. broad; stem 9-15 cm. long, 2-3 cm. thick.

Common. Among fallen leaves under oak trees. Claremont, California. January. C. F. Baker.

A large species well marked by its fibrillose pileus, stout stem, evanescent annulus, and farinaceous taste and odor.

Pileus carnosus, convexus vel late convexus, subviscidus, fibrillosus, alutaceus, in centro obscurior ubi fibrillis rufobrunneis ornatus, margine levi, carne alba, odore saporeque farinaceis; lamellae confertae, adnexae, albae, aliquando acie brunnescentes; stipes aequalis, solidus, subradicans, rufobrunneus, ad apicem albus, velo crasso, molli, albo, evanescente; sporae ellipsoideae,  $10-12\ \mu \times 8-9\ \mu$ .

Pileus 10-11 cm. latus; stipes 9-15 cm. longus, 2-3 cm. crassus.

### *Clitocybe microspora*

Pileus thin, broadly convex or slightly depressed in the center, dry, often eccentric, glabrous or finely and obscurely fibrillose when old, on the margin sometimes irregular or lobed, white or cream-colored, flesh white, odor and taste farinaceous; lamellae thin, close, narrow, unequal, decurrent, white; stem equal, subcartilaginous, hollow, colored like the pileus; spores minute, globose or broadly elliptic,  $3-4\ \mu$  long.

Pileus 2.5-6 cm. broad; stem 2.5-3 cm. long, 6-8 mm. thick.

Claremont, California. January. C. F. Baker.

Related to *Clitocybe eccentrica* Peck, from which it is separated by its larger size, pileus never umbilicate, lamellae less crowded, stem hollow, and spores smaller.

Pileus tenuis, late convexus seu centro leviter depresso, siccus, saepe eccentricus, glaber vel in maturitate obscure fibrillosus, in margine aliquando irregularis lobatusve, albus vel cremeus, carne alba, sapore et odore farinaceis; lamellae tenues, confertae, angustae, inaequales, decurrentes, albae; stipes aequalis, subcartilagineus, cavus, albus; sporae globosae vel late ellipsoideae,  $3-4\ \mu$  longae.

### *Clitocybe sphaerospora*

Pileus fleshy, nearly plane, centrally depressed when old, glabrous, opaque, brick-red, darker in the center, flesh tough, white, no distinct taste or odor; lamellae subdistant, narrowed toward each end, decurrent, white, interspaces somewhat venose;

stem equal, slightly radicating, solid, white ; spores globose, 10-12  $\mu$  broad.

Pileus 5.5-7 cm. broad; stem 5-6.5 cm. long, 1.5-2 cm. thick.

Under oaks. Claremont, California. January. C. F. Baker.

A species belonging to section *Disciformes*, tribe 2, and well marked by its reddish pileus, solid stem, and large globose spores.

Pileus carneus, subplanus, in maturitate centro depresso, glaber, lateritius, centro obscurior, carne lenta, alba; lamellae subdistantes, utrinque angustatae, decurrentes, albae, interstitiis subvenosis; stipes aequalis, subradicans, solidus, albus; sporae globosae, 10-12  $\mu$  latae.

Pileus 5.5-7 cm. latus; stipes 5-6.5 cm. longus, 1.5 cm. crassus.

### *Leptonia flavobrunnea*

Pileus thin, fragile, convex, umbilicate or centrally depressed, decurved on the margin, sometimes becoming nearly plane, minutely tomentose in the center, subhygrophanous, dark brown or reddish brown when young and moist, yellowish brown when dry, taste slightly farinaceous; lamellae adnate or subdecurrent, somewhat close, pale lemon-yellow becoming reddish ochre or pinkish, sometimes transversely venose; stem slender, fragile, flexuous, terete or compressed, stuffed or hollow, glabrous, fibrous, pallid or lemon-yellow, becoming brownish yellow, often curved and white at the base; spores subglobose, angular, uninucleate, obliquely apiculate at one end, 8  $\mu$ .

Pileus 10-25 mm. broad; stem 5-7.5 cm. long, 2-3 mm. thick.

Gregarious. In swamps under deciduous trees. Stow, Massachusetts. August. S. Davis & G. E. Morris.

Pileus convexus, tenuis, fragilis, umbilicatus vel centro depresso, margine decurvus, quondam subplanus, centro minute tomentosus, subhygrophanus, rufo-brunneus juveno et humido, flavo-brunneus sicco, saepe leviter farinaceo; lamellae adnatae seu subdecurrentes, subconfertae, citrinae, demum roseolae, aliquando transverse venosae; stipes gracilis, fragilis, flexuosus, teres compressusve, farctus cavusve, glaber, fibrosus, pallidus citrinusve, deinde brunneo-luteus, saepe basi curvus et albus; sporae subglobosae, angulares, uninucleatae, oblique apiculatae, 8  $\mu$ .

### *Inocybe Bakeri*

Pileus fleshy, broadly convex, becoming nearly plane, dry, densely fibrillose, yellowish or tan-colored, flesh white; lamellae

close, adnexed, subventricose, pale brown, ferruginous brown when mature; stem nearly equal, solid, slender, glabrous, mealy at the top, becoming striate, more or less radicating, white; spores ferruginous-brown,  $12-14 \mu \times 6-7 \mu$ ; cystidia  $40-50 \mu$  long.

Pileus 2.5-5.5 cm. broad; stem 5-8 cm. long, 5-6 mm. thick.

Under oak trees. Claremont, California. January. C. F. Baker.

Related to *I. sambucina* Fr. but separated by its smaller size, larger, and more slender stem, and the absence of any strong odor. Belongs to the tribe *Velutini*.

Pileus carneus, late convexus, demum subplanus, siccus, dense fibrillosus, cremoreus vel subalutaceus, carne alba; lamellae confertae, adnexae, subventricosae, pallido-brunneae, deinde ferrugineo-brunneae; stipes subaequalis, solidus, gracilis, glaber, ad apicem albo-farinosis, demum striatus, subradicans, albus; sporae ferrugineo-brunneae,  $12-14 \mu \times 6-7 \mu$ ; cystidia  $40-50 \mu$  longa.

Pileus 2.5-5.5 cm. latus; stipes 5-8 cm. longus, 5-6 mm. crassus.

### Inocybe bulbosa

Pileus fleshy, nearly plane, subumbonate, dry, radiately fibrillose, slightly rimose, tan-colored or ochraceous; lamellae thin, close, broadly sinuate, pale buff, becoming brownish ochraceous; stem straight, glabrous, solid, bulbous at the base, cream-colored; spores oblong, even,  $10-18 \mu \times 6-7 \mu$ ; cystidia subcylindric,  $60-80 \mu \times 15-20 \mu$ .

Pileus 3-4.5 cm. broad; stem 5-7 cm. long, 7-9 mm. thick, the bulb 15-17 mm. in diameter.

Under oak trees. Solitary. Claremont, California. February. C. F. Baker.

This species belongs to the section *Rimosae* and is related to *I. rimosia* (Bull.) Fr., but it is a larger species with a more expanded and less distinctly rimose pileus, more strongly bulbous stem, and larger cystidia.

Pileus carneus, subplanus, subumbonatus, siccus, fibrillosus, leviter rimosus, alutaceus ochraceusve; lamellae tenues, confertae, late sinuatae, luteolae, demum brunneo-ochraceae; stipes rectus, solidus, glaber, basi bulbosus, pallidus; sporae leves, oblongae,  $10-18 \mu \times 6-7 \mu$ ; cystidia subcylindracea,  $60-80 \mu \times 15-20 \mu$ .

Pileus 3-4.5 cm. latus; stipes 5-7 cm. longus, 7-9 mm. crassus, bulbus 15-17 mm. latus.

### **Flammula praecox**

Pileus fleshy, convex, becoming nearly plane, glabrous, moist or hygrophanous, brown or reddish brown, paler when old and dry, sometimes with a dull greenish tint, margin at first involute, flesh pallid; lamellae rather close, adnate or sometimes slightly rounded behind, pale ochraceous becoming brownish ochraceous, whitish and minutely crenulate or eroded on the edge; stem equal or slightly tapering upward, becoming hollow with age, silky-fibrillose, slightly floccose or furfuraceous at the top when young by the pure white slight and evanescent veil, pallid, with a soft white tomentum at the base; spores subochraceous, ellipsoid,  $7-8 \mu \times 4-5 \mu$ .

Pileus 2-3 cm. broad; stem 2-4 cm. long, 4-6 mm. thick.

Gregarious or cespitose. On decaying wood, bark, or branches of deciduous trees, commonly basswood, *Tilia americana* L., or even on dead herbaceous stems. Rockville, Indiana. February and March. G. T. Howell.

Remarkable for its early appearance. It apparently belongs to the tribe *Sapinei* but the color of the young lamellae is uncertain.

Pileus carneus, convexus, demum subplanus, glaber, hygrophanus, brunneus, deinde pallido-brunneus vel rufo-brunneus, aliquando viride tinctus, primo margine involuto, carne pallida; lamellae subconfertae adnatae, aliquando adnexae, pallido-ochraceae, demum brunneo-ochraceae, acie albidae, crenulatae vel erosae; stipes aequalis vel sursum leviter attenuatus, demum fistulosus, sericeo-fibrillosus, in juventate ad apicem leviter floccosus vel furfuraceus velo candido evanescente, pallidus, basi tomento molli candido; sporae subochraceae, ellipsoidae,  $7-8 \mu \times 4-5 \mu$ .

Pileus 2-3 cm. latus; stipes 2-4 cm. longus, 4-6 mm. crassus.

### **Naucoria vinicolor**

Pileus broadly convex or centrally depressed, glabrous, dry, wine-colored, flesh reddish; lamellae subdistant, broad, adnexed, wine-colored; stem equal, hollow, fibrillose, subbulbous, colored like the pileus; spores elliptic, obtuse at each end, smooth,  $8-9 \mu \times 5-6 \mu$ .

Pileus 2-3 cm. broad; stem 3-5 cm. long, 3-4 mm. thick.

Growing from decaying wood or other vegetable matter in open ground. Claremont, California. January. C. F. Baker.

A peculiar species but well marked by its vinous red color. The base of the stem is often covered by a white tomentum. It belongs to the section *Gymnotae*.

Pileus late convexus vel in centro depresso, glaber, siccus, vinicolor, carne rufescens; lamellae subdistantes, latae, adnexae, vinicolores; stipes aequalis, fistulosus, fibrillosus, subbulbosus, concolor; sporae ellipsoideae, utrinque obtusatae, leves,  $8-9 \mu$   $\times$   $5-6 \mu$ .

Pileus 2-3 cm. latus; stipes 3-5 cm. longus, 3-4 mm. crassus.

### **Agaricus bivelatus**

Pileus fleshy, thin, broadly convex, radiately fibrillose and floccose, cream-colored slightly tinged with pink, smoky brown in the center; lamellae thin, close, free, pink then seal-brown; stem equal or slightly bulbous, glabrous, shining, white-floccose at the top, stuffed or hollow, cream-colored, with a narrow double annulus which at length disappears; spores subglobose,  $5-6 \mu$   $\times$   $4-5 \mu$ .

Pileus 4-5 cm. broad; stem 3.5-6 cm. long, 8-11 mm. thick.

Under oaks. Claremont, California. January. C. F. Baker.

A distinct species well marked by its double veil, the outer or lower layer being thin and separable from the upper thicker layer.

Pileus carneus, tenuis, late convexus, radiatim fibrillosus, flocosus, cremeus incarnato leviter tinctus, in centro fumoso-brunneus; lamellae tenues, confertae, liberae, incarnatae demum atro-brunneae; stipes aequalis vel leviter bulbosus, glaber, nitidus, farctus vel fistulosus, cremeus, ad apicem floccis albis, annulo dupli angusto, demum evanescente; sporae subglobosae,  $5-6 \mu$   $\times$   $4-5 \mu$ .

Pileus 4-5 cm. latus; stipes 3.5-6 cm. longus, 8-11 mm. crassus.

### **Agaricus subnitens**

Pileus fleshy, broadly convex or slightly depressed in the center, densely fibrillose, shining on the margin, cream- or tan-colored, flesh white; lamellae thin, close, free, pink becoming dark brown; stem equal or slightly thickened below, stuffed or hollow, white and fibrillose above, cream-colored and shining below with a finally deciduous brown but white-margined annulus; spores elliptic, purplish brown,  $6-8 \mu$   $\times$   $4-5 \mu$ .

Pileus 4.5-9.5 cm. broad; stem 8.5-13 cm. long, 1-1.5 cm. thick.

Under oaks. Claremont, California. January. C. F. Baker.

Remarkable for its large annulus, which eventually disappears.

Pileus carneus, late convexus vel in centro leviter depresso, dense fibrillosus, margine nitidus, cremeus alutaceusve; lamellae tenues, confertae, liberae, incarnatae demum atro-brunneae; stipes

aequalis vel leviter infra incrassatus, farctus fistulosusve, supra albus et fibrillosus, infra cremeus et nitidus, annulo crasso, brunneo, margine albo, demum deciduo; sporae ellipsoideae, purpureo-brunneae,  $6-8 \times 4-5 \mu$ .

Pileus 4.5-9.5 cm. latus; stipes 8.5-13 cm. longus, 1-1.5 mm. crassus.

### **Hypholoma campanulatum**

Pileus thin, campanulate, dry, somewhat shining, glabrous, sometimes slightly appendiculate with fragments of the white veil, ochraceous; lamellae thin, close, nearly free, pale brown becoming dark brown, whitish on the edge; stem long, equal, glabrous, hollow, white or cream-colored with a soft white tomentum at the base; spores blackish brown, elliptic oblong,  $8-10 \mu \times 4-5 \mu$ .

Pileus 3-4 cm. broad; stem 8-13 cm. long, 4-7 mm. thick.

Open ground among shrubs, grass, and weeds. Claremont, California. January. C. F. Baker.

Pileus tenuis, campanulatus, siccus, subnitidus, glaber, aliquando albi veli fragmentis leviter appendiculatus, ochraceus; lamellae tenues, confertae, subliberae, pallido-brunneae, demum atro-brunneae, in acie albidae; stipes longus, aequalis, glaber, fistulosus, albus cremeusve, basi tomento molli albo; sporae oblongae ellipsoideaeve, atro-brunneae,  $8-10 \mu \times 4-5 \mu$ .

Pileus 3-4 cm. latus; stipes 8-13 cm. longus, 4-7 mm. crassus.

### **Phyllosticta innumerabilis**

Spots large, suborbicular, sometimes occupying more than half the leaf, brown, yellowish on the circumference; perithecia hypophyllous, minute,  $80-100 \mu$  broad, densely gregarious, very numerous, membranous, orbicular, amber-colored; spores oblong or cylindric, hyaline,  $6-8 \mu \times 1.5-2 \mu$ , sporophores  $10-20 \mu \times 1-1.2 \mu$ .

On living leaves of *Amelanchier*. Fort Niobrara, Nebraska. September. Rev. J. M. Bates.

Maculae magnae, suborbicularares, aliquando folii partem magnum occupantes, brunneae, in margine flavidae; perithecia hypophylla, minuta,  $80-100 \mu$  lata, dense gregaria, numerosissima, membranacea, orbicularia, mellea; sporae oblongae vel cylindraceae, hyalinae,  $6-8 \mu \times 1.5-2 \mu$ , sporophoribus  $10-20 \mu \times 1-1.2 \mu$  suffultae.

### **Phoma platysperma**

Perithecia minute, about 0.5 mm. broad, numerous, covered by the epidermis, erumpent, black; spores subglobose or broadly ellipsoid,  $10-12 \mu \times 8-10 \mu$ .

On bark of black willow, *Salix nigra* Marsh. River Forest, Chicago, Illinois. March. E. T. & S. A. Harper.

Perithecia minuta, 0.5 mm. lata, numerosa, epidermide tecta, erumpentia, nigra; sporae subglobosae aut late ellipsoideae, 10-12  $\mu$   $\times$  8-10  $\mu$ .

### **Sphaeropsis simillima**

Perithecia minute, 0.25-0.33 mm. broad, densely gregarious, rarely 2-4 united in a tuft, erumpent, black; spores elliptic or oblong, obtuse, 20-25  $\mu$   $\times$  10-12  $\mu$ .

On bark of silver maple, *Acer saccharinum* L. River Forest, Illinois. April. E. T. & S. A. Harper.

The perithecia, being occasionally slightly tufted, show an intimate relationship with the genus *Haplosporella*, but as the simple perithecia are much more numerous than the tufted, the species is here placed in the genus *Sphaeropsis*. The specific name is suggested by the great similarity between this species and *Sphaeropsis fertilis* Peck.

Perithecia minuta, 0.25-0.33 mm. lata, dense gregaria, rare caespitosa, erumpentia, atra; sporae ellipsoideae vel oblongae, obtusae, 20-25  $\mu$   $\times$  10-12  $\mu$ .

### **Dothiorella Celastri**

Perithecia cespitose, 2-20 in a cluster, commonly crowded, erumpent, black, whitish within, unequal, subcoriaceous, subastomous; tufts 0.5-1 mm. broad; spores broadly elliptic or subglobose, hyaline or subhyaline, 5-8  $\mu$   $\times$  4-5  $\mu$ .

On dead stems of bitter-sweet, *Celastrus scandens* L. Riverside, Illinois. March. E. T. & S. A. Harper.

In some specimens there appears to be a slight stroma or a few hyphae on which the perithecia are seated. The perithecia are unequal in size and shape.

Perithecia caespitosa, vulgo conferta, erumpentia, inaequalia, subcoriacea, subastomata, atra, intus albida; caespites 0.5-1 mm. lati; sporae late ellipsoideae vel subglobosae, hyalinae subhyalinae, 5-8  $\mu$   $\times$  4-5  $\mu$ .

### **Diplodina fusispora**

Perithecia 0.5-1 mm. broad, densely gregarious, sometimes slightly cespitose, irregular or subglobose, erumpent, black; spores short-fusiform, acute at each end, hyaline, at first simple, then uniseptate, 16-20  $\mu$   $\times$  4-5  $\mu$ .

On branches of silver maple, *Acer saccharinum* L. River Forest, Illinois. April. E. T. & S. A. Harper.

Perithecia 0.5-1 mm. lata, dense gregaria, aliquando leviter caespitosa, irregularia vel subglobosa, erumpentia, atra; sporae breve fusiformes, utrinque acutae, hyalinae, primo simplices, deinde uniseptatae,  $16-20 \mu \times 4-5 \mu$ .

### **Myxosporium acerinum**

Pustules minute, covered by the epidermis, scattered, grayish; spores oozing out and forming minute whitish dots or masses of unequal size, very large, oblong, often narrowed toward one end, granular within, hyaline,  $24-40 \mu \times 8-12 \mu$ .

On bark of silver maple, *Acer saccharinum* L. River Forest, Illinois. April. E. T. & S. A. Harper.

Acervuli minuti, in cortice nidulantes, sparsi, grisei; sporae exudantes et massas minutis inaequales albidas formantes, maxima, oblongae, saepe infra attenuatae, intus granulares, hyalinae,  $24-40 \mu \times 8-12 \mu$ .

### **Stagonospora linearis**

Perithecia pulvinate or hemispheric, 1-1.5 mm. broad, even or rugulose, erumpent, firm, black, whitish within, often yellowish at the base, seriately arranged; spores straight or slightly curved, subcylindric, subclavate or subfusoid, obtuse at each end, triseptate, hyaline,  $40-60 \mu \times 5-6 \mu$ , supported on slender branching sporophores.

On dead branches of hickory. River Forest, Illinois. January. E. T. & S. A. Harper.

Apparently well marked by the long spores and branched sporophores. The perithecia in the specimens seen are astomous.

Perithecia pulvinata hemisphaericave, 1-1.5 mm. lata, levia rugulosave, erumpentia, firma, atra, intus albida, basi flavescentia, seriatim disposita; sporae rectae vel leviter curvae, utrinque obtusae, triseptatae, subcylindraceae, subclavatae, vel subfusiformes, hyalinae,  $40-60 \mu \times 5-6 \mu$ , sporophoribus gracilibus ramosis suffultae.

### **Bovistella floridensis**

Peridium subglobose, 6-20 mm. broad, flaccid, cortex minutely granular or subpulverulent, brown, soon drying and often forming squamules about the apex, then disappearing and revealing the glabrous whitish inner peridium which opens by a definite circular mouth; sterile base present but compact and scanty; capillitium

of long, slender, branching and intertwined subhyaline threads about equal to the spores in diameter, grayish when freed from the spores and viewed with the naked eye, glebe brown when mature; spores globose, rough,  $4-5 \mu$ , pedicel  $10-20 \mu$ .

On the college campus, DeFuniak Springs, Florida. G. Clyde Fisher.

Peridium subglobosum, 6-20 mm. latum, flaccidum, cortice minute granulari pulverulentove, brunneo, in siccitate squamulas minutas circum apicem formante, demum evanescente; peridium interius glabrum, albidum, ore rotundo dehiscens, basi sterili parvo; capillitium filamentis longis, gracilibus, ramosis, intricatis, subhyalinis compositum; sporae globosae, asperulae, pedicellatae,  $4-5 \mu$  latae; pedicellae  $10-20 \mu$  longae.

GEOLOGICAL HALL,  
ALBANY, NEW YORK

Peck, C H . 1909. "New species of fungi." *Bulletin of the Torrey Botanical Club* 36(6), 329–339.
