EXECUTIVE SUMMARY

Caracle Creek International Consulting Inc. was contracted by Laurion Mineral Exploration Inc. (“Laurion”) to implement a diamond drilling program on their Enid-Massey Property.

The Enid-Massey Property (“property”) has potential for Ni-Cu-PGM mineralization hosted in gabbros, and volcanogenic massive sulphide (VMS) mineralization hosted in mafic and felsic volcanics.

The property is located in Enid, Massey, Cote and Fortune Townships in the Porcupine Mining Division, about 35 km west of Timmins, Ontario (Figure 1). It is bounded by UTM NAD83 coordinates 17U 430000E to 447000E and 5373000N to 5384000N. The property consists of 56 staked mineral claims containing 589 units approximately 9535 Ha in area, as well as 11 contiguous optioned leased mineral claims approximately 176 Ha in area.

Diamond drilling commenced on January 16th, 2008 and was completed by January 31st, 2008.

A total of 921 m of diamond drilling was completed in 8 drill holes. The drilling program was designed to test IP anomalies coinciding with previously identified AeroTEM EM anomalies. The program was split into two sectors, Santrap and Zed’Or with 5 holes totalling 630 m being completed on the Santrap sector, and 3 holes totalling 291 m on the Zed’Or sector.

Weakly anomalous copper, nickel, and zinc values were intersected in diamond drill holes SA08-01 and ZE08-01. The most significant intersection in terms of base metal mineralization was 7 ppb Au, 2.44 ppm Ag, 239 ppm Cu, 93 ppm Ni, and 1112 ppm Zn over 1.0m in diamond drill hole ZE08-01.

1.0 INTRODUCTION

Laurion began to acquire the property in 2005 through staking and option agreements. Several phases of surface and diamond drilling programs have been completed by Laurion on the property.

Most of the conductors tested by diamond drilling were explained by the presence of semi-massive to massive sulphides, usually consisting of pyrrhotite with lesser amounts of pyrite. The sulphides are typically anomalous in one or more of Cu, Zn, Ag, and Au.

A diamond drilling program was completed on the property from January 16th to 31st, 2008, and is the basis of this report.

2.0 PROPERTY DETAILS

2.1 Location and Access

The property is located in Enid, Massey, Cote and Fortune Townships in the Porcupine Mining Division, about 35 km west of Timmins, Ontario (Figure 1). The property occurs in NTS 42 A/12 and is bounded by UTM NAD83 coordinates 17U 430000E to 447000E and 5373000N to 5384000N.

The property has been broken up into different sectors. These include the Fortune-Tyche, Santrap, Baktrian, Cote-Bihar, Biaz, Pero, Talaos, Zed’Or, Argos West, and Argos East (Map 2).

Excellent all year round access to most of the property can be gained from Timmins by driving west on Highway 101 and then turning north onto the Malette Road (also known as the Montcalm Mine Road). The Malette Road is an all weather gravel road, and traverses the Enid-Massey property from about the 31 to 44 km stations. Access to the drill sites reported herein can be reached by a series of trails located off of the Malette Road. A winter road at the 31 km station provided access to the Zed’Or grid, and a trail at the 43 km station provided access to the Santrap grid.

A full range of services, supplies, and accommodations are provided in the city of Timmins.

2.2 Topography and Vegetation

The local terrain is typical of the Precambrian Shield, with low rolling hills and marshy areas. Vegetation on higher ground consists of a variety of hardwoods such as poplar and birch, with coniferous trees that include spruce and balsam. In the lower ground, typically more wet in character, black spruce, tamarack, alder swales, and cedar predominate. Water for exploration purposes is available from beaver ponds, marshes, and small streams that are located on the property.

Snowfall generally begins in November and extends into late March, early April. Lakes are usually passable with adequate ice thickness from late December through to late March. Between 50 and 100 mm of monthly rainfall is normal from April to October. The mean temperature is -13°C in January and 19°C in July.

Figure 1: Location of the Enid Massey Property.

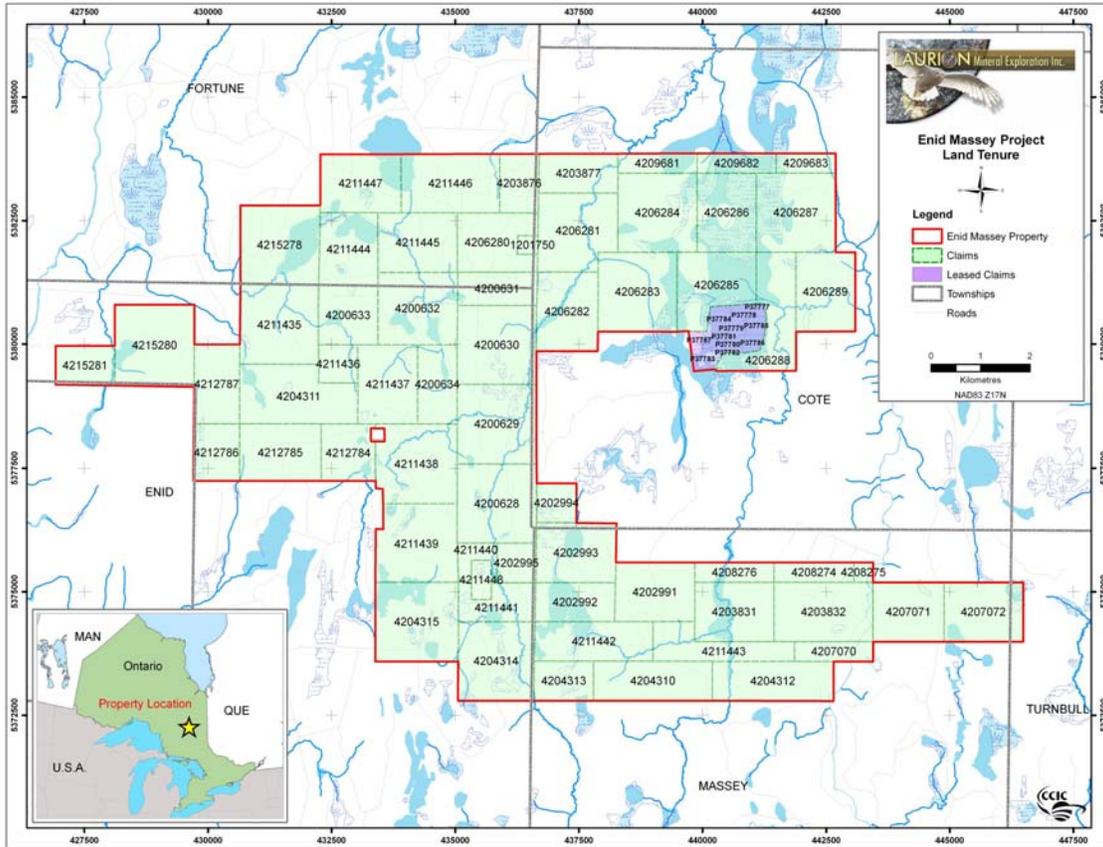

Figure 2: Enid-Massey Property

2.3 Claims

The property consists of 56 staked mineral claims containing 589 units, or approximately 9535 hectares and 11 contiguous optioned leased mineral claims.

The claims are located in Enid, Massey, Cote and Fortune Townships in the Porcupine Mining Division (Figure 2, Table 1).

Laurion assembled the property between 2005 and 2007 through option agreements and staking. Laurion is the recorded holder of the claims and has the right to earn 100% undivided interest on the optioned claims subject to 1 to 3% net smelter returns in favour of the original vendors.

3.0 PREVIOUS WORK

1930: Hollinger Mines optioned the property from prospector George Sweet located in Laurion’s Baktrian sector. The property contained two Cu-Ni showings to Hollinger Mines. Hollinger drilled four shallow diamond drill holes, one under the northwestern showing and three under the southeastern showing. Results are unknown.

1952: Hollinger Mines again optioned the above property from A. Lepic and E. Gagnon of Timmins, Ontario, and carried out geologic mapping, ground magnetometer surveys and limited trenching.

1955: Dominion Gulf Company staked the area above area and during 1955 and 1956 carried out detailed geological mapping and ground magnetometer surveys. Authors of both reports concluded that the gabbros in the area had potential for containing sulphide deposits, especially along the contact between the gabbro and the greenstone, and both authors recommended doing an EM survey. There is no indication that the recommendations were followed up.

1964: Magnet Consolidated, Yukeno and New Rouyn Merger Mines Ltd. carried out ground Magnetic, Sharpe SE-200 EM and Ronka Mark IV EM on a portion of 17 claims located in the area of Laurion’s Argos sector. At least one attractive EM conductor was found and a program of geochemical soil sampling was recommended. There is no indication of further work.

1965: Globe Exploration & Mining Company Ltd. carried out soil sampling on the area of Laurion’s Argos Sector. No geochemical anomalies of interest were reported. A ground magnetic and EM survey was also completed. Three diamond drill holes totaling 1500 feet were completed. The core was logged as mainly greywacke with minor granitic rocks. References to the presence of pyrite, pyrrhotite, quartz and chalcopyrite, were noted, but no indications of probable concentrations. Only 7 samples were submitted for assay, and results are not known.

1965: Mespi Mines Limited carried out regional airborne geophysical surveys in the northeast corner of Enid Township, including a portion of the northeast corner of the Baktrian Sector, and the Santrap sector. The south-central part of the survey over flew LME’s Santrap Sector, and located only two weak conductors. They did not follow up on these conductors.

1977: Noranda Exploration Co. Ltd drilled two short X-Ray drill holes into the Santrap sector. Exact location is unknown but is believed to be near current hole SA-06-02. They reported basalt, silicified tuff, felsic porphyries, oxide iron formation and “a few narrow sections display fair conductivity” They found “up to 5% sulphide mineralization, chiefly pyrite with some chalcopyrite”. Their drill logs show only two samples assayed, one of which is weakly anomalous in Ag, Cu and Zn.

2005-2007: Laurion Mineral Exploration Inc. carried out an AeroTEM geophysical survey, completed linecutting, and ground geophysics consisting of MaxMin II, magnetics, and IP. Twenty six diamond drill holes were completed in the Santrap, Argos, Baktrian, and Biaz sectors. Anomalous Cu, Zn, Ag and Au values were intersected.

4.0 GEOLOGY

4.1 Regional Geology

Supracrustal rocks of the area belong to the Kamiskotia Volcanic Complex (KVC), a bimodal assemblage, including tholeiitic basalts and subordinate basaltic andesites and andesites, and high silica rhyolites. The KVC is intruded by a large layered tholeiitic intrusion known as the Kamiskotia Gabbroic Complex (KGC). The northern part of the KGC is, in turn, intruded by a large, oval shaped granophyric body which may be coeval with the KGC and may be the uppermost, volatile-rich portion of the same body (Barrie, 2000)

Four volcanogenic copper-zinc+/-silver+/-gold deposits, including the Kam-Kotia Mine have been mined from rocks of the KVC.

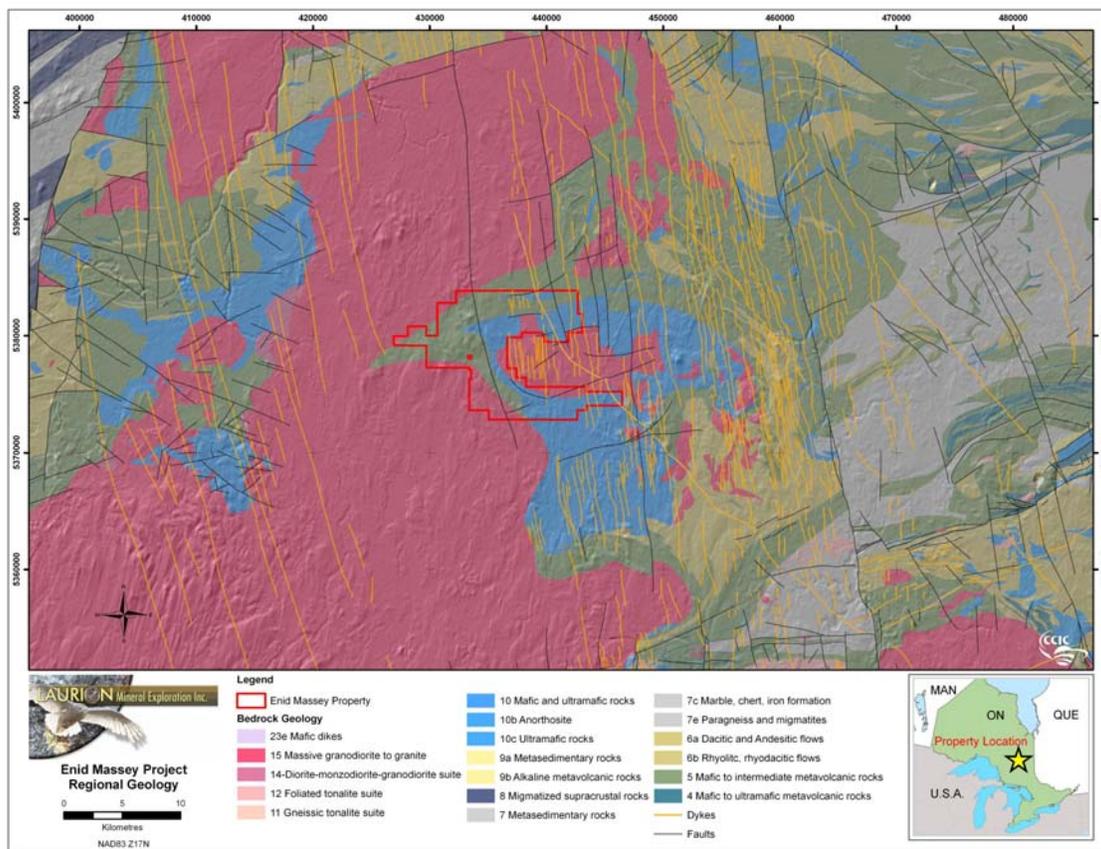

Figure 3: Regional Geology

4.2 Property Geology

Much of the Enid-Massey property is underlain by the northern portion of the Kamiskotia Gabbroic Complex. In this area the KGC consists of Upper Zone mesocumulus and orthocumulus gabbro-norites and ferroan gabbro-norites (Barrie, 2000). In northeastern Enid township it is common to find coarse grained pegmatoid leucogabbros with frequent massive to near massive clots many cm in diameter consisting of magnetite or ilmenite, or a mixture of the two. Rarely, lensoid concentrations of near massive pyrrhotite contain up to 1.5% combined Cu-Ni.

Due to a lack of exploration and large areas covered by swamp or glacial outwash sands, little is known of the volcanic rocks surrounding the KGC. It may be reasonably assumed that the KVC wraps around the north and west portions of the gabbro and may have similar potential for volcanogenic massive sulphide deposits as found in the Kam-Kotia Mine area (Tihor, 2007).

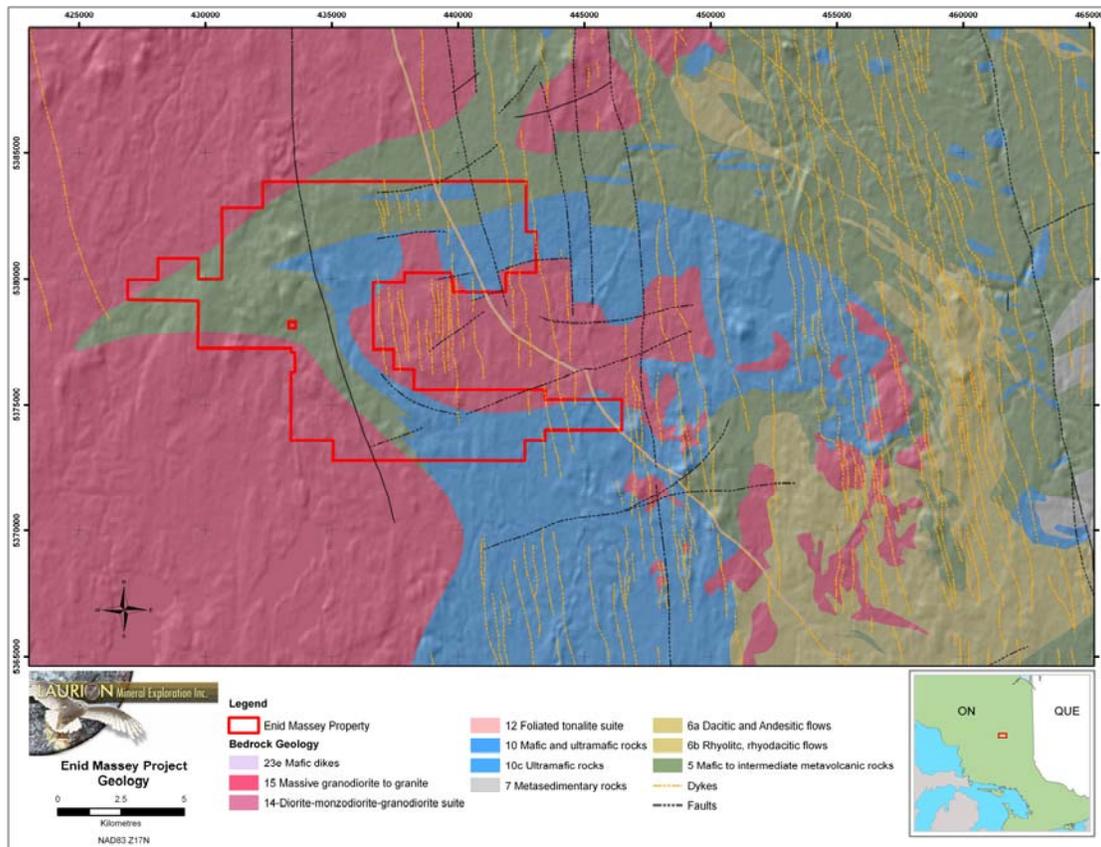

Figure 3: Property Geology

5.0 2008 DIAMOND DRILLING PROGRAM

5.1 Methods

A total of 8 diamond drill holes, totalling 841 m of drill core (Table 2), were completed on the property between January 16th and 31st, 2008. The program was split into two sectors, Santrap and Zed’Or with 5 holes totalling 630 m being completed on the Santrap sector, and 3 holes totalling 291 m on the Zed’Or sector. The drill holes completed on the Santrap sector include SA08-01 through to SA08-05, and the drill holes completed on the Zed’Or sector include ZE08-01 through to ZE08-03.

Map 3, located in the back pocket of this report, provides the drill hole locations and their respective projections to surface. Most of the holes were situated along cut grid lines using grid coordinates to locate the collars. Collars were surveyed by hand held GPS after the drill rig was moved off of the collar. A Flexit survey was used to measure the spatial relationships to the drill holes (www.flexit.se).

Drill core (NQ = 4.76cm diameter) was transported from the drill site by skidder and later by pickup truck to the core shack on the Davidson-Tisdale Mine site. Prior to transportation, the core boxes were fitted with lids and wired closed. Once on the core shack, the core was unloaded and put into a metal rack for storage prior to logging. All

eight diamond drill holes were logged, and the detailed logs for holes SA08-01 through to SA08-05, and ZE08-01 through to ZE08-03 can be found in Appendix II. The logging data was directly entered in an Excel spreadsheet using a laptop computer. Cross sections and assay certificates are provided in Appendix III and Appendix IV respectively.

Table 2: Summary of diamond drill holes, Enid-Massey Property, Winter 2008.

| DDH | Easting | Northing | ELEV (m) | AZ | DIP | LENGTH (m) |
|---------|---------|----------|----------|-----|-----|------------|
| SA08-01 | 431306 | 5379041 | 344 | 210 | -50 | 153.0 |
| SA08-02 | 430766 | 5378748 | 346 | 180 | -50 | 177.0 |
| SA08-03 | 431620 | 5379348 | 334 | 210 | -50 | 99.5 |
| SA08-04 | 431728 | 5379521 | 335 | 210 | -50 | 107.0 |
| SA08-05 | 431964 | 5378971 | 370 | 210 | -50 | 93.5 |
| ZE08-01 | 442432 | 5374234 | 300 | 360 | -50 | 102.0 |
| ZE08-02 | 442431 | 5374360 | 299 | 360 | -50 | 100.0 |
| ZE08-03 | 442630 | 5374242 | 297 | 360 | -50 | 89.0 |

A total of 176 core samples were submitted for analysis. Samples were cut and sampled using a table mounted hydraulic splitter. Over the sample interval, one half of the core was placed into individual labelled plastic bags with a corresponding sample tag inserted. The bags were then stapled shut, and placed into burlap bags. The samples were then delivered by a logistics company to Accurassay Laboratories processing facility in Lively, Ontario.

Once the core had been logged and sampled, metal tags were attached inscribed with the hole number, box number, and corresponding interval. The core was then cross piled and stored on the mine site.

Core samples were prepared and assayed selectively for base and precious metals by Accurassay Laboratories in Thunder Bay, Ontario. Platinum, palladium, and gold were done using fire assay (lead collection). Base metals were completed by using an Aqua Regia dissolution with an ICP (Inductively Coupled Plasma) finish. Alternating blank and standard check samples were submitted over the intervals at every tenth sample as a quality control measure. Of the 176 samples that were submitted, 9 samples were standards, and 8 were blanks. The standard that was used was CDN-SE-2 and was purchased at Canadian Resource Laboratories located in Vancouver, B.C. The details of the standard are found in Appendix IV, Assay Certificates.

5.2 Diamond Drilling

The drilling program was designed to test IP anomalies coinciding with previously identified AeroTEM II EM anomalies. The program was split into two sectors, Santrap and Zed’Or with 5 holes totalling 630 m being completed on the Santrap sector, and 3 holes totalling 291 m on the Zed’Or sector.

Drill holes SA08-01 through to SA08-05 were collared on the Santrap grid, and ZE08-01 through to ZE08-03 were collared on the Zed’Or grid.

Diamond drill hole SA08-01 was collared at 2+00W, 5+35N. The hole was drilled with an azimuth of 210° and dip of -50°. The hole was drilled to a depth of 153.0 m. Sulphides consisted dominantly of trace to 1% finely disseminated and remobilized pyrite and pyrrhotite. No significant values were returned.

Diamond drill hole SA08-02 was collared at 5+00W, BL 0. The hole was drilled with an azimuth of 180° and dip of -50°. The hole was drilled to a depth of 177.0 m. Sulphides consisting of up to 1% disseminated pyrite and chalcopyrite were intersected from 42.3 to 45.0 m. No significant values were returned.

Diamond drill hole SA08-03 was collared at 1+00W, 9+70N. The hole was drilled with an azimuth of 210° and dip of -50° to a depth of 99.5 m. Sulphides consisting of pyrite and pyrrhotite up to 5% over 40cm were intersected, as well as some more minor sections. No significant values were returned.

Diamond drill hole SA08-04 was collared at 1+00W, 11+70N. The hole was drilled with an azimuth of 210° and dip of -50° to a depth of 107.0 m. A 4.9 m long section hosted in a felsic tuff contained up to 2% disseminated and wispy pyrrhotite and pyrite. No significant values were returned.

Diamond drill hole SA08-05 was collared at 4+00E, 8+35N. The hole was drilled with an azimuth of 210° and dip of -50° to a depth of 93.5m. Minor sulphide mineralization was observed. No significant values were returned.

Diamond drill hole ZE08-01 was collared at L7+00E, 2+65N. The hole was drilled with an azimuth of 000° and dip of -50° to a depth of 102.0 m. Minor sulphide mineralization consisting of disseminated and wispy pyrite and pyrrhotite was noted. No significant values were returned.

Diamond drill hole ZE08-02 was collared at L7+00E, 3+90N. The hole was drilled with an azimuth of 000° and dip of -50° to a depth of 100.0 m. Up to 5% disseminated to locally net-textured pyrrhotite and pyrite was noted. No significant values were returned.

Diamond drill hole ZE08-03 was collared at L9+00E, 2+70N. The hole was drilled with an azimuth of 000° and dip of -50° to a depth of 89.0 m. Up to 8% locally disseminated and wispy pyrrhotite and pyrite hosted in a felsic volcanic were intersected. No significant values were returned.

Figure 4 and 5 display the drill hole locations from the recently completed drilling program.

Table 3: Summary of highest metal concentrations from Winter 2008 drilling.

| DDH | From (m) | To (m) | Int (m) | Au (ppb) | Ag (ppm) | Cu (ppm) | Ni (ppm) | Zn (ppm) |
|---------|----------|--------|---------|----------|----------|----------|----------|----------|
| SA08-01 | 56.0 | 57.0 | 1.0 | 17 | 1.25 | 621 | 603 | 47 |
| ZE08-01 | 44.0 | 45.0 | 1.0 | 7 | 1.66 | 138 | 52 | 1161 |
| ZE08-01 | 45.0 | 46.0 | 1.0 | 7 | 2.44 | 239 | 93 | 1112 |

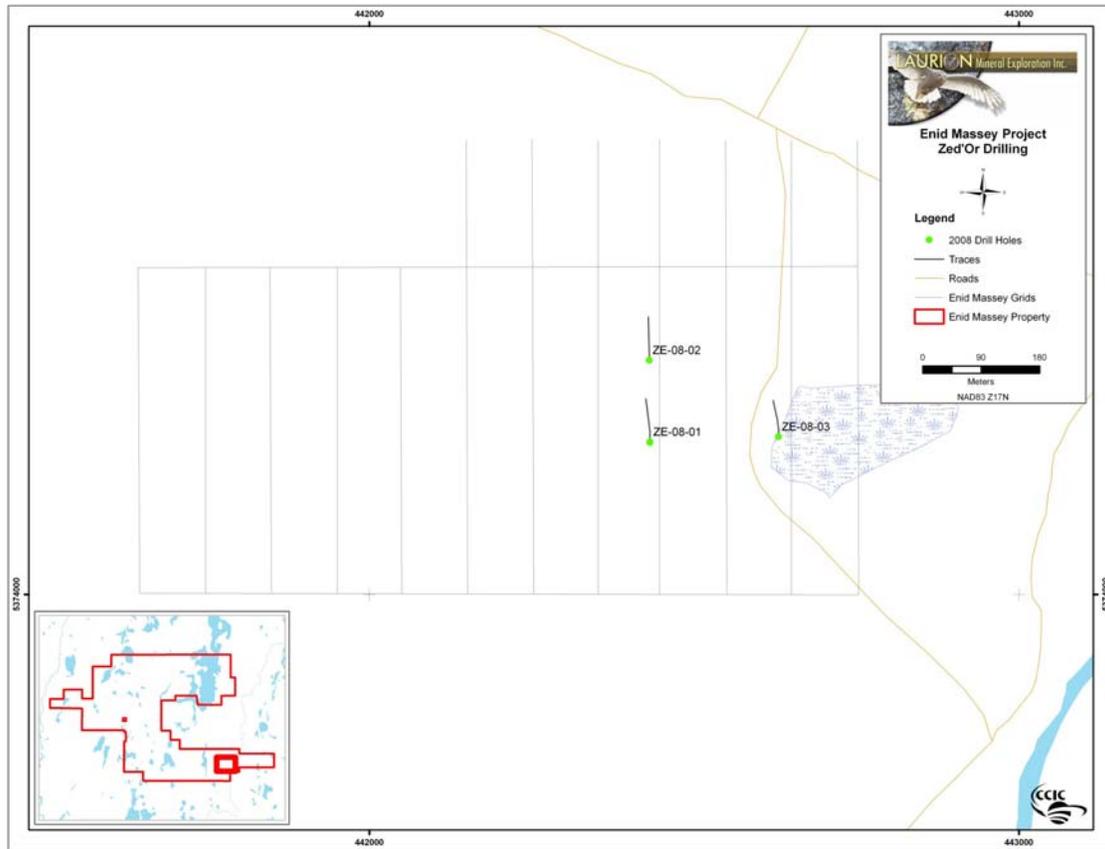

Figure 5: 2008 Drill Hole Locations, Zed’Or Sector.

6.0 CONCLUSIONS

The principal conclusions of the Winter 2008 Enid Massey Property drilling program are as follows:

- 1) The drilling of the ground IP anomalies for the most part was explained by the presence of disseminated to banded sulphides. Drill hole SA08-01 and ZE08-01 intersected anomalous zones of copper, nickel, and zinc mineralization.

7.0 RECOMMENDATIONS

The following recommendations can be made on the basis of the Winter 2008 exploration program completed in on the Santrap and Zed’Or sectors:

- 1) No further work is recommended on these two sectors. Further work on the property should concentrate along the northern part of the property and in the Cote-Bihar sector in the area of the C-9 sulphide showing.

Appendix I

Statement of Qualifications

STATEMENT OF QUALIFICATIONS

I, Joerg Martin Kleinboeck of 800 Peninsula Road, North Bay, Ontario, do hereby certify that:

I am a practising consulting geologist with Caracle Creek International Consulting Inc. of Sudbury, Ontario.

I am a graduate of Laurentian University, Sudbury, Ontario with a B.Sc. Geology, 2000, and have been practising my profession as a geologist since.

I am a member with the Association of Professional Geoscientists of Ontario (#1411).

I am a member of the Prospectors & Developers Association of Canada (PDAC).

I have an active prospector’s license for the province of Ontario (#1002600).

I hold no interests in the properties or securities of Laurion Mineral Exploration Inc.

Joerg Martin Kleinboeck
August 15th, 2008
North Bay, Ontario
