Foreword

A Compendium of Tree Species of Nepal is intended to serve an important need of the students of forestry, forestry professionals and natural resource managers. Based on a careful study of the syllabuses that have come into use at the I. Sc. and B. Sc. levels, this book is an attempt to use the findings of recent works pertaining to tree species. The book provides information about tree species on their morphology, natural occurrence, natural regeneration, artificial regeneration, diseases, pests, and parasites, wood properties and rate of growth, uses, agro-forestry application, silvicultural system, conservation status, and royalty rate and marketing price.

There is no dearth of books on tree species, but each of these books available emphasizes a definite aspect of the tree species, not all the important aspects. So, these books lack in some important aspects and do not give the holistic picture of a tree. This compendium, unlike other books, gives nearly a complete picture of tree species. Furthermore, it is formatted in such a way that readers can easily understand and benefit from its concise form. It is a comprehensive summary of tree species, so this is unique and of its own kind.

“Tree morphology” is the specialty of the book. It has been explained in detail with the help of diagrams of different parts like leaf, flower, fruits, etc. of tree species. This will help readers particularly in identification of tree species. In addition, it presents chemical characteristics such as crude protein content, i.e., nutritional value of fodder species, gum and resin, tannin content, pulp and paper, etc. which makes this compendium different from other books. Readers can save their valuable time by using this document instead of searching for many books.

I hope therefore that students as well as professionals will find this compendium very useful. It is worth their money that they will spend buying it and worth their time they will invest reading it.

Ishwar Chandra Dutta, Ph.D.
Formerly Dean & Professor
Institute of Forestry, Pokhara
T.U., Nepal

ACKNOWLEDGEMENT

Firstly, this compilation is dedicated to my respected teachers Mr. C.L. Das, late V.P. Jayaswal and Mr. P.N. Pradhan; my lovely son Ashutosh and all my friends.

I express my deep sense of gratitude and respect to Prof. Dr. A. K. Das, Prof. Dr. I.C. Dutta, Mr. D.N. Thakur, and Mr. J.N. Shah for their help, encouragement, guidance and practical suggestions extended to complete this compilation.

I would like to express my sincere gratitude to Mr. Abdhesh Singh, who helped in the editing of this compilation especially language correction.

This book is very much a product of the institute of forestry. A number of teachers have shared and nourished my enthusiasm. They read several drafts of manuscripts and suggested numerous improvements in aspects related to their specialized fields, specifically Dr. B.K. Paudel, Dr. Julie Huddle, Mr. J.N. Yadav and Mr. R. A. Khan in silviculture & silvicultural system; Mr. J.N. Shah, Mr. A.R. Gyawali, and Mr. S. Choudhary in timber utilization; Mr. K.R. Tiwari and Mr. K.M. Shrestha in soil suitability and agro-forestry application; Mrs. Sunita Singh in taxonomy and tree morphology; Dr. B.R. Bhatta and Mr. J. N. Pandey in forest pathology and forest entomology respectively. I hereby express my sincere and profound gratitude to all of them.

Sincere thanks goes to Mr. Arvind Kumar Thakur and Mr. Anand Mohan Sharma for word processing of the manuscript as invaluable assistance during the period of compilation as well as during the final preparation.

Heartly thanks are expressed to Mr. Thakur Prasad Silwal, Mr. Ajeet Kumar Karna, Mr. Uday kumar Singh, Mr. Shankar Prasad Gupta and Mrs. Nagina Yadav who rendered their active help during the period of compilation as well as its final preparation.

A very special appreciation goes to my parents, relatives and colleagues who always encourage and inspire me. A deep appreciation is extended to my wife, Nirmala for her inspiration, patience and understanding shown during the preparation of the manuscript as well as final preparation.

I request all the readers of this book to give their faithful comments or suggestions for improvements. Any kind of suggestions and comments for improvement and betterment of the book by any readers will be highly welcomed and appreciated.

R.B. Thakur
Pipariya-6, Sarlahi,
Nepal

Wt. : Weight

TREE MORPHOLOGY

Shape of the simple leaf

| | | | | |
|---|---|---|---|---|
|  |  |  |  |  |
| Sagittate: Leaf with an arrow shaped leaf blade. | Hastate: Sagittate leaf with its two lobes directed outside. | Auriculate: Having a flat lateral expansion like the lobe of the ear. | Peltate: Flat body of a leaf, a bract or a stigma, attached to the stalk by lower surface. | Bilobed: Having two lobes. |

| | | | | |
|---|---|--|---|---|
|  |  |  |  |  |
| Trilobed: Having three lobes. | 5 Lobed or palmate: With mid ribs of lobes or leaflets all radiating from apex of petiole. | Palmatifid: Leaves divid into lobes to about middle, at acute angles to each other. | Pedatisect: | Lyrate: Large terminal lobe and some smaller basal lobes. <i>e.g.</i> , radish, mustard. |

| | | | | |
|---|---|---|---|---|
|  |  |  |  |  |
| Palmately compound leaves | | | | |
| Runcinate: Terminal large pointed lobe and the smaller lobes pointed towards the base. | Pectinate: Pinnatifid like a comb with narrow close-set segments. | Bifoliate: Palmate compound leaf with two leaflets growing for same point. | Trifoliate: Palmate compound leaf having three leaflets growing for same point | Quadrifoliate: Compound palmate leaf, with four leaflets arising at a common point |

Pinnately compound leaf

Other compound leaf

Bipinnate:
Primary rachis gives a no. of secondary rachii which bears a row of leaflets in pairs.

Tripinnate: Primary rachis gives a no. of secondary rachii that in turn give tertiary rachii which bears leaflets in both sides.

Decomposed:
More than thrice pinnae.

Digitate: Leaves with several finger-like leaflets radiating from a central point & joined only at base.

Other compound leaf

Petiole

Ternate: Divided into 3 equal parts, these may be further divided into 3 parts, thus 2 – ternate.

Foliate or digitate

Lyrely pinnate

Winged

Amplexicaul:
Clasping or surrounding the stem, as base of leaf.

Leaf apex

Acute:
Ending in a sharp point forming an acute angle, e.g., mango.

Obtuse: With blunt or rounded end e.g., Banyan.

Notched

Apiculate:
Forming abruptly to a small tip, e.g., *Dalbergia*.

Acuminate:
Drawn out into long point; tapering; pointed, e.g., *Ficus religiosa*.

Leaf apex

Leaf base

Caudate:
Pointed and drawn out like a tail. *e.g.*, Peepal.

Truncate:
Almost flat.

Rounded

Cuniate:
Wedge shaped, *e.g.* pistia.

Rounded

Leaf base

Leaf margin

Cordate: *heart-shaped, i.e.,* with the base shaped like the figure of a heart on cards.

Decurrent: *running down into;* said of a sessile leaf when blade is prolonged below insertion & so runs down stem.

Sagittate

Serrate: Toothed, the teeth directed upwardly. *e.g.*, rose.

Leaf margin

Crenate: With scalloped margin.

Sinuous

Undulate

Erose

Spinous: With spines or prickles.

Venation

Position of leaf

Parallel: All the veinlets run parallel to each other.

Reticulate: Vein lets irregularly distribute & fuse to each other to form a network of veins

Opposite: On different sides of the axis with the bases at the same level.

Alternate: A single leaf arising at each node.

Whorled: More than two leaves arranged in a circle round an axis.

above

Shape of flower

Stellate: *Star-shaped*; with radiating rays like the points of a star.

Campanulate Bell-shaped, the petals are fused to each other.

Funnel-shaped: Called as infundibuliform.

Labiate: *Two-lipped*.

Personate: Zygomorphic, gamopetalous corolla with two lips.

Tubular: Tube like, gamopetalous corolla

Digitaliform

Ligulate: Corolla forming a short, narrow tube below and ligule like flat structure above.

Spurred corolla: Drawn out into a beak or spur.

Inflorescence

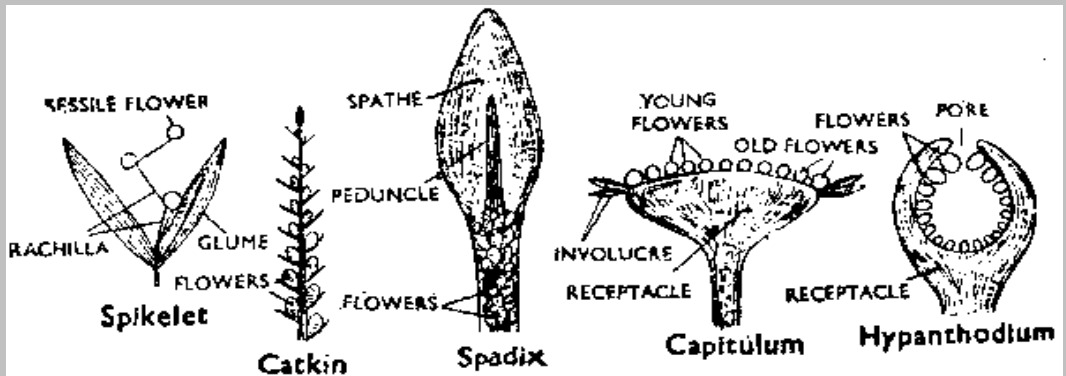

Raceme:
Inflorescence having a common axis & stalked flowers in acropetal succession.

Corymb: A raceme with lower pedicels elongated so that the top is nearly flat.

Corymbose raceme: It is an intermediate between corymb and typical raceme.

Umbel: A cluster of flowers whose spreading stalks or rays arise from apex of stem, resembling spokes of an umbrella.

Spikes: Inflorescence with sessile flowers along a simple, undivided axis.

Spikes: Inflorescence with sessile flowers along a simple, undivided axis.

Catkin: A spike with unisexual flowers and pendulous rachis, e. g., *Morus*.

Spadix: A racemose inflorescence with elongated axis, sessile flowers & an enveloping spathe, e. g., *Musa*

Capitulum: An inflorescence of sessile flower crowded together on a receptacle & surrounded by involucre.

Hypanthodium : Inflorescence with concave capitulum on whose walls, flowers are arranged, e. g., *Ficus*.

Fruits

Caryopsis:
Very small one-seeded fruit with pericarp fused with seed coat: *e.g.*, maize.

Achene: Small one-seeded fruits with pericarp (membranous or leathery), separated from seed coat.

Drupe: A fleshy fruit with an inner hard stone enclosing the seed.

Stone: Having a stony endocarp around the seeds.

Glans or nut: A one seeded fruit with a hard outer covering.

Acorn: A nut partly enclosed within a cup which is made up of a circle of hardened, bract leaves. *e.g.* Oak

Carcerule: Ripened fruits break up into indehiscent, *e.g.*, tulsi.

Samara: A dry winged fruit that does not split open. *e.g.*, *fraxinus*

Compound samara: It splits at maturity into one seeded winged mericarps *e.g.* *Acer*.

Berry: A simple juicy fruit, usually small, with seeds in the middle of a pulp.

Regma: Fruits split up at maturity into three cocci or dehiscent single seeded parts.

Capsule: A dry fruit formed of two or more fused carpels that splits open when ripe.

Siliqua: A long narrow two chambered fruit. *e.g.* Mustard.

Sorosis: Multiple fruit developing from a spike or spadix or female catkin, *e.g.*, mulberry.

Cone: Female organ of Conifers formed of woody scales on that seeds are borne

Pome: apple, Succulent fruit with seeds in many cartilaginous dry cells.

Syconus (Fig): Develop from hypanthodium type of inflorescence, e.g., banyan.

Amphi sarca:

Pepo: Many seeded fruit with parietal placentation, e.g., cucumber.

Hesperidium: Special type of berry in which endocarp is membranous, partitioned & bears juicy hairs, e.g., citrus fruits, orange.

Balausta: Fruit contains two irregular rows of seeds, one above the other.

Follicles: A dry pod-like fruit splitting down one side only.

Pod or legume: A long cylindrical or somewhat flattened fruit, usually splitting into 2 valves, as in *Leguminosae*.

Lomentum or legume: Fruit is constricted between seeds into a no. of one seeded compartments, e.g., gum tree.

Spiral legumes

Thalamus

Ectaerio

Sorosis

Capsule or pyxis

Berry

CHAPTER: II

TREE SPECIES OF TERAI

(1)

| | |
|--------------------------|-------------------------------|
| Local name: Khair | Sub-family: Mimosaceae |
| <i>Acacia catechu</i> | Family: leguminosae |

1. Natural occurrence:

It occurs between Terai -1400m elevations, widespread in Terai, it is quite common in peninsular region, particularly in drier parts; it occurs in tropical dry mixed deciduous forests.

2. Morphological Characteristics:

| | |
|---------------|--|
| Leaf | Leaves are pinnate. Leaves shedding during February; new leaves appear during April-May. |
| Flower | Flowering commences in June and continues till July to August; flowers are pale yellow in cylindrical spike. |
| Fruit | Pods are glabrous, flat and oblong. |
| Seed | Seed ripens between November-March. |
| Bark | Bark is dark greyish brown; exfoliating in long, narrow strips. |

3. Silvicultural characteristics:

| | |
|-----------------------|---|
| Light | It is a strong light demander; does not tolerate any kind of suppression. |
| Frost | Frost hardy. |
| Drought | Very drought resistant. |
| Fire | Fire resistant. |
| Soil | Prefers well-drained coarse, gravelly and alluvial soil: can grow on black cotton soil. |
| Coppice | Coppices well; produces root sucker. |
| Associates | It makes a good association with <i>Dalbergia sissoo</i> ; common associates are <i>Anogeissus latifolia</i> , <i>Diospyros melanoxylon</i> , and <i>Lagerstoemea parviflora</i> , <i>Terminalias</i> . |
| Tree Nature | A moderate sized deciduous tree. |
| Met.condition. | Max.Temp. 40 to 48 ⁰ C, Min. Tamp (-1 to 12.8 ⁰ C); rainfall: (50cm to 200cm) |
| Root system | Develop a strong tap root system; can withstand flooding. |

4. Natural regeneration:

| | |
|----------------------------------|---|
| Seed productⁿ | Good seed year occurs every year. |
| Seed dispersal | Seeds can be disseminated by river, water and wind. |
| Seed germinatⁿ | Seeds can germinate on alluvial deposits. |
| Other | It can be regenerated by coppices. |

5. Artificial regeneration:

| | |
|--------------------------------------|---|
| Preferred propagⁿ | Direct sowing, entire planting, stump planting |
| Seed collectⁿ time | January to February. |
| No. of seed kg⁻¹ | 30,000 to 40, 000seeds kg ⁻¹ , individual tree yields 0.5 to 2 kg seed. |
| Seed extraction | Seed should be dried in sun, until they open, and then beaten with stick to separate the seeds. Seeds cleaned by winnowing. |
| Seed storage | Orthodox seed. Dry thoroughly in the sun. |
| Viability of seed | Seeds retain their viability 6-8 months. |
| Seed Treatment | Seeds soak and scarify before plantings. |
| Seed sowing time | Seed should be sown during March to April for July planting. |
| Duration of germⁿ | 30 days. |
| Germination (%) | 60-80%, germination is epigeal. |
| Nursery period | Seedling: 12-14 in Terai; 14-16 weeks at higher altitude. |
| Best planting size | 20-30cm tall with root collar diameter 3mm or larger. |

6. Forest pathogens:

The fungus *Ganoderma lucidum*, is a root parasite causes high mortality in khair plantation. The *Angiosperm Parasites*, *Loranthus languorous* and *Dendrophthoe falcata* are often found on khair. The tree is attacked by *Buprestid Beetle* and *Cerambycide Beetle*, which usually attack teak. *Porcupines hystrix* are seriously damaged to plantation or killed by eating their bark partly or wholly.

7. Wood properties:

| | |
|-------------------------|--|
| Weight | Wood is very heavy-to-heavy; it weighs about 1008-1040kgm ⁻³ at 12 % moisture content (m.c.); specific gravity is 0.98. |
| Hardness | Timber is very hard. |
| Working quality | It is difficult to saw and work, it is also difficult to chip with machines. |
| Strength | Timber is extremely strong. |
| Calorific value | c.v is about 25,600 KJkg ⁻¹ . |
| Durability | Timber is very durable not attacked by white ants. |
| Preserva. Treat. | It is not required. |
| Seasoning | It seasons slowly but well. |
| Wood color | Sapwood: yellowish white; heartwood: light or dark red, turning brownish with age; wood is straight grained to interlocked grain; heartwood is pinkish to reddish brown and medium to coarse textured. |
| Porous | Wood is diffuse porous. |

8. Uses:

| | |
|--------------------|---|
| Timber | Fairly good source of timber, it is used for making rice pestles, oil and sugar cane crushers, ploughs, boats, furniture carts, sword handles etc. |
| Fuel wood | It is an excellent fuelwood. It makes a good and high quality charcoal. |
| Fodder | It is a good fodder tree in India, but least used in Nepal. |
| Edible food | Seed of khair gives 44.2% crude protein. |
| Tannin | Cutch is used for tanning and dyeing purposes; cutch is used for dyeing pulp & paper, at present cutch is being used to a larger extent in printing than in dyeing. |

| | |
|-------------------------|---|
| Gum and resin | The gum resin from tree is used in mastectomies. Gum has sweetening taste and forms strong mucilage with cold water. |
| Ecological Value | Trees are planted to check erosion and help water conservation. It has a symbiotic association with <i>Rhizobium bacteria</i> , which forms nodules in the root and fix N ₂ . |
| Medicinal Value | An extent from the plant proved toxic to other growth of fungi, <i>Periculari Orizae</i> , <i>Clletotrichum falcatum</i> . Katha has been long used in ayurvedic medicine, it is regarded as astringent, cooling and digestive, used to relax condition of throat, mouth and gum; also used in cough and diarrhoea. |
| Other | Lac can be successfully grown on khair trees; Katha is an indispensable ingredients of <i>Pan</i> preparation. |

9. Agroforestry application:

This tree light, deciduous crown and nitrogenous bacterial nodules in the roots, so it is suitable for planting along field bunds at a distance of 4.5m from agricultural crops (Hocking, 1998) .

10. Silviculture systems:

In mixed dry deciduous forests, it is frequently worked under coppice, coppice with stand-ards or coppice- with reserves system on a rotation of 30 years for coppice. (Parkash,1991)

11. Royalty: NRs. 10/kg for air-dry wood. (Forests rules, 1995).

12. Market price: NRs. 60-70/kg for air-dry wood at Sirha district (Parajuli *et al*, 1997).

②

| | |
|---------------------------------|--------------------------|
| Local name: Haldu, karma | Trade name:Haldu |
| <i>Adina cordifolia</i> | Family: Rubiaceae |

1. Natural occurrence:

It is commonly found up to 800m altitudes. It occurs in Terai, Bhabar and Duns, often extending to outer Himalayas .

2. Morphological character:

| | |
|------------------|--|
| Leaf | Leaves are simple, opposite and heart shaped; leafless for short time in May. |
| Flowering | Flower is yellow in globes; flowering occurs between June–July. |
| Fruiting | Capsules split into two dehiscent cocci. |
| Seed | Seeds are minute; ripen in cold season. |
| Bark | Bark is light grey; exfoliating in patches, blaze light red inside with white streaks. |

3. Silvicultural characteristics:

| | |
|----------------|---|
| Light | Light demander. |
| Frost | Frost tender. |
| Fire | Fire tender |
| Soil | It grows best on freely drained soil.It often establishes on landslips, alluvial soil near river. It attanis a good growth on clayey loam and sandy loam soils. |
| Coppice | It coppices readily. |

| | |
|--------------------------|---|
| Associates | Sal is the major constituents. Some associates are: <i>Acacia catechu</i> , <i>Albizzia pocera</i> , <i>Dillenia pentagyna</i> , <i>Gmelina arborea</i> , <i>Holoptelia integrifolia</i> , <i>Mallotus philippinensis</i> . |
| Graze& browse | Browsing sensitive, it causes considerable damage to seedling. |
| Tree nature | It occurs scattered in deciduous forests. |
| Soil pH | It tolerates high pH value up to 8.3. |

4. Natural regeneration:

| | |
|---------------------------------|---|
| Seed productⁿ | Seeds are shed between April and June. |
| Seed dispersal | Seeds are dispersed by wind. |
| Seed germination | Germination takes place early in the rain. It establishes well on bare ground such as landslips, alluvial soils near rivers and abandoned cultivation land. |
| Coppice/ root sucker | Natural regeneration may occur from coppice shoots. |

5. Artificial regeneration:

| | |
|--|--|
| Preferred propagⁿ | Direct sowing, entire planting. |
| Seed collectⁿ time | April-June |
| No. of Seed Kg⁻¹ | Seed is very light about 11 million kg ⁻¹ , 1 kg of fruit yield about 60,000 seeds. |
| Seed extraction | The flesh should be removed from the seed before storage. |
| Seed storage | Orthodox seed; fruit should dry in sun and store in sealed plastic bag. |
| Viability of seed | Viability of seed should retain for 12 month; germination is better at 9 months than fresh, viability lost after 2 nd season. |
| Seed Treatment | Not required |
| Seed sowing time | March. Seed should be sown on trays, as seeds are tiny. |
| Duratⁿ of germinatⁿ | Germination can obtain in 30 days. |
| Germination (%) | 30-40%. |
| Nursery period | Seedling Nursery seedling requires three to five month for July planting. |
| | Stump Stump is prepared from 12-15 month old seedling. |

6. Forest pathogens:

- The borers *Batocera Rufomaculata* and *Xylotrechus Smei* attack the timber.
- The wood is highly susceptible to drywood termites.
- It is comparatively susceptible to brown rot than white rot.

7. Wood properties:

| | |
|------------------------|--|
| Weight | Wood weighs about 695 kgm ⁻³ at 12% m.c; light to moderately heavy. |
| Hardness | Wood is hard. |
| Working quality | It saws well, takes good polish, easily fissile. |
| Strength | Moderately strong. |
| Calorific value | About 27000 KJkg ⁻¹ . |
| Durability | Wood is moderately durable in exposed situations & durable under cover. |
| Seasoning | It is moderately refractory wood, seasons well. |
| Porous | Pores are small to very small, not visible to naked eye. Diffuse porous; growth ring is usually indistinct |

8. Uses:

| | |
|-------------------------|---|
| Timber | Timber is used for carving; bobbins, furniture, paneling etc. |
| Fuel wood | A good fuelwood species, charcoal 32.1%. |
| Fodder | Leaves are considered as a medium quality fodder. |
| Tannin | Bark gives tannin 7-10%. |
| Medicinal value | Roots are used as astringent in dysentery. Bark is acrid and bitter used in biliousness. It is also regarded as febrifuge and antiseptic. |
| Pulp & paper | Wrapping, writing and printing paper is also made from the wood pulp of this species. |

9. Rate of growth:

Haldu growth is very slow in the first year seedlings being only 10-15cm in the nursery. Following year, growth is faster and seedlings are 50-60cm fairly fast and annual height increment of saplings is about 60cm. (Parkash, 1991).

10. Silvicultural system: In mixed forest, it is worked under selection system with an exploitable diameter of about 60cm. In areas of poor growth, it is worked under simple coppice. In sal forest, Haldu is a principal associates, clear felling system followed by artificial regeneration, or shelter wood or selection system should be adapted. (Parkash, 1991).

11. Royalty: NRs. 100/kg for air-dry wood. (Forest rules, 1995)

12. Marketing price: NRs. 200/cu.ft for round timber and NRs. 350/cu.ft for sawn timber at Sirha district, Nepal. (Parajuli *et al*, 1997)

3

| | |
|------------------------|------------------------------------|
| Local name: Bel | English name: Bengal Quince |
| <i>Aegle marmelos</i> | Family: Rutaceae |

1. Natural occurrence: It occurs scattered in the Terai, lower Hills and the Duns.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are alternate, trifoliate, occasionally, digitately five foliolate, leaflets ovate lanceolate. |
| Flower | Flowers are large, greenish white, sweet scented, in short axillary panicles. |
| Fruit | Fruits are globose, grey or yellowish, ring woody. |
| Seed | Seeds are numerous, oblong, compressed, embedded in pulp. |
| Bark | Bark is soft, corky, light grey, exfoliating in irregular flakes. |

3. Silvicultural characteristics:

| | |
|-------------------|---|
| Light | Light demander. |
| Frost | It is a fairly frost resistant. |
| Drought | Drought hardy and found in dry localities unfavorable to the majority of the species. |
| Soil | It can withstand various types of soils and a pH range of 5 to 10. |
| Coppice | It coppices well. |
| Associates | It is generally associated with <i>Acacia cathechu</i> , <i>Anogeisus latifolia</i> , <i>Bauhinia purpurea</i> and <i>Butea monosperma</i> etc. |

| | |
|---------------------------------|--|
| Graze & browse | Grazing and browsing animals cause severe damage to the seedlings. |
| Tree Nature | It is a moderate sized, spinous, slender, aromatic tree, with a somewhat fluted bole, growing wild throughout the deciduous forest of Terai, Duns and lower Hills. It is often cultivated in farm. |
| Meteorological condition | In its natural habitat, absolute Max. Temp. (40-46) ⁰ c, absolute Min.Temp. (0-7) ⁰ c, annual rainfall (570 to 2000)mm. |

4. Artificial regeneration:

| | |
|---|--|
| Preferred propagⁿ | Nursery raised seedlings, root cuttings, by layering, root suckers. |
| Seed collectn time | Fruits are collected between March and May. |
| No. of seed kg⁻¹ | 5300 seeds kg ⁻¹ . |
| Seed extraction | Seed should be washed to remove the pulp. |
| Seed storage | Orthodox seed. It should be dried and stored in air-tight container. |
| Viability of seed | Seeds have short viability from 1 to 6 months. |
| Seed treatment | It is not required. |
| Seed sowing time | Seeds are sown in June or July. |
| Duratrⁿ of germⁿ | Germination completes within 21 days. |
| Germination (%) | Germination may obtain up to 56%. |
| Nursery period | Seedling: Seedlings require at least one year to fit for transplanting. |
| Best planting size | 20-30cm tall seedlings with 3-5mm root collar diameter. |

5. Diseases, pests and parasites of Bel: (i) Leaves, twigs, fruits and thorns are sometimes infected by *Xenthomonas bilvae* which causes a short hole and fruit canker. (ii) Young leaves and shoots are eaten by the caterpillars of *Paplio demoleus*. (iii) The beetles of *Amblirrhynus poricollis* etc. feed on the plant sap and defoliate the trees. (iv) Fruits are attacked by white ants when they fall to the ground.

6. Wood properties:

| | |
|------------------------|---|
| Wood color | Wood is light yellow and strong aromatic when first exposed, later fading to yellowish grey or greyish white. |
| Hardness | Wood is hard. |
| Weight | Wood is heavy, specific gravity is 0.89 and weight is 912 kgm ⁻³ . |
| Working quality | It is fairly easy to saw and fairly make smooth surface. |
| Durability | Timber is fairly durable if not contact with ground or in exposed situations. |
| Seasoning | It is difficult to season and has a marked tendency towards surface cracking, cupping, and twisting. |
| Others | Heartwood is lacking. |

7 Uses:

| | |
|-------------------------|---|
| Timber | Timber is used for tool-handles, agricultural implements, furniture, carving etc. |
| Fodder | The young leaves and shoots are used as fodder for cattle, sheep & goats. |
| Edible food | Ripe fruit is eaten fresh. |
| Tannin | Bark contains 5.52% tannin. |
| Gum and resin | Fruits yield 2% dried, water soluble gums, which serves as a good adhesive. |
| Ecological value | Due to its ability to grow in poor, stony and alkaline soils, it is |

| | |
|------------------------|---|
| | recommended for reclamation of wastelands and also for windbreaks. |
| Medicinal value | Roots as well as the bark are used in the form of decoction as a remedy in <i>Melancholia</i> , intermittent fevers and palpitation of the heart. Fruit is used in chronic diarrhoea and dysentery. |
| Paper and pulp | It is also used for making pulp for manufacture of wrapping paper. |

8. Royalty Rate: NRs. 2/kg for dry fruit. (Forest rule, 1995)

9. Marketing price: NRs. 20/kg at major market in Nepal dealing with NTFP (1997).

(4)

| | |
|-----------------------------|----------------------------------|
| Local name: Maharukh | |
| <i>Ailanthus excelsa</i> | Family name: Simarubaceae |

1. Natural occurrence: It generally occurs between Terai to 800m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are pinnately compound up to 90cm long with 8-14 pairs of leaflets. |
| Flower | Flowers are small, yellowish in panicles. |
| Fruit | Fruits are one seeded samara. |
| Bark | Bark is a light grey and smooth in young trees with large leaf scars, rough granular and greyish brown in older trees. |

3. Silvicultural characteristics:

| | |
|-----------------------|--|
| Light | It is a strong light demander. |
| Frost | Frost tender. |
| Drought | Seedlings are sensitive to drought. |
| Soil | It is capable of growing on poor soils under relatively low rainfall. It does not grow well on clays and waterlogged areas. It thrives best on porous loamy soils. |
| Coppice | It coppices well and produces root suckers. |
| Tree nature | It is a large, deciduous tree with a straight cylindrical bole. |
| Browsing | It has a high immune to protect from browsing. |
| Rate of growth | It is a fast growing tree. |

4. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Direct sowing, entire planting, cuttings, stump planting. |
| Seed collectⁿ time | Seeds ripen in April. |
| No. of seed kg⁻¹ | 10,000 seeds kg ⁻¹ . |
| Seed extraction | Seeds are separated from the wings by beating and winnowing. |
| Seed storage | Orthodox seed. The dried seed should be stored in sealed plastic bags. |
| Viability of seed | Viability of seed remains for less than one year. |
| Seed treatment | Not required. |
| Seed sowing time | Seeds are sown soon after collection. |
| Duration of germⁿ | Germination completes within 45 days. |
| Germination (%) | Germination may obtain upto 70-90%. |

| | | |
|---------------------------|-----------------|--|
| Nursery Period | Seedling | Seedlings should require 6 month in the nursery. |
| | Stump | Seedlings should require 1year in the nursery for stump. |
| Best planting size | | 15-25 cm tall seedling with 3-5mm root collar diameter. |

5. Diseases, pests and parasites of Maharukh:It is attacked by a defoliator *Atteva fabriciella* almost round the year.

6.Wood properties:

| | |
|------------------------|---|
| Wood Color | Wood is white. |
| Hardness | Wood is soft. |
| Weight | Wood is light (Specific gravity is 0.45 and weight 335-480 kgm ⁻³) |
| Working quality | It is a easy to saw and work well. |
| Strength | It is fairly strong wood. |
| Durability | It is perishable in the open but not so in water. It is susceptible to damage by white ant and insect attack. |
| Preserv. treat. | Timber is treatable with preservative. |

7. Uses:

| | |
|-------------------------|---|
| Timber | It is used for veneers, plywood, packing cases, and poor quality matchwood. |
| Fuel wood | It makes a good fuel wood. |
| Fodder | Leaves along with the twigs are found to be a suitable fodder for cattle, sheep, and goats. |
| Gum and resin | Tree yields an inferior quality of gum. |
| Ecological value | It serves as one of the hosts for 'Eri' silkworm and as a bee pasturage. |
| Medicinal value | Bark is bitter, astringent, febrifuge and anthelmintic. It has anti-spasmodic and expectorant properties and is used for asthma, bronchitis, and dysentery. It is also used for dyspepsia and earache, antiseptic properties. |
| Paper &Pulp | Chemical pulps can be prepared from the wood by sulphate process, which is suitable for writing and printing papers. |

(5)

| | |
|-------------------------------|--|
| Local name: Rato siris | Eng name: Kokko |
| <i>Albizzia chinensis</i> | Family: Mimosaceae, Leguminosae |

1. Natural occurrence: : It occurs between Terai to 1500m. According to Champion and Seth (1968) it occurs in northern tropical moist deciduous forest.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are with 8-15 pairs of pinnae, leaflets 50-80, lanceolate. |
| Flower | Flowers are white with pinkish filaments, in terminal and axillary panicles. |
| Fruit | Pods are thin & brown. |
| Seed | Pod contains 8-12 seeds. |
| Bark | Bark is grey with short vertical wrinkles crossed by deeper horizontal furrows. |

3. Silvicultural characteristics:

| | |
|---------------------------|---|
| Light | Moderate light demander |
| Frost | Frost sensitive. |
| Drought | Drought sensitive. |
| Fire | Fire resistant. |
| Soil | It prefers moist sites. |
| Coppice | It coppices well. |
| Associates | In lower altitudes, it often associates with sal and other <i>Albizzias</i> and at higher altitude, it associates with sal. |
| Graze & browse | Leaves are palatable, so seedlings are severely damaged by browsing. |
| Tree nature | A large deciduous with a broad, spreading and flat-topped crown. |
| Other | It is sensitive to grass competition. It is also liable to damage the branches by wind-storms. |

4. Natural regeneration:

| | |
|-------------------------|--|
| Seed production | The pod begins to ripen in Nov –Dec & continue to hang on the branches throughout the dry season. |
| Seed dispersal | Seeds are dispersed by wind. |
| Seed germination | Germination & establishment is best on loose soil with a fair degree of moisture. Seeds begin to germinate with rainfall during monsoon. |

5. Artificial regeneration:

| | | |
|-------------------------------------|--|--|
| Preferred propagⁿ | Direct showing (found to be the best), stump planting, entire plating. | |
| Seed collection time | December – March. | |
| No. of seed kg⁻¹ | About 3000 pods & 20,000–70,000 seeds k.g ⁻¹ . | |
| Seed extraction | Pods are dried in the sun for a few days until they open. Seeds are extracted by hand. | |
| Seed storage | Seeds should be dried & stored in sealed polythene bags with insecticide. | |
| Viability of seed | Seed can be stored for a year. | |
| Seed treatment | Seed should be manually scarified or treated with hot water by immersing it for two to three minutes in water that has been boiled, then soaking in cold water for 24 hours. | |
| Seed sowing time | August to September. | |
| Duration of germination | For unscarified seed: seed germinates well in 3 to 4 days, Seeds treated with hot water: Germinates in 6-12 days. | |
| Germination (%) | Seed germination is about 50%. | |
| Nursery Period | Seedling | <1000m: it requires 4 months, >1000m: it requires for 10-11 month after sowing in August to September. |
| | Stump | Stumps are prepared from one-year-old seedling. |
| Best Planting Size | 20-30cm tall seedlings with 3-5mm root collar diameter. | |
| Other | It can be raised only in moist localities. | |

6. Diseases, Pests and Parasites of Rato Siris:

Diseases affecting *Albizzias* are: **i). Root-rot:** caused by *Armillaria mellea* & *Ganoderma lucidum*, **ii) Heart rot:** caused by *Ganoderma applanatum* and *Polyoprous gilvus*. **iii) Leaf rusts:** caused

by *Ravenellia* and *Uredo* iv) leaf spots: caused by: *Serospora albiziae*.

7. Wood properties:

| | |
|-------------------------|---|
| Weight | Wood weighs about 300-500kgm ⁻³ . Timber is light to moderately heavy, specific gravity is 0.72. |
| Hardness | Timber is soft. |
| Working quality | Timber is easy to saw and work. It takes an excellent polish |
| Strength | It is less strong timber. |
| Calorific value | Sapwood: 4358 calories, Heartwood: 4845 calories. |
| Durability | Timber is not very durable in exposed situations, or in contact with ground. |
| Preserva. treat. | Heartwood is very refractory to treatment. Sapwood is easily treatable. |
| Seasoning | Highly refractory wood to seasoning, i.e., and timber is liable to severe splitting and surface cracking. |
| Wood color | Sapwood is large & white while heartwood is brown. Growth rings distinct to the eye. |

8. Uses:

| | |
|-------------------------|---|
| Timber | Use for box making, especially tea-boxes, packing cases & for matches. Use for decorative veneers, cabinet making, paneling and picture-frame. |
| Fuel wood | It is a good fuel wood. |
| Fodder | A good fodder with high crude protein content about 15% and total digestible nutrients about 38%. |
| Tannin | Bark contains 22% tannin. |
| Gum and resin | Gum is used for sizing Daphne paper. |
| Ecological value | It belongs to leguminosae family, so it fixes atmospheric N ₂ . |
| Medicinal value | Barks infusion is used as a lotion for cuts, scabies and other skin diseases. The seeds and leaflets are fairly toxic to melon-worm larvae and cotton stainer adults. |
| Paper and pulp | The wood yields 47.8-49% pulp by sulphate process. It is suitable for writing and printing paper after it is mixed with suitable long fibred pulp. |
| Others | The wood yields 47.8-49% pulp by sulphate process. It is suitable for writing and printing paper after it is mixed with suitable long fibred pulp. |

⑥

| | |
|-------------------------------|---------------------------|
| Local name: Kalo siris | Eng name: Kokko |
| <i>Albizzia lebbek</i> | Family: Mimosaceae |

1. Natural occurrence:

It occurs between Terai to about 1200m but common in lower altitudes. It is a constituent of riverain forest with *Dalbergia sissoo* forest and *Acacia catechu*, and *Shorea-Terminalia tomentosa* forest. According to Champion and Seth (1968) it is characteristic of northern tropical moist mixed deciduous forest.

2. Morphological characteristics:

| | |
|------------------|---|
| Leaf | Leaves are bipinnate with 8-18 leaflets. New leaves appear in March-April. |
| Flowering | Flowers are greenish yellow in color. Flowering in April to May. |
| Fruit | Pods are dark red-brown when ripe. Fruiting in Oct.-Nov, remain long in tree. |

| | |
|-------------|---|
| Seed | When pods are dry, they open to release seeds. |
| Bark | Bark is dark brown to greenish black, rough with longitudinal and transverse fissures on outer surface. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Light demander |
| Frost | Frost hardy. |
| Drought | Fairly drought resistant. |
| Soil | It prefers a good wel-drained loamy soil, can grow fairly well on clayey, laterite or black cotton soil. |
| Coppice | It coppices well and produces root suckers. |
| Associates | It is often associated with <i>Dalbergia sissoo</i> , <i>Acacia catechu</i> , <i>Shorea robusta</i> , <i>Terminalia tomentosa</i> , and other <i>Abizzias</i> . |
| Browsing | Grazing and browsing sensitive, it suffers greatly from browsing. |
| Tree nature | It is a deciduous tree with wide spreading crown. |
| Root system | It has a superficial root system, it is apt to blow down by wind. Due to heavy crown, it suppresses the weeds. |

4. Natural regeneration:

| | |
|-----------------------------|---|
| Seed production | It produces seed annually and abundantly; seeds remain viability for long period of time. |
| Seed dispersal | Seeds are dispersed by wind. |
| Germination | Seeds are extensively damaged by insects, so natural regeneration may be poor. |
| Establishment | Establishment of seedling is high on well-drained, loamy and moist soils. |
| Coppice/root suckers | Natural regeneration also takes place from coppice or root suckers. |

5. Artificial regeneration:

| | | |
|-------------------------------------|---|---|
| Preferred propagⁿ | Direct sowing, entire planting, stump planting, ball of earth, cutting. | |
| Seed collection time | Seeds are collected between Nov.-January. | |
| No. of seed kg⁻¹ | 5000-10000 seeds kg ⁻¹ , 880 pods kg ⁻¹ which give about 300gm of seed. | |
| Seed extraction | Pods are dried in the sun for a few days until they open; seed extraction is done by hand. | |
| Seed storage method | Orthodox seed, put thoroughly dried seed in the polythene bags, seal tightly and keep in a cool place; germination improves after storage of 2-4 years. | |
| Viability of seed | Viability of stored seed is about 30 years. | |
| Seed treatment | Seed is scarified or treated with hot water before sowing. | |
| Seed sowing time | Above 1000m: Aug.-Sep, below 1000m: February. | |
| Duration of germination | For unscarified seed: seed germinates well in 3-4 days; seed treated with hot water germinates in 6-12 days. | |
| Germination (%) | 50-60% from the fresh seed, germination is epigeous. | |
| Nursery Period | Seedling | <1000m: seedling obtain after 4-5 months, >1000m: 9-12 months |
| | Stump | For stump, plants should be raised in beds for 12-15 months. |
| Best planting size | Stump: 8-13mm thick at root collar, 4cm shoot length and 20-25cm root. | |

6. Diseases, pests and parasites of Kalo Siris:

Several insects of the order *Coleoptera*, *Lepidoptera*, and *Hemiptera* attack the *Albizia lebbek*. *Ravenelia sessilis* attacks leaves and pods of this tree.

7. Wood properties:

| | |
|----------------------------|--|
| Wood color | Sapwood is white or yellowish white, heartwood is dark brown with black streaks, and is very decorative |
| Weight | Wood weighs about 680 kgm ⁻³ at 12% moisture content, and sp.gr.is 0.61, wood is light. |
| Hardness | Sapwood is soft while heartwood is hard. |
| Working quality | It difficult to saw & machine because of broadly interlocked nature of grain. It takes a good polish. |
| Strength | It is strong wood. |
| Calorific value | Calorific value is about 27000 KJkg ⁻¹ . |
| Durability | Sap wood is perishable so it should be removed as soon as possible; but heart wood is durable even in exposed situation. |
| Seasoning | Timber is moderately refractory to seasoning with tendency to end spitting & surface cracking. |
| Porous | Diffuse porous growth ring is distinct to indistinct, pores are large to very large, clearly visible to eye. |
| Texture & grain | Coarse and even texture with straight to somewhat wavy or slightly interlocked grain. |
| Other | The wood is resistant to termites. |

8. Uses:

| | |
|-------------------------|--|
| Timber | It is used for building, furniture, paraquet flooring & decorative articles, carts, agricultural implements and rice pounders. |
| Fuel wood | It is not a good fuel wood; burns slowly; smoke irritates the eyes. |
| Fodder | Leaves are a good fodder with 17% to 26% crude protein content, are nutritious and palatable. |
| Edible food | Seed leaves give 39.5% crude protein. |
| Tannin | The bark yields (7 to 11%) tannin. |
| Gum and resin | The tree also produces gum. |
| Ecological value | It is frequently planted on the poor sites and for erosion control. It is used for afforestation and is grown as a shade tree in tea gardens. It is planted along roadsides and in gardens as an avenue. |
| Medicinal value | The root bark and root gum are used as dental powder for strengthening the gums. The plants have antiseptic, anti-dysenteric and anti-tubercular properties. |
| Paper & Pulp | The wood gives 50.3% yield of bleached pulp by sulphate method. Pulp is suitable for writing and printing paper.. |

9. Agroforestry application: Due to its high quality fodder, it is widely used in Silviculture systems. Due to its shallow and lateral rooting habit, it is not suggested to grow in cultivated fields. (Hocking, 1993)

10. Silvicultural systems: Since it is generally found in mixed crop, it is worked under simple coppice, coppice with reserves or selection system. (Parkash,1991)

11. Royalty rate: NRs. 100/cu.ft. for round timber at stump site.(Forest rules,1995)

12. Marketing price: NRs.120/cu.ft. Round timber and NRs. 220/cu.ft. for sawn timber at Sirha district.(1997)

(7)

| | |
|-------------------------------|---------------------------|
| Local name: Seto siris | |
| <i>Albizzia procera</i> | Family: Mimosaceae |

1. Natural occurrence:

It occurs between Terai-1350m. According to Champion and Seth (1968), it is found in northern tropical moist mixed deciduous forest.

2.Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaf-rachis is glabrescent, pinnae 4-12, bipinnately compound leaf. |
| Flower | Flowers are yellowish white; sessile; flowers appear in June -August. |
| Fruit | Pods are thin, strap-shaped and glabrous. A dry pod contains several seeds. Fruiting is in cold season. |
| Seed | 6-12 seeds in each pod, which are flat, hard, smooth typical of legumes. |
| Bark | Bark is smooth and yellowish or greenish-white. |

3. Silvicultural characteristics:

| | |
|------------------------------|---|
| Light | Light demander, it can not tolerate suppression; it can withstand moderate shade in early stage but not later. |
| Frost | Frost tender. |
| Drought | Fairly drought resistant. |
| Soil | Well-drained alluvial and sandy loam soils are the best for its growth. It prefers moist alluvial sites and swampy places, often near watercourses. |
| Coppice | Coppice is exceedingly well. It produces root suckers. |
| Associates | It is often associated with <i>Albizzia lebeck</i> . |
| Grazing &browsing | Leaves are palatable, so seedlings are seriously damaged by grazing and browsing animals. |
| Tree nature | It is a large deciduous tree, 18-24m in height and 1.8m and over in girth. Tree is particularly common in low lying moist savannahs. |
| Other | It is a very sensitive to grass competition. Branches are liable to be broken by strong winds. Plants often die back after planting. It is a multipurpose tree providing better timber, fuel wood and fodder. |

4. Natural regeneration:

| | |
|----------------------------------|--|
| Seed production | Seed production takes place annually. |
| Seed dispersal | Seeds are dispersed by wind, partly by water. |
| Seed germinatⁿ | Germination takes place readily if sufficient moisture is available. |
| Establishment | Establishment of seedling is high on alluvial soil near river. |
| Coppice | Natural regeneration also takes place by coppice. |

5. Artificial regeneration:

| | |
|-------------------------------------|--|
| Preferred propagⁿ | Direct sowing, entire planting, stump planting. |
| Seed collection time | Seed ripens between December-January. |
| No. of seed kg⁻¹ | 18,000-24,000 seeds kg ⁻¹ . |
| Seed extraction | Pods are dried in the sun for few days until they open; seed extraction is done by hand. |
| Seed storage method | Orthodox seed; put thoroughly dried seed in a polythene bag, seal tightly and keep in a cool place. |
| Viability of seed | It retains viability about 15 months. |
| pre-sowing seed treatment | Seed is manually scarified or treated with hot water and allowed to cool for 24 hours or soaking in cold water for 12 hours. |
| Seed sowing time | Above 1000m: August-September, below 1000m: March. |
| Duration of germination | For unscarified seed: seed germinates well in 3-4 days, seed treated with hot water: germinates in 6-12 days. |
| Germination (%) | 80-90%, germination is epigeal. |
| Nursery period | Seedling |
| | Stump |
| Best planting size | Seedling should be 20-30cm tall for planting out at the beginning of the monsoon. |
| Others | Roots of Albizias are symbiotic with <i>Rhizobium</i> bacteria, which form nodules and fix atmospheric N ₂ . |

6. Diseases, pests and parasites of Seto Siris:

i) Young trees are seriously affected by *Fusarium solani*. ii) *Ganoderma applanatum* causes heart rot and white sap. iii) Several insects of the orders *Coleoptera*, *Lepidoptera* and *Hemiptera* attack the tree.

7. Wood properties:

| | |
|----------------------------|--|
| Weight | Sapwood weighs about 460kgm ⁻³ & heartwood weighs about 640kgm ⁻³ at 12% moisture content. Specific gravity is about 0.6. |
| Wood color | Sapwood is white color and heartwood is light or dark brown. |
| Working quality | Due to interlocked fibres, siris timbers are not always easy to saw and machine, they take an excellent polish. |
| Strength | It is a strong wood. |
| Calorific value | It has a calorific value of 26,800 KJkg ⁻¹ . |
| Durability | Sapwood is perishable so it should be removed as soon as possible. Heartwood is durable even in exposed situations. |
| Preservative treat. | Timber is good for preservative treatment. |
| Seasoning | Albizias are moderately refractory wood to season; they have tendency to end splitting and some surface cracks. If properly stacked and well protected against rapid drying, they season well. |
| Texture & grain | Lustrous, coarse and even textured with straight to somewhat wavy or interlocked grain. |
| Porous | Diffuse porous wood. |
| Other | The wood is resistant to termites. |

8. Uses:

| | |
|-------------------------|--|
| Timber | It is largely used for sugarcane crushers, rice-pounders, wheels, agricultural implements, bridges and house posts. It is well known for parquet, strip flooring, paneling, and railway carriage work. |
| Fuel wood | Fuel wood produces irritant smoke and makes good charcoal. |
| Fodder | Leaves are a fairly good cattle fodder, containing about 17% crude protein. |
| Edible food | Analysis of seed gives 30.5% protein. |
| Tannin | Bark contains 12-17% tannin & leaf contains 3.2% tannin. |
| Gum and resin | The tree also produces gum. |
| Ecological value | It is a leguminous plant, so it fixes atmospheric N ₂ . It is used for afforestation and also grown as a shade tree in tea-gardens. |
| Medicinal value | The plant is used for stomach and intestinal diseases and during pregnancy. All parts of plant show anti-cancer activity. The decoction of bark is given in rheumatism and haemorrhage. Bark is used as fish poison. |
| Paper & Pulp | The wood gives 50.3% yield of bleached pulp by sulphate method. Pulp is suitable for writing and printing paper. |

9. Agroforestry application: Same as Kalo siris.

10. Silvicultural system: It is worked on coppice system, with a rotation of 20-40 years. In some states of India, it is worked on clear felling system on a 60-year rotation. (Parkash, 1991)

(8)

| | |
|-------------------------------|-----------------------------|
| Local name: Kaju | Eng name: Cashew nut |
| <i>Anacardium occidentale</i> | Anacardiaceae |

1. Natural occurrence:

It is native to tropical America and naturalized in warmer parts of Terai and India. It can be grown under a wide range of climatic and soil conditions; altitudes from sea level to 1000m, and annual rainfall varies from 500 to 3500mm.(Hocking, 1993)

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are ovate or obovate oblong, hard, and glabrous. |
| Flower | Flowers are small, yellow with pink strips, terminal panicles, with both staminate and hermaphrodite flowers. |
| Fruit | Fruits are kidney-shaped nuts, fleshy receptacle. |

3. Silvicultural characteristics:

| | |
|---------------------------|--|
| Frost | Frost tender. |
| Light | Light demander. |
| Soil | It grows best on deep loam. It is not very tolerant of saline and clayey soil. It grows well in shallow and impervious soil. It can grow satisfactorily even on relatively infertile acidic soil with little rainfall, unsuitable for most other crops, but it bears no fruit in these harsh conditions. (Hocking, 1993) |
| Graze & browse | It is not browsed by cattle. |
| Drought | Drought resistant. |

| | |
|----------------------|--|
| Tree nature | It is a small, spreading, evergreen tree, sometimes reaching a height of 12m. |
| Wind firmness | It is highly resistant to strong winds since Roots system is strong and penetrating, both top and lateral roots. (Von Maydel, 1986). |

4. Artificial regeneration:

| | |
|---|---|
| Preferred propagation | Entire planting, direct sowing, air layering, grafting, budding, inarching. |
| Seed collection time | Seeds are collected between March and June. |
| No. of seed kg⁻¹ | 145-165 seeds kg ⁻¹ . |
| Viability of seed | Seeds remain viable for 8 months after collection. |
| Seed sowing time | May and June. |
| Duratⁿ of germination | Germination is completed in about 20 days. |
| Germination (%) | Germination can obtain 80-100%, if seeds are stored in tin receptacles. Seeds store in airtight containers give 90-95% germination. |

5. Wood properties:

| | |
|-------------------|--|
| Colour | Wood is reddish brown. |
| Hardness | Wood is fairly hard. |
| Elasticity | Wood is heavy wt. 608kgm ⁻³ . |

6. Uses:

| | |
|-------------------------|---|
| Timber | It is termite resistant and is used for very good timber for local constructions, packing cases, country boats and tea chests. |
| Fuel wood | It is also used as fuel wood. |
| Edible food | Cashew kernel is eaten as a dessert and is an important item of confectionery. It is used raw, roasted or fried. |
| Tannin | Testa is a good source of condensed type of tannins (24-26%) & bark contains 9% tannins. |
| Ecological value | Cashew trees are used for afforestation purposes. Site selection for afforestation is the barren, denuded areas, which are usually unsuitable for raising any other timber species. |

Other uses of *Anacardium occidenatalae*:

Kernels: Kernels yield an oil (40-53%), which is said to have a nutritive value equal to almond oil and superior to olive oil. It is a good medicinal and chemical antidote for irritant poisons.

Cashew apple: It looks like an over-ripe apple, has a fibrous flesh and nutritious and juicy. It is edible and yields delicious beverages. The fresh fruit is also used in the vinegar industry. Its juice is used as diuretic and is useful for kidney troubles and in advanced cases of cholera.

Cashewnut shell: It yields a gum, which is acidic in nature, are useful in cosmetic, pharmaceutical, textile, paper and ink- industries.

Cashewnut shell liquid: Cashewnut shell yields a vesicant juice, known in trade as cashew nut shell liquid (CNSL), which is a rich source of naturally occurring phenols and raw materials for the manufacture of numerous industrial products like plywood adhesive, thermoplastic and thermosetting resins, plastics, lubricants etc.

Cashewnut husk: It contains 24-26% condensed type of tannins.

Cashewnut bark: The bark exudes a pale yellow to reddish gum, which possesses insecticidal properties, is useful in bookbinding and other pharmaceuticals.

Cashewnut buds and young leaves: are used as vegetables. They are also a source of green manuring.

Cashewnut leaves: Leaves contain 23% tannin.

7. Agroforestry applications: In homestead garden tree, it is grown in combination with a no. of other trees and shrubs. In regular plantations, intercropping with arable crop (taungya) is practiced for 7-8 years, till the tree canopies close up. (Hocking, 1993)

8. Silvicultural system: Trees are rarely felled except when they become too old (over 40 years). Since it occurs in mixed forest, it is carried out under selection system. . (Hocking, 1993)

(9)

| | |
|-----------------------------|-------------------------------|
| Local name: Banjhi | English name: Axlewood |
| <i>Anogeissus latifolia</i> | Combretaceae |

1. Natural occurrence: It occurs in Nepal from the Terai to about 1700m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are elliptic-obtuse, entire, rounded at both ends, reddish when they first appear, again turning red before falling off. |
| Flower | Flowers are minute, greenish, and yellow in globose heads on short axillary peduncles. |
| Fruit | Fruits are small, two winged, yellowish brown or reddish brown. |
| Seed | Fruit contains single seed. |
| Bark | Bark is pale yellowish, or pinkish brown, spotted all over with pale greenish or yellow depressions, exfoliating in thin rounded flakes. |

3. Silvicultural characteristics:

| | |
|--------------------------------|---|
| Light | It is a strong light demander. |
| Frost | It is somewhat frost resistant. |
| Drought | Fruits are small, two-winged yellowish brown or reddish brown. |
| Fire | Fruits contain single seed. |
| Soil | The tree grows on a variety of geological formations including sandstone, limestone, and metamorphic rocks. It grows best on alluvial soils. It avoids swampy and badly drained soils and requires good drainage. |
| Coppice | The tree coppices and pollards well in most localities. Coppicing in the rainy seasons is unsuccessful. The best season for pollarding is not later than March. It produces root suckers. |
| Associates | It is commonly associated with sal forests. |
| Graze & browse | It is rather unpalatable and not greatly damaged by browsing. |
| Tree nature | It is a large, deciduous tree, with a drooping branches |
| Meteor.condⁿ | In its natural habitat, Max.shade Temp. is (38-47 ⁰ C), Min. (0-15 ⁰ C), annual rain fall varies from (625-2250 mm). |

4. Artificial regeneration:

| | |
|---------------------------------------|--|
| Preferred propagatⁿ | Direct sowing, entire planting, stump planting. |
| Seed collection time | Seeds ripen between Dec. to March. |
| No. of seed kg⁻¹ | 100,000 to 120,000 seeds kg ⁻¹ . |
| Seed storage method | Orthodox seed. The dried seed should be stored in sealed plastic bags. |
| Viability of seed | Viability of seed is about 15 months. |
| Seed treatment | Seed should be soaked in water. |
| Seed sowing time | Seed should be sown in June. |
| Duration of germⁿ | Germination may take up to six weeks. |
| Germination percent | 25% from the fresh seed. |
| Nursery period | Seedling Seedlings need about 12 months in the nursery. |
| | Stump For stumps, seedlings need more than 12 months. |

5. Wood properties:

| | |
|-------------------------------|---|
| Wood Color | Sapwood: is wide and yellowish grey in young trees and of a uniform yellowish olive grey color in mature trees. Heartwood: is purplish brown. |
| Hardness | Wood is very tough and hard. |
| Working Quality | Wood is heavy to very heavy (Sp.gr. is 0.944 kgm ⁻³) |
| Strength | Timber is strong and elastic. |
| Calorific value | Sapwood: 4986 calories: Heartwood: 4909 calories. |
| Durability | The timber is fairly durable if not exposed to wet conditions. It is attacked by white ants. |
| Preservative treatment | The heartwood is very refractory to treatment, penetration of preservative being practically nil from side or end. |
| Seasoning | Timber is difficult to season. In kiln-seasonings and even in mild air-drying, it has a tendency to develop surface cracks. |

6. Uses:

| | |
|-------------------------|--|
| Timber | Timber is used for building, houses, for furniture, agricultural implements and veneers. |
| Fuel wood | The timber makes an excellent charcoal and fuel. |
| Fodder | Its leaves are used as fodder. |
| Tannin | Bark contains 12-18% tannins. Young red leaves and shoots contain up to 50% tannins where as mature leaves contain 32% tannin. |
| Gum and resin | The tree is the main source of gum. The exudation of gum is more in dry years. Gum is used in calico printing and in confectionery. It is used as an emulsifier, stabilizer and thickener in ceramics, foods and pharmaceuticals. It can be used in hair setting agent. It is an efficient binder. |
| Ecological value | Bark is bitter and astringent. It is practically useful in chronic diarrhoea. |
| Medicinal value | Bark is bitter and astringent. It is practically useful in chronic diarrhoea. |
| Paper and pulp | Wood is suitable for making paper. |

(10)

Local name: Kadam

| | |
|--------------------------------|-------------------|
| <i>Anthocephalus chinensis</i> | Family: Rubiaceae |
|--------------------------------|-------------------|

1. Natural occurrence: Terai to 1000m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are coriaceous, broadly ovate and elliptic-oblong. |
| Flower | Flowers are yellow in color. |
| Fruit | Fruit is fleshy & orange in color, ripening yellow with a single kernel. |
| Seed | Seeds are small, muriculate. |
| Bark | Bark is grey and fissured. |

3. Silvicultural characteristics:

| | |
|--------------------------|--|
| Light | Light demander but tolerate some shade in early life. |
| Frost | Frost tender |
| Drought | Drought sensitive, i.e, young seedlings are sensitive to drought, but liable to damping-off with an excess of moisture in the soil. |
| Soil | It grows best on deep alluvial soil with a good water supply. The growth is poor on stiff, badly drained soil. |
| Coppice | It coppices well. |
| Associates | It is an associate of Sal forest. |
| Browsing | Grazing and browsing sensitive, very liable to damage by browsing. |
| Tree nature | A large deciduous tree, occasionally buttressed, up to 37.5m in height and 2.4m in girth, with a clear bole and horizontal branches. Tree is frequently found in moist, warm type of deciduous and evergreen forests. It is a shade tree plantation throughout the country |
| Meteor. Condition | In its natural habitat, absolute Max.Temp is (32-43.3)0C and absolute Min.Temp (3-15.5) ⁰ C, the normal rainfall varies from 150-500cm. |

4. Natural regeneration:

| | |
|-------------------------|---|
| Seed production | Seeds are produced annually and abundantly. |
| Seed dispersal | Seeds are dispersed by animals, birds, and also by water. |
| Seed germination | The seedlings appear in dense masses in the rainy season. |
| Establishment | If seedlings protected from grazing, they establish themselves. |

5. Artificial regeneration:

| | |
|-------------------------------------|---|
| Preferred propagation | Entire planting, stump planting. |
| Seed collection time | Fruits ripen from Nov-Feb. |
| No. of seed kg⁻¹ | Very small seed, 900,000 to 2700,000 seeds kg ⁻¹ . |
| Seed extraction | Seeds extracted by macerating the fruit in water, then they are dried in the sun. |
| Seed storage method | Seed can be stored for a year in a container. |
| Viability of seed | Viability of stored seed is about 1 year. |
| Seed treatment | Does not require. |
| Seed sowing time | Seed should be sown in Feb-Mar. for July planting. |
| Duration of germⁿ | Germination takes place in three weeks. |
| Germination percent | Germination is 80% from fresh seed. |

| | | |
|---------------------------|-----------------|--|
| Nursery period | Seedling | 4 -5 months. |
| | Stump | 1-year-old seedling is made into stumps. |
| Best planting size | | Stump: 8-13mm thick at root collar, 4cm shoot length & 20-25 cm root. |
| Other | | Seedlings are sensitive to the drought and excessive moisture. |

6. Diseases, pests and parasites of Kadam:

Dendrophthoe falcata attack on this tree. The larvae and beetles of several insects and pests bore the wood. Some larvae defoliate the tree.

7. Wood properties:

| | |
|----------------------------|--|
| Wood color | Wood is light colored, white or yellowish white. The sapwood and heartwood are not distinguishable. |
| Weight | Wood is light or moderately heavy (600kgm^{-3}) and sp.gr. is 0.35. |
| Hardness | Wood is lustrous, soft or moderately hard. |
| Working quality | It is easy to work to a smooth finish. |
| Strength | It is moderately strong. |
| Calorific value | Its fuel wood yields about $23,000\text{KJkg}^{-1}$ when burnt. |
| Durability | It is not durable. Graveyard test have shown that natural durability of timber is 23 months but treated timber is durable. |
| Preservative treat. | Timber can be easily treated. |
| Seasoning | Timber is non-refractory to seasoning. |
| Rate of tree growth | The tree shows 2-8 rings per 2.5cm, the annual growth increment varying between 1.96 and 7.98cm. It is one of the fast growing tree species. |

8. Uses:

| | |
|-------------------------|---|
| Timber | The timber is used for excellent veneers, matchboxes, match splinters, packing cases, tea-boxes, and light constructional work. |
| Fuel wood | It is a good fuel wood, burns slowly, and produces occasionally crackling sound. |
| Fodder | Leaves are fed to cattle. Young leaves are slightly aromatic with unpleasant taste while older ones are odourless and sour. |
| Edible food | Fruits are edible and flowers are used as vegetable. |
| Tannin | The bark also contains tannin (4.61%). |
| Medicinal value | The stem bark is reported to possess tonic, astringent, febrifugal and anti-diuretic properties and is given in coughs. The juice of bark is treated for the inflammation of the eye. |
| Paper & pulp | The bark fibre is useful for the cordage. The wood can be pulped, gives a pulp of better color for writing, printing and wrapping paper. The cold Caustic soda process yields pulp (70-89%) suitable for newsprint. It is suitable for making Pencils of high & medium qualities. |

9. Tending operation: Being a fast-growing species, establishes itself soon. Hence, it does not need much of weeding and cleaning both in natural forests and in plantations.

10. Silvicultural system: It is found in mixed forests, worked under selection system, on a felling cycle with a prescribed exploitable diameter/ girth. (Parkash, 1991).

11. Royalty rate: NRs. 40/cu.ft. for round logs at the stump sites. (Forest rules, 1995).

12. Marketing price: NRs. 120/cu.ft. for round logs and NRs. 225/cu.ft. for sawn timber at Kabilbastu District, Nepal (1997).

(11)

| | |
|---------------------------|--------------------------|
| Local name: Neem | Eng name: Nim |
| <i>Azadirachta indica</i> | Family: Meliaceae |

1. Natural occurrence:

It occurs between Terai to about 900m. According to Champion and Seth (1968) it is characteristics of Northern tropical wet evergreen forest.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are imparipinnate, alternate and leaflets 8-19. |
| Flower | Flowers are white or pale-yellow, small, scented, numerous & slender. |
| Fruit | Fruits are globose with few seeds. |
| Bark | Bark is grey or dark grey, rough, reddish brown inside. |

3. Silvicultural characteristics:

| | |
|-------------------------|---|
| Light | Light demander but tolerate heavy shade during the early years. |
| Frost | Very sensitive to frost esp. In seedlings and sapling stage. |
| Drought | Drought hardy. |
| Fire | Fire tender species. |
| Soil | It grows on almost all kinds of soils including clayey, saline & alkaline soils, but does not well on black cotton soil. It thrives better than most other trees on dry, stony, shallow soil with a waterless sub-soil or in places where there is a hard, calcareous, or clay pan near the soil. It does not tolerate inundation. Dislike excessive moisture and can't stand water logging |
| Coppice | It coppices and produces root suckers and withstands pollarding well. |
| Browsing | Damage by browsing animals. |
| Tree nature | A large evergreen and multipurpose tree, with a straight bole, and long spreading branches forming a broad crown. |
| Meteo. condition | In its natural habitat; absolute Max.Temp: 49 ⁰ C, the normal rainfall varies from 45-112cm |

4. Artificial Regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Direct sowing, stump planting, entire planting. |
| seed collectⁿ time | Seed ripens in June to July. |
| No. of seed kg⁻¹ | 3000-6500 depulped seeds kg ⁻¹ . |
| Seed extraction | The pulp should be removed from the fruit before sowing. |

| | | |
|---|--|--|
| Viability of seed | Viability of seed is very short. | |
| Seed treatment | Does not require. | |
| Seed sowing time | Seed should be sown immediately after collection. | |
| Duration of germinatⁿ | Germination occurs within a week or two. | |
| Germination percent | 80%, germination is hypogeal. | |
| Nursery period | Seedling | 4 -5 months |
| | Stump | 1-year-old seedlings are made into stumps. |
| Best planting size | Stump: 8-13mm thick at root collar, 4cm shoot length and 20-25cm root | |

5. Main diseases of neem are:

A. Nursery diseases :(i.) Damping off-caused by *fusarium oxysporum*.

B.Foliage Diseases :(i) **Rhizoctonia leaf web blight:** caused by *Rhizoctonia solani* **ii. Colletotrichum leaf spot and blight:** caused by *Callecotrichum gloeosporioides*. **iii.Alternaria leaf spot and blight:** caused by *Alternaria alternata*.

C.Root rots: caused by *Ganoderma lucidum*

D.Pink diseases: caused by *Corticium salmonicolor*.

6. Wood properties:

| | |
|----------------------------|---|
| Wood color | Its timber is decorative. Sapwood is greyish white, and heartwood is red. |
| Weight | The wood weighs between 560-850kgm ⁻³ . It is moderately heavy wood. |
| Hardness | Heartwood is very hard. |
| Working quality | It is easy to saw and work by hand or machines, does not take polish well. |
| Calorific value | Wood has high calorific value of about 29,000kJkg ⁻¹ . |
| Durability | Its timber is durable, even in open situations. |
| Seasoning | Timber is moderately refractory and seasons well. |
| Rate of tree growth | The rate of growth is fairly good, showing five rings per 2.5cm, giving a mean annual girth increment of 3.2cm. |

7. Uses:

| | |
|-------------------------|--|
| Timber | The timber is used for furniture, carts, packing-cases, ship and boat building, agricultural implements etc. |
| Fuel wood | It is a good fuel wood except for producing acrid and irritating smoke. |
| Fodder | A good fodder tree; crude protein content is 12-18%, leaves are placed in cloths, book and paper to repel insects. |
| Edible food | Pulp of the fruit is eaten. |
| Tannin | Heartwood contains tannin, stem bark contains 12-16% tannin, and bark also yields red dye. |
| Gum & resin | The bark exudes gum, which is stimulant, demulcent and tonic and is useful in catarrhal and other affections. The gum possesses adhesive properties; gum is used by silk-dyers in the preparation of colors. |
| Ecological value | The trees increase the soil fertility and water holding capacity. It has unique properties of calcium-mining which changes the acidic soil into the neutral. The trees has been used for the afforestation of dry localities, ravine and for checking for soil erosion as wind breaks. It is very useful roadside avenue tree in dry and moderately dry climate and an excellent shade tree during the hot season. |

| | |
|------------------------|--|
| Medicinal value | Neem extracts possesses anti-diabetic, anti-bacterial and anti-viral properties, have been successfully used in case of stomach worms and ulcers. Bark is useful in malarial fever and cutaneous diseases. Seeds contain the azadirachtin which inhibits the feeding of locust. Kernel oil are used in cosmetic preparation such as creams, hair -lotions, medicated-soaps, washing-soaps and tooth-pastes and antimicrobial activity. Twigs are traditionally used as tooth brushes. The seed produces an oil used for soap manufacture and in pharmaceuticals. |
| Others | The oil cake obtained from the seeds and the fallen leaves make good manure. |

(12)

| | |
|----------------------------|------------------------------|
| Local name: Simal | Eng name: Silk cotton |
| <i>Bombax ceiba</i> | Family: Bombacaceae |

1. Natural occurrence:

Terai to 1500m, the trees is very common in the dry as well as moist mixed deciduous forests. It is found in the mixed evergreen forest as well.

2. Morphological character:

| | |
|------------------|---|
| Leaf | Alternate, digitate with 5 or 7 leaflets. |
| Flowering | Flowers appear when tree is leafless. Flowering is January–March. |
| Fruiting | A hard woody capsule, 10cm long. Fruiting in April–May |
| Seed | Seeds are embedded in dense wools. |
| Bark | Bark is pale ash to silver grey, smooth in early years, later became rough with cracks. |

3. Silvicultural character:

| | |
|---------------------------------|--|
| Light | Strong light demander. |
| Frost | Frost tender. |
| Drought | drought resistant |
| Fire | Seedling severely affected but pole thick bark resists to damage by fire. |
| Soil | Grow well on deep, sandy, alluvial soils. Poor growth on stiff clays & badly drained soils. |
| Coppice | Coppices well in early stage but not later. Also produce root suckers abundant. |
| Associates | Sal is the major constituents. Some other associates are: <i>Acacia catechu</i> , <i>Adina corndifolia</i> , <i>Albizia procera</i> , <i>Dillenia pentagyna</i> , <i>Gmelina arborea</i> , <i>Holoptelia integrifolia</i> <i>Mallotus philippinensis</i> . |
| Browsing | Sensitive, it causes considerable damage to seedling. |
| Tree nature | The tree grows sporadically in the mixed deciduous forest & alluvial – Savannah type forest, tending to be gregarious nears the riverbanks. |
| Meteorological condition | Absolute Max. Temp (37.5–50) ⁰ C, Absolute Min. Temp (-2.5 to 17.5) ⁰ C, Average annual rainfall (50 -460 cm or more.) |
| Other | Shows die–back phenomenon as sal; it is a fast growing tree; buttress formation; deciduous tree; branches horizontal. |

4. Natural regeneration:

| | |
|----------------------------------|--|
| Seed production | Good seed year comes annually. |
| Seed dispersal | The seed is dispersed by wind |
| Seed germinatⁿ | Seedlings come up in clumps of dense thorny shrubs, and grasses where they get protection against grazing . They colonize abandoned cultivation. |
| Coppice/ root suckers | Natural regeneration may occur from coppice or root sucker. |

5. Artificial regeneration:

| | | |
|-------------------------------------|---|------------------------|
| Preferred propagⁿ | Direct sowing, entire planting, stump planting, branch cutting but survival rate is poor. | |
| Seed collection time | April to may. | |
| No. of seed kg⁻¹ | 100 dry pods= 2kg equivalent to 600gm seed= 21,000-45,000 seed kg ⁻¹ . | |
| Seed extraction | Pods should be dried thoroughly in the sun. | |
| Seed storage | Orthodox seed, store in sealed container, plastic bag. | |
| Viability of seed | 1 year. | |
| Seed treatment | Not necessary | |
| Seed sowing time | March. | |
| Duration of germination | Germination commences within a week and is completed within about 25 days. | |
| Germination (%) | 20-80 %. | |
| Nursery | Seedling | 2-3 month |
| Period | Stump | One year old seedling. |
| Best planting size | Stump shoot: 3.8 cm, root 30cm extra shoot as well as root are are cut off and the side roots are pruned. | |
| Other | The tree has thin foliage and its power of suppressing weeds is very poor, so weeding requires after the first one or two year. | |

6. Forest diseases, pests, parasites and damages by animals:

- *Ganoderma lucidum*, a root rot fungal diseases cause severe damage in plantations.
- Standing trees may be infested by a no. of pests such as long horn beetles, defoliators , and shoot borer .
- *Tonica niviferana* , a shoot borer bores through the young shoots, often killing the tree.
- Several beetles and larvae bore the dead wood.
- **Injuries by animals**, Porcupines, rats and mice gnaw the fleshy roots of young seedlings. Bison and deer browse and trample young plants. Squirrels are very fond of flower buds.

7. Wood properties:

| | |
|------------------------|--|
| Weight | It is light in weight between 250-500kgm ⁻³ , 385kg/m ³ at 12% mc. |
| Wood color | Timber is creamy white or pale pink in color. |
| Hardness | Extremely soft wood. |
| Working quality | Moderate fissile. It is easy to saw and work. It peels well without any preliminary treatment. Due to coarse texture and prominent vessels lines , it absorbs too much paint and varnish. It glues well. |
| Strength | Its timber has very weak strength |

| | |
|-------------------------------|--|
| Calorific value | It has a fairly high calorific value: 20,500KJkg ⁻¹ . |
| Durability | Its wood is slightly durable. |
| Preservative treatment | It is very easily treatable with preservatives, penetration being complete. Treated timber is moderately durable in open but lasts longer under cover. |
| Seasoning | It is non refractory wood i.e : capable of withstand rapid seasoning . The timber may be air seasoned but kiln seasoning is preferable. |
| Others | The tree has very short rotations. |
| Growth rate | Under favorable condition, growth is rapid. It can reach a diameter of 38cm in ten year. It is a fast growing tree species. |
| Porous | Diffuse porous, growth ring is indistinct to distinct. |

8. Uses:

| | |
|-------------------------|---|
| Timber | Sapwood and heartwood are not distinguishable. The wood is extremely perishable in open condition. The timber may be used for plywood , match industry , pulp and paper etc. |
| Fuel wood | It is not a good fuel wood species. |
| Fodder | Young twigs and leaves are lopped for fodder. The seed cake is richer in protein, is an excellent cattle feed. Leaves are medium quality fodder. |
| Edible food | The tender leaves are eaten; the flower buds and fleshy calyces are eaten. The young roots are eaten either raw or roasted as sweet potato in India. |
| Tannin | Gum contains tannin; root contains 0.5% tannin; bark contains 3.01% tannin. |
| Gum and resin | The bark exudes a gum from natural wounds caused probably by decay or insects. Gum is astringent, tonic and demulcent properties and used for dysentery, influenza and menorrhagia. Gum also contains tannic acid. |
| Ecological value | It is a good habitat for vulture and hawks, bees etc. Due to high rate of depletion of Simal trees, it would be possible to extinct the vulture, hawks and so many species DOF has banned to cut this tree. |
| Medicinal value | The young fruits are used as expectorant, stimulant, and diuretic and considered in beneficial calculus affection, chronic inflammation and ulceration of bladder and kidneys. |
| Other | The floss from this tree is known as Indian kapok. The capsule of this tree is silky cotton, not very long but short or strong. A tree is full bearing produces 4.0-7.2kg clean floss, free from seeds. The floss is suitable for stuffing lifebelts and other life saving appliances besides mattresses, cushions and pillows. |

9. Tending operation:

Simal being a fast-growing species requires little weeding after the first 1 or 2 years.

10. Silvicultural system:

For plantation crops, the best silvicultural system is clear felling followed by artificial regeneration on a rotation of 25-40 years, according to site factors and the size of timber most in demand. (Parkash, 1991)

11. Royalty rate: NRs. 80/cu.ft. for round timber at the stump sites. (Forest rules, 1995).

12. Market price: NRs. 125/cu.ft. for round timber and NRs. 200/cu.ft for sawn timber at Sirha district, Nepal. (1997).

| | |
|--------------------------------|--------------------------------------|
| Local name: Raj briksha | English name: Indian Laburnum |
| <i>Cassia fistula</i> | Caesalpinaceae |

1. Natural occurrence: It is an indigenous species of Nepal, commonly occurring between Terai and 1400m elevations.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves have rachis and glandless petiole, leaflets 4-8 pairs, distinctly stalked, oblong or ovate, clothed with young, caducous, silvery & pubescence. |
| Flower | Flowers are bright yellow, in axillary, pendulous, lax racemes. |
| Fruit | Pods are cylindrical; pendulous; smooth; hard; dark brown or black. |
| Seed | Seeds are light brown, hard, smooth, shiny bi-concave, 40-100 seeds embedded in sweetish pulp. |
| Bark | Bark is grey; smooth; exfoliating in small woody scales. |

3. Silvicultural characteristics:

| | |
|---------------------------------|--|
| Light | It is light demander but withstands moderate shade. |
| Frost | Frost tender. |
| Drought | Drought resistant. |
| Soil | It grows under a very wide range of climatic and edaphic variations; and it can grow on poor; shallow soil. |
| Coppice | It coppices well. |
| Associates | It occurs frequently in Sal forests. |
| Graze & browse | Browsing sensitive. |
| Tree nature | It is a deciduous, medium sized and scattered tree. |
| Meteorological Condition | In its natural habitat, absolute Max. Temp: (35-47.5) ⁰ C, absolute Min.Temp: (0-17.5) ⁰ C, annual rainfall 450-3000mm or even more. |

4. Natural regeneration:

| | |
|---------------------------------|---|
| Seed productⁿ | Pods commence falling on the ground from April until September or even later. |
| Seed dispersal | Seed are dispersed by animals which eat the pulp and reject the seeds or swallow or pass them out. |
| Seed germination | Seeds germinate during the rains, a few lying dormant until the second or even the third rains. |
| Establishment | Seedling will establish if it protected from frost, weed growth, damping-off diseases. |
| Root sucker | Much of the natural regeneration of the forest is from root suckers esp. in hills where surface roots are liable to be exposed. |

5. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Direct sowing, nursery raised seedlings, stump planting. |
| Seed collectⁿ time | Seeds are collected from Dec-April. |
| No. of seed kg⁻¹ | 6300 seeds kg ⁻¹ . |
| Seed storage | Orthodox seed. Seeds are being collected and separated from the pods |

| | |
|---------------------------|---|
| method | and stored in calico bags for at least one year to after-ripen.. |
| Viability of seed | Seed can retain its viability for more than ten years. One year old seed germinates better than fresh seed. |
| Seed treatment | Seed should be treated with hot water. |
| Seed sowing time | Seed sown in March or April. |
| Germination (%) | 65% for two-year-old seed, down to 40% after 13 years. |
| Nursery | Seedling 3-5 month, seedlings are ready for monsoon planting. |
| Period | Stump Stump should be prepared from one-year-old seedlings. |
| Best planting size | 15-30cm tall seedlings are necessary. |

6. Diseases, pests and parasites of Rajbriksha:

- i). **Brown spongy heart-rot:** Caused by *Trametes incerta*.
- ii). **Angiospermic parasites:** *Dendrophthoe falcata* is also attacked on this plant.

7. Wood properties:

| | |
|-------------------------|---|
| Wood color | Sapwood is wide, white or pale, dirty white in colour. Heartwood is greyish or yellowish red to brick red or light reddish brown. |
| Weight | Wood is very heavy. It weighs about 970 kgm ⁻³ . Average wt. 700kg/cu.ft. |
| Working quality | It is difficult to work, but seasoned wood presents no difficulty. It finishes to a smooth surface and polishes well. |
| Strength | Timber is very strong. |
| Durability | Timber is durable even in contact with water. The heartwood is very durable in the open and under cover; is considered more durable than Sal. Sap wood is not liable to fungal attacks, but liable to attack by borers. |
| Preserva. treat. | Sapwood can be protected from borer attack by antiseptic treatment. |
| Seasoning | Highly refractory wood for seasoning i.e, very difficult to season. Air seasoning of wood may result severe surface cracking, cupping and splitting. By girdling of trees, surface cracking and end-splitting may reduce. |
| Growth rate | It is a slow growing species for the first 2 to 3 years, after which the growth is more rapid. |

8. Uses:

| | |
|-------------------------|---|
| Timber | Timber is suitable for house-posts, bridge posts, electric poles, agricultural implements, excellent tool handles, high class furniture, boat building etc. |
| Fuel wood | It is an excellent fuel and yields first class charcoal. |
| Fodder | Leaves are used as fodder for livestock. |
| Edible food | Leaves are eaten. |
| Tannin | Bark yields (3-8) % tannin. Twig bark gives a much better colour than the bole bark, it is used for tanning heavy leather. |
| Gum and resin | Seed yields a dark coloured gum which have possibility as a source of industrial gum. Seeds also yield oil (3%). |
| Ecological value | Tree is planted for ornament in gardens. |
| Paper and pulp | Wood may be suitable for soft paper. |
| Others | Leaves are also a source of green manure. |

Medicinal value of Rajbriksha:

- **Bark:** Possesses tonic and anti-dysentric properties. Powder or decoction of bark is used in leprosy, jaundice syphilis and heart diseases.
- **Pods:** The ethanolic (50%) extract of the pods showed anti-fertility activity in the female. It is given in disorders of liver and in biliousness, acts as a tonic.
- **Fruit pulp and stem bark:** are used in ayurvedic preparations for the treatment of blood impurities.
- **Crushed seeds and leaves:** are employed for making a *Sherbet*, which are useful in jaundice, biliousness, skin diseases and swollen throat.
- **The whole seed powder:** cures intestinal amoebiasis.
- **Root and its bark:** Possess astringent, tonic, febrifugal and purgative properties. The aqueous extract of the root bark exhibits anti-inflammatory activity.
- **A decoction of flower:** is giving in stomach troubles.

9. Tending operation: Nursery-raised seedlings are more sensitive to weeds than drought; therefore weeding is more important than watering.

10. Silviculture systems: In fuel forests, mixed with other species, it is usually worked under simple coppice system on a rotation of 30-40 years. (Parkash, 1991)

11. Roylty rate: NRs. 2/kg for dry seed (Forests rules, 1995)

12. Market price: NRs. 30/kg for seed at major road heads of Nepal. (1997).

(14)

| | |
|-------------------------|--------------------------|
| Local name:Tooni | |
| <i>Cedrella toona</i> | Family: Meliaceae |

1. Natural occurrence: It grows from Terai to 1700m. According to Champion and Seth (1968), it is found in tropical moist mixed deciduous forest. It also occurs in the lower valleys of Himalayas.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are paripinnate, leaflets opposite: 5-10 pairs and leafless during Jan-Feb. |
| Flower | Flowers small, white, honey-scented, in much branched. Flowering: Mar-April. |
| Fruit | Fruits are elongated. Fruiting during June-July. |
| Seed | Seeds with membranous wings at both ends. |
| Bark | Thin dark-grey bark which is smooth up to middle age. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Moderately light demander. |
| Frost | Frost hardy species. |
| Drought | Drought sensitive. |
| Fire | Fire sensitive. |
| Soil | It grows best on well-drained, deep, rich, loamy soil. On dry soil, growth is stunted. |
| Coppice | It coppices well. |
| Associates | At lower altitude, it is a common associate of Sal forest and <i>Schima – Castanopsis forest</i> at higher altitude. |
| Browsing | Seedlings are liable to damage by browsing. |
| Tree nature | It is a large deciduous tree with a dense spreading crown. |

4. Natural regeneration:

| | |
|---------------------------------|---|
| Seed productⁿ | Seeds ripen just before monsoon. |
| Seed dispersal | Seed dispersal takes place by wind and water. |
| Seed germin^t | Germination better after pre-monsoon rain or during the early monsoon. |
| Seed Establis. | Germination are established good on deep, sandy, loam soil, near river and abandoned cultivated land. |

5. Artificial regeneration:

| | | |
|--|--|---|
| Preferred propagⁿ | Direct sowing, Entire planting, Stump planting. | |
| Seed collection time | Seeds ripen between April and June. Capsule collected from the tree before they open. | |
| No. of seed kg⁻¹ | 125,000-589,000 seeds kg ⁻¹ . Average being about 350,000 seeds kg ⁻¹ . | |
| Seed extraction | After collection, the capsules are dried in the sun until they open, then beaten with stick to separate the seeds. Seeds are cleaned by winnowing. | |
| Viability of seed | Viability of seed remains for 3-12 months. | |
| Seed treatment | Seeds should be soaked in water for 48 hours before sowing. | |
| Seed sowing time | Seeds should be sown within 3 months after collection. Seeds should be sown in beds or trays under shade. | |
| Duratⁿ of germinatⁿ | Germination is completed within 10 to 15 days. | |
| Germination (%) | Germination is 60-80%. | |
| Nursery Period | Seedling | Seedlings are planted at the break of monsoon. When the seedlings are about 5cm tall, pricked out in polytubes. |
| | stump | Two year old seedlings are used for making stumps. |

6. Diseases, pests and parasites of Tooni:

- 1.Pests:** The stem borer *Hypsipyla robusta* is a serious pest
- 2.Diseases:** i) **Root diseases:** caused by *Ganoderma lucidum*. ii) **Heart rot diseases:** Caused by *fomes senex*. iii) **Leaf diseases:** caused by *Discella cedrelae*.
- 3. Two phanerogamic parasites:** Affect the tree i.e., *Cuscutta reflexa* and *Loranthus spp*.

7. Wood properties:

| | |
|------------------------|--|
| Weight | Heartwood is light brick red to reddish brown. |
| Hardness | Wood is moderately hard. |
| Working quality | Tooni is one of the easiest woods to saw and work. If properly finished and filled, it takes a very good polish. |
| Strength | Timber is moderately strong. |
| Calorific value | Sap wood: 21,700KJkg ⁻¹ , heartwood: 21,400KJkg ⁻¹ . |
| Durability | Timber is moderately durable. |
| Preserv. Treat. | The wood needs thorough preservative treatment. |
| Seasoning | Tooni is a fairly easy wood to air season, if care is taken with the stacking. |
| Growth rate | It is a fast growing species. |

8. Uses:

| | |
|------------------|---|
| Timber | Heartwood is used for furniture, interior boards, planks, carvings and cigar boxes. It is an excellent light building wood. |
| Fuel wood | It gives a good fuel wood. |
| Fodder | Leaves are lopped for fodder. Leaves contain about 15% crude protein. |

| | |
|-------------------------|--|
| Tannin | Sulfur colored dye is extracted from the flowers. |
| Ecological value | Popular avenue tree is planted along roadsides, canals and in gardens. |
| Medicinal value | Bark is astringent and anti-periodic. |
| Paper and pulp | Stem bark yields a cordage fibre. |

(15)

| | |
|----------------------------|-----------------------------------|
| Local name: Satisal | Eng. Name: Indian Rosewood |
| <i>Dalbergia latifolia</i> | Family: papilionaceae |

1. Natural occurrence:

It is common from Terai to 1000m. It occurs in Terai, Bhabar and Duns. According to Champion and Seth (1968) it occurs in northern tropical moist mixed deciduous forests.

2. Morphological Characteristics:

| | |
|------------------|---|
| Leaf | Leaves are imparipinnate and leaflets are 5-7. |
| Flowering | Flowers appear in April and are whitish in color. |
| Fruiting | Fruiting takes place in June |
| Seed | 1-3 seeds per pod. |

3. Silvicultural characteristics:

| | |
|-------------------------|--|
| Light | It is a moderate light demander |
| Frost | It is more frost tender than <i>Dalbergia sissoo</i> , it should not be planted where regular frost occur. |
| Drought | It is drought resistant. |
| Fire | Once established it can withstand annual ground fire, but killed by crown fire. |
| Soil | It grows best on well- drained, deep, moist, loamy soil. It does not tolerate bad drainage. |
| Coppice | It coppices well and produces root suckers. |
| Associates | It is commonly found in <i>Dalbergia sissoo</i> forest. |
| Tree nature | It is a large deciduous tree. In moist location, it is almost evergreen. It has spreading crown. |
| Graze&Browse | Leaves are palatable so seedlings are severely damaged by browsing animals. |

4. Natural regeneration:

| | |
|----------------------------------|--|
| Seed productⁿ | Seeds ripe in June- July .Ripen pods fall down just before the monsoon. |
| Seed dispersal | Seed dispersal takes place by wind and water. |
| Seed germinatⁿ | Seeds germinate during rainy season. Seedlings are liable to damage by browsing animals, fire and frost. |
| Root suckers | It also takes place from root suckers as it produces root suckers abundantly. |

5. Artificial regeneration

| | |
|-------------------------------------|---|
| Preferred propagⁿ | Direct sowing, entire planting, stump planting. |
| Seed collection time | December to April. |
| No. of seed kg⁻¹ | 18,000 - 37,000seeds kg ⁻¹ . |
| Seed extraction | Seed should be dried in the sun until they open, then beaten with stick |

| | | |
|--|-----------------|---|
| | | to separate the seed. Clean the seed by winnowing. |
| Seed storage | | Orthodox seed. Dry the seeds thoroughly in the sun. |
| Viability of seed | | 6 month. |
| Seed treatment | | Not necessary. |
| Seed sowing time | | February to March. |
| Duratⁿ of germinatⁿ | | 21 days. |
| Germination (%) | | 20-80%. |
| Nursery period | Seedling | 3 months; plantation is best before the monsoon season. |
| | Stump | From one year old seedling, the stump can be prepared. |
| Best planting size | | 20 -30 cm tall seedling. |

6. Diseases, pests and parasites of Satisal

Heartwood is rarely attacked by borers and white ants. The sapwood is easily attacked by borers belonging to *Bostrichyidae*, *Cerambycidae*, *Curculionidae* and *Lyctidae*. *Polyporus gilvus* has been recorded on the timber causing white rot.

7. Wood Properties

| | |
|------------------------|--|
| Weight | Moderately heavy-to-heavy wood, wood weighs about 820kgm ⁻³ . |
| Hardness | Wood is hard. |
| Elasticity | Timber is elastic. |
| Working quality | It is easy to saw and work, takes a very good polish. |
| Strength | Strong wood. |
| Calorific value | C.v is about 21360 KJkg ⁻¹ . |
| Durability | Heartwood is very durable but sapwood is less durable. Often attack by borers. |
| Preser. treat. | Sapwood is easily treatable. Heartwood does not require treatment. |
| Seasoning | Moderately refractory wood to seasoning. |
| Wood color | Heartwood and sap wood are easily differentiated, sap wood is yellowish white heartwood light purple brown to deep purple brown. |
| Porous | A diffuse porous wood. Growth ring is indistinct to fairly distinct. |

8. Uses:

| | |
|-------------------------|--|
| Timber | Rosewood is highly prized for high class furniture and cabinet making, it is famous as a decorative timber, very suitable for marine and aircraft grade plywood, popular for carving and engraving. Excellent for high class bent furniture and used for superior walking sticks, umbrella handles and other wood articles |
| Fuel wood | It is an excellent fuel wood. |
| Fodder | Trees are lopped for fodder. |
| Ecological value | It is a leguminous plant so fix atmospheric N ₂ and makes soil fertile. It helps in soil conservation. |

9. Agroforestry application:

Being light-crowned and deep-rooted, it appears quite feasible to raise this species as individual trees on field margins, and boundaries or within crop fields. (Hocking, 1993)

10. Royalty rate: NRs. 250/cu.ft. for round logs at the stumps sites. (Forest rules, 1995).

11. Market price: NRs. 800 to 1000/cu.ft. for sawn timber at Kapilbastu district , Nepal. (1997)

(16)

| | |
|---------------------------|-----------------------------------|
| Local name: Sissoo | Sub –Family: Papilionaceae |
| <i>Dalbergia sissoo</i> | Family: Leguminosae |

1.Natural occurrence: In Nepal it grows up to 1500m. Its general distribution is in the Indus, Ganges and Brahmaputra river systems, including their tributaries from Afghanistan to Assam.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaf shedding: Mid- Jan to Mid-March (Paush- Falgun); leaves appear: March and April). |
| Flower | Flowering (March- May). |
| Fruit | Yellow brown pods that turn dark brown as they ripen in Dec-Jan. |
| Seed | Kidney-shaped seed. Do not naturally split from the pods which drop off the tree intact. |

3. Silvicultural characteristics:

| | |
|-----------------------------|--|
| Light | Strong light demander. |
| Frost | Frost hardy. |
| Drought | Drought hardy. |
| Fire | It is not very fire resistant (moderately fire resistant). |
| Soil | It grows well on alluvial soil, but poor growth on saline soil, heavy clay soil, and less than 60cm soil depth. It does not grow in waterlogged areas. |
| Coppice | It coppices and pollards freely and produces abundant root suckers, especially when the roots have been damaged. |
| Associates | It makes a good association with <i>Acacia catechu</i> on freshly deposited soil. |
| Graze & Browsing | Grazing and browsing sensitive. i.e, youngs are very liable to damage by grazing and browsing animals. |
| Tree nature | It is a large deciduous tree with clear bole. It is often gregarious on new alluvial lands or river banks. |
| Other | Roots are nodulated. Seedlings are sensitive to weed and grass competition. |

4. Natural regeneration:

| | |
|---------------------------------|---|
| Seed productⁿ | Seed production abundantly almost every year. Pods fall between Dec–Mar. |
| Seed dispersal | Seed dispersal by wind and flood water, so in nature, it is found near rivers. |
| Seed germination | Germination begins when ground is moistened by river and rain water. For establishment, it requires full overhead light, permeable soil and freedom from weeds. |
| Root suckers | Naturally it may grow from root sucker. |

5. Artificial regeneration:

| | |
|-------------------------------------|--|
| Preferred propagⁿ | Direct sowing, entire planting, stump planting, branch cutting and root cutting. |
|-------------------------------------|--|

| | |
|------------------------------------|--|
| Seed collection time | December to March. |
| No. of seed kg⁻¹ | 33,000 seeds kg ⁻¹ |
| Seed extraction | Seed should be dried in sun, until they open and then beaten with stick to separate the seeds. Clean the seeds by winnowing. |
| Seed storage | Orthodox seed; dry thoroughly in the sun. |
| Viability of seed | 6 to 12 months. |
| Seed treatment | Soak the segments of pod containing the seed in cold. |
| Seed sowing time | March to June. |
| Duratⁿ of germ. | Germination takes place in 8 -10 days. It completes within 15 days. |
| Germination (%) | 90-100 %; germination is epigeal. |
| Nursery period | seedling For Terai: 4 months, above Terai 8 -12 months |
| | Stump For Terai: 12 months, above Terai 15 -16 months. |
| Best planting size | For stump: Root collar dia.7–15mm, stem 3-5cm & tap root 20-25cm tall. |

6. Diseases, pests and parasites of Sissoo:

i). Sissoo wilt (*Fusarium solani*) can cause a serious incidence of deaths on sites liable to water-logging. ii). *Ganoderma lucidum*: a bracket fungi cause root rot. iii). *Polyporus gilvus* also causes root & butt rot. iv). Minor damage is caused by two foliage rusts (*Uredo sissou* and *Maravalia achroa*), a leaf spot (*phyllachora dalbergiae*) and powdery mildew (*Phyllactinia dalbergiae*). v). The larvae of *Plecoptera reflexa* can cause serious defoliation.

7. Wood properties

| | |
|----------------------------|--|
| Wood color | Heart wood and sapwood are easily distinguishable. Sapwood: pale brown, Heartwood: golden brown to deep brown. |
| Weight | Moderately heavy-to-heavy wood, wood weighs about 780kgm ⁻³ . |
| Hardness | Wood is hard. |
| Elasticity | Timber is elastic. |
| Working quality | It is easy to saw and work, takes a very good polish. |
| Strength | Very strong wood. |
| Calorific value | c.v of heartwood is 21,700 KJkg ⁻¹ . |
| Durability | Heart wood is very durable and sapwood is less durable which is often attacked by borers. |
| Preserva. treat. | Sapwood is easily treatable. Heartwood does not require treatment. |
| Seasoning | Moderately refractory wood to seasoning. |
| Grain & texture | Lustrous, coarse & even textured with straight to some what wavy or interlocked grain. |
| Porous | Diffuse porous wood; rays fine to very fine. |
| Growth rate | It grows rapidly under favorable conditions either naturally grown or planted or coppiced. |

8. Uses:

| | |
|------------------|---|
| Timber | Heartwood is used for building, furniture, cart wheels and tool handles. Suitable for marine and aircraft grade plywood. Most popular wood for carving and engraving. |
| Fuel wood | It is an excellent fuel wood, makes an excellent charcoal. |

| | |
|-------------------------|---|
| Fodder | It is a valuable fodder tree. Leaves contain 15-16% crude protein content and total digestible nutrients about 50%. |
| Ecological value | It is a leguminous plant so fix atmospheric N ₂ and makes soil fertile. It helps in soil conservation. |
| Other | Tree is an excellent source of honey. |

9. Agroforestry application: Sissoo is a friend of the farmer, as well as the forester—a tree which pays rich dividends. (M.D. Chaturvedi). This quote reflects its fast growth and high quality products. In national degraded forestland, sissoo is being raised by leased taungya in some areas. On private land, it is grown as Agro-silviculture system, silvo-pastoral system, aqua-silviculture, agro-silvo-pastoral system, as it has thin crown which offers minimum light competition. Due to its strong lateral roots, it has some limitation to grow in semi arid land. (Anon 1980).

10. Silvicultural systems: For natural riverain forest, it is worked under selection system with thinning. For irrigated plantations, it is worked under coppice- with standards with 22 years rotations and for unirrigated plantations. It is worked under clear felling systems on 50 to 60 years rotations with artificial regenerations. (Parkash, 1991).

11. Royalty rate: NRs.50/cu.ft. for round logs at stump sites. (Forest rules, 1995).

12. Market price: NRs. 200 to 300/cu.ft. for round timber and NRs. 300 to 600/cu.ft. for sawn timber at Sirha district, Nepal. (1997).

(17)

| | |
|------------------------------|--------------------------|
| Local name: Tendu | |
| <i>Diospyros melanoxylon</i> | Family: Ebenaceae |

1. Natural occurrence: It is found betⁿ Terai to 1500m. It is likely to be confined in western Terai of Nepal. According to Champion and Seth (1968) it occurs in northern tropical dry deciduous forests.

2 Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves: alternate and sub-opposite, broad-ovate, coriaceous and hairy when young. |
| Flower | Male flower: Sub-sessile in short drooping cymes. Female flowers: solitary; larger than the male flowers. Flowering during June-Aug. |
| Fruit | Fruit: globose, glabrous, smooth, yellow when ripe. Pulp: yellow, sweet, aromatic. Fruiting: April-May. |
| Seed | Seeds are 4-8. |
| Bark | Bark is greyish black exfoliating in regular rectangular scales. |

3. Silvicultural characteristics:

| | |
|----------------|---|
| Light | Light demander. Seedling will withstand moderate shade. |
| Frost | Frost hardy. |
| Drought | Drought resistant. |
| Fire | Fire resistant. |
| Soil | It can grow on a wide range of soil type, poor denuded soil, dry hill slopes, stony soils and moist valleys where it grows best. It is sensitive to water |

| | |
|---------------------------|---|
| | logging and dampness. |
| Coppice | It coppices moderately well and pollards better, produces vigorous root suckers. |
| Associates | It is associate of sal, <i>Lagersrtoemia parviflora</i> , <i>Anogeissus latifolia</i> . |
| Graze & browse | Young plants are immune to browsing. |
| Tree nature | It is a medium sized, crooked deciduous tree. |

4. Natural regeneration:

| | |
|-------------------------|---|
| Seed production | Seeds ripen from April to June. |
| Seed dispersal | Seed dispersal is by wind; seed falls on the ground before monsoon. |
| Seed germination | Seeds germinate during monsoon. |
| Establishment | Seedlings require partial shade in the early stage. |

5. Artificial regeneration:

| | |
|--|--|
| Preferred propagⁿ | Direct sowing, entire planting, stump planting (is not very successful). |
| Seed collection time | Seed collection between April and June. Seeds are berries type. |
| No. of seed kg⁻¹ | Each fruit contains 3-8 seeds, about 1100 seeds kg ⁻¹ . 5 kg of fruits produce about 1 kg of seeds. |
| Seed extraction | Seeds are thoroughly dried in the sun. Seed is extracted by beating. |
| Seed storage | Seeds can be stored in airtight container in cold places. |
| Viability of seed | Seeds retain their viability about 6-12 months. |
| Seed treatment | Alternate wetting and drying the seeds for 48 hours. |
| Seed sowing time | April or May. |
| Duratⁿ of germinatⁿ | Germination completes within one month. |
| Germination (%) | Germinative capacity of fresh seed is 90%. Germination (%) decreases between 10-60% after one year of storage. |
| Nursery period | Seedling 3-5 month. |
| | Stump From one year old seedlings. |
| Other | Entire planting is done earlier because seedling develops long tap- roots. |

6. Wood properties:

| | |
|-------------------------|--|
| Wood color | Heartwood is very dark green or greenish black. |
| Hardness | Extremely hard and tough wood. |
| Weight | Wood weighs about 960 kgm ⁻³ . |
| Working quality | Difficult to saw and work. Wood can be finished to a fine smooth polished surface. |
| Strength | Wood is fairly strong. |
| Durability | Naturally wood is durable. Lighter colored portions are not durable. |
| Preserva. treat. | Heartwood is non-durable and requires preservative treatment. |
| Seasoning | Highly refractory wood for seasoning i.e., very difficult to season. |
| Growth rate | Its rate of growth is slow. Rate of coppice growth is some what more. |
| Other | It is diffuse porous wood. Growth ring usually distinct. |

7. Uses:

| | |
|------------------|---|
| Timber | Its timber is an excellent wood for hammer and tool handles, it is used for carving, walking sticks and umbrella handles. |
| Fuel wood | Fuel wood is poor quality as it gives out sparks. |

| | |
|-------------------------|--|
| Fodder | It gives poor quality fodder. Leaves contain about 7% crude protein and digestibility coefficient is very low. |
| Edible food | Fruits are edible. |
| Ecological value | Suitable for afforestation in degraded sites like abandoned cultivated land. |
| Others | Its main use is for wrappers of bidis from leaves. |

9. Agroforestry application: Tendu mixed with agricultural crop is not known. Being deep-rooting habit, its cultivation on field boundaries appears to be a feasible. (Hocking, 1993).

10. Silvicultural system: It is found as an associate of Sal forest. In moist mixed deciduous forest, it is worked under uniform or clear-felling or their modifications. In dry mixed deciduous forest, it is worked under coppice or coppice with reserves system on a coppice rotation of about 30 years. Since tendu leaves are a valuable material for *Bidi* industry, forest working plans usually do not permit its felling, unless over mature, dying or in clear felling coupes. (Parkash, 1991).

(18)

| | |
|----------------------------|----------------------------|
| Local name: Gamhari | |
| <i>Gmelina arborea</i> | Family: Verbenaceae |

1. Natural occurrence:

Terai to 1200m, it occurs in sal forest of Terai, Bhabar and Duns. It is found in moist mixed deciduous forest.

2. Morphological characteristics:

| | |
|------------------|---|
| Leaf | Leaf is alternate, broadly ovate. Flower appears with new leaf in Mar-April. |
| Flowering | Flowers are yellow in color. |
| Fruiting | A drupe about 2.5cm long and yellow when ripe. Fruiting is bet ⁿ May-June. |
| Seed | Seeds are usually lenticular. No. of seed varies between 1 and 3. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Light demander |
| Frost | Moderately frost hardy species i.e., frequent frost can kill the tree. |
| Drought | Moderately drought resistant, but intolerant of excessive drought. |
| Soil | It prefers moist fertile valleys, with good drainage. It can also grow on poor dry sites but the growth is stunted. |
| Coppice | It coppices well. |
| Associates | It is the major constituents of sal. Some associates are: <i>Acacia catechu</i> , <i>Adina cordifolia</i> , <i>Albizia procera</i> , <i>Dillenia pentagyna</i> , <i>Gmelina arborea</i> , <i>Holoptelia integrifolia</i> <i>Mallotus philippinensis</i> . |
| Browsing | Sensitive, it causes considerable damage to seedlings. |
| Tree nature | It is a deciduous tree, growing to more than 30m high on favorable sites. |
| Other | It is a fast growing timber species. |

4. Natural regeneration:

| | |
|---------------------------------|--|
| Seed productⁿ | Fruit ripens in May and June. |
| Seed dispersal | Fruit pulp is eaten by deer and cattle, thus these animals help to disperse of seed. |
| Seed | Seeds germinate during monsoon. Alternate heat and moisture are needed to |

| | |
|--------------------|--|
| germination | stimulate germination. Seeds will not germinate under dense shade of grass and weed that also hampers germination of seed. |
| Coppice | Natural regeneration may occur from coppice shoots. |

5. Artificial regeneration:

| | | |
|--|--|--|
| Preferred propagⁿ | Direct sowing, entire planting, and stump planting. | |
| Seed collection time | Fruit ripens between May and June. | |
| No. of seed kg⁻¹ | 1600 kernels kg ⁻¹ ; 1 kernel may have up to three seeds. | |
| Seed Extraction | Pulp should be removed from kernels. | |
| Seed Storage | Recalcitrant seed. | |
| Viability Of Seed | Properly depulped and dry seeds will retain its viability for six month or may longer and in cold storage (5 ^o c, it may store for 2 or more years. | |
| Seed treatment | Soak seeds in water for 48-72 hours and plant as soon as possible after collection. | |
| Seed sowing time | Seed should be sown immediately after collection. | |
| Duratⁿ of germinatⁿ | Germination commences within 7-14 days after seed sown. | |
| Germination (%) | 13-85%. | |
| Nursery Period | Seedling | Two months require for seedling. |
| | Stump | Stumps are made from one year old nursery raised seedling. It is simple to raise <i>Gmelina</i> as stump plants. |

6. Forest pathogens:

- Damage is caused by defoliators, (*Calopepla* spp) and borers (*Dihamnus* spp.and *Alicide* spp.)
- A fungus, *Poria rhizomorpha* causes stem and root diseases in shady, unfavorable and waterlogged situations and in clayey soils.

7. Wood properties:

| | |
|-------------------------|---|
| Weight | Wood is rather light (420-640) kgm ⁻³ and specific gravity is 0.47. |
| Hardness | It is a hard wood. |
| Elasticity | This wood is elastic in nature. |
| Working quality | It is easy to saw and work to a smooth surface. It finishes and polishes well. It peels well on a rotary lathe. |
| Strength | Wood is strong. |
| Calorific value | Its c.v. of wood is 20,100KJkg ⁻¹ |
| Durability | Timber is durable in contract with water. Natural durability of timber is about 15 years. |
| Preserva. treat. | It requires no preservative treatment. |
| Seasoning | It is non refractory wood i.e., seasons well without cracking or warping. |
| Wood color | Wood is creamy white in color, turning yellowish in exposure. |
| Rate of growth | Rate of growth is fast. Coppice growth is also very fast. |
| Porous | Diffuse porous to semi ring porous wood, growth ring is distinct to indistinct. |

8. Uses:

| | |
|------------------|--|
| Timber | It is the one of the best & most reliable timber of India. Used for furniture, veneer, plywood, pulpwood, planking, match sticks, match boxes etc. |
| Fuel wood | It is a good fuel wood species. Charcoal burns well. |

| | |
|-------------------------|---|
| Fodder | It is a good fodder for cattle. |
| Edible food | Fruits are eaten by cattle and man. |
| Ecological value | Its leaves are sometimes used as feed for silkworm. |
| Medicinal value | It is also planted in garden and avenues, the drupes, leaves, flowers, roots and barks are used as medicine. |
| Other | Tender leaves are demulcent. Leaf juice is used for foul ulcers; root is bitter used as tonic, stomachic, laxative and galactagogue. Bark is bitter tonic and stomachic and useful for fever and indigestion. |

9. Agroforestry application: The tree casts shade and nothing grows under dense stands.

10. Silviculture system: It is carried both to coppice system as well as clearfelling followed by artificial regeneration of the species. (Parkash, 1991).

(19)

| | |
|----------------------------------|------------|
| Local name: Bot Dhainyaro | |
| <i>Lagerstroemia parviflora</i> | Lythraceae |

1. Natural occurrence: It grows in Terai and Bhabar zone up to 1200m altitude.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are elliptic, oblong or ovate and glabrous. New leaves appear in May. |
| Flower | Flowers are in lax axillary and terminal panicles, white & fragrant. Flowering: May-July. |
| Fruit | Capsules are ovoid or ellipsoid. |
| Seed | Seeds are winged. |
| Bark | Bark is light grey to reddish, smooth, exfoliating in narrow longitudinal flakes. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Light demander. |
| Frost | Frost hardy species. |
| Drought | Drought resistant |
| Fire | It recovers well after fire. |
| Soil | It grows on a variety of soil; prefer recent alluvium; avoid waterlogged areas; thrives best on deep porous loam, though often found on clay. It also grows on black cotton soil. |
| Coppice | Tree coppices well and also produces root sucker. It pollards vigorously. |
| Associates | It is an associate of Sal forests. |
| Browse | It is not browsed by cattle |
| Tree nature | It is a medium sized deciduous tree. It is generally found in dry mixed forests; it is not gregarious. |
| Others | Rotation of 30 year for the production of pole. |

4. Natural regeneration:

| | |
|------------------------|--|
| Seed production | Fertile seeds produce one year out of three. |
|------------------------|--|

| | |
|-------------------------|---|
| Seed dispersal | Seed dispersal takes place by wind. |
| Seed germination | Germination is successful during rainy seasons. |
| Establishment | Seedling well establish on recent alluvium & abandoned cultivated land. |

5. Artificial regeneration:

| | |
|--|--|
| Preferred propagⁿ | Entire planting, stump planting, hard-wood cuttings (cutting during Feb. and March, when tree is leafless). |
| Seed collection time | December to May. |
| No. of seed kg⁻¹ | 30,000-60,000 seeds kg ⁻¹ |
| Seed storage method | Orthodox seed; seeds should dry thoroughly in the sun and store in air tight container. |
| Viability of seed | Viability of seed is best at 2 nd and third year in storage, and then again deteriorates. |
| Seed treatment | Orthodox seed, seeds should be soaked in water for 48 hours before sowing. |
| Seed sowing time | Seeds are sown during March on open beds. |
| Duratⁿ of germinatⁿ | Germination completes within 28 days. |
| Germination (%) | Fresh seed: 10%, three year old seed: 40%, 4th year: nil. Germination is better from two or three years old seed than fresh seed, due to after-ripening. |
| Nursery | Seedlings are ready after 15 months in the nursery. |
| Seedling | |
| Period | Stump can be prepared from 1 to 2 year seedlings. |
| Best planting size | Seedling: 30cm tall with 5 to 7mm root collar diameter. |

6. Diseases, pests and parasites of Bot Dhainyaro:

Following fungi attack the tree:

1. **White stump rot:** *Fomes durissimus*.
2. **Dark brown heart rot:** *Fomes fastuosu*
3. **Spongy yellow heart rot.**
4. **White pocket rot.**
5. **Grey heart rot** etc.

7. Wood properties:

| | |
|------------------------|--|
| Wood color | Sapwood: greyish white; heartwood: brownish grey or sometimes a greyish brown. |
| Weight | Wood weighs about 850 kgm ⁻³ ; Wood is heavy; sp.gr. is 0.75. |
| Hardness | Wood is hard. |
| Working quality | A fairly easy wood to saw and work; saws with less trouble when green. It takes a good polish after careful filling. |
| Strength | Wood is strong. |
| Calorific value | Sapwood: 4,951 Calories; Heartwood: 4,885 calories. |
| Durability | Wood is fairly durable. Average life as determined by graveyard test is 4 -5 years. |
| Preserv. treat. | Heartwood is not much durable & requires thoroughly preservative treatment. |
| Seasoning | It is refractory wood to seasoning; difficult to air season as it is prone to end-splitting, surface cracking and warping. |
| Growth rate | Rate of growth is moderately fast. Mean annual girth increment is 0.96 inch. |
| Porous | Diffuse porous, no annual rings; pores moderate size & irregular wavy grain. |

8. Uses:

| | |
|-------------------------|---|
| Timber | It produces valuable timber. It is used for building construction, door and window frames, carts and agricultural implements. |
| Fuel wood | It is an excellent fuelwood and makes a very good charcoal. |
| Fodder | It is not a good fodder tree; crude protein content is about 8%; total digestible nutrient: 50%. |
| Tannin | Bark: 7-10% tannin, leaf: 16% tannin. Bark is used for dyeing thread; bark dyes black. |
| Gum & resin | Yield a sweet edible gum. |
| Ecological value | Tree is a host of the <i>Tussar</i> silk worm. It is used for ornamental plantings. |
| Paper & pulp | The wood is useful in the manufacture of ryon grade pulp. |
| Others | It yields an inferior fibre. |

9. Silviculture system: It is suitable for working under simple coppice or coppice with reserves system on a rotation of 30 years or more for production of poles. In mixed high forest, it is worked under selection system with an exploitable girth of about 0.9m. (Parkash, 1991).

10. Royalty rate: NRs. 50/cu.ft. for round logs at the stump site. (Forest rules, 1995).

11. Marketing price: NRs. 1450 to 1500/ ton at urban center of Kapilbastu, Nepal. (1997).

(20)

| | |
|---------------------------|----------------------------------|
| Local name: Mahuwa | English name: Butter tree |
| <i>Madhuca indica</i> | Family: Sapotaceae |

1. Natural occurrence: It is commonly found between Terai and 1200m. It is found in mixed deciduous forest of Sal.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are clustered near ends of branches, elliptic, or elliptic oblong, coriaceous. |
| Flower | Flowers are in dense fascicles near ends of branches, calyx: coriaceous, corolla: tubular, cream-colored, scented and caducous. |
| Fruit | Berries are ovoid, long, greenish turning reddish yellow or orange when ripe. |
| Seed | Seeds are 1-4, brown, ovoid & shining. |
| Bark | Bark is dark coloured and cracked. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Strong light demander. |
| Frost | Frost hardy. |
| Drought | Drought resistant. |
| Coppice | It coppices fairly well. |
| Associates | It is often found in sal forest. |
| Browse | When young, it is browsed by deer and cattle. |
| Tree Nature | It is a medium-sized deciduous tree, usually with a short bole and large rounded crown. |

4. Artificial regeneration:

| | |
|--------------------------------------|---|
| Preferred propagⁿ | Direct sowing, nursery raised seedling, stump planting. |
| Seed collectⁿ time | Seeds are collected between June and August. |

| | |
|---|--|
| No. of seed kg⁻¹ | 450 seeds kg ⁻¹ . |
| Viability of seed | Seeds are viable for 1 to 6 months. |
| Seed treatment | Not required. |
| Seed sowing time | Seeds are sown between July and August. |
| Duratⁿ of germination | Germination completes within 15 days. |
| Germination (%) | Germination is high. |
| Nursery period | Seedling: 12 months in the nursery. |
| Best planting size | 20-30cm tall seedlings. |

5. Diseases, pests and parasites of Mahua:

i) **Tree** is damaged by *Loranthaceous* parasites. ii). **White spongy rot:** is caused by *Polystictus steinheilianus*. iii). **Heart rot:** caused by *Fomes caryophyllii* iv). **Root and butt rot :** caused by *Polyporus gilvus*. v). **Leaves** are eaten by caterpillars of *Achaea janata*.

6. Wood properties:

| | |
|------------------------|--|
| Wood color | Sapwood is reddish white to brownish white. Heartwood is light to dark red or reddish brown. |
| Weight | Wood is heavy, (sp.gr. is 0.95 to 0.97, and wt. is 61-62 lb /cu.ft). |
| Working quality | It is difficult to saw but takes a fair polish. |
| Strength | Wood is strong. |
| Calorific value | Sapwood: 4890-4978 calories. |
| Durability | Wood is durable. |
| Preserv. treat. | Heartwood is difficult to treat with antiseptic oil but sapwood treats readily. |
| Seasoning | Mahua wood is refractory and liable to split and crack. |

7. Uses of Mahua:

- i). **Mahua oil:** Fresh oil from properly stored seed is yellow in colour with a pleasant taste. Mahua oil is used mainly in the manufacture of soaps, particularly laundry soaps. Mahua's oil is edible and used for cooking purposes in some rural areas. Refined oil is used in the manufacture of lubricating greases and fatty alcohols. Oil is also used for candles. It has emollient properties and is used in skin diseases, rheumatism and headache.
- ii). **Mahua cake:** Mahua cake is used as manure. It possesses insecticidal and pesticidal properties.
- iii). **Mahua flowers:** Corollas are a rich source of sugars and contain appreciable amounts of vitamins and calcium. Mahua flowers are eaten raw or cooked. Mahua flowers are largely used to the preparation of distilled liquors. Flowers are also used for the preparation of vinegars; flowers are also used as feed for livestock. Flowers are regarded as cooling, tonic and demulcent. They are used in coughs, colds and bronchitis; they show anti-bacterial activity against *Escherichia coli*. Honey from the flower is edible and is used for eye diseases.
- iv). **Mahua timber:** Wood is used for building purposes as beams, doors, window frames, especially posts. It is used for carriage, furniture, turnery, sports, good musical instruments, ship building, boats, bridges and other constructions; it is also a good fuelwood.
- v). **Mahua berries:** Mahua berries are eaten raw or cooked; they are also eaten by cattle, sheep, goats, monkeys, and parrots.
- vi). **Leaves:** Leaves are eaten by cattle; they are also used as green manure.

8. Agroforestry application: It is not usually planted in agricultural lands since it has wide-spreading dense crowns. (Hocking, 1993).

9. Silviculture system: Since the tree is valuable for its flowers and seeds, which it continues to provide up to more than 200 years age, it is rarely felled. It is generally reserved both in high forests and coppice forests. In some locations, in mixed deciduous forest, it is worked under selection fellings. (Parkash, 1991).

(21)

| | |
|------------------------------------|--------------------------------|
| Local name: Sindure, Rohini | Trade Name: Kamala Tree |
| <i>Mallotus philippinensis</i> | Family: Euphorbiaceae |

1. Natural occurrence: It often occurs between Terai and 1500m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaves | Leaves are variable; broadly ovate to ovate; oblong ; glabrous above pubescent with numerous red gland beneath. |
| Flower | Flowers are in spikes, dioecious and small. |
| Fruit | Capsule globose, 3-lobed, 3-valved, densely covered with reddish brown glandular pubescence. |
| Seed | Seeds are sub-globose, black and smooth. |
| Bark | Bark is thin, grey, and somewhat rough. |

3. Silvicultural characteristics:

| | |
|----------------------------|---|
| Light | Shade bearer, tree can stand considerable shade. |
| Frost | Frost hardy. |
| Drought | Drought resistant. |
| Soil | It grows on a wide range of soil types. |
| Associate | It is commonly found in sal and certain shrub and mixed forests. |
| Coppice | It coppices well. |
| Tree nature | It is a shrub or a small, much branched, evergreen tree with a short and often buttressed bole. |
| Graze & browse. | It is extensively browsed by cattle, goats, and other wild animals. |

3. Natural regeneration:

| | |
|------------------------|--|
| Seed production | Seeds fall in the beginning of the rainy season. |
| Seed dispersal | Seeds are dispersed by wind. |
| Germination | Seeds are germinated in the rainy season. |
| Establishment | Seedlings are susceptible to damage by browsing and by drought and insect attack .These factors hamper the establishment of seedlings. |

4. Diseases, pests and parasites of Sindure, Rohini:

i. Tree is attacked by **several rot-causing fungi**; *Fomes caryophylli*, *Polyporous adjustus* etc. **ii. Heartwood**: is damaged by the borer *Aphrodisium cantori*. **iii. Sapwood of felled and dead timber**: is liable to attack by *Xylotrechus smei*.

5. Wood properties:

| | |
|------------------------|--|
| Wood color | Wood of kamala tree is whitish to light reddish grey, often with darker streaks and somewhat lustrous. |
| Weight | Hard wood, moderately tough and heavy (Av.wt. is 48 lb/cu.ft.) |
| Working quality | It is somewhat difficult to saw, but can be worked to a smooth surface under tools. |
| Calorific value | Sapwood : 4,835 calories. |
| Seasoning | Kamala wood is refractory. It warps and shrinks badly and is liable to insect attack. |

6. Uses:

1). Kamala dye: The red pubescent is separated from ripe fruit by beating and shaking. It may be obtained by stirring the fruits vigorously in the water, when the dye settles down as a sediment, the sediment is collected, dried and pieces of pericarp and other refuse separated by sifting.

- The yield of powder is 1.4 -3.7 % of the wt. of fresh fruits. Kamala dye is available as a Granular, reddish brown resinous powder, almost without odour and taste.
- Kamala dye is extensively used in dyeing of silk and wool.
- It is used for colouring food stuffs and beverages
- It is used for anti-oxidant for ghee and vegetable oils.

2. Kamala powder: It is used in external applications for parasitic affections of skin, such as scabies, ringworm, and herps.

3. Kamala seed oil: Kamala seed kernels yield oil or semi-solid fat which is used in the formulation of hair fixers and ointments.

4. Kamala seed cake: The seed cake left after the extraction of oil may be used as manure.

5. Kamala wood: It is relatively unimportant timber .It is suitable for rafters, tool handles, match-boxes and small turnery articles.

- It is extensively used as fuelwood.

6. Kamala leaf: are used as fodder.

7. Tannin and dye: Leaves and barks contain tannin. Bark contain 6-10% tannin which is deep reddish colour, useful for leather. Root yields a red dye.

8. Medicinal value: All parts of the Kamala tree are used in external applications for skin disease.

(22)

| | |
|----------------------------|------------------------------------|
| Local name: Bakaino | English name: Persian Lilac |
| <i>Melia azedarch</i> | Family: Meliaceae |

1. Natural occurrence:

It grows between 700-1300m, usually occurs in rather moist forest or in valleys in *Schima-Castanopsis* forest. It is native to Iran (West Asia).

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are bi- or occasionally tri-pinnate, leaflets ovate or lanceolate and serrate. Leafless occurs during December to March. |
| Flower | Flowers are lilac, fragrant, in axillary panicles. |
| Fruit | Fruits are an ellipsoid-globose, drupe with 4-5 seeds fruiting during cold season. |
| Seed | Seeds are contained within a hard stone. |
| Bark | Bark is dark grey with shallow longitudinal furrows. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Light demander. It can grow under light shade in youth. |
| Frost | Frost hardy. |
| Drought | Drought resistant. |
| Fire | It is fire tender. |
| Soil | It can survive on shallow soil, but growth is stunted; rapid growth on deep, well-drained and fertile soil. |
| Coppice | It coppices well. |
| Associates | It is associated with <i>Schima-Castanopsis</i> forest. |
| Browsing | Seedlings are liable to damage by browsing. |
| Tree nature | It is a moderate sized deciduous tree; cylindrical bole; bearing a spreading crown and an ornamental avenue tree. |
| Other | Tree is liable to blow down by wind. Burrs often produce on the stem esp. near the base. |

4. Natural regeneration:

| | |
|---------------------------------|--|
| Seed productⁿ | Seed production is abundant and annually. |
| Seed dispersal | Seed dispersal takes place by birds and mammals. |
| Seed germ. | Germination will be plenty during rainy season. |
| Establishment | Seedlings are well established on deep, fertile and well-drained soil. |
| Root suckers | Natural regeneration may take place from root-suckers. |

5. Artificial regeneration:

| | | |
|--|--|--|
| Preferred propagⁿ | Direct sowing, entire planting, stump planting, cuttings, root suckers. | |
| Seed collection time | Seed ripens between November to March. | |
| No. of seed kg⁻¹ | There are about 850 dried fruits, or 1200-1500 cleaned stones kg ⁻¹ . Single stones have five seeds. | |
| Seed extraction | Stones have to be broken by hammer and the seed picked out carefully. | |
| Seed storage method | Orthodox seed; dry thoroughly in the sun; store in airtight container. | |
| Viability of seed | Viability of seed remains for five years. | |
| Pre-sowing seed treatment | It is not necessary but germination period of untreated seed is long, retaining the flesh. Removing the flesh, soaking and cracking the stones may help the rapid germination of seed. | |
| Seed sowing time | <1500m: Seed sown in March to April, >1500m: August. | |
| Duratⁿ of germⁿ | Germination starts in 2-8 weeks and may extend over several months. | |
| Germination (%) | 80% when seeds are fresh. | |
| Nursery period | Seedling | <1500m: 3-4 months take for monsoon planting, >1500m: 11 months. |
| | Stump | Stump can be prepared from 11-month seedling. |
| Best planting size | 15-20cm tall seedlings with 3 to 5mm root collar diameter. | |

6. Diseases, pests and parasites of Bakaino:

1. Root rots: Mainly caused by *Rosellinia bunodes*. **Brown root rot:** is caused by *Ganoderma lucidum*. **2. Stem and twig diseases** caused by *Corticium salmonicolor*. **3. Leaf diseases:** caused by *Cercospora spp.* **4. Phanerogamic parasites** affect the branches and the whole tree.

7. Wood properties:

| | |
|------------------------|--|
| Wood color | Sapwood: Yellowish white, Heartwood: Red, turning reddish brown with age. |
| Hardness | It is tough and moderately hard. |
| Working quality | It is easy to work, turn peels and finish. |
| Weight | Moderately heavy wood, wood weighs about (400-600) kgm ⁻³ . |
| Calorific value | c.v of heartwood is 20,900KJkg ⁻¹ ; c.v of sapwood is 21,300 kJkg ⁻¹ . |
| Durability | Wood is durable. It is resistant to attack by white ants. |
| Seasoning | Moderately refractory wood to seasoning. |
| Growth rate | It is a fast growing tree species. |
| Other | Rotation year should be for 20 years. It is resistant to attack by white ants. |

8. Uses:

| | |
|-------------------------|--|
| Timber | Use for toys, cigars-packing cases; suitable for sportswear; roofing material and agricultural implements; furniture; ornamental plywood. |
| Fuel wood | It is a medium quality fuel wood. |
| fodder | Leaves are highly nutritious, crude protein content is about 12%. |
| Edible food | Its fruits are poisonous to man and animals though sheep, goats and birds eat the fruit without any ill effect. |
| Gum & resin | Gum exudes which are used in spleen enlargement. |
| Ecological value | It is grown as a shade tree in coffee and tea plantation; suitable for afforestation in ravine land, grassland, abandoned cultivated and denuded land. |
| Medicinal value | Leaf juice is considered as an anthelmintic, anti-lithic, diuretic. A decoction of leaves is regarded as astringent and stomachic. Aqueous extracts of the heartwood are useful in asthma. Seeds are used in rheumatism. |
| Others | It is a fast growing multipurpose tree. The leaves, bark, fruits possess insect repellent properties. Extract of leaves are used in sprays, protect plants against grasshoppers and locusts. |

9. Agroforestry application: Due to its long leafless period during winter, it is suitable to grow winter agricultural crop. It is also successfully planted in sugarcane. (Hocking, 1993).

10. Silvicultural system: For plantation, it is worked under 7-8 year rotation for fuel. It is short-lived, tuens hollow and unsound beyond 0.6-0.9m girth so it must have to be removed. (Parkash, 1991).

11. Royalty rate: NRs. 40/cu.ft. for round logs at the stump site. (Forest rules, 1995).

12. Marketing price: NRs. 250/cu.ft. for round logs at the major cities of Nepal. (1997).

(23)

| | |
|------------------------------------|----------------------------------|
| Local name: Sandan | Family: Leguminosae |
| <i>Ougenia dalbergoides</i> | Sub Family: Papilionaceae |

1. **Natural occurrence:** It grows between Terai to 1200m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are pinnately, trifoliolate, leaflets coriaceous, leafless during Feb-Mar. |
| Flower | Flowers are in short fascicled racemes, white or pink, somewhat fragrant. Flower appears during March-April. |
| Fruit | Fruit: a pod, linear-oblong, flat, light brown. Fruiting: May-June. |
| Seed | Each pod contains 2-5 seeds. |
| Bark | Bark is grey or brown, deeply cracked. |

3. Silvicultural characteristics:

| | |
|-------------------------|--|
| Light | Light demander. Young seedlings require some shade. |
| Frost | Seedling: Frost tender, mature trees: Frost hardy |
| Drought | Seedlings: Drought sensitive; mature trees: Drought resistant. |
| Fire | Fire tender, trees are damaged by fire. |
| Soil | It can grow on a wide range of soil type; can grow on clayey soils and gravelly deposits and grows best on alluvium soils. |
| Coppice | It produces coppice and root sucker well. Root suckers quickly establish land slips and eroded sites. |
| Associates | It is a common associates of sal forests at lower altitudes; and <i>Pinus roxburghii</i> at higher altitude. |
| Browsing | Seedlings and saplings are readily browsed. |
| Tree nature | A small to medium-sized deciduous tree with fairly straight to crooked trunk. Sandan is common, sometimes almost gregarious, in mixed deciduous forests. |
| Ecological value | It has superficial root system. It is a characteristics species of landslips, banks, and sites of river and exposed situations on alluvial loam it attains a comparatively large size. |

4. Natural regeneration:

| | |
|---------------------------------|--|
| Seed productⁿ | Pods ripen during May and June. Pods falls on the ground in June- July. |
| Seed dispersal | Seed dispersal takes place by wind. |
| Seed germination | Germination takes place early in the rains, and generally abundant on bare loose ground, landslips along roadsides and on cultivated field. |
| Establishment | Establishment of seedling will be best, if grass & weed competition is negligible, similarly damage by grazing and browsing animals may be less. |
| Root sucker | It produces long root sucker, by which natural regeneration may take place. |

5. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagation | Direct sowing, entire planting, stump planting, shoot cutting, and root cutting. |
| Seed collectⁿ time | Pods are collected between June and July. |
| No. of seed kg⁻¹ | 28,000-33,000 seeds kg ⁻¹ . |
| Seed storage | Orthodox seed; dry thoroughly in the sun; store in air-tight container. |
| Viability of seed | Viability of seed is much low. |
| Seed treatment | Seeds should be soaked in water for 48 hours before sowing. |

| | |
|---|--|
| Seed sowing time | Seeds are sown immediately after collection. |
| Duratⁿ of germiⁿ | Seed takes 10-30 days for germination. |
| Germination (%) | Germination may obtain 75%. |

6. Diseases, pests and parasites of Sandan:

Heart rot diseases: Caused by *Fomes Caryophylli*, **Buff brown pocket rot** caused by *Polystictus nilgheriensis*. The tree is susceptible to damage by a no. of defoliators and borers.

7. Wood properties:

| | |
|------------------------|--|
| Wood color | Sapwood: light grey, Heartwood: a greyish brown or light reddish brown. |
| Weight | Heavy wood; sp.gr is 0.84, av.wt. is 865 kgm ⁻³ . |
| Hardness | Tough and very hard wood. |
| Working quality | Timber is difficult to saw and work, takes a good polish. |
| Strength | Timber is strong. |
| Calorific value | Sapwood: Calorific value is 4891 cal., Heartwood: c.v. is 5178 calories. |
| Durability | The wood is durable; less liable to termite attack. Graveyard test indicate a natural durability of timber is 10-15 years. |
| Seasoning | Wood air seasons slowly without much degrade. Seasoning in the logs are satisfactory. |
| Porous | Diffuse porous, pores are moderate in sized, enclosed irregular shaped. |
| Growth rate | Height growth of seedling is slow under natural conditions. |

8. Uses:

| | |
|-------------------------|--|
| Timber | It produces valuable timber .It is used for agricultural implements, cart and carriage building, construction work, furniture e.t.c. It is elastic, special timber for marine plywood. |
| Fuel wood | It gives a good fuel wood. |
| Fodder | Tree is lopped for fodder. |
| Tannin | Bark contains 7% tannins. |
| Ecological value | Sandan is a useful lac host. |
| Medicinal value | An exudation from the incised bark is used in diarrhoea and dysentery. Bark is used as a febrifuge and also as fish poison. |
| Paper and pulp | Stem bark yields a cordage fibre. |

9. Agroforestry application: Since the tree has plentiful lateral roots which produce root-suckers readily, it is not suitable with agriculture crops as minor tillage operation will encourage root suckers. (Hocking, 1993).

10. Silvicultural system: In mixed forests, it is worked as an accessory species alongwith the principal and more valuable species i.e. sal, teak etc, under coppice, coppice-with reserve, uniform, selection or selection-cum-improvement system.

11. Royalty rate: NRs. 100/cu.ft. for round logs at the stump sites. (Forest rules, 1995).

12 Marketing price: NRs. 1450-1500/ton at the Kapilbastu district, Nepal.(1997).

| | |
|----------------------------|------------------------------|
| Local name: Amala | |
| <i>Phyllanthus emblica</i> | Family: Euphorbiaceae |

1. Natural occurrence: It is found in most parts of Nepal below 1500m.

2. Silvicultural characteristics:

| | |
|----------------|--|
| Light | Strong light demander. |
| Coppice | It coppices well and pollards moderately well. |
| Other | Growth of young seedling is considerably retarded by weed competition. |

3. Artificial regeneration:

| | |
|-------------------------------------|---|
| Preferred propagⁿ | Direct sowing, entire planting. |
| Seed collectⁿTime | Fruits are collected between September and December. |
| No. of seed kg⁻¹ | 34,000 seeds kg ⁻¹ . Each fleshy fruit contains a hard stone with 4-6 seeds. |
| Seed extraction | The seeds can be extracted by exposing the stones to the sun until they crack and allow the seed to escape. |
| Seed storage | Orthodox seed, which is dried in the sun and stored in airtight container. |
| Viability of seed | It can be stored for at least 12 months. |
| Germination (%) | Germination may obtain 20-30%. |
| Nursery period | Seedling: are planted out during monsoon season after 9 months. |

4. Wood properties:

| | |
|------------------------------|---|
| Wood color | Wood is red. |
| Hardness & Weight | Wood is hard. Wood weighs about 840 kgm ⁻³ . |

5. Uses:

| | |
|-------------------------|---|
| Timber | Timber is used for agricultural implements and inferior building and furniture. |
| Fuel wood | It is a good fuelwood. |
| Edible food | Fruits are edible which are highly nutritious, contains all form of vitamins. |
| Tannin | Fruits, leaves and barks are used in tanning. |
| Ecological value | It is used in afforestation of degraded sites in the drier parts. |

6. Royalty rate: NRs. 2/kg for fruit. (Forest rules, 1995).

7. Marketing price: NRs. 25/kg at major market near its production site. (Parajuli *et al*, 1997).

(25)

| | |
|-------------------------------|---|
| Local name: Vijay Sal | English name: Malabar Kino tree |
| <i>Pterocarpus anacardium</i> | Family: Leguminosae, Papilionaceae |

1. Natural occurrence: It often occurs between Terai, Duns, and mid-hills of deciduous forest.

2. Morphological characteristics:

| | |
|------------------|--|
| Leaf | Leaves are imparipinnate, leaflets usually 5-7 and oblong. |
| Flowering | Flowers are in large panicles, yellowish and fragrant. |

| | |
|-----------------|---|
| Fruiting | Pods are orbicular, flat and winged. |
| Seed | Seeds are 1-2, convex and bony. |
| Bark | Bark is grey, rough, longitudinally fissured and scaly. |

3. Silvicultural characteristics:

| | |
|--------------------------|---|
| Light | It is a moderate light demander. |
| Drought | Young seedlings are frost tender, while mature trees are frost hardy. |
| Soil | It prefers a soil with a fair proportion of sand, though it is often found on red loam with a certain amount of clay. |
| Coppice | It coppices fairly well, but is found pollards better. It produces root suckers sparingly |
| Associates | It is associated with sal forest. |
| Graze&browse. | It is extensively browsed by cattle, goats, and other wild animals. |
| Tree nature | It is a moderate to large sized deciduous tree with a straight clean bole. It is found in deciduous forests both on undulating and flat ground. |

5. Artificial regeneration:

| | | |
|--|---|---|
| Preferred propagⁿ | Direct sowing, nursery raised seedling, stump planting. | |
| Time of seed collecⁿ | Seeds are collected between December and April. | |
| No. of seed/kg | 1590-1940 fruits kg ⁻¹ . | |
| Seed storage | Orthodox seed. | |
| Viability of seed | Seeds retain their viability for 6-12 months. | |
| Seed treat. | Seeds are soaked in cold water. | |
| Seed sowing time | Seeds are sown in June. | |
| Germination (%) | 40-90%. Germination commences on 10 days onwards. | |
| Nursery period | Seedling | Seedling takes 12 months in the nursery. |
| | Stump | Stump can be prepared from one-year-old seedling. |

6. Diseases, Pests and Parasites of Vijay Sal: The tree is attacked by a no. of insects, mostly defoliator , and some fungi which causes rotting of the wood.

7. Wood properties:

| | |
|------------------------|---|
| Wood color | Sapwood: is pale yellowish white or white, narrow. Heartwood: golden yellowish brown with darker streaks. |
| Weight | Wood is tough and very hard, and moderately heavy (Specific gravity is 0.796, weight is 801 kgm ⁻³). |
| Working quality | Wood is easy to saw but rather difficult to work to a good finish. It machines well and takes a good surface. |
| Strength | Wood is strong. |
| Calorific value | Sapwood 4,904 calories, heartwood 5,141 calories. |
| Durability | Timber is fairly durable in exposed situations and very durable under cover. |
| Seasoning | Wood is medium refractory and air seasons well without splitting, warping or surface cracks to any appreciable extent. |

8. Uses:

| | |
|---------------|---|
| Timber | Timber is used for house building, ship building, rail-way sleeper electric transmission poles, agricultural implements , tool handles, bridge , etc. |
|---------------|---|

| | |
|-------------------------|---|
| Fuel wood | Timber is used as an excellent fuel wood. |
| Fodder | Leaves make an excellent fodder. |
| Tannin | Bark contains a reddish brown colouring matter. |
| Medicinal value | The tree yields a gum-kino which exudes when an incision is made through the bark up to cambium. The gum-kino is a powerfully astringent, used in the treatment of diarrhoea and dysentery. It is locally applied in leucorrhoea and in positive haemorrhages. It is used for toothache. Bark is used as an astringent and in toothache. Flowers are used in fever. An aqueous infusion of the wood is used in diabetes and water stored in vessels made of wood is reputed to have antidiabetic qualities. |
| Pulp & paper | Gum kino is used in dyeing, tanning and printing and potential use for paper industry. |

9. Silvicultural systems: Since it is a tree of mixed deciduous forests, it is worked under either selection system or simple coppice or coppice with standard system in which coppice rotation is 40-50 years and no. of standards per hectare 25. (Parkash, 1991).

10. Royalty rate: NRs. 100/cu.ft. for round logs at the stump. (Forest rules, 1995).

11. Market price: NRs. 300/cu.ft. for round timber and NRs. 600/cu.ft for sawn timber at the urban center of Kapilbatu district, Nepal. (Parajuli *et. al*, 1997).

(26)

| | |
|--|----------------------------------|
| Local name: Shrikhanda, chandan | English name: Sandal wood |
| <i>Santalum album</i> | Santalaceae |

1. Natural occurrence: The tree flourishes the best between altitudes of 600 and 1050m, though it may ascend up to 1350m and descend as low as 360m.

2. Morphological character:

| | |
|------------------|---|
| Leaf | Leaves are glabrous, thin, elliptic-ovate or ovate – lanceolate. |
| Flowering | Flowers are straw colored, brownish-purple, reddish purple or violet unscented in terminal and axillary paniculate cymes. |
| Fruit | Drupe globose, purple black, with hard, ribbed endocarp. |
| Seed | Seeds are globose or obovoid. |
| Bark | Bark is reddish or dark grey or nearly black, rough, with deep vertical cracks on older trees. |

3. Silvicultural character:

| | |
|----------------|--|
| Light | Light demander. |
| Drought | The tree is sometimes killed by prolonged drought and it often suffers from bark–scorching due to insolation. |
| Fire | Tree is extensively sensitive to fire. |
| Soil | Sandal tree grows mostly on red, ferruginous loam overlying metamorphic rocks, chiefly gneiss and tolerates shallow, rocky ground and stony or gravely soils, avoids saline and calcareous soils. The growth is luxuriant on rich and fairly moist soils. The tree needs good drainage and does not withstand water logging. |

| | |
|-------------------------|--|
| Coppice | Young sandal tree coppices fairly well. But the older trees have little or no coppicing power, except on moist conditions. Root suckers are freely produced, when the roots are exposed or injured or when the tree has been felled. |
| Associates | Primary hosts for Nepal is <i>Sesbania</i> , <i>Amaranthus</i> , <i>Calotropis</i> secondary hosts are: <i>Acacia catechu</i> , <i>Acacia nilotica</i> , <i>Albizia spp</i> , <i>Cassia siamea</i> , <i>Dalbergia sissoo</i> and <i>Terminalia arjuna</i> . |
| Tree nature | It is a small to medium-sized, evergreen, semi-parasitic tree, with slender branches, commonly found in the comparatively dry regions of peninsular India. |
| Meteorolog.cond. | It grows the best where rain–fall varies between 60 to 160cm. |
| Other | Sandal tree is a root parasite which establishes contact with the host through the formation of haustoria. It obtains its requirement of lime and potash directly from the soil through its roots, while for N ₂ and P, it partially depends upon its host, absorbing these elements through haustoria. |

4. Natural regeneration:

| | |
|---|--|
| Seed production | Fruits ripen between January and March |
| Seed dispersal | Seeds are dispersed by birds. |
| Seed germination & Establishment | Germination is profuse in the forest immediately after the monsoon but mortality is high due to excessive heat of sun, drought, fire, grazing, trampling, insect and pests attack and excessive weed growth. |

5. Artificial regeneration:

| | |
|---------------------------------------|--|
| Preferred propagⁿ | Direct sowing, Entire planting cutting. |
| Seed collectⁿ time | Fruits are collected during January to March. |
| No. of seed kg⁻¹ | 7,000 to 10,000 seeds kg ⁻¹ . |
| Seed storage method | Orthodox seed. Put thoroughly dried seed in a polythene bag, seal tightly and keep in cool place. |
| Viability of seed | Seed begins to loose viability after about 2 years. |
| Seed treatment | Seeds are scarified and soaked in water before it is sown in trays. Seeds are treated with fungicide and nematicide. |
| Seed sowing time | Seeds are sown during February and March. |
| Duration of germinⁿ | Seeds germinate in about 8 to 14 days. |
| Germination (%) | Germination is up to 80%, germination is slow and irregular. |

6. Diseases, insects, pests and parasites of Shrikhanda:

- i. **Spike disease:** caused by mycoplasma like bodies (MLB'S).
- ii. **Other diseases:** a. Damping-off b. Leaf curl disease.

7. Wood properties:

| | |
|-------------------|--|
| Wood color | Sapwood and heartwood are sharply demarcated. Sapwood is white to whitish yellow and unscented. Heartwood is scented, light yellowish brown when freshly cut turning dark brown with exposure and ageing to reddish brown. The scent lasts for many years. Heartwood is yellow or brown, dull to somewhat lustrous, with an oily feel. |
|-------------------|--|

| | |
|------------------------|---|
| Weight | Wood is moderately hard to hard, heavy (Sp.gr. is 0.92, av.wt. is 897 to 1,137 kgm ⁻³). |
| Working quality | Wood saws without difficulty and can be worked to a smooth surface and takes a stain like polish. |
| Durability | Timber is durable. Heartwood is not attacked by termites but sapwood is often extensively attacked. |
| Preserv. treat. | It is treatable with an aqueous solution of boric acid by diffusion process. |
| Seasoning | Timber seasons almost without fault but slowly. |

Uses of sandal wood:

(1) Sandal wood :

- i). It is one of the finest wood for carving and it possesses smoothness, uniform fibres and straight and closed grains; moreover, it is comparatively free from knots and is freely worked with tools.
- ii). Sandal wood is used in walking sticks, combs, picture frames, fan handles, table lamps, trays, chess-boards, chess men etc.
- iii) . Saw dust is used for the extraction of the oil.

Medicinal uses: Both the wood and oil have long been used in medicine. They are credited with cooling ,diaphoretic, diuretic and expectorant properties. A paste of wood is applied to burns, fevers and headache. Oil of sandalwood is used for the treatment of gonorrhoea.

(2) Sandal wood oil:

- i). The yield of oil varies, being highest in the roots (Up to 10% of the weight) and the lowest in the chips which constitute an admixture of heartwood and sapwood (About 1.5 to 2.5%) .
Average
yield of oil from good billets and roots ranges between 4.5 and 6.25%. The main constitute of sandal wood oil is santol (C₁₅H₂₄O).
 - ii. Sandal wood oil is very highly prized as raw material in perfumery. It has an important use in soaps, face creams, toilet powders and other cosmetic industries. It is highly used in medicinal purposes.
- (3) **Sandal wood roots:** Yield a high percentage of sandal wood oil (4.4%) of the finest quality.
 - (4) **Sandal wood seed:** Seeds yield 50-55% of a dark red viscid fixed oil (60%) yield by hot-pressing), which is thicker than the castor oil. Its oil has vulcanizable properties, so the oil can be used in the rubber industry .The seed oil is used in the skin diseases. The endosperm of the seed is edible.
 - (5) **Sandal-fruits:** Fruits contain betulic acid, glucose, fructose and sucrose.
 - (6) **Sandal-leaves:** Fresh leaves of sandal wood yield a pale yellow wax.

8. Agroforestry application:

It is planted in homestead gardens mixed with other trees. Because of its very valuable heartwood, this species is very often planted along field bunds and similar locations in the dry and semi-arid rainfed areas. (Hocking, 1993).

9. Royalty rate: NRs. 25/kg for dry wood. (Forest rules, 1995).

10. Marketing price: NRs. 800/kg for dry wood at Kathmandu, Nepal. (1997).

| | |
|---------------------------|-------------------------------|
| Local name: Kusum | English name: Lac tree |
| <i>Schleichera oleosa</i> | Family: Sapindaceae |

1. Natural occurrence: It is commonly found from Terai to 900m elevations, especially in moist localities.

2. Morphological characteristics

| | |
|---------------|--|
| Leaf | Leaves are paripinnate, leaflets elliptic or elliptic oblong, coriaceous. |
| Flower | Flowers are minute, yellowish green, bisexual, in axillary racemes. |
| Fruit | Berries are smooth or slightly prickly. |
| Seed | Seeds are brown, irregularly ellipsoidal, oily, enclosed in a succulent aril which dries up on the seed. |
| Bark | Bark is grey or brown, reddish inside, exfoliating in small, round, and irregular flakes. |

3. Silvicultural characteristics:

| | |
|--|--|
| Light | It is a shade bearer tree. |
| Frost | Frost hardy. |
| Drought | Drought hardy. |
| Soil | It thrives best on light, well-drained, gravelly or loamy soils, although it also occurs on sandy and laterite soils. The tree prefers slightly acidic soils. It is common in Siwalik range on the sides of ravines on sandstone or on boulder beds. |
| Coppice | Its coppicing power varies. It pollards well. It freely produces root-suckers. |
| Associates | It is commonly associated with Sal forest. |
| Graze & browse | Browsing sensitive. |
| Tree nature | It is a medium to large sized, deciduous or nearly evergreen tree. |
| Meteorⁿ condⁿ | In its natural habitat: Absolute Max. Shade temp: - (35-47.5) ⁰ C. Absolute Min. Temp. (-2.5 to 17.5) ⁰ C. Rainfall varies from 75 to 250cm. |

4. Natural regeneration:

| | |
|------------------------------|--|
| Seed prodⁿ | Fruits fall towards the end of summer or at the beginning of the rainy seasons. |
| Seed dispersal | Seeds are dispersed by animals and birds. |
| Seed germⁿ | Germination and establishment of seedling largely depend upon the quickness of the seeds becoming covered by the earth and debris. |
| Root sucker | Natural regeneration can also be obtained from the root suckers. |

5. Artificial regeneration:

| | |
|-------------------------------------|---|
| Preferred propagⁿ | Direct sowing (fresh seeds are sown in thoroughly prepared soil bed), Stump planting. |
| Seed collection time | Seeds are collected between June-July. |
| No. of seed kg⁻¹ | 1410-2190 seeds kg ⁻¹ . |
| Seed extractⁿ | Pulp should be removed. |
| Seed storage method | Seed can be stored for one year in gunny bags and two years in sealed tins. |
| Viability of seed | Seeds are viable only for a short period. |

| | | |
|-------------------------------------|---|---|
| Seed treatment | Not required. | |
| Seed sowing time | Seeds are better to sow immediately after collection. | |
| Duration of germⁿ | 10-90 days. | |
| Germination (%) | Germination capacity of the seed is 58%. | |
| Nursery Period | Seedling | Next July. |
| | stump | Stump can be prepared from one year old seedling. |
| Best planting size | 15-20cm tall seedling | |

6. Diseases, Pests and Parasites of Kusum:

(i).**Stem blight:** Caused by *Rosellinia bunodes* (ii) **Yellow cork root:** caused by *Polyporus weberianus* (iii).**white spongy rot:** caused by *Hexagonia apiaria* (iv). The most important insect attacking the tree is the **lac insect** *Laccifer lacca* (v). Several defoliators, borers and sap suckers attack the tree.

7. Wood properties:

| | |
|------------------------|---|
| Wood color | Sapwood is white or pale-brownish white and heartwood uniform light-reddish brown. |
| Hardness | Very hard and tough wood. |
| Weight | Wood is very heavy (sp.gr is approx. 0.91-1.08, wt. 945-1,185 kgm ⁻³). |
| Working quality | Timber is very difficult to saw when dry, and fairly well in a green state. |
| Strength | Timber is very strong. |
| Calorific value | Sapwood: 4950 cal. Heartwood: 4928 calories. |
| Durability | Timber is not durable in exposed situations. It is durable under cover and is not much prone to borer and termite attack. |
| Preser. treat. | Timber is easily amenable to treat with preservatives. |
| Seasoning | It is one of the most refractory woods to season. |

8. Uses:

| | |
|-------------------------|---|
| Timber | Timber is commonly used for agricultural implements, tool handles, cart-wheels, sleepers, furniture, etc. |
| Fuel wood | It makes a good fuel and an excellent charcoal. |
| Fodder | Trees are lopped for fodder. |
| Edible food | Raw fruits are prickled, the ripe ones possess whitish pulp and pleasant, acidic taste and are often eaten during summer. Seeds are often eaten raw or roasted. Young shoots are also eaten. |
| Tannin | Flowers yield a dye. |
| Gum & resin | The tree yields a resin. Bark contains 9.4% tannin. |
| Ecological value | The tree is an important host for <i>kusumi</i> -lac and the finest quality of lac is obtained from this tree. Flowers are a source of nectar for honeybees. |
| Medicinal value | Bark is astringent and used in external applications for itch, pain in back, inflammations and ulcers. |
| Paper & pulp | In mixture with other woods such as <i>Terminalia chebula</i> , <i>Terminalia alata</i> , <i>Ougenia ooeimensis</i> , <i>Tectona grandis</i> . Kusum wood yields pulp suitable for the manufacture of wrapping and printing papers. |

Other uses of Kusum:

i).**Kusum kernel oil:**The kernels constitute 60-65% of the seeds and the rest being the shell.The fat content of the kernels varies from 59-72%.Kusum oil is a yellowish brown,semi-solid, with a faint

odour of bitter almonds. Its oil has long been used for hairdressing. It is also used for culinary and lighting purposes, as a lubricant for machinery and for cure of itch, ache, burns and other forms of skin troubles. It can be used for soap manufacture and as a textile lubricant.

ii). **Kusum oil-cake:** It has a good manurial value. The cake is also used for fuel.

(28)

| | |
|------------------------------|--|
| Bhalayo | Marking nut tree or oriental cashew nut |
| <i>Semecarpus anacardium</i> | Anacardiaceae |

1. Natural occurrence:

It occurs in Sal forest of Terai, Bhabar, Duns and lower hills of mixed deciduous forest.

2. Morphological characteristics:

| | |
|------------------|---|
| Leaf | Leaves are large, simple, and ovate-oblong. |
| Flowering | Flowers are small, dull greenish yellow, dioecious, in terminal panicles. |
| Fruiting | Drupe, obliquely ovoid, smooth, shining, black when ripe. |
| Bark | Bark is dark brown, rough. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Moderate shade bearer. |
| Frost | Frost sensitive. |
| Coppice | It coppices well. |
| Associates | It is commonly associated with Sal forest. |
| Tree nature | It is a moderate sized deciduous tree. |

4. Wood properties:

| | |
|------------------------|---|
| Wood color | Wood of the tree is greyish white, often with yellow streaks. |
| Weight | Wood is moderately heavy (wt. 592 kgm ⁻³) |
| Hardness | Wood is soft. |
| Working quality | It is easy to saw and work. |
| Strength | Wood is not strong. |
| Durability | Wood is not durable. |
| Seasoning | It is susceptible to sap stain and cracks during seasoning. |

5. Uses of *Semecarpus anacardium*:

a. Wood: is suitable for cheap and light furniture, packing boxes and carving. It is fairly good for match boxes and splints. Its wood is a medium quality fuel wood.

b. Fruit: fruit is acrid, hot and anthelmintic. It is beneficial in tumours, acute rheumatism, asthma etc. The juice of the pericarp of the fruit and also the tree trunk is a powerful counter-irritant and vesicant. The juice is used for tattooing.

The fleshy orange cup (Hypocarp) of the fruit is eaten when quite ripe, it is slightly astringent. Juice of pericarp has anti-bacterial properties.

c. Kernels: the kernels of the fruit, found inside the hard shell, has an almond like taste and is edible. The kernels yields (20-25%), a reddish brown, semi-drying oil with a pleasant taste,

which is used as the wood preservative against white ants and as a lubricant for wooden axles of carts.

- d. **Root bark:** the juice of the root bark has medicinal value.
- e. **Gum or gum-resin:** the tree exudes a gum or gum-resin which is used in leprosy affections and nervous debility.
- f. **Leaves:** contain saponins, is used for soap manufacturing.
- g. The tree is a host plant for the lac insect.

(29)

| | |
|------------------------|---------------------------------|
| Local Name: Sal | English Name: Sal |
| <i>Shorea robusta</i> | Family :Dipterocarpaceae |

1. Natural Occurrence:

It is commonly found betⁿ Terai-1000m and its **Max.altitude:**1500m.Sal forest is dominant in Bhabar, Terai and Duns. It also covers most of the Siwalik Hills along river valleys. Stainton (1972) distinguishes Sal forest of Nepal into **two types: 1).** Bhabar, Terai and Dun Sal forests. **2).** Hill Sal forest.

2. Morphological characters:

| | |
|---------------|--|
| Leaf | New leaf appears in March-April. Leaves are glabrous, ovate-oblong and coriaceous. |
| Flower | Flowering begins in March-April. Flowers, are yellow in color; which are in lax, axillary or terminal panicles |
| Fruit | Fruiting in May-July. Fruits are ovoid, with five wings, three long and two short. |
| Seed | Seeds are ovoid, with fleshy and unequal cotyledons. |
| Bark | Bark is reddish brown or grey, smooth or longitudinally fissured. |

3. Silvicultural characteristics:

| | |
|---------------------------------|---|
| Light | Light-demander. |
| Frost | Moderately frost hardy. |
| Drought | Drought -sensitive, show frequently dying back phenomenon. |
| Fire | One of the most fire- resistant of its region. |
| Soil | It does not grow in very sandy, gravelly soils, water -logged areas, stiff clays and limestone areas. It prefers old alluvium soil; it may grow on wide range of soil types. Good site indicator of Sal is <i>Clerodendron infortunatum</i> and poor site indicator is <i>Vitex negundo</i> . |
| Coppice | It coppices well up to 20-30cm in diameter. |
| Associates | Its primary associates are: Dabdabe, Kutmiro, Koiralo, Tanki, Haldu, Gamhari, Saj, Sandan, Tooni, Tendu etc. |
| Graze & browse. | It is sensitive to grazing and browsing; very liable to damage by browsing. |
| Tree nature | It is deciduous for a short time. A large tree exceptionally reaching a height of 45m, in hills it rarely exceeds 15m. It is one of the most gregarious forest tree species. It grows up in more or less even-aged crops, sometimes it may be in uneven- aged crops. |
| Meteorological condition | Max. Temp: (44 - 47)°C, Min.temp: (-1 to 7)°C, normal annual rainfall: 100 to 450cm |

4. Natural regeneration:

| | |
|------------------------|--|
| Seed production | Good seed year: one year in three years, fruit ripens: at the beginning of |
|------------------------|--|

| | |
|---|---|
| | the rainy season, June. Seed production: abundant, fertile, and wing-shaped. |
| Seed dispersal | Seed dispersal is by wind since the seeds are winged. Seeds are carried away by wind up to 100m from the mother tree. |
| Seed germination & Establishment | If there is rain soon after the seed fall, the germination will begin immediately. If there is bare and fertile soil, germination and establishment will be satisfactory. |

5. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Direct sowing, entire planting, stump planting. |
| Seed collectⁿ time | April to June. |
| No. of seed kg⁻¹ | 450-1000 seeds kg ⁻¹ . |
| Seed extraction | It is not needed. |
| Seed storage | Recalcitrant seeds. |
| Viability of seed | Within one week, seeds lose their viability very rapidly. |
| Seed treatment | It is not required. |
| Seed sowing time | Seeds should be sown immediately after collection. |
| Duration of germⁿ | Germination completes within 10-28 days. |
| Germination (%) | 40-60% germination is hypogeal. |
| Nursery period | Stump: The stump can be prepared from one-year-old seedlings. |

6. Wood properties:

| | |
|-------------------------------|--|
| Weight | It is heavy to very heavy wood. Wood weighs about 800 to 960kgm ⁻³ . Specific gravity is 0.68-0.82. |
| Hardness | Wood is very hard. |
| Elasticity | Wood is elastic. |
| Working qua. | Its timber is difficult to saw and work due to interlocking fibers and grains. |
| Strength | It is a very strong wood. |
| Calorific value | c.v of heartwood is 22,700, KJkg ⁻¹ ; c.v of sapwood is 21,300 KJkg ⁻¹ . |
| Durability | Natural durability of heartwood is very high. It has a long life in exposed situation above the ground, and in the ground as well as under water but sap wood is less durable. |
| Preservative Treatment | Sap wood is easy to treat with all preservatives but heartwood is very refractory to treatment, side and end penetration is almost nil. |
| Seasoning | Highly refractory wood to seasoning. (It is very difficult wood to seasoning.) |
| Grain&texture | Wood has interlocked grain and medium to coarse texture. Diffuse porous. |

7. (Diseases, Pests and Parasites in Sal forests)

- Over 150 species of fungi have been reported to cause damage to Sal trees in India.
- Many types of rots particularly by *Fomes*, *Ganoderma*, *polyporus*, *Trametes*, etc. have been recorded.
- *Fomes caryophylli* and *Hymenochaete rubiginosa* cause unsoundness of Sal.
- The insect pests of Sal include a large no. of defoliators and borers.
- Major damage of sapwood and heartwood is done by the members of the family cerambycidae.
- Sal plantations in various localities are attacked by loranthaceous parasites.

8. Uses:

Timber: Sal is the main construction material in Nepal. It is used for construction, door, window frame, planking, carts and carving. Sal is available in the market in the form of logs, sleepers, planks, poles and scantlings. After preservative treatment, Sal poles are suitable for overhead, electric, telegraph and telephone lines. It is used for sleepers, beams, scantling and agricultural implements.

Firewood and charcoal: It is an excellent fuel wood. It also makes a good charcoal.

Fodder: Leaves are lopped for fodder, though they are of only medium quality.

Edible food: Sal seeds are sometimes eaten after roasting especially in times of food scarcity. Seed yields 19-20% of fatty oil (Sal butter); Oil is also suitable for soap.

Tannin: Sal bark, along with leaves and twigs, gives tannin material; Bark: 7-12% & young leaves: 20%, twigs and leaves: 22% of tannin.

Gum and resin: On tapping, the Sal tree yields an oleo-resin known as Sal dammar which is widely used as incense. Sal dammar has been used as plastering medium for walls and roofs and as cementing material for plywood.

Ecological value:

Sal is one of the primary hosts of tasar silkworm (*Antheracia mylitta*). It is also recorded as the host of the *kusumi* strain of lac of insect (*Laccifer lacca*).

Medicinal value: The oleo-resin of the Sal is used in the indigenous systems of medicine as an astringent and detergent and is given in diarrhoea and dysentery. It is also used as an ingredient of ointments for skin diseases and in ear troubles.

Paper and pulp: Sal wood is reported to yield a pulp suitable for the manufacture of paper in admixture with bamboo pulp.

Others: Sal oil cake contains 10-12% protein and about 50% starch and can be used as cattle and poultry feed.

8. Royalty rate: NRs. 200/cu.ft. for air dry round timber. (Forest rules, 1995).

9. Marketing price: NRs. 300 to 500/cu.ft. for round logs and 600 to 800 for sawn timber at urban areas of Nepal. (1997).

(30)

| | |
|--------------------------|--------------------------|
| Local name: Jamun | |
| <i>Syzygium cumini</i> | Family: Myrtaceae |

1. Natural occurrence: It is widespread in Nepal from the Terai to about 1600m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are simple, lanceolate, elliptic-oblong or broadly ovate-elliptic, coriaceous and shiny. |
| Flower | Flowers are greenish white, fragrant in trichotomous panicles. |
| Fruit | Fruits are ellipsoid or oblong, black with pinkish juicy pulp. |
| Seed | Seeds are single. |
| Bark | Bark is brown or greyish, fairly smooth, with shallow depressions exfoliating in woody scales. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Shade bearer, especially when young. |
| Frost | Frost tender when young but hardy in old. |
| Drought | It is drought resistant even if it requires high amount of moisture. |
| Soil | It prefers clay loam soils, but will grow on sandy alluvial soils near rivers. It is not suitable for dry sandy or gravelly soils or stiff clays. A fair amount of soil moisture needs for satisfactory growth. |
| Coppice | It coppices vigorously. |
| Associates | In lower altitudes : often associate with sal forest, in higher altitude : often associates with <i>Schima-Castanopsis</i> forest. |
| Tree nature | It is a large evergreen tree which is often gregarious along streams and swampy places in the Terai. |

4. Natural regeneration:

| | |
|----------------------------------|--|
| Seed productⁿ | Fruits ripen between June and August. |
| Seed dispersal | Seeds are dispersed by animals and birds, which eat the fruits. |
| Seed germinatⁿ | Seeds germinate during the rainy season. |
| Establishment | Seedling slowly develops during the first year and rapid after second and third year if conditions are favourable. |

5. Artificial regeneration:

| | | |
|------------------------------------|--|---|
| Preferred Propagation | Direct sowing, stump planting, entire planting, grafting, cutting, and budding. | |
| Seed collection time | Seeds are collected between June and August. | |
| No. of seed kg⁻¹ | There are about 1000-1300 seeds kg ⁻¹ . | |
| Seed extraction | Fleshy part of fruit must be removed. | |
| Seed storage | Recalcitrant seed. | |
| Viability of seed | Seed loses its viability within 2-3 months. | |
| Seed treatment | It is not required. | |
| Seed sowing time | Seed should be sown immediately after collection. | |
| Duration of germination | Germinating power of fresh seed is high. Germination should be completed within 2-3 weeks. | |
| Germination (%) | Germination obtains 50% when fresh, nil after 3 months. | |
| Nursery Period | Seedling | Seedlings should be planted after 12 months. |
| | stump | Stump can be prepared from one year old seedling. |
| Best planting size | 15-20cm old seedling with 3 to 5mm root collar diameter. | |
| Other | Seedlings are sensitive to root disturbance. | |

6. Wood properties:

| | |
|----------------------------|---|
| Wood color | The wood is reddish grey to brownish grey, dull or somewhat lustrous. |
| Texture & grain | It is more or less irregular grained and medium coarse textured. |
| Hardness | Timber is moderately hard. |
| Weight | Wood is moderately heavy-to-heavy and specific gravity is 0.67 to 0.78. |
| Working quality | It saws and machines well. |
| Strength | It is strong timber. |
| Calorific value | c.v of sapwood is 4834 calories. |

| | |
|----------------------------|---|
| Durability | It is moderately durable in the open and very durable under water. |
| Preservative treat. | It is very resistant to penetration by antiseptic fluids. |
| Seasoning | Timber is highly refractory to air seasoning and is liable to surface cracking and spiling. Grdling has given the best results. Conversion could not be done in dry and hot season. |

7. Uses:

| | |
|-------------------------|---|
| Timber | Timber is used for construction, boat-building and for commercial and tea chest plywood. It is also used for agricultural implements, tool handles, cart-wheels, sleepers, furniture, etc. |
| Fuel wood | Wood is moderately good fuel wood. |
| Fodder | Leaves are palatable & widely used as fodder for cattle, sheep and goats. |
| Edible food | The ripe fruit is eaten. A wine can be prepared from the ripe fruit. Fruits are used for making preserves, squashes and jellies. The juice of unripe fruits is used for preparation of vinegar. |
| Tannin | Seeds contain 19% tannin. Stem bark contains 10-12% tannin. Bark is used for dyeing and tanning. |
| Ecological value | The blossoms are an important source of honey. The <i>tasar</i> silkworms feed on the foliage of this tree. |
| Medicinal value | Extracts of the barks, stems, leaves, buds, and flowers possess moderate antibiotic activity against <i>Micrococcus pyrogenes</i> . A decoction of the bark and also powdered seeds are useful in diarrhoea and dysentery. Extracts of the bark and seed and also leaves are used in the treatment of diabetes. |

8. Agroforestry application: It is unsuitable for growing in agronomical crop field except for shade loving crops as it has large, dense and evergreen canopy. It is mostly planted in roadside avenues, canal-side strips, wind-break, water-logged areas etc. mixed with other crops. (Hocking, 1993).

9. Silviculture system: Pure Jamun strips/belts along the stream banks are worked under coppice-with-standards for poles and timbers, generally the coppice rotation is 30 years and for standards, it is 60 years. If Jamun forms an accessory species and is worked along with other species-under selection, shelterwood, clearfelling or coppice systems. (Parkash, 1991).

10. Royalty rate: NRs. 100/cu.ft. for air dry round wood. (Forest rules, 1995).

11. Market price: NRs. 150-200/cu.ft. for round timber and NRs. 350/cu.ft. for sawn timber at Sirha district, Nepal. (Parajuli et al. 1997).

12. Conservation status: Its population is heavily depleted due to loss of its habitat for agriculture, over use, poor regeneration, low frequency; and lack of scientific mgt. of this species.

(31)

| | |
|--------------------------|------------------------------------|
| Local name:Imli | English Name: Tamarind tree |
| <i>Tamarindus indica</i> | Family: Leguminosae |

1. Natural occurrence: It is found sparsely in the Terai, lower hill, and the Duns.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are paripinnate; leaflets are 10-20 pairs; sub-sessile and oblong. |
| Flower | Flowers are small, yellowish with pink strips, in lax, few flowered racemes at the ends of the branchlets. |
| Fruit | Pods are 7.5 to 20cm long, more or less constricted between the seeds, slightly curved, brownish-ash coloured. |
| Seed | Seeds are 3-12, smooth, dark brown and shining. |
| Bark | Bark is brownish or dark grey, longitudinally and horizontally fissured. |

3. Silvicultural characteristics:

| | |
|-----------------------------------|---|
| Light | Light demander. |
| Frost | Frost sensitive. |
| Drought | Drought hardy. |
| Soil | It thrives best on the deep alluvium and porous soils, sheltered from sun. |
| Coppice | It coppices well. |
| Associates | It is often associated with sal forest. |
| Graze & browse | Browsing sensitive. Goats browse the young leaves. |
| Tree nature | It is a moderate to large-sized evergreen tree, cultivated or found naturalized throughout the Terai. |
| Meteor. conditⁿ | This tree generally prefers warm climate. |
| Other | The tree has usually a short and thick trunk, which is seldom straight. It has a handsome, dense and spreading crown of feathery foliage and is prized for ornament and for planting on the road-sides for shade. |

4. Artificial regeneration:

| | | |
|--|--|---|
| Preferred propagⁿ | Direct sowing, entire planting, cutting, and budding. | |
| Seed collectⁿ time | Fruits are collected between March and April. | |
| No. of seed kg⁻¹ | 1800 seeds kg ⁻¹ . | |
| Seed storage method | Orthodox seed. Seed should be stored in sealed container. | |
| Viability of seed | Viability of seed remains for 1 to 2 years. | |
| Seed treatment | Seeds are soaked in hot water. | |
| Seed sowing time | Seed should be sown in April. | |
| Duratⁿ of germinatⁿ | Germination generally commences in 5-10 days. | |
| Germination (%) | Germination may obtain 66%. | |
| Nursery period | Seedling | Seedling will be ready for the monsoon planting if seeds sown in April. |
| | Stump | Seedling should remain next monsoon for stump preparation. |
| Best planting size | 20-30cm tall seedlings with 5-7mm root collar diameter. | |
| Other | Regular weeding and watering should be done for the best growth. | |

6. Diseases, pests and parasites of Imli:

- i). The tree is affected by a no. of rots such as: a) **Sap rot**: caused by *Xylaria euglossa*. b). **Brownish sap rot**: caused by *Polyporus calcuttensis*. c) **White rot**: caused by *Trametes floccosa*. ii). Several insects attack the fruits and seeds of the *tamarind*, both on the tree and when stored for marketing.

7. Wood properties:

| | |
|-------------------|---|
| Wood color | Sapwood is yellowish, often with brownish red streaks. Heartwood is dark brown, usually streaked and mottled with black, particularly in old trees. |
|-------------------|---|

| | |
|------------------------|---|
| Hardness | It is very hard wood. |
| Weight | Wood is heavy (weight 913-1282 kgm ⁻³). |
| Working qual. | The wood is very difficult to work, though it takes a good polish and bends well. |
| Strength | Wood is strong. |
| Calorific value | Sapwood: 4,909 calories and Heartwood: 4,969 calories. |
| Durability | It is durable under cover, and is somewhat resistant to insect attack. |
| Preserv. treat. | It is very refractory to preservative treatment. |
| Seasoning | It is moderately refractory and shows cracking and splitting during air seasons. |
| Growth rate | Tamarind is a slow growing species. |

8. Uses:

| | |
|-------------------------|---|
| Timber | Timber is mostly used for agricultural implements, tool- handles, turnery and constructional works. It yields decorative planks for panelling and furniture. |
| Fuel wood | Wood is very good fuel, and is preferred for making gunpowder charcoal. |
| Fodder | Leaves are eaten by goats and cattle. |
| Edible food | Tender leaves, flowers and young seedlings are eaten as a vegetable. Seeds and kernels are eaten during food scarcity periods. |
| Tannin | Pulp is also used as an axillary in dyeing and tanning and for polishing and cleaning metal-ware. |
| Gum & resin | Tree exudes a dark-colored gum of poor solubility, which swells up considerably in water and has not been found of any value. |
| Ecological value | Tree is a host of the lac insect and of silkworm of the genus <i>Anaphe</i> in Nigeria. Flowers are considered to be a good source of honey, which is rich golden colour. It is recommended for planting along the fire-lines and in shelter-belts and wind-breaks to prevent soil erosion. It is also grown for afforestation of the degraded lands on drier areas. It is widely planted in avenues. |
| Medicinal value | Seeds are astringent and are used in the diarrhoea and dysentery. |

Other uses of *Tamarindus indica*:

- **Pulp and pulp products:** The fruit-pulp is the chief agent for souring-curries, sauces, chutnys and certain beverages throughout the greater parts of Nepal and India.
- **Seed:** Seed is used as a valuable raw material for the preparations of sizing powder textiles.
- **Tamarind kernel powder(TKP):** When TKP is boiled with water containing boric acid and phenol, gives a very good paper adhesive .
- **Tamarind kernel oil (TKO):** TKO are useful in the preparation of paints, varnishes and for burning in lamps.
- **Leaves** are used as green manuring of soils.
- **Fibre** is obtained from the young stems and bark.

9. Agroforestry applications: because of its dense shade and broad spreading crown, it reduces the growth of agriculture crops under it. It is mostly planted along field margins, roadside avenues, canal side strips, wind break etc. (Hocking 1993).

10. Silvicultural systems: It is worked under coppice for fuel. It is retained till its death in avenues and field boundaries. (Parkash, 1991).

(32)

| | |
|----------------------------|-----------------------------|
| Local name: Barro | |
| <i>Terminalia belerica</i> | Family: Combretaceae |

1. Natural occurrence: Terai to 1100m. According to Champion and Seth (1968), it is found in tropical moist mixed deciduous forest.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are broadly elliptic and clustered towards the end of branches. |
| Flower | Flowers are in solitary, simple, axillary spikes. Flowering during, April-June, after new leaves are appeared. |
| Fruit | Fruits are globular and grey velvety. |
| Seed | Nut has thick walled and hard. |
| Bark | Bluish or ashy grey bark and longitudinal furrows. |

3. Silvicultural characteristics:

| | |
|-----------------------------|--|
| Light | It is light demander. Young seedlings tolerate heavy shades during first or second year, but afterwards kills them. |
| Frost | It is frost tender. |
| Drought | It is a drought resistant to a considerable extent. |
| Fire | Fire tolerant and recovers well after burning. |
| Soil | It requires a good moisture supply or deep sand soil with good sub- soil drainage. |
| Coppice | It coppices fairly well, but pollards badly, does not produce root suckers. |
| Associates | It is associated with <i>Shorea robusta</i> forest or with other species of <i>Terminalias</i> . |
| Graze & browse | Sensitive. Seedlings are severely damaged by browsing animals. |
| Tree nature | A large handsome, deciduous tree. It often occurs more or less scattered and not gregariously. Stems straight, frequently buttressed when large. |
| Meteorological Cond. | In its natural habitat absolute Max.temp (36-47.5) ⁰ C, absolute Min. temp. (0-15.5) ⁰ C, normal Annual rainfall (75-330 cm). |

4. Natural regeneration:

| | |
|-------------------------|--|
| Seed production | Fruits ripen between November-March. |
| Seed dispersal | Seeds are dispersed by wind partly by water. |
| Seed germination | Seeds need moist alluvial ground for germination, if seeds fall thick cover of dead leaves or dense weed growth, germination is hampered. Loose alluvial soil is good for its germination. |

5. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Direct sowing, stump planting, entire planting. |
| Seed collectⁿ time | Fruits ripen between November-February. Fruits are collected from the ground as soon as they fall, not from the trees. |

| | |
|------------------------------------|--|
| No. of seed kg⁻¹ | 60 fruits kg ⁻¹ , (400-520) seeds kg ⁻¹ after pulp removing. |
| Seed extraction | Pulp should be removed. |
| Seed storage | Orthodox seed dry thoroughly in the sun. |
| Viability of seed | One year. |
| Seed treatment | Soak the seed in water for 48 hours. |
| Seed sowing time | February-March for monsoon planting. |
| Germination (%) | 86-100%, germination is hypogeal. |
| Best planting size | 20-30cm tall seedlings with 5-7mm root collar diameter. |

6. Diseases, Pests and Parasites of Barro:

- **Leaf disease:** Caused by *Puccinia terminaliae*, *Phyllachora terminaliae*.
- **Heart rot:** Caused by *Fomes fastuosus*, *Ganoderma applanatum*.

7. Wood properties:

| | |
|----------------------------|--|
| Weight | The wood weighs about 770 kgm ⁻³ . Wood is moderately heavy to heavy, specific gravity is (0.60-0.77). |
| Hardness | Wood is hard and tough. |
| Working quality | Timber is easy to saw and work; easy to peel and make up into good veneers; absorbs much polish and soon loses its texture. |
| Strength | It is moderately strong wood. |
| Durability | Timber is not durable in exposed situations as it is non-resistant against wood-rotting fungi, but it is more durable under cover. |
| Preservative treat. | Timber is treatable but complete penetration of preservative is not always obtained. |
| Seasoning | It is moderately refractory wood to seasoning. |
| Wood color | The wood is light grey or yellowish; sapwood and heartwood has no clear separation and hard and coarse-grained. |
| Porous | Wood is diffuse porous; pores are few, large and mostly solitary. |

8. Uses:

| | |
|-------------------------|--|
| Timber | Timber is used in house building, packing cases, ploughs etc. |
| Fuel wood | Wood is used for fuel and charcoal. |
| Fodder | Leaves are used for fodder; contain (8.6-17.2) % crude protein. |
| Tannin | Leaves have fairly high tannin content (6.4)%, fruits are also source of tannin, the bark contains (1.4-7)% tannin. |
| Ecological value | Leaves can be fed to the <i>tasar</i> silkworm. |
| Medicinal value | Fruits are used in ayurvedic medicine, especially to cure coughs. Pulp of fruit is used in the leprosy, piles, diarrhoea and dropsy. |
| Paper & pulp | The wood is in the mixture of other hardwood is suitable for the manufacture of chemical pulps for writing, printing and wrapping papers. |
| Others | The non edible from the kernels can be used in the manufacture of soaps. Seeds contain protein, from which adhesive can be developed. Fruits can be used in the preparation of oxalic acid and ink-making. |

9. Agroforestry application and silvicultural system is same as Harro.

10. **Royalty rate:** NRs. 100.00 per cft. for air dry wood (Forest Rules, 1995).

11. Market price: NRs. 120.00 per cft for round timber and NRs. 220.00 per cft for sawn timber at Siraha district, Nepal (Parajuli et al., 1997).

12. Conservation status: Same as Harro.

(33)

| | |
|---------------------------|-----------------------------|
| Local name: Harro | |
| <i>Terminalia chebula</i> | Family: Combretaceae |

1. Natural occurrence:

It occurs between tropical and subtropical forest up to 1100m. It occurs in deciduous and semi deciduous forests of Terai, Bhabar and Duns. According to Champion and Seth (1968), it is found in tropical moist mixed deciduous forests.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are ovate or elliptical with a pair of large glands at the top of petiole. New leaf appears in April. |
| Flower | Flowers are yellowish white in terminal spikes. Flowers appear during April-June. |
| Fruit | Fruits are 1” long, ovoid ellipsoidal or globose, grey vulvety. Fruiting: Jan-March. |
| Seed | Nut has thick walled and hard. |
| Bark | Bark is dark brown. |

3. Silvicultural characteristics

| | |
|---------------------------------|--|
| Light | It is a light demander but seedlings can withstand shade in the beginning. |
| Frost | It is fairly frost hardy. |
| Drought | It is a drought resistant to a considerable extent. |
| Fire | Fire tolerant and recovers well after burning. |
| Soil | It is found on a variety of geological formations and grows on clayey as well as sandy soils. It requires a good moisture supply, or deep sandy soils with good sub-soil drainage. |
| Coppice | It coppices fairly well, but pollards badly, does not produce root suckers. |
| Associates | It is associated with <i>Shorea robusta</i> forest or with other species of <i>Terminalias</i> . |
| Browsing | Sensitive. Seedlings are heavily damaged by browsing. |
| Tree nature | A medium to large sized handsome & deciduous tree. |
| Meteor. Condⁿ | In its natural habitat absolute Max.temp (36-47.5) ⁰ C, Absolute Min- temp. (0-15.5) ⁰ C, normal Annual Rainfall (75-330cm). |

4. Natural regeneration:

| | |
|------------------------------|---|
| Seed prodⁿ | Fruit ripens between November and March. |
| Seed dispersal | Seeds are dispersed by wind, partly by water. |
| Seed germⁿ | Seeds need moist alluvial ground for germination. If seeds fall on thick cover of dead leaves or dense weed growth, germination is hampered. Loose alluvial soil is good for its germination. |

5. Artificial regeneration:

| | | |
|--------------------------------------|--|--|
| Preferred propagⁿ | Direct sowing, entire planting, stump planting. | |
| Seed collectⁿ time | Fruits ripen between November and February. Seeds are collected from the tree not from the ground. | |
| No. of seed kg⁻¹ | 140-220 fruits kg ⁻¹ . 540 clean dry seeds kg ⁻¹ after pulp removing. | |
| Seed extraction | Pulp should be removed. | |
| Seed storage | Orthodox seed dry thoroughly in the sun. | |
| Viability of seed | Seeds stored for 1-2 years, germinates better than fresh seeds. | |
| Seed treatment | Soak the seed in water for 48 hours. | |
| Seed sowing time | February- March for monsoon planting. | |
| Germination (%) | 86-100%, germination is hypogeal. | |
| Nursery Period | Seedling | Three to five months for monsoon planting |
| | Stump | One-year-old seedling is required for stump. |
| Best planting size | 20-30 cm tall seedlings with 5-10mm root collar diameter. | |

6. Diseases, Pests and Parasites of Harro:

Terminalia chebula does not suffer from any serious pests. Few pests have been recorded on the species, but none of them cause any appreciable damage. Among them *Ascortis infixaria*, *Hyblaea puera*, *Asura dharmia* are important pests.

7. Wood properties:

| | |
|-------------------------------|---|
| Weight | It weighs about 920 kgm ⁻³ . |
| Hardness | It is moderately hard to hard wood. |
| Working Quality | The wood is difficult to saw especially when dry. It is also difficult to work and finishes to hard. Timber polishes well, fibres are slightly twisted. |
| Strength | Timber is strong and moderately tough. |
| Calorific value | The calorific value of wood is 3967 calories. |
| Durability | The timber is moderately durable under cover. |
| Preservative Treatment | The timber is treatable but complete penetration of preservative is not always obtained. If the timber is treated with a preservative, it will be an extremely useful wood for many purposes. |
| Seasoning | Timber is highly refractory, difficult to season so should be dried slowly & evenly. |
| Porous | Wood is diffuse porous, growth ring is indistinct, porous small & moderate size. |

8. Uses:

| | |
|------------------------|--|
| Timber | Timber is not much value and is chiefly used in construction, agricultural implements, furnitures, carts, good quality tool handles etc. |
| Fuel wood | The tree possesses a poor fuel wood. |
| Fodder | The leaves are a medium quality fodder, with 10.8-14.3 % crude protein. |
| Edible food | Fruit is a favourite food for monkeys, deer, sheeps, goat and cattle and kernel is edible and gives an oil which is used for the hair. |
| Tannin | The dry fruit surrounding the seed is rich in tannin (Average, 30-32%). |
| Gum & resin | Tree yields a gum which is used for either medicinal purposes or to dyers for mixing with other colors. |

| | |
|------------------------|--|
| Medicinal value | The fruits are credited with laxative, stomachic, tonic and alterative properties. In combination with <i>Emblica officinalis</i> , <i>Terminalia chebula</i> , and <i>Terminalia bellerica</i> , the <i>Triphala churna</i> is prepared which is an ayurvedic medicine, uses in almost all diseases. When coarsely powdered and smoked in a pipe, the fruit affords relief in asthma. |
| Other | Both myrobalans and the purified tannic acid prepared from them are widely used in ink -making. |

9. Agroforestry applications:

The tree can be grown in taungya plantation with agricultural crops. (Hocking, 1999)

10. Silvicultural systems: In mixed Sal forests, it is worked under selection system.

11. Royalty rate: NRs 100.00 per cft for air dry wood (Forest Rules, 1995).

12. Market price: NRs. 120.00 per cft for round timber and NRs. 220.00 per cft for sawn timber at Siraha district, Nepal (Parajuli et al. 1997)

13. Conservation status: It is a scarce but HMG/N is not regarded as rare, endangered or threatened species though its population is severely depleted by continuous habitat loss, poor regeneration, over use and lack of scientific mgt. of this species. (Parajuli et al. 1997)

(34)

| | |
|-----------------------------|---------------------------------|
| Local name: Saj | Eng. name: Indian Laurel |
| <i>Terminalia tomentosa</i> | Family: Combretaceae |

1. Natural occurrence:

It occurs between tropical and subtropical forest up to 1400m. It is found in tropical moist deciduous and tropical dry deciduous forests and several types of forests.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are elliptic or ovate. New leaves appear during May-June. |
| Flower | Flowers are dull yellow in terminal and axillary panicles. Flowers: May -June. |
| Fruit | Fruits are up to 5cm long with 5 broad, coriaceous. Fruiting during Feb.- April. |
| Bark | Bark is grey to black, with deep longitudinal fissures and transverse cracks. |

3. Silvicultural characteristics:

| | |
|-------------------|--|
| Light | Light demander but it is rapidly suppressed under shade. |
| Frost | Frost hardy. |
| Drought | Drought hardy. |
| Fire | It is fairly tolerant to fire damage. |
| Soil | It grows best on deep rich alluvial soil, and avoids sandy soils. It tolerate stiff clayey soil, and is found on the edges of swamp, where it can withstand of good deal of water logging. It is found naturally on soils of pH ranging up to 8.4. |
| Coppice | It coppices well up to 40cm in diameter, but above this size coppicing ability reduces. It pollards well and produces root suckers. |
| Associates | It is a common associate of sal. |

| | |
|---------------------------------|---|
| Browsing | It is palatable spp & considerable damage to seedling by cattle, deer and pigs. |
| Tree nature | It is a large deciduous, straight stemmed tree, with spreading branches and heavy crown, attaining a height of 32m or more. |
| Meteor. condⁿ | Absolute max. Temp. (35-48.8) ⁰ C, absolute min.temp: (0-15.5) ⁰ C, annual rainfall (75 to 380)cm. |
| Other | It has deep tap root system. A good nurse for young Sal in forestry localities. |

4. Natural regeneration:

| | |
|------------------------------|---|
| Seed prodⁿ | Fruits ripen between February- April |
| Seed dispersal | Seed dispersal takes place by wind partly by water. |
| Seed germⁿ | Germination and establishment of seed need full overhead light. |
| Coppice | Natural regeneration may occur from coppice shoots. |

5. Artificial regeneration:

| | |
|--------------------------------------|---|
| Preferred Propagⁿ | Direct sowing, entire planting, stump planting. |
| Seed collectⁿ time | Fruits ripen between February-April. |
| No. of Seed Kg⁻¹ | 400-700 fruits kg ⁻¹ . |
| Seed Storage | Orthodox seed dry thoroughly in the sun. |
| Viability of Seed | 1 year. |
| Seed treatment | It is not required. |
| Seed Sowing Time | March-April. |
| Duration of Germⁿ | Germination completes within 25 days. |
| Germination (%) | 40-70%, germination is epigeal. |
| Nursery Period | Seedlings 3-4 month for polypot seedlings. |
| | Stump 12-15 month for stump. |

6. Diseases, Pests and Parasites of Saj:

The species suffer from the fungi such as **i). White spongy rot**, **ii). White butt rot**: caused by *Fomes melanoporus* **iii). Spongy root and butt rot**: *Ganoderma lucidum*, and **iv). White stub rot**. Saj also suffers from the attack of some defoliators but the damage is rarely serious for ex. *Dasychira mendosa*.

7. Wood properties:

| | |
|------------------------|---|
| Weight | Wood is heavy from 800-1100 kgm ⁻³ and specific gravity is 0.707-0.94 |
| Hardness | It is very hard wood. |
| Working quality | The working quality of laurel vary considerable due to variation in weight and structure. Normal straight grained wood is easy to saw and can be worked to a good finish. |
| Strength | It is a good strong tough wood suitable for most constructional purposes. |
| Calorific value | 21,000 KJkg ⁻¹ . |
| Durability | Timber is fairly durable under cover and moderately in exposed conditions. |
| Seasoning | Wood is highly refractory i.e., season well, but liable to split. |
| Wood color | Sapwood creamy white and heartwood dull light brown or reddish or dark brown. |

8. Uses:

| | |
|---------------|---|
| Timber | It is very widely used for buildings, beams, joints, doors and windows frame. |
|---------------|---|

| | |
|-------------------------|---|
| | Use for construction of carts, agricultural implements, suitable for plywood, furniture paraquet, match splints, railway slippers. Timber is used as suitable for telegraphic or electric poles after treatments. It is suitable for fire proof buildings as it is considerable natural resistance to fire. |
| Fuel wood | It is an excellent fuel wood and makes a good charcoal. |
| Fodder | It is a good fodder tree, crude protein content: 4 to 14% digestibility coefficient of protein is nil, so leaves are equivalent to straw or hay. |
| Edible food | The exhausted bark can be used to obtaining oxalic acid in a high yield(14%). |
| Tannin | Bark is much used for tanning and also used for dyeing. Bark contains tannin as high as 18.7% its extract can also be used as cheap dye for dyeing cotton, wool, silk and jute fabrics, also dyeing pulp and paper. |
| Gum & resin | The tree exudes a gel like fluid which dries up to light yellow to amber-colored gum, used as purgative and as an adhesive. |
| Ecological Value | Leaves are much used for feeding for tasar silkworm so, the trees are extensively pollarded. |
| Medicinal Value | The bark is bitter and styptic and has diuretic and cardiotoxic properties. The decoction of bark is taken internally in atonic diarrhoea. |
| Other | Laurel can be utilized for making unbleached sulphate pulps for production of wrapping paper and for bleached sulphate pulps for production of writing and printing papers. |

9. Agroforestry application: The tree has a deep root system so it is suitable to grow with agricultural crop. (Hocking,1993).

10. Silvicultural system: It is worked as accessory species to the more valuable species, sometimes it is raised in pure plantations. It is worked under some form of selection, or shelterwood or coppice system, at some places under clearfelling system.

11. Royalty rate: NRs. 100/cu.ft. for round logs at the stump site. (Forest rules, 1995).

12. Market price: NRs. 175-200/cu.ft. for round timber and NRs. 350-390/cu.ft. for sawn timber at the major urban centers in the Terai of Nepal. (Parajuli *et. al.*, 1997).

13. Conservation status: It is endangered plant species in many parts of Nepal due to continuous habitat degradation and other deforestation activities. (Parajuli *et. al.*, 1997).

(35)

| | |
|--------------------------|---------------------------|
| Local name: Bayer | |
| <i>Zizyphus jujuba</i> | Family: Rhemnaceae |

1. Natural occurrence: It is found in the Terai, the lower hills, and Duns and near pokhara up to about 1200m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are ovate to oblong-oval or nearly lanceolate, spines are usually two, one of them mostly recurved. |
| Flower | Flowers are small, yellow or green, usually in the short clusters in the leaf axils. |
| Fruit | Fruits drupe, oblong to ovoid or sub-globose & fleshy, yellow or red when ripen. |

| | |
|------|---------|
| Seed | Stones. |
|------|---------|

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Strong Light demander. |
| Frost | Frost hardy. |
| Drought | Drought resistant. |
| Fire | It recovers well after fire. |
| Soil | It grows on a wide range of soils, and will tolerate moderately saline soils. |
| Coppice | It coppices and pollards well and produces-root sucker. |
| Associates | It is often associated with sal forest. |
| Browsing | Browsing sensitive. Goats browse the young leaves. |
| Tree nature | It is a medium sized or even large bush, deciduous tree, found in both cultivated and naturalized forest land. |

4. Artificial regeneration:

| | |
|------------------------------------|---|
| Preferred Propagation | Direct sowing, entire palnting, stump planting, root-cutting, budding, ring-grafting. |
| Seed collection | Fruits ripen between December and March. |
| No. of seed kg⁻¹ | 1000-2500 cleaned dry stones kg ⁻¹ .Each stone contains two seeds. |
| Seed extraction | Seed shoud be extracted from the stone. |
| Seed storage | Orthodox seed. Seed should be stored in sealed container. |
| Viability of seed | The cleaned stone can be stored for up to five years in sealed container, though during this period viability drops from 95- 30%. |
| Seed treatment | Either stratification of seed in sand for 60-90 days at 5 ⁰ C or scarification of seed from the stone and treatment with sulphuric acid. |
| Seed sowing time | Seeds are sown during April or May. |
| Germination (%) | To store the seed for four months to let it after-ripen improves the germination. 95% when fresh seed down to 30% at 5 years when stored in tins. |
| Nursery Period | Seedling Seedling requires 15 months in the nursery. Stump Stump can be prepared from 15-months seedling. |
| Best planting size | 20-30 cm tall seedling. |

5. Wood properties:

| | |
|-------------------|---|
| Hardness | Wood is hard. |
| Weight | It weighs about 930 kgm ⁻³ .Wood is heavy. |
| Elasticity | Wood is elastic. |

6. Uses:

| | |
|------------------------|--|
| Timber | Heartwood of old trees are used for the manufacture of combs and turnery. |
| Fuel wood | It is a good fuel wood and makes excellent charcoal. |
| Fodder | Leaves are used as fodder. Leaves contain 12.6 to 16.9% crude protein. |
| Edible food | Fruit is edible and has a high content of vitamins C. |
| Tannin | Fruit contains 10% tannin. Bark contains 7% tannin. |
| Medicinal value | Leaves are laxative and prescribed in scabies and throat troubles.Seeds are edible and frequent eating of kernels increase the flesh and strength. |
| Others | It is grown as a hedge for fencing. |

CHAPTER: III

TREE SPECIES OF MID - HILLS

(1)

| | |
|-----------------------|------------------------------|
| L.N: Phirphire | E.N: Himalayan maples |
| <i>Acer oblongum</i> | Family: Aceraceae |

1. Natural occurrence: It is found in the outer Himalayas in ravines and moist valleys, and along stream banks on well-drained soil. In Nepal, it occurs between 1200 and 2400m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are simple, oblong or lance shaped and the rounded leaf base has three veins. |
| Flower | The flowers, which appear with the young leaves in the March-April, are small petals in the whorls of five. Flowers are borne in the bunches at the ends of leaf bearing branchlets. |
| Seed | The nuts are smooth and angular and very easy to recognize as they have two divergent wings. |
| Bark | Bark is grey, smooth with vertical wrinkles. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Light demander |
| Frost | Frost hardy. |
| Soil | Good drainage and porous soil is requiring for the best growth. |
| Coppice | It coppices well. |
| Associates | It is often associated with <i>Schima-Castanopsis</i> forest. |
| Browsing | Since leaves are palatable and nutritious, browsing causes severely damaged. |
| Tree nature | It is a medium-sized evergreen tree. |
| Others | The trunk is often buttressed at the base. |

4. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Seedlings. |
| Seed collectⁿ time | December-April. |
| No. of seed kg⁻¹ | 21,000 cleaned seeds kg ⁻¹ . |
| Seed extraction | Collected twigs with seed are spread in the sun to dry and separated by beating gently with a stick. |
| Seed storage | Orthodox seed. Seed should be dried thoroughly in the sun. |
| Viability of seed | Seeds remain viable for a very short time (up to 6 months). Sow seeds soon after collection. |
| Seed treatment | None. |
| Seed sowing time | March-April. |
| Nursery period | Seedling: 15 months. |

| | |
|---------------------------|---|
| Best planting size | 20-30cm tall with 3-5mm root collar diameter. |
|---------------------------|---|

5. Diseases of Phiphire:

The tree is susceptible to various diseases: **i). White sap rot:** is caused by *Trametes lactinea* **ii).** Several borers and defoliators also attack the tree.

6. Wood properties:

| | |
|------------------------|---|
| Wood color | The wood is white, turning pale greyish brown with age. |
| Hardness | Wood is moderately soft. |
| Working quality | It is easy to saw and work both by hand and on by machine, finishes well and takes a good polish. |
| Weight | Wood is moderately heavy. It weighs about 720 kgm ⁻³ . |
| Strength | Wood is not very strong. |
| Durability | Timber is not durable in open but it is fairly so under cover. |
| Seasoning | Timber season's well. It can be kiln-seasoned easily. |

7. Uses:

| | |
|------------------|--|
| Timber | The wood is used for making drinking cups and agricultural implements. |
| Fuel wood | It is comparatively a good fuel wood. |
| Fodder | A moderately good fodder tree. |

| | |
|--------------------------------|---|
| Local name: Lekh pangre | English name: Indian horse chest nut |
| <i>Aesculus indica</i> | Family: Hippocastanaceae |

1. Natural occurrence: It is found in the wet temperate forests of the western Himalayas, usually in moist depressions and ravines. It occurs between 1200 and 2700m but commonly found between 1900 and 2400m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are digitate, leaflets 5-9 oblanceolate or oblong. |
| Flower | White tinged with yellow and red in large thyroids panicles. |
| Fruit | Capsules are ovoid, rough outside, and leathery. |
| Seed | Seeds are 2-3, dark brown, smooth and shining. |
| Bark | Bark is grey when old, exfoliating upwards, in long and thin bands. |

3. Silvicultural characteristics:

| | |
|----------------|---|
| Light | Moderate light demander, require moist and shady place for its early development. |
| Frost | Moderate frost hardy. |
| Drought | Drought sensitive. |
| Soil | The tree is very handsome and generally found growing gregarious in rich, moist, deep, cool sites, and shady ravines. In dry and hot places, its growth is stunted. |
| Coppice | It coppices well up to a considerable size, and also produce root suckers. |

| | |
|---------------------------|---|
| Associates | It is characteristic of moist sites near streams in forest of <i>Pinus roxburghii</i> and <i>Quercus leucotricophora</i> . |
| Browsing | Since leaves are palatable and nutritious, browsing causes severely damaged. |
| Tree nature | It is a large deciduous tree with a short cylindrical bole and spreading crown, distributed in the Himalayas from Kashmir to west Nepal. |
| Meteoro. condition | In its natural habitat: absolute Max. Temp. 26-39 ⁰ C, absolute Min. Temp. -4 to -12 ⁰ C or perhaps lower. Normal annual rainfall 100- 250cm or more. |

4. Natural regeneration:

| | |
|-------------------------|---|
| Seed production | The capsules open & seeds 35-44 kg ⁻¹ fall to the ground during Oct to Nov. |
| Seed dispersal | Seeds are dispersed by gravity into depression, as they are smooth & rough. |
| Seed germination | Seeds lying in moist & protected by leaves & debris germinate successfully in the spring and establish themselves. Seedlings also found in large no. in loose, moist soil among stones boulders, which hold up the seeds. |

5. Artificial regeneration:

| | |
|--|--|
| Preferred propagⁿ | Seedlings. |
| Seed collecⁿ time | Far west: January, elsewhere: September onwards. |
| No. of seed kg⁻¹ | 35-90 seeds kg ⁻¹ . one fruit contains one seed. |
| Seed extraction | Capsule segments are peeled off carefully by hand. |
| Seed storage | Recalcitrant seed. Do not allow the seed to dry out. |
| Viability of seed | It can be stored for 4-5 months if kept moist, cool and aerated. |
| Pre-sowing seed treatment | It requires moist cold stratification; this can be done by sowing immediately in autumn & allowing over-wintering or by storing in pits. |
| Seed sowing time | February -March, if stored over winter. |
| Duratⁿ of germinⁿ | Usually starts 3-4 weeks after sowing. |
| Nursery period/Seedling | <2000m: 4-6 months, >2000m: an extra 12 months are needed i.e., 16-18 months. |

6. Wood properties:

| | |
|------------------------|--|
| Wood color | Wood is of a cream color. |
| Hardness | Wood is soft. |
| Working quality | It is easy to saw and work well. |
| Weight | Wood is moderately heavy, it weighs about 500kgm ⁻³ . |

7. Uses:

| | |
|--------------------|--|
| Timber | Wood is turned into cups, dishes and plates that are used to hold milk, ghee etc. by local people. |
| Fuel wood | It is comparatively a good fuel wood. |
| Fodder | It is not very high quality fodder. |
| Edible food | The fruit is fed to cattle and goats and local people eat embryo. |

3

| | |
|-------------------------|----------------------------|
| Local name: Utis | English name: Alder |
| <i>Alnus nepalensis</i> | Family: Betulaceae |

1. Natural occurrence: It occurs between 500-2700m, mostly above 900m. At lower altitudes; it prefers moist sites and shady aspects. According to Champion and Seth (1968) it occurs in Himalayan moist temperate forest.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are alternate, elliptical with prominent parallel veins. |
| Flower | Flowers are in male and female catkins. Male catkins: long and pendulous, Female catkins: short and rigid. |
| Fruit | Fruit is a small woody cone. |
| Seed | Seed is very small and winged. |
| Bark | Bark is silvery grey with horizontally pattern of raised swellings. |

3. Silvicultural characteristics:

| | |
|-------------------------------|--|
| Light | Light demander. It is a pioneer species, which grows well in full sunlight. |
| Frost | It is a moderate frost hardy, young seedlings are often defoliated by frost and very often killed. |
| Drought | In its natural habitat, the drought seldom occurs. |
| Fire | It is a fire resistant species, as it contains large amount of water, and found in moist sites. |
| Soil | It grows well on soils with high water content, but not in water-logged areas; common near river and stream; does not need high fertility; grow well in landslips, gully and open areas. |
| Coppice | Coppicing ability is severely affected with provenance and time of cutting. |
| Associates | Mostly pure forest but sometime it may be found in <i>Schima-castanopsis</i> forest. |
| Grazing & browsing | Seedlings are liable to damage by browsing. It is a relatively immune from browsing above 50cm height. |
| Tree nature | It is a large deciduous tree of Himalayas; tree having a sparsely branched with a straight cylindrical bole. |
| Other | It performs symbiotic relationship with <i>frankia</i> , an actinomycetes which forms root nodules to fix atmospheric N ₂ . |

4. Natural regeneration: It takes place through seeds. Seeds are dispersed by winds.

5. Artificial regeneration:

| | |
|--------------------------------------|---|
| Preferred propagⁿ | Direct planting, entire planting and bare-root planting. |
| Seed collectⁿ time | November-April. |
| No. of seed kg⁻¹ | 400,000-23,00,000 seeds kg ⁻¹ ; one tree yields at least 1 kg of fruits; about 8 kg of fruits give 1 kg of seed. |
| Seed extraction | Catkins are dried in the sun and shaken. The extracted seed is winnowed to clean out dust and chaff. |
| Seed storage method | Orthodox seed; seeds are thoroughly dried in the sun, and then put in polythene bag with seal- tight. |
| Viability of seed | Unstored seeds remain viable for only a few months while stored seed can remain viable for more than one year. |
| Seed treatment | None |
| Seed sowing time | <1500m: March, 15000-2000m: September, 2000-2500m: August, >2500m: frost is an increasing hazard. |

| | |
|---|--|
| Duratⁿ of germiⁿ | Germination starts 1-2 weeks after sowing, & completes 2 weeks later. |
| Nursery period/Seedling | Seedlings remain in nursery bed until July. <1500m: 4 months, >1500m: 11 months. |
| Best planting size | 25-30cm tall, root collar diameter is 3-4 mm. |

6. Forest pathogens:

Alder is attacked by defoliators, one of them are *Oreina spp* (Chrysomelidae). The larva of a cossid moth, *Zeuzera spp*, is a stem borer, which attack on this tree.

7. Wood properties:

| | |
|------------------------|---|
| Wood color | Sapwood is white and heartwood is reddish brown when fresh; turns to light brownish grey on exposure. |
| Working quality | It is easy to saw and work. |
| Weight | Wood is light 320-370 kgm ⁻³ . |
| Calorific value | Relatively low calorific value 18,230 kJkg ⁻¹ . |
| Durability | Wood is moderately durable. |
| Seasoning | Non-refractory wood to seasoning, it seasons well. |

8. Uses:

| | |
|-------------------------|---|
| Timber | It is a medium quality timber, used for simple construction, furniture etc. |
| Fuel wood | It is not a good fuel wood species in respect of calorific value but it dries rapidly and burns easily. |
| Fodder | Mature leaves are eaten by sheep and goats but not by cattle. |
| Tannin | Bark contains 7% tannin. |
| Ecological value | It is a shade tree for cardamoms. Direct sowing of seed is done for stabilizing landslips, moist ravines and roadsides. Tree is used for anti-erosion work. |
| Paper and pulp | Wood yields 39% pulp suitable for newsprint and for ordinary wrapping and writing a paper. |

(4)

| | |
|----------------------------------|---------------------------|
| Local name: Seto Chuletro | |
| <i>Brassaiopsis hainla</i> | Family: Araliaceae |

(1). **Natural occurrence:** 800-1800m. (2). **Silvicultural characters:** **Tree Nature:** A small evergreen tree. **Light:** Light demander. **Frost:** Moderately frost resistant. (3). **Artificial regeneration:** **Method of propagation:** From seed, hardwood cutting. **No. of seed/kg:** 25,000 to 35,000. **Time of seed collection:** June to July. **Seed nature:** Recalcitrant seed. **Seed treatment:** Flesh must be removed. **Sowing season:** May or June, immediately after collection. **Germination (%):** 80% from fresh seed **Duration of germination:** 3-4 weeks. **Crude protein content:** 22%. It is a good quality fodder tree.

(5)

| | |
|----------------------------------|---------------------------|
| Local name: Kalo chuletro | |
| <i>Brassaiopsis glomerulata</i> | Family: Araliaceae |

(1). **Natural occurrence:** 1200-2000m grow at higher altitude than B.hanila.(2). **Silvicultural characters:** **Tree Nature:** A small evergreen tree. **Light:** Light demander. **Frost:** Moderately frost resistant.(3). **Artificial regeneration:** **Method of propagation:** From seed, hard-wood cutting. **Time of seed collection:** April. **Seed nature:** Recalcitrant seed. **Seed treatment:** Flesh must be removed. **Sowing season:** April-June, immediately after collection. **Germination (%):** 80% from fresh seed **Duration of germination:** Starts 2-3 weeks and continue for 3-4 weeks.

6

| | |
|-------------------------|------------------------------|
| Local name: Gayo | |
| <i>Bridelia retusa</i> | Family: Euphorbiaceae |

1. **Natural occurrence:** It occurs up to 1200m in Nepal.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are rigidly coriaceous, lanceolate or ovate lanceolate, acute or acuminate. |
| Flower | Flowers are unisexual, small, and yellow in clusters on long, terminal or axillary panicle spikes. |
| Fruit | Drupes which are globose fleshy, purple-black. |
| Seed | 1-2 seeded. |
| Bark | Bark is grey or brown, exfoliating in irregular flakes. |

3. Silvicultural characteristics:

| | |
|---------------------------|---|
| Light | It will withstand moderate shade. |
| Frost | Seedlings: frost tender, mature trees: frost hardy. |
| Drought | Moderately drought resistant |
| Soil | It is capable of surviving on dry shallow soil. |
| Coppice | It coppices well and produces root suckers. |
| Associate | It is common associate of <i>Shorea robusta</i> forest. |
| Graze & browse | Trees are lopped for fodder, since leaves are palatable; it is severely browsed by cattle. |
| Tree nature | It is a shrub or medium to large deciduous tree. Young stems often with stout blunt thorns. |

4. **Natural regeneration:** It takes place through seeds, which are dispersed by birds.

5. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagaⁿ | Seedlings. |
| Seed collecⁿ time | Fruits ripen between November and March. |
| No. of seed kg⁻¹ | 10,000 to 18,000 seeds kg ⁻¹ . Each fruit contains 1 or 2 bony seeds. |
| Seed extraction | Pulp should be removed from the seeds before they are sown. |
| Viability of seed | Viability of seeds is rather short, about six months. |
| Seed treatment | Seed should be soaked in water for 24 hours. |
| Germinatⁿ percent | 75% from fresh seed. |

6. Wood properties:

| | |
|-------------------|---|
| Wood color | Sapwood: greyish white to grey, heartwood: grey or olive brown. |
| Hardness | Wood is moderately hard. |

| | |
|------------------------|---|
| Working quality | It is easy to saw and work well. It takes a good polish. |
| Weight | Wood is moderately heavy; weight is 830 kgm ⁻³ . |
| Durability | Timber is fairly durable. |
| Seasoning | Non-refractory wood to seasoning, it seasons without serious defects. The logs require conversion immediately after felling and are stacked open piles under cover. After proper seasoning and preservative treatment; it can be substitute for Sal and teak. |

7. Uses:

| | |
|------------------------|---|
| Timber | It is used for making carts, cart shafts, wheels and agricultural implements, and other tool handles. |
| Fuel wood | It is comparatively a good fuel wood. |
| Fodder | Leaves are a good cattle feed. Leaves contain 14-18% crude protein. |
| Edible food | Fruits are edible. |
| Tannin | Bark contains 16-40% tannin. |
| Medicinal value | Bark is a valuable astringent and is used in rheumatism. |

(7)

| | |
|---------------------------------|------------------------------------|
| L.N: Bhimsen pati | E.N: White butterfly bush |
| <i>Buddleja asiatica</i> | Family: <i>Buddlejaceae</i> |

1. Natural occurrence: It occurs in Nepal between 350 and 2000m. It is mostly distributed in tropical and sub-tropical regions.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are opposite, lanceolate, oblong or acuminate. |
| Flower | Flowers are white, fragrant, in erect or drooping terminal panicle spikes. |
| Fruit | Fruits are ellipsoid. |

3. Silvicultural characteristics:

| | |
|-----------------------------|--|
| Light | Light demander. |
| Frost | Seedlings: frost tender, Older trees: frost hardy. |
| Soil | They are mostly vigorous growers, easily cultivated under suitable conditions in any goods soils and in full sunshine. |
| Coppice | It coppices well. |
| Associates | At its lower range, it is an under storey of sal and at higher range, it is an under storey of pine forests. |
| Grazing & browse | Trees are lopped for fodder, since leaves are palatable; it is severely browsed by cattle. |
| Tree nature | It is a large sized evergreen tree. It is common on wasteland. |

4. Artificial regeneration:

| | |
|-------------------------------------|--|
| Preferred propagⁿ | Seedlings, stem cuttings. |
| Sed collectⁿ time | Fruiting: April, fruit ripening: end of May. |
| No. of seed kg⁻¹ | Seeds are very minute. Twenty million seeds kg ⁻¹ . |
| Seed storage | Orthodox seed; seed should be dried thoroughly in the sun. |
| Viability of seed | Viability of seed retains for at least one year. |

| | |
|--------------------------------|---|
| Nursery period/Seedling | At lower altitudes: about four months. At higher altitude: an extra 12 months are needed. |
| Best planting size | 20-30cm tall planting stocks. |

5. Wood properties:

| | |
|-----------------|-------------------------------------|
| Hardness | Wood is tough and moderately hard. |
| Weight | Wood weighs about 44 lbs per cu.ft. |

6. Uses:

| | |
|-------------------------|---|
| Timber | Wood of branches makes good walking sticks. |
| Fuel wood | It is comparatively a good fuel wood. |
| Fodder | It is a medium quality fodder. Leaves contain about 20% crude protein. |
| Edible food | Flowers and seeds are edible. |
| Ecological value | Plant is grown as an ornamental hedge and also suitable for growing on landslips. |
| Medicinal value | A concentrated infusion of the roots uses as the treatment of Malaria. |
| Others | The dried and powdered root is used by local people for the preparation of fermented liquor. Leaves are used as detergent on account of the presence of saponian. |

(8)

| | |
|--------------------------------|-------------------------|
| Local Name: Patle katus | |
| <i>Castanopsis hystrix</i> | Family: Fagaceae |

1. Natural occurrence: It grows between 1000-2500m. It is commonly found in east of Sun-koshi river and absent in the Far West. It is common in east and central Nepal. According to Champion and Seth it occurs in east Himalayan sub-tropical hill forest.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are lanceolate or narrowly elliptic. |
| Flower | Male spikes: numerous, female spikes: few. |
| Fruit | A spiny capsule |
| Seed | A smooth coated nut, nuts are 2-3. |
| Bark | Bark is grey or cinnamon brown. Young shoots are covered with hairs. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Moderately light demander. |
| Frost | Frost hardy. |
| Soil | Tree is often found on light soil, on a warm aspect and where the under growth is light. |
| Coppice | It coppices well. |
| Associates | It grows together with <i>Castanopsis tribuloides</i> , <i>Quercus lamellosa</i> and species of Lauraceae family. |
| Browsing | Browsing sensitive, liable to damage from browsing. |
| Tree nature | It is a large evergreen tree of mid-hills. |

4. Natural regeneration:

| | |
|----------------------------------|---|
| Seed production | A good seed year occurs once in three years. |
| Seed dispersal | Seed is dispersed by wind. |
| Seed germinatⁿ | Seed germinates well in rich, dark forest soil. |

5. Artificial regeneration:

| | |
|--|---|
| Preferred propagatⁿ | Entire planting (i.e. difficult due to long tap root), direct sowing stump planting, (i.e. are generally preferred). |
| Time of seed collectⁿ | Seeds are collected between Oct-Nov; fruits are collected immediately after they fall to prevent insect attack. |
| No. of seed kg⁻¹ | 600 nuts per kg ⁻¹ . |
| Seed extraction | Capsules are opened by hand. |
| Seed storage | Recalcitrant seed. Seed should not allow drying. |
| Viability of seed | Seed remains viable for a few months if stored moist, cool and aerated. |
| Seed treatment | Soak nuts in water for 24 hours before sowing, remove any that float. |
| Seed sowing time | Seeds are soaked in nursery beds immediately after collection. |
| Duratⁿ of germinatⁿ | Germination starts about four week after spring sowing and continues for another 3-4 weeks. If sown in autumn, germinates early in spring, 3-5 month later. |
| Germination (%) | Germination is 70-90%, germination is hypogeal. |
| Nursery Period | Seedling |
| | stump |
| Best planting size | <1800m, 15-16 month requires after spring sowing, >1800m, another year will be necessary. Stump made from one-year-old seedlings. Seedlings should be taller than 20cm. |

6. Parasites of Patle Katus:

Viscum articulatum, *Taxillus vestitus* and *Macrosolen psilanthus* are important parasites on this tree.

7. Wood properties:

| | |
|----------------------------|---|
| Wood color | Timber is light greyish-brown. |
| Hardness | Its wood is hard. |
| Working quality | It is easy to saw and work, and finish to a good surface. |
| Weight | Its timber is light to moderately heavy. Its wood weighs about 740kgm ⁻³ . |
| Strength | Timber is moderately strong. |
| Calorific value | Calorific value of completely dried wood is 4,842 calories. |
| Durability | Its wood is durable. |
| Preservative treat. | Heartwood is easy to treat but complete penetration is not always obtained. |
| Seasoning | Non-refractory wood to seasoning. |

8. Uses:

| | |
|--------------------|--|
| Timber | Timber is suitable for construction work, railway slipper after creosote treatment, cheap furniture. |
| Fuel wood | It is a good fuel wood species. |
| Fodder | Leaves are of good fodder. |
| Edible food | Its nuts are edible. |
| Tannin | Bark and leaf contain (11-13%) and 12% tannin respectively. |

| | |
|--------------------------------|--------------------------------------|
| Local name: Dhale katus | E. N.: Indian or oak chestnut |
| <i>Castanopsis indica</i> | Family: Fagaceae |

1. Natural occurrence: It grows between 1200-2900m. It prefers high rainfall areas, common from Annapurna to eastern districts, as rainfall decreased it is decreased by *C. tribuloides*. According to Champion and Seth (1968), it occurs in east Himalayan sub-tropical wet hill forest.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are elliptic-oblong or oblong-lanceolate, alternate, leathery. |
| Flower | Male and female flowers are in different spikes, flower appear in Sep. |
| Fruit | Nut enclosed in a capsule that is densely covered with prickles, fruit ripens between Oct-Dec. |
| Seed | A smooth coated nut, (1-3) nut per capsule. |
| Bark | Bark grey. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Moderately light demander. |
| Frost | Frost hardy species. |
| Soil | It prefers deep fertile, well-drained, moist soil. It is sensitive to water logging. |
| Coppice | It coppices well. |
| Associates | It is a common associate of <i>Schima wallichii</i> . |
| Browsing | Browsing sensitive, liable to damage from browsing by cattle. |
| Tree nature | It is a moderate to large sized, evergreen tree, native to mid-hills |

4. Natural regeneration:

It takes place from the seed. Seeds are dispersed by wind. Seed germinates well in rich dark forest soil.

5. Artificial regeneration:

| | | |
|--|--|---|
| Preferred propagatⁿ | Entire planting, direct sowing, stump planting. | |
| Time of seed collectⁿ | Oct-Nov. | |
| No. of seed kg⁻¹ | 1300 nutkg ⁻¹ . | |
| Seed extraction | Capsules are opened by hand. | |
| Seed storage | Recalcitrant seed; seed should not be allowed to dry. | |
| Viability of seed | Seed remains viable for a few months if stored moist, cool and aerated. | |
| Pre-sowing Seed treat. | Moist, cool stratification is needed; pit storage provides good stratification treatment. | |
| Seed sowing time | Seeds are sown in nursery beds immediately after collection. | |
| Duratⁿ of germinatⁿ | Germination starts about four weeks after spring sowing and continues for another 3-4 weeks. If sown in autumn, germinates early in spring, 3-5 month later. | |
| Germinatⁿ percent | 70-90%. | |
| Nursery period | Seedling | <1800m, 15-16 month requires after spring sowing, >1800m, another year will be necessary. |
| | Stump | Stump made from one-year-old seedling. |
| Best planting size | Seedlings should be taller than 20cm. | |

6. Wood properties:

| | |
|----------------------------|--|
| Wood color | Sapwood: yellowish white. Heartwood: greyish brown. |
| Hardness | Wood is moderately hard and rough. |
| Working quality | It is easy to saw and very easy to split. |
| Weight | Wood weighs about 700kg ⁻³ , is moderately heavy. |
| Seasoning | Moderately refractory wood to seasoning, timber seasons fairly well but liable to end splitting. |
| Grain & Texture | Wood has more or less irregularly, inter-locked grains and medium coarse textured. |

7. Uses:

| | |
|------------------------|--|
| Timber | Wood is used for constructional work, paneling in railway compartments, handles of axes etc. |
| Fuel wood | It is a good fuel wood species. |
| Fodder | A good fodder having 15% crude protein and 29% crude fibre. |
| Edible food | Fruit is edible. |
| Tannin | Bark contains 6-12% tannin, leaves contains 10% tannin. |
| Medicinal value | Bark showed anti-cancer activities in mice. The extract of stem-bark and stem show anti-viral activity against <i>Ranikhet</i> disease virus. A paste of leaves is applied for headache. |
| Others | Leaves are used for wrapping <i>Bidis</i> . |

(10)

| | |
|--------------------------------|-------------------------|
| L.N: Musure Katus | |
| <i>Castanopsis tribuloides</i> | Family: Fagaceae |

1. Natural occurrence: It occurs throughout Nepal from altitudinal range of 450-2300m. It is only katus found in the far-west region.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves lanceolate, oblong or ovate-lanceolate. |
| Flower | Male spikes: paniculate or fascicled, female spikes: solitary. |
| Fruit | A spiny capsule. |
| Seed | Nuts are 1-3. |
| Bark | Bark is dark grey, corky outside. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Moderately light demander. |
| Frost | Young seedlings are frost tender but mature trees are frost hardy |
| Soil | It grows on a variety of soil types; it needs less rainfall than <i>Castanopsis indica</i> . |
| Coppice | It coppices vigorously. |
| Associates | It often associates with <i>Schima wallichii</i> and <i>Quercus lamellosa</i> . |
| Browsing | Browsing sensitive, liable to damage from browsing by cattle. |
| Tree Nature | It is a moderate sized evergreen tree. |

4. Natural regeneration:

| | |
|---------------------------------|--|
| Seed productⁿ | Good seed year occurs once in three year. |
| Seed dispersal | Seed is dispersed by wind. |
| Seed germ. | Seed germinates well in rich dark forest soil. |

5. Artificial regeneration:

Note: Artificial regeneration of Musure Katus is same as Patle Katus except 400 nuts kg⁻¹.

6. Disease, Pests and Parasites of Musure Katus:

- 1). Young trees are liable to damage by the larva of a moth, *Zeuzera spp.*
- 2). The angiospermic parasites *Helixanthera ligustrina*, *Macrosolen psilanthus* and *Scurrula pulverulenta* are reported on this tree.

7. Wood properties:

| | |
|-------------------|---|
| Hardness | Wood is moderately hard. |
| Weight | Its wood weighs about 600 kgm ⁻³ . |
| Durability | Wood is not much durable. |

8. Uses:

| | |
|--------------------|---|
| Timber | Timber is suitable for construction work, railway sleepers after creosote treatment, cheap furniture etc. |
| Fuel wood | It is used as fuel wood, makes poor charcoal. |
| Fodder | Leaves are used as a fodder having (10-12%) crude protein. |
| Edible food | Nuts are used as food. |
| Tannin | Wood contains 16% tannin; bark contains 6-14% tannin. |
| Others | It is a multipurpose tree. |

(11)

| | |
|---------------------------|---------------------------|
| Local name: Bohori | |
| <i>Cordia dichotoma</i> | Family: Cordiaceae |

(1). **Natural occurrence:** 200 to 1500m. (2). **Silvicultural characters:** **Tree Nature:** Deciduous tree. **Light:** Moderate shade bearer. **Frost:** Frost tender. **Fire:** Fire tender. **Coppices:** Coppices and pollards well. **Soils:** Grows best on deep moist sandy loams. (3). **Artificial regeneration:** **Method of propagation:** i). Seed ii). Cutting. iii). Stumps. **No. of seed/kg:** 5000 to 8500 stones kg⁻¹. **Time of seed collection:** August to December. **Seed nature:** Orthodox seed. **Duration of germination:** 4-8 weeks. **Crude protein content:** 12-15%.

(12)

| | |
|--------------------------------|---------------------------|
| Local name: Rakchan | |
| <i>Daphniphyllum himalense</i> | Family: Cordiaceae |

(1). **Natural occurrence:** 1400 to 2300m. (2). **Silvicultural characters:** **Light:** shade tolerant species. **Frost:** Frost hardy. **Coppice:** Coppices and pollards well. **Associates:** Associate with Oak and Lauraceae. (3). **Artificial regeneration:** **Method of propagation:** i). Seed ii). Hardwood cutting. iii). Layering. **No. of seed/kg:** 600 to 700 drupes kg⁻¹. **Time of seed collection:** August to December. **Seed treatment:** May be i). Mechanical scarification ii). Stratifying the seed in cold. **Seed nature:** Orthodox seed. **Germination (%):** Variable.

(13)

| | |
|-------------------------------|------------------------------|
| Local name: Phaledo | |
| <i>Erythrina arborescence</i> | Family: Papilionaceae |

(1). **Natural occurrence:** 1500-3000m. (2). **Silvicultural characters:** **Tree nature** deciduous tree. **Light:** Light demander. **Frost:** Frost hardy. **Coppice:** It coppices well. **Associates:** It is commonly associated with *Schima-Castanopsis* forest. **Soil:** Deep-fertile and well- drained soil. (3). **Artificial regeneration: Method of propagation:** i). Entire planting ii). Cuttings. **No. of seed/kg:** 2000 seeds kg⁻¹. **Viability of seed:** 5 years. **Time of seed collection:** April and June **Seed nature:** Orthodox seed. **Sowing season:** Spring season. **Germination (%):** 90%. **Duration of germination:** 3 weeks. **Crude protein content:** 17%.

| | |
|----------------------------|------------------------------|
| Local name: Phaledo | |
| <i>Erythrina stricta</i> | Family: Papilionaceae |

(1). **Natural occurrence:** 1000-1600m. (2). **Silvicultural characters:** Same as *E. Arborscence*.

(3). **Artificial regeneration:** Same as *E. arborscence* except seed collection time is Nov. to March.

| | |
|----------------------------|------------------------------|
| Local name: Phaledo | |
| <i>Erythrina suberosa</i> | Family: Papilionaceae |

(1). **Natural occurrence:** 900-1200m. (2). **Silvicultural characters:** Same as *E. arborscence*. (3). **Artificial regeneration:** Same as *E. arborscence* except seed collection time is Nov. to March.

(14)

| | |
|-----------------------------------|-------------------------|
| Local name: Thulo Jhingane | |
| <i>Eurya acuminata</i> | Family: Theaceae |

(1). **Natural occurrence:** 1300-2700m. (2). **Silvicultural characters:** **Tree nature** deciduous tree. **Light:** Light demander. **Frost:** Frost hardy. **Drought:** Drought hardy. **Associates:** It is commonly associated with *Eurya cerasifolia*. **Soil:** Grow on poor soil . (3). **Artificial regeneration: Method of propagation:** i). Entire planting ii). Direct sowing. **Time of seed collection:** Berries are collected between Nov.and Feb. **Viability of seed:** Short viability. **Sowing season:** Immediately after collection. **Crude protein content:** 7%.

| | |
|----------------------------------|-------------------------|
| Local name: Sano Jhingane | |
| <i>Eurya cerasifolia</i> | Family: Theaceae |

(1). **Natural occurrence:** 900 to 2300m. (2). **Silvicultural characters:** Same as *E. acuminata* except it is often associated with *E. acuminata*. (3). **Artificial regeneration:** Same as *E. acuminata* except time of seed (berries) collection is May and June. **Crude protein content:** Poor quality fodder.

(15)

| |
|--------------------------|
| Local name: Pipla |
|--------------------------|

| | |
|------------------------------|------------------------|
| <i>Exbucklandia populnea</i> | Family: Hamamelidaceae |
|------------------------------|------------------------|

(1). **Natural occurrence:** 1300-2100m. (2). **Silvicultural characters:** Tree nature Evergreen. **Light:** Shade bearer. **Frost:** Frost sensitive. (3). **Artificial regeneration:** **Method of propagation:** i). Entire planting ii). Direct sowing. **No. of seed/kg:** 200,000 seeds kg⁻¹. **Viability of seed:** 1 year. **Time of seed collection:** Dec-Jan. or March. **Seed nature:** Orthodox seed. **Sowing season:** April to May. **Germination (%):** 19% (Lab test in Nepal). **Duration of germination:** 2-4 week. **Crude protein content:** 17%.

(16)

| | |
|----------------------------|------------------|
| Local name: Lankuri | |
| <i>Fraxinus floribunda</i> | Family: Oleaceae |

1. **Natural occurrence:** It occurs throughout Nepal between 1200-2700m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are oppositely arranged, compound in 3-4 pairs and a terminal leaf. Edges of leaflets are finely toothed |
| Flower | The small white, scented flowers, which appear between March and April, are borne in bunches at ends of twigs. |
| Fruit | A samara. |
| Seed | Winged seed cannot be separated from the fruit. |
| Bark | Young tree: grey and smooth, older tree: rough and deeply fissured longitudinally with age. |

3. Silviculture characteristics:

| | |
|--------------------|---|
| Light | It is a light demander species; seedling needs full over sunlight while older trees cannot tolerate some shade. |
| Frost | Seedlings are frost sensitive but mature trees are frost hardy. |
| Soil | Its growth is best on deep, moist soils, but it can tolerate difficult sites. In India, it is often associated with calcareous soil but in Nepal it is frequently found on non-calcareous soil. |
| Coppice | It coppices well. |
| Associates | It is often found in <i>Schima-Castanopsis</i> forests and also sometimes as an under storey to <i>Pinus roxburghii</i> . |
| Browsing | Trees are lopped for fodder. Since leaves are palatable, it is severely browsed by cattle. |
| Tree Nature | It is a deciduous tree of moderate to large sized with a rounded crown. |

4. Natural regeneration:

| | |
|-------------------------|--|
| Seed production | Seeds ripen in September-January. |
| Seed dispersal | Seeds are dispersed by wind. |
| Seed germination | Seeds remain dormant throughout the monsoon and germinate in the next monsoon. |

5. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagaⁿ | Direct sowing, entire planting, cuttings. |
| Time of seed collection | September-January. |
| No. of seed kg⁻¹ | 60,000 samaras per kg. |
| Seed extraction | Keep green samaras in the shade and does not allow drying out. |
| Seed storage method | Brown seed is orthodox, put thoroughly dried seed in a polythene bag, seal tightly and keep in a cool place. Green seed: recalcitrants, do not dry in the sun, sow immediately after collection. |
| Viability of seed | Brown seed: remain for 3 years. Green seed: very short. |
| Seed treatment | Brown seed: Require a season of warmth followed by cold to overcome dormancy. Green seed: none. |
| Seed sowing time | Brown seed: February -March, green seed: September - October. |
| Duration of germination | Green seed: At lower altitude, starts in 2-4 weeks. At higher altitude, in the following March. Germination completes within 2 weeks. |
| Germination (%) | Green seed: Usually 70%. |
| Nursery period | Seedling: <1500m: 9-10 months for green seed. >1500m: 21-23 months. |
| Best planting size | 20-30 cm tall with root collar diameter of 3mm or larger. |

6. Wood properties:

| | |
|------------------------|---|
| Wood color | The wood is white with a light red tinge. |
| Hardness | It is hard and tough wood. |
| Working quality | It saws and works well; it takes a good polish. |
| Weight | Wood weighs about 770kgm ⁻³ . |

7. Uses:

| | |
|------------------------|--|
| Timber | Timber is used for oars, ploughs, and carrying poles. |
| Fuel wood | Wood is used as fuel. |
| Fodder | Leaves contain 7.5% crude protein content. A good quality fodder for cattle. |
| Medicinal value | Juice can be extracted from the stem, has laxative properties. |

(17)

| | |
|----------------------------|------------------------------|
| Local name: Puwanle | |
| <i>Ilex excelsa</i> | Family: Aquifoliaceae |

(1). **Natural occurrence:** 600 to 2100m. (2). **Silvicultural characters:** **Tree nature** Medium sized evergreen tree. (3). **Artificial regeneration:** **Method of propagation:** i). Entire planting. **No. of seed/kg:** 70,000 seeds kg⁻¹. **Viability of seed:** 3 years. **Time of seed collection:** July and Sept.. **Seed nature:** Orthodox seed. **Seed treatment:** Seed mixes with sand and keep in cold place. **Sowing season:** April to May. **Crude protein content:** 10-11%.

(18)

| | |
|--------------------------|-----------------------------|
| Local name: Okhar | English name: Walnut |
| <i>Juglans regia</i> | Family: Juglandaceae |

1. **Natural occurrence:** It occurs throughout Nepal from 1200-2500m. According to Champion and Seth (1968) it is found in moist temperate forest.

2.

3. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are alternate, imparipinnate, leaflets 5-13, sub-sessile, elliptic to oblong-lanceolate. |
| Flower | Male flowers: in long drooping catkins, female flower: single or two to three together at the end of young shoots. |
| Fruit | Fruit is a green drupe with leathery exocarp, endocarp hard, woody wrinkled. |
| Seed | A nut. |
| Bark | Bark is grey, longitudinally fissured. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | A light demander tree. |
| Frost | Frost hardy. |
| Soil | It occurs naturally on especially deep, moist, well-drained, boulders alluvium, near streams. It does not grow well on stiff, badly drained or acid soils. |
| Coppice | It coppices well. |
| Associates | Its associates: in western: <i>Quercus leucotricophora</i> , <i>Aesculus indica</i> , <i>Acer spp.</i> , in eastern: <i>Quercus lamellosa</i> . |
| Browsing | Young seedlings are liable to damage by browsing. |
| Tree nature | It is a large deciduous and monoecious tree. |
| Others | It cannot tolerate strong wind. |

4. Natural regeneration:

| | |
|---------------------------------|---|
| Seed productⁿ | Natural regeneration takes place on gentle slope with loose but deep, fairly moist soil. |
| Seed dispersal | Seed dispersal takes place by gravity. |
| Seed germination | Birds, monkeys and rodents destroy large quantities of seeds. A fair degree of warmth and soil moisture is necessary for germination. |

5. Artificial regeneration:

| | |
|-------------------------------------|---|
| Preferred propagⁿ | Direct sowing, entire planting, bare-root seedlings, stump planting. |
| Seed collection time | Seeds ripen between September and December. |
| No. of seed kg⁻¹ | 35-120 nuts kg ⁻¹ . |
| Seed extraction | Remove the flesh by hand. |
| Seed storage method | Recalcitrant seed; seed can be stored for a year or more, if kept moist, cool, and aerated. |
| Viability of seed | One year or more if properly stored. |
| Seed treatment | Requires moist cold stratification. |
| Seed sowing time | Seeds are sown either immediately after collection or in February after pits storage over winter. |
| Duration of germⁿ | Spring-sown seed usually takes 1-2 months for germination. |
| Germination (%) | Germination is 70-80%, hypogean. |
| Nursery period | Seedling: <1500m: 5-8 months, >1500m: another year will be |

| | |
|--|-----------|
| | required. |
|--|-----------|

6. Forest pathogens: Leaf diseases are caused by *Erysiphe polygoni* and *Phyllactinia guttata*.

7. Wood properties:

| | |
|----------------------------|--|
| Wood color | Sapwood: Broad, greyish white. Heartwood: Greyish brown in color. |
| Hardness | Wood is moderately hard. |
| Working quality | The wood is easy to saw and work. It finishes to a smooth shiny surface, takes a fine polish. |
| Weight | Wood weighs about 28-46 lb/cu ft. |
| Strength | It is a strong wood. |
| Durability | Walnut timber is durable under cover, but not so in exposed situations. It is resistant to white ants and fungus attack. |
| Preserva. treat. | It does not require any antiseptic preservative treatment. |
| Seasoning | Medium refractory wood to seasoning, wood seasons slowly and requires considerable attention. |
| Grain & texture | Wood is straight-grained, medium and even-textured. |

8. Uses:

| | |
|------------------------|---|
| Timber | Timber is suitable for rifle parts and gunstocks. One of the best woods for furniture and carving gives extremely beautiful plywood and veneer, use in musical instrument. |
| Fuel wood | It is a very good fuel wood. |
| Fodder | The oil cake is rich in protein and is used as cattle feed. Twigs and leaves are lopped for fodder. |
| Edible food | Fruits are edible; it is also valued in confectionery and in ice creams. The kernel contains vitamin 'A' and ascorbic acid. The kernels yield 60 to 70 % of a drying oil, known as walnut oil, which is used for edible purposes. |
| Tannin | Green walnut nulls, shells, bark and leaves are used for dyeing and tanning. |
| Medicinal value | Leaves are rich in ascorbic acid, carotene and an olive brown volatile oil. Leaves and barks are used in eczema, herpes, scrofula and syphilis. Fruits are used as alterative in rheumatism. Aqueous extracts of fresh leaves possess strong bactericidal action against <i>Bacillus anthracis</i> and <i>Corynebacterium diphtheria</i> . Unripe fruit is used as fish poison. Green walnut shells are used as hair dye. |

(19)

| | |
|---------------------------------------|------------------------------|
| Local name: Jhingat, Hallongre | |
| <i>Lannea coromandelica</i> | Family: Anacardiaceae |

(1). **Natural occurrence:** Terai to 1400m. (2). **Silvicultural characters:** **Tree nature** Evergreen tree. **Light:** Strong light demander. **Frost:** Frost tender. **Fire:** fire resistant. **Coppice:** It coppices well. **Associates:** Associate with sal forest. **Soil:** Grow on sandy soils. (3). **Artificial regeneration: Method of propagation:** i). Hardwood cutting ii).Seed. **No. of seed/kg:** 5500 to 10,000 seeds kg⁻¹. **Viability of seed:** 3 years. **Time of seed collection:** May and June. **Seed**

nature: Recalcitrant seed. **Sowing season:** Immediately after collection. **Germination (%):** 80-90%.

(20)

| | |
|--------------------------------------|-------------------------|
| Local name: Bhusure, Ghurmiso | |
| <i>Leucosceptrum canum</i> | Family: Labiatae |

(1). **Natural occurrence:** 1000 to 2800m. (2). **Silvicultural characters:** **Tree nature:** Evergreen shrub or small tree. **Coppice:** Coppices freely. **Associates:** Under storey of *Schima-Castanopsis* forest. **Soil:** Moist shady ravines. (3). **Artificial regeneration:** **Method of propagation:** i). Hard wood cutting ii). Seed. **Germination (%):** 80%. It is only used for fodder.

(21)

| | |
|--------------------------|-----------------------------|
| Local name: Champ | |
| <i>Michelia champaca</i> | Family: Magnoliaceae |

1. Natural occurrence: It occurs between 600-1500m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are ovate to lanceolate, coriaceous. |
| Flower | Flowers are usually axillary, solitary, yellow or fragrant. |
| Fruit | Fruit is fleshy capsule that opens. |
| Seed | Seed is brown, angular, with pink fleshy aril. |
| Bark | Bark is grey or brownish. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Moderately light demander, seedling and sapling will grow under high shade. |
| Frost | Frost hardy. |
| Drought | In its natural habitat, the drought seldom occurs. |
| Fire | Sensitive to fire. |
| Soil | Grow well in moist; well drained, deep and fertile soil .It does not stand water-logging. |
| Coppice | Coppice well; does not produce root suckers. |
| Associates | It is mostly found in <i>Schima-Castanopsis</i> forest. |
| Browsing | Young seedlings are liable to damage by browsing. |
| Tree nature | It is a very light, evergreen tree with a straight cylindrical bole. |
| Other | It is a very fast growing species. It produces numerous epicormic branches. |

4. Natural regeneration:

| | |
|---------------------------------|--|
| Seed productⁿ | Seed production is obtained almost every year. |
| Seed dispersal | Seed dispersal takes place by wind. |
| Seed germination | Germination of seed is hampered as birds & rodents destroy much of seed. |

5. Artificial regeneration:

| | |
|-------------------------------------|---|
| Preferred propagⁿ | Entire planting, stump planting, direct sowing. |
| Seed collection time | Seed is collection between August-September. |

| | |
|------------------------------------|---|
| No. of seed kg⁻¹ | 1000 seeds kg ⁻¹ . |
| Seed extraction | The collected fruits spread in the shade for 2-3 days until they open. Seeds are removed by gentle threshing. |
| Seed storage Method | Recalcitrant seed should not be dried in the sun; it should be kept in cool, moist and aerated place. It should be buried underground, putting in a fine wire mesh bag. |
| Viability of seed | Viability of seed is very short about two weeks. |
| Seed treatment | Arils must be removed. |
| Seed sowing time | Seed should be sown from Sep- Dec within a few days of collection. |
| Germination (%) | 85% from fresh seed. |
| Nursery period | Seedling: < 1000m, 9-10 month. >1000m, a second year is necessary. |
| Best planting size | Seedling should be 30-40 cm tall. |

6. Wood properties:

| | |
|-------------------------------|---|
| Wood color | Wood is yellowish to olive brown. |
| Hardness | It is a soft wood. |
| Working quality | The timber is easy to saw, works to a smooth surface and takes a good surface. |
| Weight | Lightwood, wood weighs about 460-660 kgm ⁻³ at 12% moisture content, specific gravity is 0.53. |
| Calorific value | C.v of heartwood is 21,300 KJkg ⁻¹ . |
| Durability | Timber is not very durable. |
| Preservative treatment | Heartwood is refractory to treatment, side and end penetration of preservatives being practically nil, sapwood can be easily treated. |

7. Uses:

| | |
|-------------------------|---|
| Timber | Wood is used for posts, boards, veneers, furniture, decorative fitting, carving and shipbuilding. |
| Fuel wood | It is a good fuel wood. |
| Fodder | It is a good fodder species. |
| Edible food | Fruits are edible. |
| Tannin | Bark yields tannins. The flower yields a yellow dye used for dyeing textiles. |
| Eco. value | A variety of silkworms are rear on the tree. |
| Medicinal values | The seed contains 32.2% of fat, a resin and resin acids. The seed fat is used in the medicine. Fruits and seeds are useful for healing cracks in feet. Bark is stimulant, diuretic and febrifuge. |
| Others | Suitable for making pencils. Flowers are distilled to produce perfumes; |

(22)

| | |
|--------------------------------|-------------------------|
| Local name: Rani salla | E.N: Chir pine |
| <i>Pinus roxburghii</i> | Family: Pinaceae |

1. Natural occurrence: It occurs between 400-2000m altitudes. It grows up to 2700m in western Nepal.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are in cluster of three, long, light green, needle shaped. |
| Flower | Flowers are conelets. Male flower: about 1.5cm long, arranged in the form of cones, female flower: female cone, solitary, woody, |
| Fruit | Fruits are woody cones, wings, membranous. |
| Seed | Winged seed. |
| Bark | Bark is dark grey, often reddish, deeply fissured, rough, and exfoliating in longitudinally elongated plates. |

3. Silvicultural characteristics:

| | |
|--|--|
| Light | Strong light demander. |
| Frost | Frost hardy species. |
| Drought | Drought resistant. |
| Fire | It is fire hardy due to thick insulating bark, but damage from the fire is considerable since highly resinous tree found on dry, hot slopes/aspects. |
| Soil | It prefers well-drained, light-textured, warm, and dry southern aspects. |
| Coppice | It is a non coppicer. |
| Associates | Associates of lower limit: <i>Shorea robusta</i> , <i>Gmelina</i> , <i>Litsea</i> , <i>Bauhinia</i> and <i>Anogeissus spp.</i> Associate of upper limit <i>Pinus wallichiana</i> , <i>Quercus incana</i> , <i>Rhododendron arboreum</i> , <i>Lyonia ovalifolia</i> , |
| Browsing | Cattle and sheep do not graze, since leaves are unpalatable to livestock. |
| Tree nature | It is a large, monoecious, evergreen, resiniferous tree. The chir is typically gregarious tree forming pure forests but it often occurs mixed with other species mainly at lower and upper limit. |
| Meteorological conditⁿ | In pure chirpine forest: absolute Max. Temp (32 to 38 ^o C), absolute Min. Temp. falls below freezing point, normal annual rainfall: (100-175cm). |
| Others | It can tolerate a wide range of soil pH. It has a massive root system and is more or less wind firm. Its root has a good symbiotic relationship with <i>Mycorrhiza</i> . |

4. Natural regeneration:

| | |
|----------------------------------|---|
| Seed production | Seeds fall mostly from April to June. Certain amount of seed produces every year but good seed year occurs once in every 4-5 years. |
| Seed dispersal | Seed is dispersed by wind. |
| Seed germinatⁿ | Germination is best on bare ground such as abandoned cultivation or burnt areas. Germination commences at the beginning of the monsoon. |
| Establishment | Establishment of seedling is greatly influenced by light, drought, and topography, soil, under growth, fire, grazing and grass cutting. |

5. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Seedling: direct sowing, entire planting. |
| Seed collectⁿ time | Seeds collect between January and March when the cones turn brown. |
| No. of seed kg⁻¹ | 8,000-12,300 sees kg ⁻¹ . 100 cones yield about 450 gm of seed. |
| Seed extraction | The cone should spread on a tarpaulin in the sun until fully open, |

| | |
|--|--|
| | then knocked together to dislodge the seeds. |
| Seed storage | Orthodox seed. Dry the seeds thoroughly in the sun. Properly dried seed can be stored in sealed plastic bags for more than one year and store in a cool place. |
| Viability of seed | Viability of seed is more than one year if seed is properly dried. |
| Pre-sowing seed treatment | Generally it is not required, sometimes seed may soaked in cold water for 2-3 days before sowing. |
| Seed sowing time | Nursery: <1000m February-March, >1000m: August –September. |
| Duration of germinaⁿ | Germination begins after 8-10 days, & is completed in another 10-20 days. |
| Germination (%) | Germination is usually obtained 70-90%. |
| Nursery period | Seedling: <1000m: 4-5 months, 1000-2000m: 10-11 months. |
| Best planting size | 20-30 cm tall seedling. |

6. Forest pathogens: Important diseases of Chir pine:

- i) **Pine swertia felt rust:** caused by *Cronartium himalayense*,
ii) **Needle rust:** caused by *Coleosporium campanulae*.

7. Wood properties:

| | |
|-------------------------|--|
| Wood color | Sapwood: White to creamy white, heartwood: light red when first exposed, turning reddish brown with age. |
| Working quality | It is easy to saw and work by hand or by machine, though its resinous nature tends to clog saw teeth. |
| Weight | Wood is heavy; it weighs about 650 kg m ⁻³ . |
| Strength | Its wood is somewhat weak. |
| Calorific value | C.v is about 21,200 kJkg ⁻¹ . |
| Durability | The timber is not very durable in exposed situations, but durable under cover. |
| Preserva. treat. | Wood requires preservative treatment. |
| Seasoning | Non- refractory wood to seasoning. |

8. Uses:

| | |
|------------------------|--|
| Timber | It is used for constructional purposes, furniture, packing cases, electric transmission poles, and railway slipper after treatment. |
| Fuel wood | It burns rapidly and, a good fuel wood. |
| Edible food | The seeds are eaten by inhabitants of hilly areas. |
| Tannin | Bark contains 11-14% tannin. |
| Gum and resin | Turpentine is used in the pharmaceutical preparations, perfumery industry, and insecticide and also as solvent. |
| Medicinal value | The turpentine oil is valued in medicine, acts as an expectorant and is useful in chronic bronchitis. |
| Paper and pulp | The chirwood is suitable raw materials for making pulp and paper. |
| Industrial uses | Turpentine oil is one of the basic raw materials for the synthesis of terpene chemicals which are used in variety of industries such as adhesive, paints, soaps, cosmetics, etc. |

Uses of Chirpine Rosin:

1). The rosin is obtained as solid residue in the distillation of the terpentine oil from the oleoresin.2). The yield of rosin is about 75% of the quantity of oleoresin distilled.3). The rosin is principally used in paper, soap, cosmetics, paint, varnish, and rubber and polish industries.4). It is used as an ingredient of printing inks, casein glues.5).It is used in the manufacture of fire works, match compositions, shell explosives, insecticides.6). Rosin is a source of rosin oil, rosin spirit, rosin pitch and abietic acid.

Uses of Pine needle oil: The young twigs and fresh needles yield a valuable essential oil, is known as pine needle oil which is used in the scenting of soaps, in both preparations, room sprays, deodorants and similar products.

(23)

| | |
|--------------------------|-----------------------|
| L.N.: Gobre salla | E.N: Blue pine |
| <i>Pinus wallichiana</i> | Pinaceae |

1. Natural occurrence: It occurs between 1800-3600m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are needle like in clusters of five, bluish green, persisting partly for 2-3 years. |
| Flower | Male flowers: catkins like, arranged in clusters, yellow to light brown. Female flower: solitary, cylindrical, light brown. |
| Fruit | Fruit is a long, soft deciduous cone. |
| Seed | Seeds are ovoid, wings membranous. |
| Bark | Bark is smooth and resinous in young stems, turning grey and corky with shallow fissures on mature trees. |

3. Silvicultural characteristics:

| | |
|---------------------------------|---|
| Light | Strong light demander. |
| Frost | Frost hardy, it suffers from snow, the crowns break and young trees develop curvature at the base. |
| Drought | Seedling may suffer from the drought after the end of monsoon and again in April and May. |
| Fire | Resistant to fire, blue pine is less fire resistant than chitpine. |
| Soil | It prefers well-drained, porous soil, and will grow on limestone soil. |
| Coppice | It is a non-coppicer. |
| Associates | Blue pine frequently associates with deodar, spruce, silver fir, oaks, <i>Rhododendron arboreum</i> <i>Lyonia ovalifolia</i> , <i>Populus ciliata</i> etc. |
| Browsing | It has immune to protect itself from browsing. |
| Tree nature | It is a tall, evergreen, resinous tree with spreading or drooping branches. |
| Meteorological condition | In natural sites: absolute Max Temp: 37.8 ⁰ C, absolute Min. Temp. -18 ⁰ C, annual rainfall varies from 100-190cm. Throughout its habitat, heavy snow fall occurs during winter |
| Others | It can tolerate the competition from shrub and weed growth. Root system is superficial, it is massive and the tree is firm. |

4. Natural regeneration:

| | |
|---------------------------------|---|
| Seed productⁿ | Seeds are shed at the end of the monsoon in October and November. |
|---------------------------------|---|

| | |
|-------------------------------|---|
| Seed dispersal | Seeds are dispersed by wind. |
| Seed germiⁿ | Blue pine regenerates profusely because i) . Fertile seed commences to be produced at an early age of about 10- 15 years. ii) . Good seed year are frequent. iii) . There is hardly any year when trees do not bear sufficient amount of seed. |
| Establishment | Blue pine establishes well if seedlings are protected from fire and grazing, and obtains abundance of light. |

5. Artificial regeneration:

| | |
|-------------------------------------|--|
| Preferred propagⁿ | From seedling only: direct sowing, entire planting. |
| Seed collection time | Seeds are collected between Oct and Nov. Usually adequate seeds produce each year. Collecting period is short as seed is quickly shed. |
| No. of seed kg⁻¹ | 15,000-30,000 seeds kg ⁻¹ . Seed trees can give 100 or more cones. |
| Seed extraction | The cones should spread on a tarpaulin in the sun until fully open, then knocked together to dislodge the seeds. |
| Seed storage method | Orthodox seeds, put thoroughly dried seed in a polythene bag, seal tightly and store in a cool place. |
| Viability of seed | Seed retains viability for more than a year if stored in an airtight container. |
| Seed treatment | None. |
| Seed sowing time | <2000m: March-April, >2000m August –September. |
| Duration of germⁿ | Germination takes place in 2-3 weeks, but it greatly varies. |
| Germination (%) | Germination achieves 20-90% depending on source and freshness of seed. |
| Nursery period | Seedling: <2000m: 14-15 month, >2000m: 22-23 month. |
| Best planting size | 15-20 cm tall seedling require before planting. |

6. Disease, pests and parasites of Blue-pine:

i). Fomes heartrot: caused by *Fomes pini*. **ii). Stem blister rust:** caused by *Cronartium ribicola*. **iii). Root and butt rot:** caused by *Armillaria mellea*. **iv). Flowering plant parasites:** The dwarf mistletoe *Arceuthobium minutissimum* is a common parasite of blue pine.

7. Wood properties:

| | |
|----------------------------|---|
| Wood color | Sapwood: whitish, heartwood: light pink to red with darker striations. |
| Hardness | Its wood is soft. |
| Working quality | One of the easiest woods to saw, machine and bring to a good finish. |
| Weight | Its wood is moderately heavy, wood weighs about 480 kgm ⁻³ . |
| Strength | Its wood is weak. |
| Calorific value | C.v is about 20,900 KJkg ⁻¹ . |
| Durability | Wood is durable under cover but not so durable in exposed situations. |
| Preserva. treat. | Its wood requires thorough preservative treatment. |
| Seasoning | It is a non-refractory wood to seasoning. It seasons well and is not so liable to twist and warp as that of <i>Pinus roxburghii</i> |
| Grain & Texture | Straight and fairly even grained, medium fined textured wood |
| Other | The rotation period is about 120-180 years. |

8. Uses:

| | |
|-------------------------|--|
| Timber | The wood of blue pine is considered to be the best among indigenous pines. It is used as constructional work, furniture, cheap pencils, musical instrument, match boxes etc. |
| Fuel wood | It is an excellent fuel wood and makes an excellent charcoal. |
| Fodder | Leaves are unpalatable to animals & goats but buffaloes will browse buds. |
| Edible food | Seeds are eaten either raw or roasted. |
| Tannin | The bark contains a fair amount of coloring matter and is sometimes used for dyeing silk and wool. |
| Gum and resin | It produces a good resin, but the yield is less than that of <i>Pinus roxburghii</i> , so it is not generally tapped for resin. |
| Ecological value | It is widely used for afforestation in ravine lands, dry and rocky areas, denuded hill slopes, land slips and scree, road side plantation etc. |
| Medicinal value | The roots yield an oil, which is applied by the workers in the paddy fields to keep off water insects. |
| Paper and pulp | It is suitable for the manufacture of bleached and unbleached Kraft papers by the sulphate process. |
| Others | Bark is used for roofing. On distillation, the crude oleoresin gives 27.5% of terpenic oil and 68% rosin. |

(24)

| | |
|---------------------------|-------------------------|
| Local name: Painyu | |
| <i>Prunus cerasoides</i> | Family: Rosaceae |

1. **Natural occurrence:** It occurs in Nepal between 1200-2400m throughout Nepal.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are deciduous, alternate, apex-long pointed and a double-toothed margin. |
| Flower | Flowers are often appear before the new leaves, are very attractive, borne in clusters at the end of the branches. |
| Fruit | Fruit a red fleshy drupe or cherry, each with a single seed. |
| Seed | Seed contains within a hard stone. |
| Bark | The bark is grey brown, shiny and patterned with irregular horizontal bands of raised corky patches. The bark of older trees tends to peel off in strips. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Seedling: tolerate some shade, older trees: light demander. |
| Frost | Seedling: frost tender, older trees: frost hardy. |
| Soil | It is more tolerant of poor soil conditions than most species except pines. |
| Coppice | It coppices as well as produces root suckers well. |
| Browsing | Trees are lopped for fodder, since leaves are palatable, severely browsed by cattle. |
| Tree nature | It is a medium to large sized deciduous or evergreen tree. |

4. Artificial regeneration:

| | |
|--------------------------------------|---|
| Preferred propagⁿ | Seedlings, root suckers, cuttings. |
| Seed collectⁿ time | March- May. |
| No. of seed kg⁻¹ | 2500-3200 seeds kg ⁻¹ . |
| Seed extraction | Fruit is soaked in water, rubbed together and rinsed well. |
| Seed storage | Orthodox seed should be dried thoroughly in the sun. |
| Viability of seed | Viability of seed retains for a year. |
| Seed treatment | Soak the seed in water for 2-3 days. |
| Seed sowing time | <1500m: March–April when seed is fresh, >1500m: late August to early September. |
| Duration of germⁿ | Germination completes within 2-3 weeks. |
| Germination (%) | Up to 85%. |
| Nursery period | Seedling: <1500m: 3-4 month, >1500m: 10-11 month. |
| Best planting size | 20-30 cm tall with root collar diameter of 3mm or larger. |

5. Wood properties:

| | |
|------------------------|--|
| Wood color | Sapwood: whitish and lustrous, heartwood: reddish brown. |
| Hardness | Moderately hard wood. |
| Working quality | It saws and works well, it takes a good polish. |
| Weight | Wood weighs about 720 kgm ⁻³ . |
| Strength | Wood is strong. |
| Calorific value | 19,100 KJkg ⁻¹ . |
| Durability | Wood is durable. |
| Seasoning | It seasons well. It is resistant to fungus and insect attack and works to a good finish. |

6. Uses:

| | |
|------------------------|---|
| Timber | It is used for making building and making ornamental furniture. The wood of saplings, branches and root suckers make excellent walking sticks and umbrella crooks. Its timber is suitable for the manufacture of the gunstocks. |
| Fuel wood | It is a good quality fuel wood. |
| Fodder | Leaves contains 6% crude protein, are fed to sheep and goats but not cattle. |
| Edible food | Fruits are edible. |
| Tannin | Bark is used for tanning. |
| Medicinal value | The smaller branches are crushed and soaked in water and taken internally to stop abortion. Kernel is used as a remedy for stone and gravel. |
| Others | Seeds are used in the necklaces. |

| | |
|---------------------------|--------------------------|
| L.N: Thulo phalant | English name: Oak |
| <i>Quercus lamellosa</i> | Fagaceae |

1. Natural occurrence: It is found in east and central Nepal at altitude between 1600 and 2800m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are broadly oblong to lanceolate, sharply serrate. |
| Flower | Male spikes: solitary, female spikes: solitary or in short spikes. |
| Fruit | Fruits: acorns that is stackless. |
| Seed | A corn. |
| Bark | Bark is grey-brown with rough spots. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Seedlings are moderately shade tolerant but sapling stage onwards the tree develops best with full overhead light. |
| Frost | Frost hardy. |
| Drought | Drought resistant. |
| Fire | It is very susceptible to damage by fire. |
| Soil | It grows well on deep, well- drained, moist soils and on clay loam. |
| Coppice | It coppices very well. It does not produce root suckers. |
| Browsing | Seedlings are severely damaged by browsing animals. |
| Associates | It is frequently associated with Lauraceae (<i>Litsea</i> , <i>Cinnamomum</i> , <i>Machilus</i> , and <i>Lindera</i> etc.). In wet areas, it forms very dense forest with abundant epiphytes. |
| Tree nature | It is a large evergreen tree. |
| Growth rate | Its mean annual girth increment is about 1.2-2.0 cm. |

4. Artificial regeneration:

| | |
|-------------------------------------|---|
| Preferred propagⁿ | Direct sowing, entire planting, stump planting. |
| Seed collection time | Seeds ripen between Oct & Dec. About one year in three is a good seed year. |
| No. of seed kg⁻¹ | 25-30 seeds kg including the cups, 150-250 seeds after removal of cups. |
| Seed extraction | Remove the cups by hand. |

Note: Other information of artificial regeneration is same as *Quercus leucotricophora*.

5. Wood properties:

| | |
|-------------------|--|
| Wood color | The wood is light russet to greyish brown. |
| Hardness | Its wood is hard. |
| Weight | Wood is very heavy-to-heavy. Wood weighs about 940 kgm ⁻³ . |

6. Uses:

| | |
|------------------|--|
| Timber | Wood is used for oars, ploughs and carrying poles. |
| Fodder | Leaves are used as fodder and contain 10% crude protein. |
| Fuel wood | Its wood is also used as fuel wood. |

| | |
|--------------------------------|-----------------------------------|
| L.N.: Sano banjh | E.N.: Fagaceae |
| <i>Quercus leucotricophora</i> | Syn: <i>Quercus incana</i> |

1. Natural occurrence: It occurs between 1650 and 2400m. It occurs abundant in central and western parts of Nepal; and scarce, rare or absent towards east.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are oblong or ovate–lanceolate with white or grey tomentum beneath. |
| Flower | Male flowers: male spikes densely hairy and clustered, female spikes: usually sessile. |
| Fruit | Fruits are fleshy, acorns single or in pairs. |
| Seed | Nut is ovoid, brown with a grey pubescence near the apex. |
| Bark | Bark is grey to greyish brown, silvery when young, peeling off in rounded flakes. |

3. Silvicultural characteristics:

| | |
|--------------------------|---|
| Light | Seedlings: shade tolerant for 2-3 years. Older saplings & poles: strong light demander. |
| Frost | Frost hardy. |
| Fire | Sensitive to fire. |
| Soil | It needs moderately fertile soils, growing well on clays derived from shales and clay loams but does not grow well on dry sites. |
| Coppice | It coppices well. |
| Associates | Its common associates are <i>Rhododendron arboreum</i> , <i>Cedrus deodara</i> , <i>Pinus roxburghii</i> , and <i>Pinus wallichiana</i> . |
| Browsing | Browsing sensitive. It suffers heavily by browsing and by frequent lopping. |
| Tree nature | A moderate sized to large evergreen tree. <i>Q.incana</i> , is gregarious, and sometimes form pure forests to a considerable extent. |
| Meteor. condition | In its natural habitat: Max.Temp. 35 ⁰ C, Min. Temp: < 0 ⁰ C, mean annual rainfall: 100 to 230 cm. |

4. Natural regeneration:

| | |
|---------------------------------|--|
| Seed productⁿ | One year in two is good seed year. |
| Seed dispersal | Seeds are dispersed by wind. |
| Seed germination | Destroying the seeds due to bears, monkeys, squirrels, rats, birds and insect damage, hampers germination of seed. |
| Establishment | Drought, grazing, grass cutting, and fires are key factors for establishment of seedlings. |

5. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | From seedlings only: direct sowing, entire planting. |
| Seed collectⁿ time | Seeds are collected between November and March. |
| No. of seed kg⁻¹ | 500-800 seeds kg ⁻¹ . |

| | |
|-------------------------------------|--|
| Seed extraction | Remove cups by hand. |
| Seed storage method | Recalcitrant seed. Khashru cannot be stored and should be sown within 2-3 days after collection. |
| Viability of seed | Viability remains for very short period. |
| Seed treatment | Generally it is not required. At higher altitude, moist and cold stratification gives better result. |
| Seed sowing time | February-March after stratification over winter. |
| Duration of germⁿ | It germinates after 4-8 weeks. |
| Germination (%) | Germination is usually high (60-80%). |
| Nursery period | Seedling: After 15-16 months for spring sowing. |
| Best planting size | Seedlings should be at least 20cm tall before planting out. |

6. Disease, pests and parasites of Sano banjh: **i). Heart rot:** caused by *Fomes spp* and *Polyporus spp.ii*). **Root rot:** caused by *Armillaria mellea*, *Fomes Annosusiii*). **Powdery mildew:** caused by *Sphaerotheca lanestris.iv*). Many parasites like *Loranthus* and *Viscum spp.* affect the tree.

7. Wood properties:

| | |
|-------------------------------|---|
| Wood color | The wood is light russet to light greyish brown. |
| Hardness | Its timber is very hard. |
| Working quality | It is easy to saw and works to a smooth surface and takes a bright polish. |
| Weight | Wood is very heavy, weighing about 1020kgm ⁻³ . |
| Strength | Wood is moderately strong. |
| Calorific value | Heartwood: 19,100KJkg ⁻¹ , sapwood: 19,400KJkg ⁻¹ . |
| Durability | It is moderately durable under cover, but liable to attack by large borers. |
| Preservative treatment | High refractory wood to seasoning. It is liable to split and warp severely and is very difficult to season. |
| Grain & texture | Straight or somewhat wavy grained, medium fine but uneven-textured wood. |

8. Uses:

| | |
|------------------------|--|
| Timber | It is not a good timber as it warps and splits badly. Use for low- grade construction and agricultural implements. |
| Fuel wood | It is a good fuel wood, makes extensively good charcoal. |
| Fodder | Leaves are of a great value as a fodder. It contains average crude protein about 10.6%. |
| Edible food | Birds, wild animals and cattle greedily eat seeds. |
| Tannin | Bark contains 6-23% tannin, wood contains of 4-5% of tannin. |
| Gum and resin | A sweet exudation is collected from the plant, is used in the preparation of confectionary. |
| Medicinal value | Acorns are used in the indigenous medicine as diuretic and in gonorrhoea and also as an astringent in indigestion and diarrhoea. |

Quercus semicarpifolia

Family: Fagaceae

1. **Natural occurrence:** It occurs between 1700 and 3800m altitude. It commonly occurs between 2400 and 3000m altitude especially in the west.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are elliptical or oblong, spinous toothed or entire. |
| Flower | Male spikes: crowded, female spikes: short, acorn subglobose, in clusters of 3 or more. |
| Fruit | Fruits are fleshy acorn. |
| Seed | A fleshy nut, which can be removed from the cup. |
| Bark | Bark is dark grey, exfoliating in irregular woody scales. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Strong light demander. |
| Frost | Frost hardy. |
| Fire | Sensitive to fire. |
| Soil | It tolerates the wide range of soil type. It needs moderately fertile soils, growing well on limestone as well as many other type of soil. It prefers warm, dry southern slopes and absent in high rainfall areas. |
| Coppice | It coppices well. It pollards fairly well. The growth of coppice shoot is very slow. |
| Associates | It associates with <i>Picea smithiana</i> . |
| Browsing | It is sensitive to browsing. |
| Tree nature | It is an evergreen or semi-evergreen tree. It is gregarious and forms a pure forest along the tops and upper slopes within its well-marked zone. |
| Meteo.cond. | Khasru forests occur in regions of heavy snowfall and moderate rainfall. |
| Other | It is slow growing species and difficult to raise in the nursery. |

4. Natural regeneration:

| | |
|-------------------------|---|
| Seed production | Natural regeneration takes place from seeds. One year in three is good seed year. |
| Seed dispersal | Seeds are dispersed by wind. |
| Seed germination | Destroying the seed due to bears, monkeys, squirrels, rats, birds and insect damage, germination of seed gets hampered. |
| Establishment | Drought, grazing and grass cutting, and fire are key factors for establishment of seedlings. |

5. Artificial regeneration:

| | |
|-------------------------------------|--|
| Preferred propagⁿ | From seedlings only: direct sowing, entire planting. |
| Seed collection time | Seeds are collected between June and August. Time of seed collection is important because acorns can begin to germinate while still on the tree. |
| No. of seed kg⁻¹ | 150-200 acorns kg ⁻¹ after removal of cups. |
| Seed extraction | Loose cups should be removed by hand. |
| Seed storage method | Recalcitrant seed. Khasru cannot be stored and should be sown within 2-3days after collection. |

| | |
|-------------------------------------|--|
| Seed treatment | Generally it is not required. At higher altitude, moist and cold stratification gives better result. |
| Seed sowing time | Seed should be sown immediately after collection in July- August. |
| Duration of germⁿ | Khashru seed starts to germinate 4-5 weeks after sowing. |
| Germinatⁿ percent | Germination is usually high (60-80%). |
| Nursery period | Seedling: Seedling should require 2-3 year in nursery bed. |
| Best planting size | Seedling should be at least 20cm tall before planting out. |

6. Disease, pests and parasites of Khasru: i). Root rot diseases: caused by *Ganoderma lucidum*, ii). **Heart rot:** caused by *Fomes spp*, *Hymenochate rubiginosa* and *Polyporus spp* .

7. Wood properties:

| | |
|----------------------------|---|
| Wood color | The wood is light pinkish brown to reddish brown. |
| Hardness | Its timber is hard. |
| Weight | Wood is heavy to very heavy. Wood weighs about 860 kgm ⁻³ . |
| Strength | Its wood is strong. |
| Durability | Its wood is durable. |
| Grain & Texture | The wood is straight to irregular grained, medium fine & uneven textured. |

8. Uses:

| | |
|-------------------------|--|
| Timber | It is used for constructional purpose and agricultural implements. |
| Fuel wood | Wood is an excellent source of fuel wood and charcoal. |
| Fodder | It is the most abundant fodder species; leaves contain 7.3% crude protein. |
| Tannin | Leaves and bark contain 8%, 7-11% tannin respectively. |
| Ecological value | Leaves are suitable for feeding the caterpillar of silkworm, <i>Antheraca pernyi</i> . |

(23)

| | |
|-------------------------|---------------------------|
| L.N: Bains | E.N: Willow |
| <i>Salix babylonica</i> | Family: Salicaceae |

1. Natural occurrence: It occurs between 1400 and 3650m altitude in Nepal.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are long, narrow pointed tips, and edges are finely toothed. |
| Flower | The flowers, which appear with the new leaves in February or March, pale yellow male and female catkins. |
| Seed | Seed capsules are stalkless, greenish in color, small and smooth. |
| Bark | Bark is fissured, rough and ridged. |

3. Silvicultural characteristics:

| | |
|----------------|--|
| Light | Light demander. |
| Frost | Frost hardy. |
| Drought | Drought does not generally occur in its natural habitat. |
| Fire | Fire resistant. |

| | |
|--------------------|--|
| Soil | The tree thrives well in clayey soils in swampy places along the banks of rivers and streams, preferring low elevations and warm climate so it is frequently planted on water logging areas. |
| Coppice | It coppices and pollards well. |
| Associates | It is after associated with <i>populus ciliata</i> . |
| Browsing | Trees are lopped for fodder, since leaves are palatable; it is severely browsed by cattle. |
| Tree nature | It is a small to moderate sized, short lived, ornamental deciduous and dioeciously trees, with spreading branches and drooping branchelets. |
| Others | Tree can withstand heavy lopping. Rate of growth is fast. |

4. Natural regeneration: It often takes place through seeds that are dispersed by wind.

5. Artificial regeneration: It mostly occurs through stem cuttings.

6. Wood properties:

| | |
|------------------------|---|
| Wood color | Wood is white. |
| Hardness | Wood is soft. |
| Working quality | It is easy to saw and work well. Wood is smooth and even grained .It takes a good polish. |
| Seasoning | It is non-refractory wood to seasoning. |

7. Uses:

| | |
|-------------------------|--|
| Timber | It is the best wood for cricket bats. Pliable branches are used for making basket. |
| Fuel wood | It is also used as fuel. |
| Fodder | Leaves are used for fodder. |
| Tannin | Bark and leaves contain 3-9% and 4.9% tannin respectively. |
| Ecological value | It is a very useful for stabilizing stream banks, landslips, and dam sides and for planting up swampy areas. |
| Medicinal value | Leaves and barks have astringent and tonic properties. Catkins and twigs are used as an antipyretic, and an infusion of leaves is given in rheumatism. |
| Paper & pulp | It is a suitable wood for preparing paper and pulp. |

(29)

| | |
|------------------------------|----------------------------|
| Local name: Gogan | |
| <i>Saurauria napaulensis</i> | Family: Sauraiaceae |

1. Natural occurrence: This is a tree of temperate Himalayas, occurring between 750-2100m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are grouped towards branch tips; leaves are large, on short stalks, finely toothed edges, and rust colored hairs on the underside. |
| Flower | The attractive pink flower, on short branches arising from leaf axils. |
| Fruit | The small fleshy fruit, which is green, turning to yellow when it ripens. In fruits, seeds are immersed in Jelly. |

| | |
|-------------|--|
| Seed | Seeds are tiny and brown. |
| Bark | Bark is reddish brown, and when old is vertically fissured and cracked into long rectangular scales. |

3. Silviculture characteristics:

| | |
|--------------------|---|
| Light | Shade bearer i.e., fairly tolerant to shade. |
| Frost | Seedling: frost tender, mature trees: frost hardy. |
| Soil | It is usually found in moist, shady localities such as the side of the ravines. It is a moderately tolerant to soil of low fertility. |
| Coppice | It coppices well. |
| Associates | It is found in <i>Schima-Castanopsis</i> forest. |
| Browsing | Seedlings are severely damaged by browsing. |
| Tree nature | It is a small to medium sized deciduous tree. |

4. Artificial regeneration:

| | |
|--------------------------------------|---|
| Preferred propagⁿ | Seedlings, cuttings, coppice. |
| Seed collectⁿ time | March-April. |
| No. of seed kg⁻¹ | 4-8 million seeds kg ⁻¹ . |
| Seed extraction | The fruit is placed in a cloth bag. The bag is squeezed under water to remove the jelly and rinsed several times in clean water. When all the jelly is removed, the bag containing seed is dried. |
| Seed storage method | Orthodox seed, put thoroughly dried seed in a polythene bag, seal tightly and keep in a cool place. |
| Viability of seed | Viability of a seed retains for a year. |
| Seed treatment | It is not required. |
| Seed sowing time | March-April. |
| Duration of germination | If seeds are sown in March-April, germination takes 3-6 weeks. If seeds are sown in between Sept. & Feb., germination takes considerable longer time. |
| Germination (%) | Germination usually around 22%. |
| Nursery period | Seedling: 14-15 months and can be planted out in July |
| Best planting size | 20-30 cm tall with root collar diameter of 3mm or larger. |

5. Wood properties:

| | |
|-------------------|---|
| Wood color | Wood is light pink. |
| Hardness | Wood is soft. |
| Weight | Wood is light and spongy. Wood weighs about 400 kgm ⁻³ . |

6. Uses:

| | |
|--------------------|---|
| Fodder | Leaves are used as an excellent fodder; leaves contain 12.2% crude protein. |
| Edible food | Ripe fruit is eaten. |
| Others | Leaves are used for plates. |

Schima wallichii

Family: Theaceae

1. Natural occurrence: It occurs between 900-2000m, common tree in eastern and central Nepal of mid-hills.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are simple and alternately arranged on branches, leathery, lance like and pointed tip. |
| Flower | Flowers, which appear in May, are small, fragrant, white and quite showy, borne singly. |
| Fruit | Fruit is a small, hard and brown woody capsule. |
| Seed | Seeds are very light and dispersed by wind. |
| Bark | Bark is grey and marked with vertical and disconnected fissures, and shallow streaks. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Moderately light demander. |
| Frost | Moderately frost hardy. |
| Soil | It can grow on a wide range of soil type. |
| Coppices | It coppices very well. |
| Associates | It is often associated with <i>Castanopsis spp.</i> , sometimes associated with <i>Pinus roxburghii</i> and <i>Shorea robust.</i> |
| Browsing | Browsing sensitive. |
| Tree nature | It is a large, evergreen tree. |
| Others | Dieback often caused by <i>Corticium salmonicolor.</i> |

4. Natural regeneration:

| | |
|------------------------|--|
| Seed production | Abundant and fertile seed produces annually. |
| Seed dispersal | Seeds are wing-shaped which are dispersed by wind. |
| Germination | For germination of seed, enough light is required. |

5. Artificial regeneration:

| | |
|-------------------------------------|--|
| Preferred propagⁿ | Entire planting. |
| Seed collecⁿ time | Seeds are collected between January and April. |
| No. of seed kg⁻¹ | 1,60,000-3,50,000 seeds kg ⁻¹ . |
| Seed extraction | Shaking and gentle threshing by placing the fruits in the sun for a few days until the seed open. |
| Seed storage method | Orthodox seeds, dry thoroughly in the sun then stored in the airtight container, and keep in cool places. |
| Viability of seed | Viability of seed is short. |
| Seed treatment | It is not required. |
| Seed sowing time | Seeds are sown immediately after collection. Generally seeds are sown in March or April for July planting. |
| Duration of germⁿ | Germination takes place in 1-3 weeks. |
| Germination (%) | 40%. |
| Nursery period | Seedling: 15 months. |
| Best planting size | 30-45cm.tall seedlings. |

6. Wood properties:

| | |
|----------------------------|--|
| Wood color | Wood is light reddish brown. |
| Hardness | Its wood is moderately hard. |
| Working quality | It is easy to saw and work with a smooth surface. |
| Weight | Wood weighs about 690kgm^{-3} . |
| Strength | In hardness, its wood is 15% below than teak. |
| Calorific value | Calorific value is about $20,500\text{KJkg}^{-1}$. |
| Durability | It is not very durable wood. |
| Preservative treat. | Heartwood is very difficult to treat, sapwood is readily treatable. |
| Seasoning | Highly refractory wood to seasoning, i.e., wood has tendency to warp and twist and also crack while it is seasoning. |

7. Uses:

| | |
|------------------------|--|
| Timber | It is used for house building, railway sleepers and planks. |
| Fuel wood | A good fuel wood. |
| Fodder | Medium quality fodder, it contains 9.6% crude protein, more valued for bedding than as a fodder. |
| Medicinal value | The young plants, leaves and roots are used medicinally against fevers and the bark is anthelmintic and rubefacient. |

CHAPTER: IV

TREE SPECIES OF HIGH HILLS

(1)

| | |
|------------------------------------|-------------------------|
| L.N.: Chingure, Gobre salla | E.N.: Silver fir |
| <i>Abies pindrow</i> | Pinaceae |

1. **Natural occurrence:** It is found between 2100 and 3000m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | The needles persist for three to six years; leaves are distichously. |
| Flower | Flowers are monoecious. Male catkins: long, sessile, and usually clustered. Female catkins: solitary or in distant pairs, erect, situated a little below the tips of shoots. |
| Fruit | An erect cone, which breaks up on the tree. |
| Seed | Seed is resinous with a large wing and a soft seed coat. |
| Bark | Bark is smooth on young stems, dark grey or greyish brown, deeply cleft with vertical fissures when old. |

3. Silvicultural characteristics:

| | |
|--------------------------------|--|
| Light | Shade bearer, it has little or no undergrowth under dense shade. |
| Frost | It is frost hardy. It suffers little from snow break. |
| Drought | Seedlings are drought sensitive, as they require a moist fresh soil for their best development. |
| Fire | Fire does not occur in silver fir forest. If fire occurs, it is more sensitive to injury than any other conifer of that region. |
| Soil | It prefers cool and moist locality with deep, rich soil, with heavy snowfall. It avoids dry, shallow soil and depressions. |
| Coppice | It is non-coppicer. |
| Associates | It is usually dominant but it may mix with others: broad leaf: <i>Juglans</i> , <i>Aesculus</i> , <i>Q.semicarpifolia</i> , and <i>Q. floribunda</i> , Conifers: <i>Tsuga dumosa</i> , <i>Picea smithiana</i> , <i>Pinus excelsa</i> . |
| Tree nature | It is a tall evergreen tree with dense conical crown. It is found on north and west facing slopes, usually in damp gullies but found in all aspects at higher altitudes. |
| Meteor.condⁿ | Seasonal snowfall is favorable to its regeneration. |
| Root system | The root system of silver fir is somewhat superficial, spreading and not very massive. Trees are apt to be thrown by wind on exposed situations. |

4. Artificial regeneration:

| | |
|-------------------------------------|---|
| Preferred propagⁿ | From seedlings: (i) Direct sowing (ii) Entire planting (iii) Bare-root stock planting which has been successful in higher altitude. |
| Seed collecⁿ time | Seeds are collected bet ⁿ Sep.- Oct., with good seed after every 3-4 years. |
| No. of seed kg⁻¹ | 27,000 seeds kg ⁻¹ . |

| | |
|--|---|
| Seed extraction | Seed should be dried in the shade and allow breaking naturally, do not force to open. Remove wings by gently rubbing, seeds in a cloth bag then winnow. |
| Seed storage method | Orthodox seed. Dry seed for several days in the sun, then put in a polythene bag, seal tightly and keep in a cool place. |
| Viability of seed | Viability of seeds retain for only six months. |
| Seed treatment | It may need moist, cold stratification, if collected from high altitude. |
| Seed sowing time | Seeds sow during Feb-Mar. Mycorrhizal associations are essential. |
| Duratⁿ of germⁿ | At 2000m , germination of unstratified seed starts about two weeks, and is completed within a month. At higher altitude , these periods will be longer. |
| Germination (%) | 75-90%, germination is epigeous. |
| Nursery period | Seedling: At least three years. |
| Best planting size | More than 20cm in height. |

5. Diseases, Pests and Parasites of silver oak:

(i) **Needle rust of spruce and fir:** caused by *Ceropsora piceae*, *Chrysomyxa deformans*, *Peridermium piceae*, *Perdermium thomsoni*, (ii) **Root rots:** caused by *Armillaria mellea*. (iii) **White pocket rot:** caused by *Fomes annosus*, *Polyporus tomentosus*. (iv) **Heart rot:** caused by *Fomes fomentarius*, *Fomes pini*, and *Fomes robustus*.

6. Wood properties:

| | |
|----------------------------|--|
| Wood Color | No difference in color between sapwood and heartwood. Wood is creamy white to pale yellow turning light brown on exposure. |
| Hardness | Its wood is soft to moderately hard. |
| Fissibility | It is extremely fissile. |
| Weight | 450kg/m ³ (28lbs./cu.ft.) at 12% moisture content. |
| Strength | Its wood is somewhat weak. |
| Durability | Its wood is fairly durable. |
| Preser. Treat. | It requires thoroughly preservative treatment, although it is refractory to treat. |
| Seasoning | It is non-refractory wood to seasoning. |
| Porous | A non-porous wood, growth ring distinct on all the three surfaces. |
| Grain & texture | Medium to fine and even textured with straight grain. |
| Other | It is very slow growing species. Resin canals absent. Woods are much knotty. |

7. Uses:

| | |
|-------------------------|---|
| Timber | It is suitable for all types of packing cases, containers and fruit cases. Wood, which is treated with preservative, is suitable for railway slipper, aircraft work, veneer, match etc. |
| Fuel wood | It is an important fuel wood tree. |
| Gum & resin | It gives very little resin. |
| Paper & pulp | Its wood is suitable for paper and pulp. |
| Others | Branches are used as litter. |

8. Royalty rate: NRs. 40/cu.ft. for round timber (Forest rules, 1995).

9. Marketing price: NRs. 350/cu.ft. for sawn timber at hilly urban center of Nepal (1997).

10. Conservation status: It is threatened species due to heavy felling & other deforestation works.

| | |
|--------------------------------------|-----------------|
| L.N. :Talispatra, bunge salla | |
| <i>Abies spectabilis</i> | Pinaceae |

1. Natural occurrence: It is found in central and western Nepal between 2400 and 4400m. It is found in higher altitudes than *Abies pindrow*.

2. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | It is a shade bearer. It has little or no undergrowth with under dense shade. |
| Frost | It is frost hardy; it suffers little from snow break. |
| Drought | Seedlings are drought sensitive, as they require moist soil for their best growth. |
| Fire | Young seedlings are very sensitive to fire. |
| Soil | It prefers cool and moist locality with deep, rich soil, with heavy snowfall. It avoids dry, shallow soil and depressions. |
| Coppice | It is a non-coppicer. |
| Associates | It forms almost pure forests between 3,000 and 3,600m. It is often associated with Juniper, various species of rhododendrons, maling bamboo <i>Arundinaria racemosa</i> . |
| Tree nature | A tree resembling <i>Abies pindrow</i> but usually more stunted and gnarled. It is an evergreen tree with thick spreading horizontal branches. |

3. Artificial regeneration:

| | |
|--|--|
| Preferred propagⁿ | From direct sowing, entire planting, wilding planting. |
| Seed collectⁿ time | September-January; good seed years are infrequent. |
| No. of seed kg⁻¹ | There are 8,500-12,000 seeds kg ⁻¹ . |
| Seed extraction | Seed should be dried in the shade and allow breaking naturally, do not force to open. Remove wings by gently rubbing, seeds in a cloth bags then winnow. |
| Seed storage | Orthodox seed, dry seed for several days in the sun, then put in a polythene bag, seal tightly and keep in a cool place. |
| Seed treatment | It may need moist cold stratification, if collected from high altitude. |
| Seed sowing time | February-March; mycorrhizal association is essential. |
| Duratⁿ of germⁿ | At 2,000m, germination of unstratified seed starts about two weeks, and is completed within a month. At higher altitude: these periods will be longer. |
| Germⁿ percent | Germination may obtain 55%. |
| Nursery period | Seedling: Seedling requires at least three years. |
| Best planting size | More than 20cm in height with 5-7mm root collar diameter. |

5. Wood properties:

Wood properties are similar to the *Abies pindrow*.

6. Uses:

Uses are similar to the *Abies pindrow*.

| | |
|------------------------------|----------------------------|
| Local name: Bhojpatra | English name: Birch |
| <i>Betula utilis</i> | Betulaceae |

1. Natural occurrence: It occurs in alpine region of Nepal and India between 2700 and 4200m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are stalked, ovate, unequally serrate & slightly hairy along mid ribs. |
| Flower | Male catkin few, perianth 4 –parted. Female catkin: solitary or in pair, perianth none. |
| Fruit | Fruits are erect catkins. Fruiting seasons: September to October. |
| Seed | Seeds are tiny winged and very light. |
| Bark | Bark is light colored, smooth and papery, peeling off in long thin strips. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | It is a strong light demander. |
| Frost | It is a frost hardy species. |
| Drought | It is a drought resistant. |
| Soil | Birch forest is occurring in open exposed tracts, which are under snow throughout the greater part of winter. It frequently occurs in gullies. |
| Coppice | It coppices well. |
| Associates | It is associated with <i>Rhododendron campanulatum</i> , <i>R. anthropogon</i> , <i>Abies spectabilis</i> , <i>Pinus wallichiana</i> , <i>Picea smithiana</i> , <i>Quercus spp</i> , <i>Juniperus spp</i> . |
| Browsing | Browsing sensitive. Seedlings are heavily damaged by browsing animals. |
| Tree nature | It is moderate sized, slow growing deciduous tree. |

4. Artificial regeneration:

| | |
|---|--|
| Preferred propagⁿ | Direct sowing, entire planting. |
| Seed collectⁿ time | Seed ripens between August and October. |
| No. of seed kg⁻¹ | 2.5 million Seeds kg ⁻¹ . |
| Seed extraction | Catkins are spreaded in the shade for several days, to let them fully yellow. Catkins are broken up by hand and sieve and winnow to clean. |
| Seed storage | Orthodox seed; should be dried thoroughly in the sun and stored in the sealed container in a cool and safe place. |
| Viability of seed | Viability of seed remains for about six months. |
| Seed treatment | It is necessary to stratify seed in cold, moist, sand for four weeks at higher altitudes. |
| Seed sowing time | Seeds are sown in March. |
| Duratⁿ of germination | Germinations begin after 2-3 weeks. |
| Germination (%) | Fresh seeds: 32% stratified stored seed: 65%. |
| Nursery period | Seedling: It requires at least two years in nursery. |
| Best planting size | 20-30 cm tall, root collar diameter 3mm or bigger. |

5. Uses:

| | |
|------------------|--|
| Timber | Timber is widely used for furniture, carpentry and construction. |
| Fuel wood | It is widely used as fuel wood. |

| | |
|------------------------|--|
| Fodder | Leaves are palatable and contain high protein content. |
| Eco. value | It is planted to stabilize the gully in higher altitude. |
| Medicinal value | Bark is antiseptic, carminative, used to heal up the wounds; also useful in bronchitis; disease of the blood and the ear, and in leprosy (Ayurveda). |
| Paper and pulp | Bark is used as a high quality writing paper. |
| Others | Bark is widely used in water proving, roofs, insulating, cracks in walls and making bottle stoppers. |

6. **Royalty rate:** NRs. 5/kg for dry bark. (Forest rules, 1995).

7. **Market Price:** NRs. 150/kg at major trading centers of Nepal. (Parajuli *et al.*,1997).

8. **Conservation status:** Its population is scarce due to heavy felling and other deforestation works.

(4)

| | |
|---------------------------|-----------------------------|
| Local name: Deodar | English name: Deodar |
| <i>Cedrus deodara</i> | Pinaceae |

1. **Natural occurrence:** It occurs in Nepal between 1,900 and 2,600m, usually on northwest and northeast facing slopes in Western Nepal.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Needles are 2.5-4cm long, in dense clusters at the end of short shoots. |
| Flower | Male flowers: appears June, Female flowers: appears August. |
| Fruit | Female cone ripens in late October to November. |
| Seed | Seeds are winged. Good seed year occurs once in three years. |

3. Silvicultural characteristics:

| | |
|---------------------------------|---|
| Light | It is a light demander but young seedlings require some side shade. |
| Frost & drought | It is frost hardy. It is sensitive to drought in seedling stage. |
| Graze & browse | Young seedlings are liable to damage by browsing. |
| Fire | Both seedlings and mature trees are sensitive to fire. |
| Tree nature | It is a very large, evergreen, an ornamental tree, extensively planted near the temples. |
| Coppice | It is a non-coppicer. |
| Soil | It grows on a verity of soils, but avoids stiff, badly drained soils; on shallow rocky soils, its growth is stunted. It occurs naturally on mountainous country with slope varying from moderate to precipitous as well as on level ground on river valleys at suitable elevation. Deodar forests are found on all important geological formations such as granite, gneiss, mica, shale, limestone, quartzite, etc. Its best growth is attained on deep fairly porous fertile soil and cool situations. |
| Associates | Deodar is a gregarious tree and frequently forms pure forests, but it also mixes other species such as <i>Pinus wallichiana</i> , <i>Picea smithiana</i> , <i>Cupressus torulosa</i> , <i>Taxus baccata</i> , <i>Quercus spp</i> , <i>Aesculus spp</i> , <i>Juglans regia</i> , <i>Rhododendron</i> , <i>Pyrus pashia</i> etc. |
| Meteor. cond^a | Its best growth is found where annual rainfall varies from 100-175cm. Its |

| |
|--|
| growth is failed if rainfall exceeds in Eastern Himalayas. |
|--|

4. Artificial regeneration:

| | |
|--------------------------------------|---|
| Preferred propagⁿ | Entire planting, direct sowing, bare root planting. |
| Seed collectⁿ time | The cones are collected between October-December. |
| No. of seed kg⁻¹ | 8,000 seeds kg ⁻¹ . |
| Seed storage | Orthodox seeds are dried in the sun so as to shed the winged seed. |
| Viability of seed | The seed loses its viability within about 4 months. So the seeds should be sown immediately after collection. |
| Seed sowing time | Seeds are sown in November and allow passing the winter and germinating in following spring. |
| Duration of germⁿ | Germination takes place about two weeks to start. |
| Germination (%) | Germination takes place 80-90%. |
| Nursery peri./seedling | One-year-old seedlings are planted in late autumn or early spring. |

5. Diseases, Pests and Parasites of deodar: Various diseases of deodar: (i) Root and butt rot: caused by *Fomes annosus*, **(ii) Root rot:** caused by *Armillaria mellea* **(iii) Witches broom:** caused by *Peridermium cedri*. **(iv) Butt rot and trunk rot:** caused by *Peniophora luna*.

5. Wood properties:

| | |
|------------------------|--|
| Wood Color | Sapwood is white & heartwood is yellowish brown turning brown on exposure. |
| Working Quality | The wood is easy to saw either by hand or by machine. It finishes to a moderate well. It cannot be efficiently wax-finished and takes varnish only moderately well. |
| Weight | Wood is light and weighs about 560 kgm ⁻³ . |
| Strength | It is the strongest of coniferous woods and about as strong as teak. |
| Calorific val. | Its calorific value is 5,294 calories. |
| Durability | It is the most durable coniferous timber. |
| Preserv. treat. | Due to the presence of a volatile chemical substance, which acts as a repellent, deodar is resistance to termite. Resistance against fungi can be increased by treating with preservative like creosote. |
| Seasoning | Timber seasons well without any difficulty under cover. Rapid drying leads to surface cracking and splitting. |
| Other | The wood is oily and characteristically scented. |

6. Uses:

| | |
|------------------------|--|
| Timber | Deodar is one of the most important and valuable timber. Primary use of deodar is for railway slipper. Timber is used for beams, rafters, frame work, door and furniture. It is an important construction timber. |
| Fuel wood | Its wood is an excellent fuel wood. |
| Tannin | Bark contains 8.25% tannin. |
| Medicinal value | The bark is astringent and useful in fevers, diarrhoea and dysentery. An alcoholic extracts of bark shows significant activity against diphtheria-bacteria and an aqueous extracts of the dried bark shows anti-inflammatory activity against acute and chronic inflammations. The wood possesses diaphoretic, diuretic and carminative properties and is useful in fever and in |

| | |
|-------------------------|---|
| | pulmonary and urinary disorders. The wood is one of the ingredients of the well-known ayurvedic preparations <i>Bhadradarvadi taila</i> , prescribes for diabetes, leprosy. |
| Paper & pulp | It can be used as a source of pulpwood. |
| Other | The timber is suitable for making high and medium quality pencils after suitable treatment. |

(5)

| | |
|---------------------------|------------------------------|
| Local name: Dhupi | English name: Cypress |
| <i>Cupressus torulosa</i> | Cupressaceae |

1. Natural occurrence:

In Nepal it is found between 1800 and 3500m in the west, its eastern limit being the Kali Gandaki valley.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are opposite, triangular and closely imbricate. |
| Flower | Flowers are monoecious; male flowers: cylindrical with numerous decussate peltate stamens; female flowers: globose cones. |
| Fruit | Mature cones. |
| Seed | Seeds are small, compressed and winged. |
| Bark | Bark is greyish brown, peeling off in long thin strips. |

3. Silvicultural characteristics:

| | |
|--------------------------------|---|
| Light | It is a moderate light demander. |
| Frost | Frost hardy. |
| Drought | It is one of the most drought tolerant tree species in Nepal. |
| Soil | It is commonly found on limestone but it may grow on dry and poor soil, but the growth is stunted. |
| Coppice | It is a non-coppicer. |
| Associates | It is usually associated with <i>Cedrus deodara</i> and is often dominant on very steep limestone slopes. |
| Tree nature | It is a large evergreen tree with a pyramidal crown; branches ascending; horizontal or drooping, curving markedly upwards towards the ends. |
| Meteo. condⁿ | It occurs in regions where the rainfall is 300mm or less. |

4. Natural regeneration:

| | |
|----------------------------------|---|
| Seed productⁿ | Ripe cones shed their seeds between Aug and Dec. while they are still on tree. |
| Seed dispersal | Seeds are winged and dispersed by wind. |
| Seed germinatⁿ | Germination takes place in next monsoon. |
| Establishment | Seedlings establish themselves on bare sites such as landslips and abandoned fields easily. |

5. Artificial regeneration:

| | |
|-------------------------------------|---|
| Preferred propagⁿ | Direct sowing, entire planting. |
| Seed collection time | Seeds ripen in April; are shed until August; are collected in June. |
| No. of seed kg⁻¹ | There are 1,70,000 to 2,50,000 seeds kg ⁻¹ . |
| Seed extraction | Seeds are extracted by drying the cones, and later beating. |
| Seed storage method | Seeds are stored in sealed container and at cool place. |
| Viability of seed | Viability of seed remains for 18 months, and then falls off rapidly. |
| Seed sowing time | August- December. |
| Germination (%) | Germination is sporadic. (50-60) % germination takes from fresh seed. |
| Nursery period | Seedling: Seedlings need about 15 months in the nursery. |

6. Diseases, pests and parasites: **Diseases: i). Rusts** are caused by *Gymnosporangium distortum* and *G. cunninghamianum* **ii). Branch cankers** are caused by *Monochaetia unicornis*.

7. Wood properties:

| | |
|------------------------|---|
| Wood Color | Heartwood is light brown, fragrant and an excellent quality wood. |
| Hardness | Wood is moderately hard. |
| Working Quality | It is easy to saw and work; finishes to a smooth clean surface. It does not exude any oil so it can be beautifully painted or polished. |
| Weight | Wood weighs about 600 kgm ⁻³ . It is heavy wood. |
| Strength | It is a strong wood. |
| Durability | Timber is very durable. |
| Seasoning | It is a non-refractory wood to seasoning. |

8. Uses:

| | |
|-------------------------|---|
| Timber | Timber is used for bridge building, house construction and furniture; also suitable for sleepers and aircraft work. |
| Fuel wood | It is used for fuel wood. |
| Ecological value | It is planted as an ornamental tree. |
| Others | Its timber is used for pencil manufacture. Wood is burnt as incense. |

6

| | |
|--------------------------|------------------------------|
| Local name: Dhupi | English name: Juniper |
| <i>Juniperus indica</i> | Cupressaceae |

1. Natural occurrence:

It is found in alpine scrub forests between 2,700m and 4,000m. According to Champion and Seth (1968), it is found in East Himalayan dry forest alpine scrub.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are in whorls of 3, linear-subulate, sharply pointed, Upper surface: concave glaucous, bluish white. Lower surface: bluntly keeled. |
| Flower | Flowers are usually dioecious, axillary. Flowers appear in March-April. |
| Fruit | Fruits sub-globose, bluish black when ripe. Fruits ripen in Aug-Sept. of the 2 nd year. |
| Seed | Seeds are usually three, elongated and ovoid. |

| | |
|-------------|------------------------|
| Bark | Bark is reddish brown. |
|-------------|------------------------|

3. Silvicultural characteristics:

| | |
|---------------------------------|---|
| Light | It is a moderate light demander. |
| Frost | It is a frost hardy. |
| Drought | It is the most drought resistant species. |
| Coppice | Unlike other conifers, it coppices. |
| Associates | It is the only tree in such areas but has an open shrubby under storey. |
| Meteor. condⁿ | It occurs in regions having 350 and 500mm rainfall. |

4. Natural regeneration:

| | |
|---------------------------------|--|
| Seed productⁿ | Fruits ripen in August-September. |
| Seed dispersal | Seeds are dispersed by birds. |
| Seed germination | Natural regeneration is often difficult due to heavy grazing pressure in the alpine areas. |
| Establishment | For establishment of seedling, strict protection from grazing is necessary. |

5. Artificial regeneration:

| | |
|--|---|
| Preferred propagⁿ | i). Entire planting: for raising seedlings, the seed should be sown in the trays, and the seedlings pricked out in the polytube when they reach a height of 2-3cm, ii). Short side cutting: taken in Oct-Nov. |
| Seed collection time | Seeds are collected between June and September. |
| Seed storage method | Seed needs cold stratification over winter before it is sowing. |
| Viability of seed | Seeds viability can retain for 20 years. |
| Seed treatment | Seeds soak in hot water for few minutes to increase the germination. |
| Duratⁿ of germⁿ | Germination may take up to two years. |
| Germination (%) | Germination is very irregularly. |

6. Wood properties:

| | |
|------------------------|--|
| Wood Color | Wood is pinkish or reddish brown. |
| Hardness | Wood is moderately hard. |
| Working Quality | Wood is extremely fissile, easy to saw and work. |
| Durability | Wood is very durable. |
| Seasoning | Wood is non-refractory to seasoning. |
| Other | Wood is fragrant and highly resinous. |

7. Uses:

| | |
|-------------------------|---|
| Timber | Timber is used for fencing, veneering, turnery, and also used for making lead pencils. |
| Fuel wood | It is an excellent fuel wood; it can be burnt even when green. |
| Edible food | Juniper fruits are used in the preparation of alcoholic's beverages. |
| Tannin | Bark is used for tannin; the fruits and roots yield brown and purple dyes respectively. |
| Ecological value | It is planted as an ornamental tree. |
| Medicinal value | The fruits and volatile oil possess carminative stimulant and diuretic properties and are useful in dropsy. These are also used in disorders of the urino-genital tract such as gonorrhoea, leucorrhoea. The wood is diuretic |

| | |
|-----------------------|--|
| | and blood purifier, used in rheumatism and cutaneous diseases. |
| Cedar wood oil | The wood on steam-distillation yields 1-3% of a volatile oil, is known as cedar wood oil which is used in insecticides, perfumery, soaps, cleaning and polishing preparations. |
| Others | Juniper needles are rich in ascorbic acid; they also contain resin, wax and esters. The wood and young twigs are burnt as incense. |

| | |
|---------------------------------|-----------------------------|
| Local name: Jhulle salla | English name: Spruce |
| <i>Picea smithiana</i> | Family: Conifereae |

1. Natural occurrence:

It is found at elevations of 2,000 to 3,800m, chiefly to the west of Himal Ganesh.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are dark green; spreading all round the shoots; incurved- needle, persisting for a no. of years. |
| Flower | Male flowers: monoecious, axillary, catkin-like, greenish yellow; Female cones: solitary, terminal, ripe cones cylindrical ovoid. |
| Fruit | Cones are terminal, cylindrical & pendulous after fertilization & dark brown when ripe. |
| Seed | Seeds are obliquely oblong and dark-grey. |
| Bark | Bark is brownish grey, furrowed, exfoliating in small scales. |

3. Silvicultural characteristics:

| | |
|---------------------------------|---|
| Light | It requires certain amount of shade in early stage, but once established complete overhead light is necessary for optimum development. |
| Frost | It is frost hardy. |
| Fire | Fire does not occur in the spruce forest, if it occurs, spruce is severally affected. |
| Soil | It occurs on various geological formations; the most common being mica, schist, shale, gneiss, and limestone. |
| Coppice | It is a non-coppicer. |
| Associates | It is associated with <i>Abies pindrow</i> , <i>Cedrus deodara</i> , <i>Pinus wallichiana</i> , and a no. of broad leaf tree such as <i>Aesculus indica</i> , <i>Juglans regia</i> , <i>Quercus</i> and <i>Acer</i> . |
| Tree nature | It is a very tall evergreen tree. Branches are whorled, spreading or drooping, with slender pendulous branch-lets. |
| Meteor. condⁿ | Climatically it belongs to cool temperate regions of the Himalayas with a heavy snowfall and a total annual precipitation of 100-250cm, Max. shade temp. seldom reaches 32 ^o C. |
| Root system | It has more or less superficial root system and is not wind-firm. |

4. Natural regeneration:

| | |
|------------------------------|--|
| Seed prodⁿ | Natural regeneration takes place through seed. Cones ripen between October-November. A good seed year may be after each 3-4 years. |
| Seed dispersal | Seeds are dispersed by wind. |
| Seed germⁿ | Seed begins to germinate during June-July of the following year. Germination |

| | |
|----------------------|--|
| | period continues up to September. |
| Establishment | Establishment of seedling may be succeeded, if there is (i) Recently exposed mineral soil, (ii) Protection from fires & (iii) Freedom from dense weed growth. |

5. Artificial regeneration:

| | |
|-------------------------------------|---|
| Preferred propagⁿ | Direct sowing, entire planting. |
| Seed collecⁿ time | Seeds collect during Oct-Nov, before ripening & dispersal of the seed. |
| No. of seed kg⁻¹ | 34,000 seeds kg ⁻¹ . |
| Seed storage | Orthodox seed. Seeds are dried in the sun so as to shed the winged seed. |
| Viability of seed | Three years when kept in cold storage, much less in calico bags. |
| Seed sowing time | Fresh seed should be sown in nursery in October or November. |
| Duration of germination | Germination commences towards the ends of the following May or June and continues during July and August. |
| Germination (%) | Germination normally obtains 40%. |
| Nursery period/ seedling | Seedlings may be pricked out in the nursery when two years old and planted out an age of three or four years. |

6. Diseases, Pests and Parasites are same as *Abies pindrow*.

7. Wood properties:

| | |
|------------------------|--|
| Wood Color | Spruce wood is white; turning brownish with age. There is little differentiation between sapwood and heartwood. |
| Hardness | It is soft to moderately hard. |
| Working Quality | The wood is easy to saw and work, but the presence of excessive no. of large knots, the carpentry value is reduced. It is very satisfactory for rotary cut veneer. It takes varnish well. It offers in well glueing. |
| Weight | Wood is light (Average specific gravity is 0.48; average weight is 481kgm ⁻³). |
| Strength | Wood is relatively strong for its weight. |
| Durability | Its wood is not durable in open and moderately so under cover. |
| Preser. treat. | Its wood is difficult to treat with preservative even under pressure. |
| Seasoning | The wood is easy to season, but develops fine long splits if exposed to direct sun in green state. |
| Other | It is a non-porous wood and resin canals present. |

8. Uses:

| | |
|------------------------|--|
| Timber | Wood is used for planking, rough furniture, tea boxes, packing cases, railway slipper after preservative treatment etc. |
| Fuel wood | It provides good fuel wood and charcoal. |
| Tannin | Bark contains 4.22% tannin. |
| Medicinal value | Oil is extracted from the fresh leaves and twigs, and may be used as bath salts, room sprays, and deodorants. |
| Paper and pulp | The wood yields a long fibred pulp, which is used for the manufacture of news-print and cheap printing and writing papers. |
| Others | Leaves contain alkaloid, used as manure and as little for cattle feed. |

| | |
|--------------------------------|-----------------------------------|
| Local name: Lali Gurans | English name: Rhododendron |
| <i>Rhododendron arboreum</i> | Ericaceae |

1. Natural occurrence: It occurs between 1500m and 3300m but is common above 2300m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are crowded at the ends of branches; narrow; and pointed at both ends; leathery and shiny. |
| Flower | The large attractive bell-shaped flowers appear in bunches at the ends of branchlets, the flowers are generally a deep crimson color, and when in full bloom the trees are a wonderful sight. |
| Fruit | The small seed capsules are oblong, slightly curved and ringed length ways. |
| Seed | Seeds are dark brown, minute, compressed and oblong. |

3. Silvicultural characteristics:

| | |
|--------------------------|---|
| Light | It is a light demander tree species. |
| Frost | It is a frost hardy. |
| Drought | Young seedlings are very sensitive to drought. |
| Fire | Overgrazing and fire favors the spread of the species. |
| Soil | It thrives best on moist loam without lime but can also grow on rocky ground if there is sufficient soil-moisture unlike many species. |
| Coppice | It coppices well. |
| Associates | It is a common in western Himalayas and occurs in association with <i>Quercus incana</i> , <i>Lyonia ovalifolia</i> , <i>Pinus roxburghii</i> . |
| Graze& browse | Leaves are unpalatable to browsing animals. |
| Tree Nature | It is an evergreen, much branched and a small moderate sized tree. |

4. Artificial regeneration:

| | |
|-------------------------------------|---|
| Preferred propagⁿ | Cuttings and seedlings. |
| Seed collection time | Seed ripens between August and March. |
| No. of seed kg⁻¹ | Seeds are minute, about 12million seeds kg ⁻¹ . |
| Seed extraction | Seeds are extracted by drying the capsules on a sheet of paper in the sun. |
| Seed storage | Orthodox seed; should be dried thoroughly in the sun and stored in the sealed container in a cool and safe place. |
| Viability of seed | Viability of seeds remains for 2 years. |
| Seed treatment | Seed should be soaked in water before sowing. |
| Seed sowing time | Seeds are sown during February and March. |
| Duration of germination | Growth of seedling is very slow. When plant takes two or three leaves, it should be pricked out in container. |
| Germination (%) | Germination may obtain more than 80% from the fresh seed. |
| Nursery period | Seedling: Seedlings are planted out during the monsoon. |
| Best planting size | 20-30cm tall seedling with root color diameter 3mm or bigger. |

5. Forest pathogens: The tree attacked by several fungi and insects.

6. Wood properties:

| | |
|------------------------|---|
| Wood Color | Sapwood: reddish to brownish white. Heartwood: reddish brown to brown. |
| Hardness | It is moderately hard wood. |
| Working Quality | It is easy to saw and work, finishes to a smooth surface. |
| Weight | It is a moderately heavy wood; specific gravity is 0.5; weight 640 kgm ⁻³ . |
| Calorific value | c.v. of sapwood: 4,973 calories. It yields poor quality charcoal. |
| Durability | Wood is not durable in the open, but moderately durable under cover. |
| Seasoning | It is highly refractory wood to seasoning. It warps badly and shrinks during seasoning. |

7. Uses:

| | |
|-------------------------|---|
| Timber | Wood is suitable for making plates, tool-handles, boxes, packing cases, posts, plywood. etc. |
| Fuel wood | Wood is used as fuel. |
| Fodder | It is unpalatable to cattle as well as cause toxic effects. |
| Edible food | The tender leaves are used as a vegetable. Flowers, sourish-sweet in taste, are eaten. |
| Ecological value | It is generally planted on newly exposed ground such as road cuttings, landslips, and crevices of bare rocks. It is planted as an ornamental tree in temperate region. It is the national flowers of Nepal. |
| Medicinal value | Flowers are used in diarrhoea and dysentery .The young leaves are applied to the fore-head to cure headache. |

(9)

| | |
|-----------------------------------|------------------------------------|
| Local name: Thingure salla | English name: Himalayan yew |
| <i>Taxus baccata</i> | Taxaceae |

1. **Natural occurrence:** It occurs in Nepal between 2,300m and 4,400m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are distichously, linear, with recurved margin, shining above, and pale-yellowish brown or rusty red below. |
| Flower | Flowers are usually dioecious, Male strobili stalked, globose, Female strobili: solitary axillary. |
| Fruit | Fruit is an ovoid berry. |
| Seed | Seeds borne in a scarlet, fleshy cup. Seed has two cotyledons. |
| Bark | Bark is reddish brown, thin and scaly. |

3. Silvicultural characteristics:

| | |
|--------------|--|
| Light | It is a shade bearer; can grow and reproduce under fairly dense shade. |
| Frost | It is a frost hardy. |
| Fire | It is a fire tender because bark is so thin that fire is fatal to the trees. |
| Soil | The common yew is a conspicuous tree in Himalayan forests, usually in shady |

| | |
|--------------------|---|
| | places under trees. It does not thrive in areas where forests have been cleared. |
| Coppice | It is a non-coppicer. |
| Associates | It is associated with <i>Picea smithiana</i> , <i>Tsuga dumosa</i> , <i>Pinus wallichiana</i> , <i>Quercus semicarpifolia</i> . |
| Tree nature | It is an evergreen shrub or tree, usually much branched with spreading branches and dense foliage. |
| Others | Leaves contain an alkaloid poison which is fatal to man and livestock. |

4. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Direct sowing, entire planting, cutting. |
| Seed collectⁿ time | Seeds ripen in November. |
| No. of seed kg⁻¹ | 8,000 seeds kg ⁻¹ . |
| Seed extractⁿ | The pulp should be removed. |
| Seed storage | Seeds should be stratified in sand over winter in a cool place. |
| Viability of seed | Seed can be stored for four years in tins in cold storage. |
| Seed sowing time | Seeds are directly sown into polytubes in the following spring. |
| Duration of germⁿ | Germination is very slow. |
| Germination (%) | Germination may obtain over 95%. |
| Nursery peri. /Seedling | Seedling takes (2-4) years in the nursery to reach 30cm in height. |
| Best planting size | 30cm tall seedlings with 5-7mm root collar diameter. |

5. Diseases, Pests and Parasites of *Taxus baccata*:

A few insects and fungi such as sapwood borer, brown cuboidal rot, white spongy rot etc. cause the decay of felled timber.

6. Wood properties:

| | |
|------------------------|--|
| Wood Color | The wood is orange brown or dark claret brown, often marked with lighter and darker streaks along the grain. |
| Hardness | It is the hardest of all coniferous woods. |
| Working Quality | Its wood saws moderately easily; works very well on machines; finishes to a beautiful and smooth surface and takes an excellent fine polish. |
| Weight | It is light to heavy wood. Wood weighs about (592-945) kgm ⁻³ . |
| Strength | Wood is valued for its great strength, durability and decorative character. |
| Calorific value | Calorific value is 4,143 calories. |
| Durability | Wood is durable. |
| Seasoning | It is a medium refractory wood to seasoning. It seasons well but slowly and possible to warping and transverse cracks if proper care is not taken. |
| Elasticity | Its wood is elastic. |

7. Uses:

| | |
|--------------------|---|
| Timber | Timber is used for furniture, veneers, parquet flooring, and paneling, and for gates and fences. It is highly prized for making bows and used for gun and rifle wood. |
| Fuel wood | It is a good fuel wood species. It burns well. |
| Fodder | Animals avoid browsing on the tree, due to poisonous containing in leaves. |
| Edible food | The non- poisonous and fleshy aril is eaten by the tribals. |
| Tannin | Red juice of the bark is used in Nepal as an inferior dye. |
| Medicinal | A medical tincture made from the young shoots is used for the treatment of |

| | |
|--------------|--|
| value | headache ,diarrhoea, coldness of the extremities etc. |
| Other | Active constituents possess taxol, essential oil, tannic acid and, 11 types of a taxine alkaloid. It is planted as an avenue tree. Extracts of <i>T.baccata</i> can be added in cosmetics, such as hair-lotions, beauty-and saving-creams and dentifrices. |

Other medicinal uses of *Taxus baccata*:

- Leaves are used in asthma, bronchitis, remedy for indigestion, hysteria, nervous complaints, and as an aphrodisiac.
- A decoction of the wood is a well-known remedy against hydrophobia in Germany.
- Leaves and barks are a good source of taxol, which is used against ovarian, lung, breast and other types of cancer.

(10)

| | |
|-----------------------------------|------------------------------|
| Local name: Thingure salla | English name: Hemlock |
| <i>Tsuga dumosa</i> | Family: Pinaceae |

1. Natural occurrence:

It occurs in Nepal between 2100m and 3600m. According to Champion and Seth (1968), it occurs in east Himalayan moist temperate forest with mixed coniferous forest.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are distichously, dark green and grooved above, silvery white beneath. |
| Flower | Flowers are monoecious; male flowers: in the axils of previous year's leaves; Female flowers: on the previous years lateral shoots. |
| Fruit | Mature cones. |
| Seed | Cones are broadly ovoid. |
| Bark | Bark is thick and rough. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | It is a shade bearer tree. |
| Frost | It is a frost hardy tree. |
| Drought | One of the most droughts tolerant tree species of Nepal. |
| Fire | It is a fire sensitive. |
| Soil | It grows on soil with a wide range of pH from 4.3-7.5. It needs mychorrizal soil in the potting mixture. |
| Coppice | It is a non-coppicer. |
| Associates | It is associated with Rhododendron, Spruce, and Fir. Upper limit: Fir and birch forest, Lower limit: <i>Aesculus-Juglans-Acer</i> forest. |
| Tree nature | It is a large evergreen, handsome tree with a pyramidal crown, spreading branches which droop gracefully. |

4. Natural regeneration:

| | |
|---------------------------------|--|
| Seed productⁿ | Ripe cones shed their seeds between Aug & Dec. while they are still on tree. |
| Seed dispersal | Seeds are winged and dispersed by wind. |
| Seed germⁿ | Germination takes place in next monsoon. |

| | |
|----------------------|--|
| Establishment | Seedlings establish themselves on bare sites such as landslips and abandoned cultivated land easily. |
|----------------------|--|

5. Artificial regeneration:

| | |
|--|---|
| Preferred propagatⁿ | Direct sowing, entire planting. |
| Time of seed collectⁿ | Seeds are collected between January and March. |
| No. of seed kg⁻¹ | About 400,000 seeds kg ⁻¹ . |
| Seed extraction | Seeds are extracted by drying the cones, and later beating. |
| Seed storage method | Seeds are stored in sealed container and at cool place. |
| Viability of seed | Seeds retain their viability after six months. |
| Seed sowing time | Seed should be sown during spring season. |
| Duratⁿ of germinatⁿ | Germination completes within 45 days. |
| Germination (%) | Germination may obtain 80-90%. |

6. Wood properties:

| | |
|------------------------|--|
| Wood Color | The wood is white. |
| Hardness | It is a soft wood. |
| Working Quality | It can be beautifully painted or polished; easy to saw and work. |
| Weight | The wood weighs about 450kgm ⁻³ , the wood is light. |

7. Uses:

| | |
|------------------|---|
| Timber | The timber is used for construction purpose; also used for making door and window frames. But it is not a very high quality timber. |
| Fuel wood | It is used for fuel wood. |

CHAPTER: V

IMPORTANT FODDER TREE SPECIES OF NEPAL

(1)

| | |
|--------------------------------------|--------------------------------|
| L. N.: Babul | E. N.: Indian rose wood |
| B.N. : <i>Acacia nilotica</i> | Family: Mimosaceae |

1. Natural Occurrence: It is found scattered in the lower Terai. Usually found in drier parts of Terai, but will not thrive without irrigation if the climate is too arid.

2. Morphological characteristics:

| | |
|----------------|---|
| Leaves | Leaves are bipinnate. |
| Flowers | Flowers are golden yellow and sweet-scented. |
| Seed | 8-12 seed per pod, compressed, ovoid and dark brown. |
| Bark | Bark is dark-brown or nearly black, with regular deep, longitudinal fissures. |

3. Silvicultural characteristics:

| | |
|----------------------------------|---|
| Light | It is a strong light demander |
| Frost | Frost tender |
| Fire | Babul is not a fire-resistant species. |
| Drought | Drought-resistant. |
| Coppice & Root sucker | The babul is usually pollarded well and is freely lopped for thorn fences & fodder. Root suckers are seldom produced. |
| Browsing | It is susceptible to browsing damage particularly by goats and camels, even by sheep and buffaloes. |
| Lopping | Lopping for fodder and thorn hedges is a source of much injury to the babul. |
| Tree nature | It is a medium to large sized almost evergreen tree. |
| Root system | The young plant develops a long taproot from the commencement, and strong lateral roots are also formed early. Under normal conditions on dry ground the taproot reaches a considerable length where water is found. |
| Soils | It grows best on alluvial silts near rivers, where it is often flooded deeply each year, but is said to tolerate a wide range of soils including heavy clays. Black cotton soil is generally very suitable for babul. |
| Associates | Babul commonly associates with Sissoo and Khair forests. |
| Climate | Absolute Max. shade temp. (32-39) ⁰ C, absolute Min. temp. (-1 to 10) ⁰ C and rainfall varies from 500 to 2,000mm. |

4: Natural regeneration: Natural regeneration is mainly through seed and seedling coppice.

| | |
|-------------------------------|--|
| Seed production | It produces abundant fertile seed annually. |
| Seed dispersal | Ripe pods get blown down to the ground by wind. The animals, which feed on the pods also help in seed dispersal. |
| Seed germination | The pods or seeds remain lying on the ground takes place only during monsoon as good soaking of the seed is necessary before germination. |
| Seedling establishment | Factors determining seedling establishment are: (a) Amount of light. (b) Competition from weeds. (c) Availability of moisture. (d) Soil condition. |

5. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Direct sowing, entire planting, |
| Seed collectⁿ time | Seeds are collected between June & July. |
| Seed storage method | Seeds should be stored in gunny bags or tins or baskets in airtight container in a cool place. Such properly stored seed retains viability for many years. No. appreciable fall of germination capacity was noticed up to three years. |
| No. of seed kg⁻¹ | There are about 9000 seeds kg ⁻¹ , germinative capacity: 30%, plants per kg of seed: 1310 |

Pre-sowing treatment of seed : The outer coat of babul seed is very hard and impermeable & some pre-sowing treatment is necessary for better germination. The following gives better results.
(a) Immersion in cold water for 48 hours before sowing. **(b)** Immersion in hot water (80°C for about 30 minutes). **(c)** Soaking in conc. H₂SO₄ (90%) for 10 to 30 minutes. **(d)** Cow dung treatment. **(e)** Clipping treatment: The outer coat is cut with sharp knife leaving a small opening through which moisture can penetrate.

6. Diseases, pests and parasites of Babul:

(i) Insect pests: The four most destructive pests of babul are *Coelosterna scabrator*, *Psiloptera fastuosa*, *P.Coerulia* and *Aeolesthes holosericea*. *C.Scabrators* is a dangerous root borer, whereas the others strip the bark off the shoots and branches.

7. Wood properties:

| | |
|------------------------|---|
| Wood colour | Sapwood is whitish, heartwood is pinkish white to light red when first exposed, turning reddish brown with age. |
| Weight | Wood is moderately heavy to heavy (Sp. gr. 0.8, wt. 817 -865 kgm ⁻³). |
| Strength | Wood is strong. |
| Hardness | Wood is hard. |
| Seasoning | Moderately refractory wood to seasoning. It seasons well even in the log. It is liable to split in the hot weather and should be converted under shade. |
| Working quality | It is somewhat difficult to saw. It works well by hand, finishes to a good surface, takes a fair polish. |
| Calorific value | 4,224 calories |

8. Uses of Babul:

(i) **Fuelwood:** Excellent fuel wood. (ii) **Heartwood:** An extract of the bark, leaves and pods is used for dyeing cotton and silks. (iii) **Lac:** Babul is a good host of lac. (iv) **Timber:** Favourite wood for art-making, agricultural implements etc. Babul is used as an avenue tree. (v) **Tanin:** Bark of babul contains 12-19% tannin. (vi) **Gum:** the gum exudes from wounds in the bark, mostly during March to May. Good quality babul gum is used in calico-printing and dyeing, as a sizing material for silk and cotton, and in the manufacture of paper. It is used as an adhesive though its adhesive strength is lower. Gum is used in diarrhoea, dysentery, diabetes, sore-throat etc. (vii) **Seeds :** Seeds are eaten roasted or raw in times of food scarcity. (viii) **Leaves and pods:** The leaves are an excellent fodder and are extensively lopped for this purpose. (ix) **Thorny branches:** Use for fencing material.

| | |
|--|----------------------------------|
| L. N. : Chiuri | E. N.: Indian butter tree |
| B.N.: <i>Aesandra butyracea</i> | Sapotaceae |

1. **Natural occurrence:** It occurs in Nepal between Terai to 1500m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | The leaves, which are crowded towards the ends of the branches, are large. They are oval-oblong in shape, leathery and have soft hairs on the undersides. |
| Flower | Flowers are white, in clusters below the leaves. |
| Fruit | Fruit is fleshy, oval, containing a single seed. |
| Seed | Seeds are elongated with a thin seed coat. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Light demander tree. |
| Frost | Somewhat frost hardy. |
| Drought | Drought resistant. |
| Associates | It is often associated with Sal forest in Terai and <i>Schima-Castanopsis</i> forest in sub-tropical zone. |
| Browsing | Leaves are palatable, so seedlings are seriously damaged by browsing animals. |
| Coppice | It coppices well. |
| Tree nature | It is a fairly large deciduous tree. |

4. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Seedlings. |
| Seed collectⁿ time | Fruits ripen between June and August. |
| No. of seed kg⁻¹ | 100 fruits kg ⁻¹ , 450 to 1000 or more seeds kg ⁻¹ . |
| Seed extractⁿ. | Do not remove the seeds from the flesh until just before sowing. |
| Seed storage method | Recalcitrant seed. Seeds are kept in fruit and do not store fruits for more than 2-3 days. |
| Viability of seed | Seeds remain viable for 2-3 days. |
| Seed treatment | All flesh should be cleaned off. |
| Seed sowing time | June to August. |
| Duration of germⁿ | Starts in 1-2 weeks and may continue for 4 weeks. |
| Germⁿ. percent | Germination percent is high as 80%. |

| | |
|---------------------------|---|
| Nursery period | For Seedling: <1000m: 11-13 months, >1000m: 23 to 25 months. |
| Best planting size | 20cm tall seedling with root collar more than 6mm in diameter and very strong tap root. |

5. Uses:

| | |
|------------------|---|
| Fuel wood | Wood weighs about 640 to 830 kgm ⁻³ . It is a good fuel wood. |
| Fruits | Fruits yield a high quality vegetable ghee (Indian butter) called as <i>chiuri</i> ghee which is widely used for burning in lamps, in sweet meats and for soap manufacture. |

(3)

| | |
|---|----------------------------|
| L. N.: Badahar | E. N. : Monkey Jack |
| B.N.: <i>Artocarpus lakoocha</i> | Moraceae |

1. Natural occurrence: It grows from Terai to 1300m, occasionally 1600m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Alternately arranged leaves are simple, large and elliptical in shape. |
| Flower | Flowers appear on the leafless branch. Male and female flower arise from different points. Male flower, which are yellow and fleshy looking, usually fall to the ground soon after they appear. |
| Fruit | Fruit is large and fleshy. |
| Seed | Seed having fleshy within seed coat. |
| Bark | Bark is dark brown, exfoliating in small, round, woody peels, reddish inside. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Light demander. |
| Frost | Frost hardy. |
| Soil | It grows best on deep permeable soils with a good supply of moisture, and does not thrive on poor soils, often occurs on the bank of river. |
| Coppice | It coppices well. |
| Associates | It is mostly occurred in Sal forest. |
| Browsing | Young plants are liable to damage by browsing animals. |
| Tree nature | It is a large deciduous tree with spreading crown and clear straight bole. |

4. Natural regeneration:

It takes place from the seed and that are dispersed by birds and other animals.

5. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Direct sowing, entire planting, cutting, root suckers. |
| Seed collecⁿ. time | Fruits ripen between late June and early August. |
| No. of seed kg⁻¹ | 1900 to 5000 seeds kg ⁻¹ . |
| Seed extractⁿ. | Flesh should be removed from the fruit. |
| Seed storage | Recalcitrant seed. |
| Viability of seed | Seeds lose their viability within a few days (2 days). |

| | |
|-------------------------------------|---|
| Seed treatment | Flesh should be removed from seeds immediately before they are sown. |
| Seed sowing time | Seed should be sown immediately after collection (July to early August) |
| Duration of germⁿ | <1500m: germination begins about two weeks and is completed 1-2 weeks later, >1500m: takes a longer period. |
| Germination (%) | 80% from fresh seed. |
| Nursery period | For Seedling: 11 months after sowing, at the beginning of rains. |
| Best planting size | Seedling will be 25-35cm in height with 5 to 7 mm root collar diameter. |

6. Forest pathogens: The tree is susceptible to damage by *Alternaria tenuis*.

7. Wood properties:

| | |
|-------------------------------|--|
| Wood Color | Wood is yellowish brown when fresh but turns dark brown after exposure. |
| Weight | Heavier than other <i>Artocarpus species</i> (Weight 640 kgm ⁻³) |
| Working Quality | Wood saws and works well, finishing to a smooth surface but do not take satisfactory polish. |
| Strength | It is fairly strong wood. |
| Durability | Timber is durable both in exposed situations and under water. Wood is resistant to white ants and marine borers. |
| Preservative treatment | It seasons well without difficulty but logs should be converted soon after felling. |

8. Uses:

| | |
|--------------------|--|
| Timber | It is a popular wood for house construction work, medium-weight furniture and boat building. |
| Fodder | Leaves are highly used as fodder. They contain about 16% crude protein. |
| Edible food | Fruit is edible; pickle is made from unripe fruit. |
| Tannin | Bark is a good source of soluble tannin and can be used for tanning purposes. |
| Others | It is planted as a shade or ornamental tree. |

(4)

| | |
|---------------------------------------|-----------------------|
| L. N.: Tanki | |
| B.N.: <i>Bauhinia purpurea</i> | Caesalpinaceae |

1. Natural occurrence: It is found throughout Nepal from Terai to 1600m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Simple leaves are partly divided into two slightly pointed lobes, by a cleft that goes half way down. Veins are arranged palmately, radiating out from the top of leaf stalk; base of leaf is like heart. |
| Flower | The purple or lilac colored flowers are large and fragrant. |
| Fruit | Pods are flat, fairly thick, slightly curved and pointed. |
| Seed | Each pod contains 10 to 15 brown, compressed seeds. |
| Bark | It has dark grey or brown bark, & young branches are covered with short, stiff hairs. |

3. Silvicultural characteristics:

| | |
|--------------|------------------------------------|
| Light | It is a moderately light demander. |
|--------------|------------------------------------|

| | |
|--------------------|--|
| Frost | Frost hardy. |
| Drought | Drought resistant. |
| Fire | It is susceptible to damage by fire. |
| Associates | It is commonly associated with <i>Shorea robusta</i> and <i>Schima- Castanopsis</i> forests. |
| Coppice | It coppices well. |
| Browsing | Young plants are severely damaged by browsing animals. |
| Tree nature | It is a medium sized, evergreen ornamental tree. |

4. Natural regeneration:

| | |
|------------------------------|--|
| Seed prodⁿ | Seeds ripen between February and May. |
| Seed dispersal | By wind. |
| Seed germⁿ | Germination takes place during rainy season. |
| Establishment | Seedling can establish easily if they are protected from browsing animals etc. |

5. Artificial regeneration:

| | |
|-------------------------------------|--|
| Preferred propagⁿ | Direct sowing, entire planting; stump planting, and branch cutting. |
| Seed collecⁿ time | February to May. |
| No.of seed kg⁻¹ | 4,000 to 5,000 seeds kg ⁻¹ . |
| Seed extractⁿ | Pods are dried in the sun and allow opening. |
| Seed storage | Orthodox seed. Seeds are dried thoroughly in the sun for several days, put in a polythene bag, seal tightly and keep in a cool place. |
| Viability of seed | Proper stored seeds can retain their viability for at least 12 months. |
| Seed treatment | Not necessary. However soaking the seeds for 24 hours, changing the water 3-4 times during this period may help reduce fungal attack during and after germination. |
| Seed sowing time | <1000m: Mid-May, 1000-1500m: early March, >1500m: August. |
| Duration of germⁿ | Germination starts about 5-10 days after sowing & completes 1-2 weeks later. |
| Germⁿ percent | Germination is high (70-90%) |
| Nursery period | For Seedling: <1500m: less than 6 month, >1500m: 11 month. |
| Best planting size | 20-30cm tall seedlings with root collar diameter is about 4-5mm or more. |

6. Forest pathogens: The species is heavily parasitized by *Dendrophthoe falcata*, *Fomes lignosus* or *Hypoxylon ustulatum* attack the roots and kill most of them.

7. Wood properties:

| | |
|------------------------|---|
| Wood Color | Wood is greyish red. |
| Weight | Wood is soft and light (weight 576 kgm ⁻³). |
| Working Quality | It is very easy to saw and work, and takes good polish. |
| Durability | Wood is not much durable; liable to attack by wood borers and white ants. |
| Seasoning | Timber seasons without cracking and should be converted green and open-stacked under cover. |

8. Uses:

| | |
|------------------|---|
| Timber | Timber is used for agricultural implements. It is also suitable for scantlings and rafter in inferior construction works. |
| Fuel wood | Wood is used as fuel wood. |

| | |
|-------------------------|---|
| Fodder | Leaves are used as fodder; contain 12.6-29.7% crude protein. |
| Edible food | Seeds are edible, which contain 27.31% crude protein. Flowers, buds are eaten as vegetable and also pickled. |
| Tannin | Bark is used in dyeing and tannin materials. |
| Ecological value | It is planted in gardens as an avenue tree, since it bears fragrant flowers. |
| Medicinal value | Stem bark has astringent properties and is used in diarrhoea. Root is carminative and root bark is poisonous. |
| Other | Bees are the most attract to the flowers, making the tree a useful one for bee-keepers. |

(5)

| | |
|---|-----------------------|
| L. N. : Koiralo | |
| B.N. : <i>Bauhinia variegata</i> | Caesalpinaceae |

1. Natural occurrence: It is found in Nepal throughout from Terai to 1900m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are rather broader than deep, rigidly, sub-coriaceous, and deeply cordate. |
| Flower | Flowers occur on the upper leafless branches, they are pink or white and quite large. |
| Fruit | A pod, which opens. |
| Seed | Seed is large, flat and rounded. |
| Bark | Bark is grey, with long vertical cracks. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Light demander. |
| Frost | Frost hardy. |
| Drought | Drought resistant. |
| Fire | It is susceptible to damage by fire. |
| Soil | It can tolerate to poor dry sites, but growth is stunted. It prefers well-drained, deep, fertile, porous soil, does not withstand water logging. |
| Coppice | It coppices well. |
| Associates | It is commonly associated with <i>Shorea robusta</i> and <i>Schima-Castanopsis</i> forest, but it occurs frequently in <i>Pine-Schima</i> forest. |
| Browsing | Young plants are severely damaged by browsing. |
| Tree nature | It is a small to moderate sized deciduous tree. |
| Other | Though it belongs to leguminosae family, it does not have rhizobial nodules on the roots. |

4. Natural regeneration: ~ same as Tanki except seeds ripen between March & May.

5. Artificial regeneration: ~ same as Tanki except **i).** Seed collection time is March to June. **ii).** No. of seed kg⁻¹ is 2500-3500 seeds kg⁻¹. **iii).** Seed sowing time is <1000m: April, 1000-1500m: early March, >1500m: August.

6. Diseases, Pests and Parasites: i. the tree is seriously damaged by the Phytophagus mite, *Eutetranychus uncatius*. ii. Plant is heavily parasitized by *Dendrophthoe falcata*.

7. Wood properties:

| | |
|------------------------------|---|
| Wood Color | Wood is greyish brown. |
| Hardness & weight | Moderately hard wood (Air dry wt. is 70 kg per cu.m.) |
| Working Quality | Wood saws and works well without any difficulty. |
| Strength | Wood is strong. |
| Calorific value | 20,100 KJkg ⁻¹ . |
| Seasoning | It seasons well without any difficulty. |

8. Uses:

| | |
|------------------------|---|
| Timber | Timber is used for agricultural implements. |
| Fuel wood | It is a good fuel wood. |
| Fodder | A good fodder tree, about 19% crude protein content with a digestibility of 25%. |
| Edible food | Buds and flowers are edible. |
| Tannin | Bark is used for tanning and dyeing. |
| Gum & resin | The tree exudes a gum. |
| Medicinal value | Root is carminative and is used in dyspepsia. Bark is astringent, tonic and anthelmintic. It is useful in skin disease, ulcer and leprosy. Dried buds are used for the treatment of diarrhoea, dysentery, worms, piles etc. |
| Others | Bark yields fiber. Leaves are used for the preparation of <i>bidis</i> . |

(6)

| | |
|---|------------------------------|
| L. N. : Lapsi | |
| B.N. : <i>Choerospondias axillaris</i> | Family: Anacardiaceae |

1. Natural occurrence: This is a fairly common tree of the temperate forests of Nepal with an altitude range between 950 and 1900m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Alternately arranged compound leaf which are crowded towards the ends of branches. Each leaf is divided into 6 to 8 pairs of leaflets and 1 terminal leaflet.(i.e, imparipinnate). Leaflets vary in shape from oval to lance like. |
| Flower | The flowers, which bloom between April and May, are small and greenish-white. They are borne in bunches at the ends of branchlets. |
| Fruit | The fruits, which ripen between November & December, is an oblong drupe, rounded at both ends and yellowish when ripe. |
| Seed | Seeds are contained within a stone. |
| Bark | The bark of young tree is grey and smooth, while that of old tree is slightly fissured, cracked and scaly. |

3. Silvicultural characteristics:

| | |
|--------------|--|
| Light | Light demander. |
| Frost | Seedlings: Frost tender and mature trees are frost hardy. |
| Soil | It has moderately tolerant of low fertility and dry soil. |

| | |
|--------------------|---|
| Coppice | It coppices well. |
| Associates | It is commonly associated with <i>Schima-Castanopsis</i> and Oak forest. |
| Tree nature | Leaves are palatable so they are severely damaged by browsing animals. |
| Tree nature | It is a medium to quite large deciduous tree. |
| Other | It does not produce fruit if planted below 950m, though the tree will grow. |

4. Natural regeneration: ~ takes place from the seed, which is dispersed by birds.

5. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Seedling, hardwood cuttings |
| Seed collectⁿ time | October–January. |
| No. of seed kg⁻¹ | 300 stones kg ⁻¹ & 1500 seeds kg ⁻¹ . A single stone contains up to five seeds. |
| Seed extractⁿ | The stones are removed from the flesh by soaking the fruits and rubbing together. The seeds are not extracted from the stones. |
| Seed storage | Orthodox seed, well-dried seed should be stored in sealed tight container. |
| Viability of seed | Seed will viable for two year. Use of smaller kernels should be avoided. |
| Seed treatment | All flesh should be removed. |
| Seed sowing time | < 1500m: late February, > 1500m: August. Whole stones should be sown. |
| Duration of germⁿ | Usually starts 3-4 weeks after sowing and may continue for 2 or 3 months. |
| Germination (%) | 80% when fresh. |
| Nursery period | For Seedling: < 1500m: 5 months, > 1500m: 11 months. |
| Best planting size | 20-35cm tall seedling with more than 3.5mm root collar diameter and well-lignified stems, strong tap roots and many fibrous roots. |

6. Wood properties:

| | |
|---------------|--|
| Weight | Wood is soft and light, weighing about 400 kgm ⁻³ . |
|---------------|--|

7. Uses:

| | |
|--------------------|--|
| Fuel wood | Its fuel wood is very inferior so it is rarely used. |
| Fodder | Leaves are used as fodder but not a very large scale. |
| Edible food | This species produces an edible fruit from which <i>Achar</i> and sweets are made. |

(7)

| | |
|---|-------------------------|
| L. N. : Khanyu | E. N. : Fig |
| B.N. : <i>Ficus cunia</i> Syn. <i>F. semicordata</i> | Family: Moraceae |

1. Natural occurrence: **Khasru khanyu:** Terai to 2000m, **Rai khanyu:** 1400-2000m.

2. Morphological characteristics:

| | |
|-------------|---|
| Leaf | Leaves are alternate, oblong-lanceolate, and very unequal sided, acuminate & serrate. |
|-------------|---|

3. Silvicultural characteristics:

| | |
|--------------|-----------------|
| Light | Light demander. |
|--------------|-----------------|

| | |
|-------------------|---|
| Frost | Somewhat frost hardy. |
| Drought | In its natural range, drought seldom occurs. |
| Fire | Fire tender. |
| Soil | It can grow on a wide range of soil type. |
| Coppice | It coppices well. |
| Associates | It is found in <i>Schima-Castanopsis</i> , as well as Sal forest. |
| Browsing | Young plants are liable to damage by browsing animals. |

4. Natural regeneration: Natural regeneration takes place from seeds, which are dispersed by birds.

5. Artificial regeneration:

| | |
|-------------------------------------|--|
| Preferred propagⁿ | Seedlings, hardwood cuttings. |
| Seed collecⁿ time | July to October. |
| No. of seed kg⁻¹ | 1 to 3.5 thousand per gram. |
| Seed extraction | The fleshy contents of the figs are squeezed into a bucket of water. Mix well and allow the seed to settle to the bottom. The water suspended pulp is thrown away. Repeat until the seed is clean. |
| Seed storage | Orthodox seed. Thoroughly dried seeds in the sun are put in the sealed tightly container and are kept in a cool place. |
| Viability of seed | Seeds will viable for two years. |
| Seed treatment | It is not required. |
| Seed sowing time | <700m: late Feb-early March, 700 to1500m: early Aug, > 1500m: early Aug. |
| Germination (%) | Germination percent is low. |
| Nursery period | For Seedling: Usually 11 months for August sown seed or 4-5 months for seed sown in February- March. |
| Best planting size | 20-25cm tall seedlings are the optimum size for planting. |

6. Uses:

| | |
|---------------|--|
| Fodder | Leaves are used as an excellent fodder. Leaves contain 11.89% crude protein. |
|---------------|--|

(8)

| | |
|--|-------------------------|
| L. N.: Dudhilo | E. N.: Fig |
| B.N.: <i>Ficus nerifolia</i> Syn.: <i>Ficus nemoralis</i> | Family: Moraceae |

1. Natural occurrence: It occurs between 900 and 2200m. It mainly grows at higher altitude than other figs

2. Morphological characteristics:

Leaves are gradually tapering to a point; veins 10-12 pairs; leaf stalks 1-2cm smooth; figs 5-8mm; branchlets reddish.

3. Silvicultural characteristics:

| | |
|----------------|---|
| Light | Light demander. |
| Frost | Frost hardy. |
| Drought | In its natural range, drought seldom occurs. |
| Fire | It is fire resistant since foliage contains high amount of water. |

| | |
|-------------------|---|
| Soil | Capable of growing on a wide range of soil type. It tolerates soils of high pH. |
| Coppice | It coppices well. |
| Associates | It is found in <i>Schima-Castanopsis</i> forest. |
| Browsing | Young plants are liable to damage by browsing animals. |

4 . Natural regeneration: Natural regeneration takes place from seeds that are dispersed by birds.

5. Artificial regeneration:

| | |
|-------------------------------------|---|
| Preferred propagⁿ | Seedlings, hardwood cuttings. |
| Seed collecⁿ time | June- August. |
| No.of seed kg⁻¹ | 1.5 to 3 thousands per gram. |
| Seed extract & storage | Same as Khanyu. |
| Viability of seed | Seeds are viable for one year. |
| Seed treatment | It is not required. |
| Seed sowing time | <1500m: Early August, >1500m: March to April. |
| Duration of germⁿ | Germination of seed takes place for 2-3 weeks. |
| Nursery period | Seedling: Usually 11 months for August sown seed or 4-5 months for seed sown in February to March. |
| Best planting size | 20-25 cm tall seedlings are the optimum size for planting. |

6. Forest pathogens: In nursery, white grubs can cause considerable damage by eating the roots.

7. Uses:

| | |
|---------------|---|
| Fodder | Leaves are used as an excellent fodder. Leaves contain 13% crude protein. |
|---------------|---|

(9)

| | |
|------------------------------------|---------------------|
| L. N.: Dabdabe | |
| B.N.: <i>Garuga pinnata</i> | Bursearaceae |

1. Natural occurrence: It occurs in Nepal up to 1300m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are imparipinnate, often covered with red galls. |
| Flower | Flowers are yellow or greenish white, polygamous. |
| Fruit | Drupe that are yellowish green to black, globose, fleshy. |
| Seed | Each drupe contains 3-4 stones. |
| Bark | Bark is greyish brown, exfoliating in large irregular flakes. |

3. Silvicultural characteristics:

| | |
|-------------------|--|
| Light | Strong light demander. |
| Frost | Frost tender. |
| Drought | Drought sensitive. |
| Fire | Fire resistant. |
| Soil | It grows on a wide range of soil type. Soil of Sal will suit for <i>Garuga</i> . |
| Coppice | It coppices well and produces root suckers. |
| Associates | The tree occurs sporadically in mixed deciduous forest and is a common |

| | |
|--------------------|--|
| | associate of Teak and Sal. |
| Browsing | Young plants are liable to damage by browsing animals. |
| Tree nature | It is medium sized deciduous tree with a straight cylindrical bole. |
| Other | The trees are able to tolerate a moderate growth of grass and low weeds. |

4. Natural regeneration: It takes place through seeds, which are dispersed by birds. The drupes fall to the ground.

5. Artificial regeneration:

| | |
|--------------------------------------|---|
| Preferred propgⁿ | Seedlings, cuttings, air layering. |
| Seed collectⁿ time | Seeds are collected between June and September. |
| No. of seed kg⁻¹ | 4,000 to 5,000 kernels kg ⁻¹ |
| Seed extractⁿ | The pulp should be removed as soon as possible after the seed has been collected. |
| Seed storage | Orthodox seed; well dried seed can be stored in sealed container. |
| Viability of seed | Viability of properly dried and stored seed can retain for at least 1 year. |
| Seed treatment | Soak the seed in hot water. |
| Seed sowing time | July. |
| Germination (%) | 44%. |
| Nursery period | Seedling Seedling will be ready for next monsoon planting. |
| | Stump Stump can be prepared from one-year-old seedling. |
| Rest planting size | 15-25cm tall seedlings with 4 -5mm root collar diameter. |

6. Wood properties:

| | |
|----------------------------|--|
| Wood Color | Sapwood is large and white, heartwood is reddish brown. |
| Weight | Wood is light to moderately heavy (Sp.gr. is 0.64 & wt. is 41lb/cu.ft). |
| Working quality | Timber is easy to saw and work. |
| Strength | Wood is strong. |
| Calorific value | Sapwood: 4,828 calories, heartwood: 4,909 calories. |
| Durability | Heartwood is fairly durable but the sapwood is perishable. |
| Seasoning | Heartwood can be air-seasoned with good results, but sapwood behaves unsatisfactorily. |
| Grain & texture | Wood is uneven-grained and coarse- textured. |

7. Uses:

| | |
|-------------------------|--|
| Timber | It is used for planking, canoes, boxes, drums, cabinetwork & house building. |
| Fuel wood | The wood is used as fuel. It gives charcoal of fair quality. |
| Fodder | Leaves and shoots are used as fodder. |
| Edible food | Drupes are eaten raw, cooked or pickled; they are strongly acidic and possesses cooling and digestive properties. |
| Tannin | Bark and leaf galls are used for tanning. |
| Gum & resin | Tree yields a greenish-yellow gum resin of no particular economic value. |
| Ecological value | Being fire-resistant and easy to propagate, it is valuable for afforestation. |
| Medicinal value | The juice of the stem is used as remedy for the opacity of conjunctiva. Leaf juice along with honey and other ingredients is given for asthma. |
| Paper and pulp | Pulp is suitable for brown wrapping paper. |

| | |
|-----------------------------------|--------------------------|
| L. N.: Siltimur | |
| B.N.: <i>Litsea cubeba</i> | Family: Lauraceae |

1. Natural occurrence: It occurs between 1000 to 2700m, particularly in areas of rather heavy rainfall, on North and North West.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are aromatic when crushed, lanceolate, tapering to a long point, alternate. |
| Flower | Flowers are small, in 4-6 flowered heads, enclosed by large concave bracts in buds. Male and female flowers are on different trees. |
| Fruit | Fruits borne on a cup formed from the persistent perianth. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Moderate light demander. |
| Frost | Frost hardy. |
| Soil | It can grow on a wide range of soil type; it prefers well drained, moist, fertile soil. |
| Browsing | Young plants are liable to damage by browsing animals. |
| Coppice | It coppices well. |
| Tree nature | It is a medium sized evergreen tree. |

4. Artificial regeneration:

| | |
|---------------------------------------|--|
| Preferred propagⁿ | Seedling, stem cutting. |
| Seed collectⁿ. time | Seed should be collected between August and September. |
| No. of seed kg⁻¹ | 14,000 seeds kg ⁻¹ . |
| Seed extraction | Flesh should be removed. |
| Seed storage | Recalcitrant seed. Seed must be kept moist. |
| Viability of seed | Viability loses very rapidly. |
| Seed treatment | Fleshy seed coat must be removed before sowing. |
| Seed sowing time | Seeds sow immediately after collection within a week in Aug-Oct. |
| Duration of germⁿ. | Seed of siltimur does not germinate until the following spring, if it is sown after September, otherwise it will germinate 4-6 weeks after sowing. |
| Germination (%) | More than 60%. |
| Nursery period | Seedling: It can be planted out in the monsoon after 11-14 months. |
| Best planting size | Seedling: 20-35cm in height, with root collar diam. of more than 3.5 mm. |

5. Wood properties: Weight: wood weighs about 580 kgm⁻³.

6. Uses:

| | |
|------------------------|---|
| Fuel wood | Wood is primarily used as a fuel. |
| Fodder | It is a moderate quality fodder. |
| Medicinal value | Fruits are used as a spice to cure for stomach disorders. |
| Others | An oil is extracted from bark, leaf and fruit. |

(11)

| | |
|---------------------------------------|------------------|
| L. N. : Kutmiro | |
| B.N.: <i>Litsea monopetala</i> | Lauraceae |

1. Natural occurrence: It occurs in Nepal from Terai to 1500m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are alternate, oval or elliptic in shape, leathery. Top surface: Dark green and smooth. Lower surface: Rust color covered with hairs. |
| Flower | Flowers appear in May, white or pale yellow in color, umbels. |
| Fruit | Fruit ripens between June & July, which turns black. |
| Bark | Bark is dark grey or light brown, smooth, but slightly furrowed with age. |

3. Silvicultural characteristics: ~ similar as siltimur except i). **Soil:** It grows best on loamy soils. It can grow on poor soil and gentle slope facing southwest. ii). **Associates:** It is commonly found in Sal forest.

4. Artificial regeneration: ~ similar as Siltimur except i). **Seed collection time:** The seed ripens between late May and early August. ii). **No. of seed kg⁻¹:** 53,00 seeds kg⁻¹. iii). **Seed sowing time:** Seed should be sown immediately after collection within a week. iv). **Duration of germ¹:** Kutmiro starts to germinate two weeks after sowing and is completed after two weeks.

5. Uses:

| | |
|---------------|---|
| Timber | Wood is used for agricultural implements. It weighs about 610 kgm ⁻³ . |
| Fodder | One of the most important fodder trees. Leaves contain 14-17% crude protein. |

(12)

| | |
|--------------------------------|------------------------------|
| L. N.: Kimbu | E. N.: White mulberry |
| B.N.: <i>Morus alba</i> | Moraceae |

1. Natural occurrence: It is commonly found from Terai to 2400m. This is a tree which is originated in China, where it grows wild often reaching a large size. It is now spread extensively throughout the Asia, and also to Europe and Japan.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaf is longish, pointed, oval or lance like, sometimes with irregularly toothed edges and occasionally lobed. Leaf base is 3 veined, rounded and cordate. |
| Flower | Tree flowers between February and April. The flowers are small and white, with male and female flowers are on different stalks. The flower spikes are short. |
| Fruit | The fruit, which ripens a couple of months later, is a small, oblong, purple or white berry, and is usually produced in profusion. |
| Bark | The bark on young tree is light colored and smooth, but with age becomes darker and vertically fissured. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Shade bearer. |
| Frost | Moderate frost hardy. |
| Drought | Drought tender. |
| Fire | It is susceptible to damage by fire. |
| Soil | It needs deep, well-aerated, loamy soils for the best growth. They can survive on poor sites, so it is used for reclaiming, ravines and other degraded lands, but the growth will be stunted. |
| Coppice | It coppices and pollards well. |
| Associates | It is found in <i>Aesculus-Juglans-Acer</i> forest. |
| Browsing | Young plants are severely damaged by browsing animals. |
| Tree nature | It is a deciduous & monoecious tree or shrub with a fairly cylindrical straight bole. |
| Other | Tree is liable to damage by winds. It grows rapidly in the early stages and reaches maturity at an early age. |

4. Natural regeneration: The natural regeneration occurs through seeds, which are dispersed by birds and animals.

5. Artificial regeneration:

| | | |
|---|---|---|
| Preferred propgⁿ: (i) Cuttings (ii). Seedlings (iii). Hardwood cuttings i.e, are taken in January or February when the trees are leafless (iv) Stumps: have good results. (v) Grafting: grafts develop better root systems than the seedlings, layering or cuttings. In Japan, grafting is widely used. | | |
| Seed collec. time | Fruit should be collected when it ripens between April and July. | |
| No. of seed kg⁻¹ | 450,000 seeds kg ⁻¹ . | |
| Seed extractⁿ | Pulp should be rubbed off the seed, which is then washed with water and dried in the sun for a few days. | |
| Seed storage | Orthodox seed, the well-dried seed can be stored in sealed-container. | |
| Viability of seed | Viability of seed will remain for 5 years, if seeds are properly stored. | |
| Seed treatment | (i) Stratification in moist sand at 5 ⁰ C for 30-90 days improves germination, or (ii). Soak the seed in water for about a week. | |
| Duration of germⁿ | Germination begins after 4-5 days and is completed in about 4 weeks. | |
| Germination (%) | Three years old seed has higher germination percentage (60%) than the fresh seed (10%). | |
| Nursery period | Seedling | <1500m: less than 6 month, >1500m: 11 month. |
| | Stump | One-year-old seedling is suitable for preparation of stump. |

6. Diseases, pests and parasites of kimbu: (i) *Phyllactinia corylea* affects mulberry leaves (ii) Mulberry trunk rot is caused by *Polyporus hispidus*. (iii). longicorn beetle (*Sthenias griesator*) bores tunnels or girdle the stem. (iv). Scale insects (*Ceroplaster spp.*) affect stems and branches of the tree. They suck the sap and ultimately kill the plant.

7. Wood properties:

| | |
|------------------------|---|
| Wood Color | Sapwood is white to yellowish white; heartwood is bright yellowish brown or golden brown, darkening after exposure. |
| Working quality | The wood is easy to saw, work, turn, bend & finish, it peels well on a rotary lathe. |
| Strength | Wood is fairly strong. |

| | |
|------------------------|---|
| Calorific value | Sapwood: 19,500 KJkg ⁻¹ , heartwood: 20,900 KJkg ⁻¹ . |
| Durability | Timber is moderately durable under cover. |
| Preser. treat. | It does not require antiseptic treatment. |
| Seasoning | It seasons well with care and can be kiln- seasoned without difficulty. |
| Hardness | Wood is moderately hard to hard. |
| Other | Wood has elasticity and flexibility. |

Uses of *Morus alba*:

1. Mulberry leaves:

(i) Leaves are useful as cattle fodder, they are nutritious and palatable. Leaves contains 13.99% crude protein. (ii) Young leaves and twigs are sometimes eaten as vegetable. (iii) Leaves are a good source of ascorbic acid. They also contain Carotene, Vitamin B, Folic acid and Vitamin D. (iv) Leaves are extensively grown for rearing silkworms. The preferential food value of mulberry leaf for silkworm larvae is attributed to the presence of three stimulant factors i.e, an attractant, a biting factor and a swallowing factor. The absence of any one of these factors inhibits feeding by larvae .(v) leaves possesses diaphoretic and emollient properties.

2. Mulberry fruits: (i) Fruits are eaten fresh or made into juice, stews and tarts. They may be squashed and fermented to yield spirituous liquors. (ii) Fruits is laxative and cooling is used for sore throat, dyspepsia and melancholia.

3. Mulberry wood: (i) Mulberry wood is used chiefly for hockey sticks, tennis and badminton rackets, cricket bats and stumps and other sport goods (ii) Wood is suitable for house building , agricultural implements, furniture and turnery. (iii) Wood is a medium quality fuel wood (iv) Wood contains tannins (32%).

4. Mulberry bark: (i) Stem bark is fibrous which is used for paper-making in China and Europe. The fibre is also used in textile industry.(ii) Bark is used as the purgative and vermifuge.

5. Mulberry root: It possesses anthelmintic and astringent properties.

(13)

| | |
|---------------------------------------|-------------------|
| L. N. : Kaphal | |
| B.N. : <i>Myrica esculanta</i> | Myricaceae |

1. Natural occurrence: It is found in Nepal between 1000 and 2300m. It is a tree of the sub-tropical and temperate zones.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | The alternately arranged leaves, which are crowded towards the ends of the branchlets, are lance-like in shape. The leaves are leathery, smooth on the top but with resinous dots on the under sides. |
| Flower | The minute green flowers, which are separated into male and female, are borne in catkin like spikes. The male ones are long and drooping while the female ones are erect. These flowers appear between July and Nov. |
| Fruit | The fruit is small, round and somewhat compressed and is covered with small pimples when ripe, the fruit is red and succulent. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | It is a moderate light demander. |
| Frost | Frost hardy. |
| Fire | Fire resistant. |
| Soil | It can grow on a wide range of soil type but it prefers well-drained , fertile and deep soil. |
| Coppice | It coppices well. |
| Associates | It is commonly associated with <i>Schima-Castanopsis</i> and oak forest. |
| Browsing | Leaves are palatable so they are severely damaged by browsing animals. |
| Tree nature | It is a small to medium sized evergreen tree. |

4. Natural regeneration: It takes place from the seeds that are dispersed by birds.

5. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Seedling. |
| Seed collectⁿ time | Fruit ripens between April and July. |
| No. of seed kg⁻¹ | About 8000 seeds kg ⁻¹ . |
| Seed extractⁿ | The pulp should be removed from the seed, washed and then dried. |
| Seed storage | Orthodox seed. The well sun dried seed should be stored in seal-tight container. |
| Viability of seed | About 6 months. |
| Seed treatment | None. |
| Seed sowing time | Seed should be removed immediately after collection. |
| Duration of germⁿ | Seed takes about 1 month to germinate. |
| Germination (%) | 55-75%. |
| Nursery period | Seedling: About one year in nursery. |
| Best planting size | 15-20cm tall seedlings with 4-5 root collar diameter. |

7. Wood properties: Weight of wood weighs about 750 kgm⁻³.

8. Uses:

| | |
|------------------------|--|
| Fuel wood | Wood is used as a fuel. |
| Edible food | Fruit is edible when ripe & can be made into a very refreshing drink in the hot weather. |
| Medicinal value | The bark is astringent and anti-septic, is widely used for various local medicines. The powdered bark is taken as a snuff for asthma, catarrh and cough. The bark powder is used to fish poison. |

(14)

| | |
|----------------------------------|-------------------------|
| L. N.: Mayel, mel | E. N.: Wild pear |
| B.N.: <i>Pyrus pashia</i> | Rosaceae |

1. Natural occurrence: It occurs between 1450 and 2500m, distributed throughout the temperate Himalayas.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Alternately arranged leaves are simple, broadly oblong and slightly pointed, with fine, rounded teeth on the edges. |
| Flower | Flowers which usually appear between March and April with the new leaves, are white, borne in bunches at the ends of short branchlets. |
| Fruit | Fruit is round, greenish brown when unripe, and darker on ripening. |
| Seed | Seeds are dark and shiny. |

3. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Light demander. |
| Frost | Frost hardy. |
| Drought | Drought resistant. |
| Soil | It has moderately tolerant of low fertility and dry soils. |
| Coppice | It coppices readily and produces abundant root suckers. |
| Associates | The tree is commonly associated with Oaks and Rhododendron at the higher levels of its range, and <i>Pinus roxburghii</i> in its lower range. |
| Browsing | Leaves are palatable so they are damaged by browsing animals. |
| Tree nature | It is a small or medium-sized deciduous tree. |

4. Natural regeneration: It takes place from the seeds, which are dispersed by birds and animals. Fruit is favoured by birds when over-ripe and black. Monkeys prefer the unripe fruits.

5. Artificial regeneration:

| | |
|-------------------------------------|--|
| Preferred propagⁿ | Seedlings, hardwood cuttings, root suckers. |
| Seed collecⁿ time | Fruits ripen between November and January. |
| No. of seed kg⁻¹ | 70,000 to 110,000 seeds kg ⁻¹ . |
| Seed extraction | Do not remove the seeds from the flesh until just before sowing. |
| Seed storage method | Recalcitrant seed. Seeds are kept in fruit and do not store fruits for more than 2-3 days. |
| Viability of seed | Seeds lose their viability quickly after extracted from the fruit. |
| Seed treatment | All flesh should be removed. |
| Seed sowing time | Seeds are sown immediately on to a raised bed. |
| Germination (%) | 78% of large fresh seeds are used. |
| Nursery period /Seedling | After 6 months in the nursery, seedlings are ready for planting during monsoon season. |

6. Wood properties:

| | |
|-------------------|---|
| Wood Color | Wood is light reddish brown. |
| Hardness | Wood is hard and close grained. |
| Weight | Wood weighs about 700 kgm ⁻³ . |

7. Uses:

| | |
|------------------------|--|
| Timber | Wood is used for walking sticks, combs etc. |
| Fuel wood | It yields comparatively good fuel. |
| Edible food | Fruit has a hard, astringent flesh, which is edible. |
| Medicinal value | The juice of the fruit is used for medicinal purposes. |
| Other | It is a spiny hedge plant. |

| | |
|--|----------------------|
| L. N.: Dhaincha, Agasthi | T. N.: Agathi |
| B.N.: <i>Sesbania grandiflora</i> | Papilionaceae |

1. Natural occurrence: It is grown between Terai to 1000m. It is native to Malaysia.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are abruptly pinnate, leaflets 41-61, linear-oblong, glabrous. |
| Flower | Racemes, 2-4 flowers, short, axillary, flowers with showy, fleshy white, pink or crimson petals. |
| Fruit | Pods are pendulous, flat and somewhat four –cornered. |
| Seed | Pods contain 15-30 seeds. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Light demander. |
| Frost | Frost tender. |
| Drought | Drought resistant. |
| Fire | Fire sensitive. |
| Soil | It can grow on a wide range of soil type. Plant grows best on black cotton soil and is self-productive where the surface soil is loose and uneven. |
| Coppice | It coppices well. |
| Browsing | Young plants are liable to damage by browsing animals. |
| Tree nature | It is a short-lived, quick growing, soft-wooded, deciduous tree. |

4. Artificial regeneration:

| | | |
|---------------------------------------|---|---|
| Preferred propagⁿ. | Seedlings, stump. | |
| Seed collectⁿ. time | Seeds are sown between October-November. | |
| No.of seed kg⁻¹ | 17,000 viable seeds per kg. | |
| Seed extractⁿ. | Pods are dried in the sun and allow opening. | |
| Seed storage method | Orthodox seed, well-dried seed can be stored in sealed container. | |
| Viability of seed | Viability of seed remains for at least 2 years. | |
| Seed treatment | Soak the seed in hot water. | |
| Seed sowing time | March- April. | |
| Germination (%) | 87% from 12 months old seed. | |
| Nursery period | Seedling | Seedlings will be ready for monsoon planting. |
| | Stump | One-year-old seedling is suitable for preparation of stump. |

5. Diseases, Pests and Parasites of Agathi: (i) *Colletotrichum capsici* causes seedling blight of Agathi forming elongated or oblong cankers on the collar region of affected seedlings.

6. Wood properties:

| | |
|------------------------------|---|
| Wood Color | Wood is white. |
| Hardness & Weight | Wood is soft. Wood weighs about 512 kgm ⁻³ . |
| Working quality | It is easy to saw and work. |
| Durability | Wood is not durable. |

Uses of *Sesbania grandiflora*:

(1). **Agathi tree:** It is grown as a shade and support tree for pepper and betel vines, and as a shade for coconut. The plant is used as effective wind-break in banana plantations, citrus and coffee plantations etc. (2). **Edible food:** Tender leaves, pods and flowers are eaten as vegetable. (3). **Flowers:** Flowers are sweetish in taste and succulent. Flowers are sacred and are valued as offering in the month of kartik in India. (4). **Wood:** Wood is valued for making toys. Charcoal from the wood is used for gun powder. The wood is a possible source of paper pulp. (5). **Bark:** Bark contains gum and tannin. Juice of the bark is used by fishermen for toughening their nuts. It is also used for tanning purposes and for coloring matting. Dried and powdered bark is used as cosmetic in Java. Bark is astringent, bitter, tonic and a febrifuge. A decoction of the bark in small doses is taken against diarrhoea and dysentery. Pounded bark is externally applied to cure scabies. (6). **Leaves** are an excellent fodder containing 36% crude protein. Leaves are excellent source of vitamin C and calcium. Leaves are aperients, tonic, diuretic and laxative and contain a non-poisonous saponin-like substance. Leaves are chewed to disinfect mouth and throat.

SILVICULTURE OF BAMBOOS AND RATTANS:**SILVICULTURE OF BAMBOOS****1. General description of Bamboos:**

Bamboos are tall, perennial, arborescent grasses, belonging to Bambuseae, a tribe under poaceae, comprising four sub-tribes: Arundinarieae, Dendrocalameae, Eubambuseae and Melocanneae. There are 50 genera and approximately 1326 species (excluding the herbaceous bamusoid grasses), generally inhabiting the humid tropical, sub-tropical and mild temperate regions of the world. The bamboos cover more than 18 million hectares of land, of which 75% is in Asia. India alone accounts for more than 50% of the total bamboo reserves in the world. There is not a single native bamboo in the whole of Europe and Antarctica.

2. Distribution:

- Bamboos are found naturally as an understorey in many types of forests.
- The distribution of bamboos is largely governed by rainfall, temperature, and latitude and soil type.
- Most of the bamboos require from 8⁰C to 36⁰C, a minimum of 100cm annual rainfall and high humidity for good growth.
- They form an important constituent of many deciduous and evergreen forests from sea-level and flat alluvial plains to high mountains up to an altitude of 4000m.
- Bio-climatic distribution of the genera is as follows: species of Arundinaria are found in the alpine region, whereas these and some species of *Bambusa*, *Dendrocalamus*, *Oxytenanthera* and *Phyllostachys* are found in the temperate regions. Sub-tropical genera are *Arundinaria*, *Bambusa*, *Cephalostachyum*, *Dendrocalamus* etc.
- The moist tropical region is represented by species of *Bambusa*, *Cephalostachyum*, *Dendrocalamus*, *Melocanna*, *Ochlandra*, *Oxytenanthera* etc. whereas the dry tropical region mostly has *Bambusa arundinacea* and *Dendrocalamus strictus* etc.
- Bamboos thrive best in monsoonal forests where they attain their maximum development. They dwindle into under-shrubs in the temperate regions and at high altitudes, some species look almost like grasses.

3. Associates of bamboos:

- Bamboos form an important constituent of many deciduous and evergreen forests. They seldom occur in pure form.
- The most important associates of bamboos are *Anogeissus latifolia*, *Embllica officinalis*, *Shorea robusta*, *Tectona grandis*, *Litsea monopetala*, *Lagerstroemia parviflora*, *Grewia spp*, *Terminalia spp*. etc.
- *Arundinaria spp* grow under Oak, Deodar, Spruce, and Silver-Fir. etc.

4. Flowering:

Most of the bamboos flower and seed gregariously once during the life-time and die soon after. Bamboos can be classified into three groups on the basis of their flowering pattern:

(i) **Those that flower annually or nearly so:** *Arundinaria wightiana*, *Bambusa atra* etc. are known to flower annually.

(ii) **Those that flower gregariously and periodically:** the important species which flower gregariously are: *Bambusa arundinacea*, *B. polymorpha*, *Melocanna baccifera* etc.

(iii) **Those that flower sporadically or irregularly:** *Arundinaria falcata*, *Bambusa giganteus*, *Dendrocalamus strictus*, *D. hamiltoni*, *D. giganteus* etc.

- *Dendrocalamus strictus* and *Bambusa tulda* fall within both the second and third group, as they are known to flower both sporadically almost every alternate year and also gregariously at long intervals, the former at 30-50 years and the latter 35-40 years.
- All populations from the same seed, irrespective of locality, start flowering at the same time.

5. Silvicultural characteristics:

- Bamboos are perennial grasses, with woody culms from rhizomes. The rhizomes may be short and thick (Pachymorph) and clustered together. They produce bamboos in well defined clumps.
- Mature bamboo clumps produce new shoots every year throughout the rainy season. These shoots develop rapidly and within two or three months, they reach their full height and diameter.
- The culms remain in the clumps if not cut for about 7-12 years, depending upon the species, dying slowly and being replaced by new culms. If older culms are not removed, they restrict the development of the rhizome system and new shoots.

6. Cultivation:

For cultivation of bamboos, following points should be carefully considered:

(i) Climate:

- The bamboos need warm temperature to grow successfully. Temperature from (-5 to 46)⁰C is suitable for their cultivation. Areas receiving rainfall between 75 and 500cm or more are suitable for bamboos.

(ii) Soil: The bamboos can be grown on denuded wastelands and watersheds along the eroded river beds, hill slopes etc.

- Bamboos grow on a variety of soils provided there is good drainage without waterlogging.
- They thrive on various geological formations such as sandstones, conglomerates, quartzites, schists and gneisses.
- A majority of the bamboos occur on sandy loam to loamy clay soils.
- Soil moisture is an important factor for the distribution, growth and quality of bamboos.

The natural regeneration and development of clumps are greatly affected by the variation in soil moisture, since the root system is very superficial. Plantations raised on poor and dry soils often do not grow well.

(iii) Manuring: Generally, fertilizer application is not practised yet for plantations but small doses of nitrogenous fertilizers are better to apply in furrows during the first year of planting.

A. Natural regeneration:

Bamboos can regenerate successfully from seeds with ease.

- Gregarious flowering, which starts at some point in the area, gradually spreads in waves, covering the whole area in 3-4 years. Numerous fertile seeds are shed, and with the onset of monsoon, germinate profusely.

- Fire and grazing hazards to natural regeneration. Weeds and shades also affect the regeneration heavily.

B. Artificial regeneration:

Bamboos are propagated artificially through seeds, divisions, offsets, and marcotting, stem or rhizome cuttings or by layers.

a. Raising bamboos from seeds:

(i) Before the onset of monsoon, the seeds are sown directly at a depth of 20-30cm in pits, 3-5m apart. Direct sowing of seeds are also done in furrows, 15cm wide and 3-5m apart along the contours.

- One kilogram of seed is sufficient for planting a hectare.
- Seeds decay if they get waterlogged or if germination is delayed due to low soil temperature resulting from early monsoon.
- Regular weeding and soil work should be done. Post monsoonal sowing eliminates the weeds.

(ii) Transplantation:

Seeds are generally sown in the nurseries before the monsoon (May-June) however, sowing after monsoon is equally efficient.

Nursery beds of 1.2m *12m facing East-West are raised near water sources in humid areas, whereas the beds are prepared sunken in arid and semi-arid areas.

- Sand, soil and farmyard manure in the ratio 1:2:1 are thoroughly mixed in the bed and worked into a depth of 20-30cm.
- Seeds are sown in lines in the bed. Raising the seedlings in polythene bag or in bamboo-baskets facilitates easy transportation.
- Planting is followed by two weeding, accompanied by soil working before the ends of rains.
- *Bambusa polymorpha* is raised through transplanting the nursery-raised seedlings with good success.
- Transplanting is done before the onset of monsoon. Three or four month old seedlings raised in polytube bags or one-year old seedlings along with the rhizomes are transplanted.
- The length of the shoot is pruned to 90cm and most of the leaves are clipped.
- The rhizomes should not be exposed to the sun and are fully covered with the original soil and firmly pressed.

b. Rhizomes:

The rhizomes, when planted, produce mature culms in about half the time taken by the seedlings.

- *Bambusa arundinacea*, *Melocanna baccifera* and *Dendrocalamus longispatus* are regenerated from rhizomes.
- It is very important that the soil around the rhizome should be pressed firmly.
- The selection and careful handling in uprooting the rhizome are important.
- Rhizomes having at least one developed buds are used.

c. Divisions:

The dwarf-bamboos are usually propagated by divisions. The culms, in small clumps of two or three with rhizome attached, are transplanted immediately before the growing season commences, with as much soil as possible around the rhizomes.

d. Offsets:

- Segments of 1-3 year old culms are used for planting. They consist usually a portion of the old culm with rhizome and roots, cut off above a node at 30-60cm from the ground

of the segments contain three nodes. The branches at these nodes are trimmed to 7.5 to 10cm. They are planted horizontally at least 2.5cm deep in trenches.

- Single-node cutting is planted slightly slanting, the node being underground.
- The planting is done in the third week of June and shade is provided against the direct sun to avoid rapid evaporation.
- Normally a new shoot is produced in the first year sometimes not until the second year, but all offsets are reported to survive and induce speedy growth.
- Offsets, planted in the late rainy season, usually fail to grow.

7. Protection of plantation: ~ is important.

- The seedlings, both in the nursery and after transplanting, are subject to damage by rats, hares and porcupines, cattle cause heavy damage to the seedlings. Wild pigs eat the tender rhizomes.

8. Preservative treatment of bamboos:

- Although bamboos compare favourably with timbers such as Sal and teak in strength properties, their natural durability is low on account of their susceptibility to insect attack, including termites.
- The treatment of bamboos is the best carried out in green condition. Normally, the branches and leaves are removed. Then they are cut into the required sizes and holes are made at nodal points before dipping in the preservative solution, but this is time consuming. It is easy to dip the freshly cut bamboos into solution with the branches and leaves still possible, they should be kept in water for 2-3 days. The treatment of bamboos in green conditions is the best by the Boucherie process.
- The treated bamboos are dried to keep 10-15% moisture and are expected to last over 15-20 years in the open and 25-30 years under cover.

9. Diseases and pests of bamboos:

Diseases: Approximately 185 species belonging to the *Ascomycetes*, *Basidiomycetes* and *Deuteromycetes* have been many different diseases affect bamboos in nurseries, plantations and natural forests.

A. Diseases of plantations and natural forests:

(i) Leaf diseases: The main leaf diseases of bamboos are listed below:

(a) Leaf blight: Caused by *Rhizoctonia solani*.

(b) Leaf rust: Caused by no. of pathogens such as *Dasturella divina*, *Puccinia melanocephala*, *Tunicospora bagchii*.

(c) Leaf spots : Caused by a no. of pathogens such as *Ascochyta bambusina*, *Corticium coleroga*, *Phyllachora graminis* etc.

(ii) Bamboo blight : Most destructive bamboo disease caused by the pathogens *Sarocaldium oryzae*.

(iii) Rhizome bud rot: Casued by *Fusarium* and *Pythium spp.*

(iv) Basal culm rot : Caused by the pathogens *Fusarium moniliforme*.

(v) Culm rot: Casued by *Fusarium spp.*

(vi) Rhizome and root rots: Caused by *Ganoderma lucidum*, *Merulius eurocephalus* and *Poria rhizomorpha*.

(vii) Stem infection: Caused by *Fusarium pallidoroseum*.

(viii) Decay in bamboo: A no. of pathogens cause decay in bamboos both in standing culms and also in bamboos in storage & use, they also affect the rhizomes. Important decay casusing

pathogens in bamboos are: *Amauroderma rugosus*, *Fomes Spp.*, *Ganoderma lucidum*, *Polystictus Spp.* etc.

B. Diseases of nursery:

Damping off and root rot diseases cause damage to the nursery seedlings.

10. Uses of bamboos:

(i) **Food :** Young shoot of several species are commonly used as vegetable. The shoots are used for making curry either alone or in combination with potatoes, tomatoes, cauliflowers, peas, etc.,

(ii) **Fodder:** Bamboos leaves are very nutritious and palatable, which are an excellent fodder species, leaves of *Bambusa* and *Dendrocalamus* species are among the best bamboos for fodder.

(iii) **Timber:** Bamboos are extensively used as timber.

- They are preferred because of their easy availability, cheapness, strength, straightness, smoothness and lightness combined with hardness and easy to split.
- Bamboos are used in foundations, frames, partition walls, doors, windows, roofs, etc.
- Large-sized bamboos are commonly used as scaffolding material.
- Various types of building boards are made from bamboos. Single mat and veneer-boards are also made from them.
- Numerous articles of every-day use such as baskets, tool handles, umbrella rods, several fancy articles are made from bamboos.

(iv) **Ornament:** The living bamboos are planted in the gardens as hedges, borders and screens and also in mass plantings, in groves and in isolated clumps.

(v) **Conservation of soil:**

- Bamboos can be grown on steep hill slopes for controlling landslides, where other economic crops do not grow.
- They are also valuable as a windbreak.
- Extensive shallow and fibrous root system and accumulation of leaf-mulch serve as efficient agents in preventing soil-erosion.
- Bamboos are grown to stabilize the shifting sands, and also for stream-bank protection, reinforcement of embankments and drainage channels.
- Besides, bamboos help preserving the fertility of soils through the addition of leaf-litter, maintenance of structure and conservation of moisture.

(vi) **Paper-pulp:** Bamboos occupy a very important place in paper making.

Bamboos pulp is suitable for preparing printing paper of good quality. It is used for the production of bond-paper, ledger-paper, art-paper, facial tissue paper, paper for air-mail, newsprint etc.

(vii) **Rayon-pulp:** Bamboos (*Bambusa arundinacea*, *Dendrocalamus strictus* and *Melocanna baccifera*) are found to be suitable for the manufacture of rayon-grade pulp and are being used on a large scale in the manufacture of rayon.

(viii) **Bamboo-parquet:** Bamboo parquet, strip for aircraft, laminated bamboo, etc. are recently manufactured.

(ix) **Banslochan:** The hollow internodes of *Bambusa arundinacea*, *B.vulgaris*, *Dendrocalamus strictus* and *Melocanna baccifera* accumulate a substance, generally called as banslochan which are the residue of the watery liquid in the form of amorphous silica in microscopically fine state.

- Banslochan is widely used as a cooling, tonic, and aphrodisiac.
- Banslochan is also used in asthma, cough, poisoning cases, paralytic complaints & others.

Silviculture of rattans:

1. Introduction of rattans: Rattan is derived from the Malay word 'Rotan' which denotes a collective name for the climbing palms called *Lepidocaryoideae* (Meaning scaly-fruited in Greek).

- It belongs to the family Palmae or Arecaceae & the largest sub-family is Calamoideae.
- Dransfield reported that more than 600 species of rattans belonging to 13 genera are distributed world wide concentrated in Africa and South East Asia.
- India and Nepal has significantly less number of species of rattans found in contrast to the South East Asia which holds over 500 species of rattans.
- Pradhan (1997) has stated that only 4 genera and 14 species of canes occur in India. The existing genera in India are *Calamous*, *Daemonorops*, *Plectocomia*, and *Corthalsia*. Three genera are endemic to Africa. The largest rattan genus is *Calamous*, which has about 370 species.
- In Nepal, only 5 species of rattans are available. They are *Calamus acanthopathus* (Gauri bet), *C.tenuis* (Pani bet), *C.leptopadis* (Dangre bet), *C.latifolia* (Pakhri bet) and Aghori bet.

2. Morphological characters:

Rattans are climbers.

i). Stems: Stems may be very short and erect or even sub-terrestrial to be called stemless or acaulescent spp. They may be solitary (i.e., single stemmed) or clustered (i.e., with many stems in an individual). Stems of the climbing species are long, usually cylindrical with uniform thickness, solid and straw yellow in color. They are extremely strong, tough and elastic. The outer surface is hard or smooth and shining ; the core is spongy.

ii). Roots: Very little is known about the root. Several swamp rattan species have complex root systems.

iii). Leaf: The leaf is generally divided into three parts-sheath, petiole and the laminar area.

a. Leaf sheath: The stem is covered with sheaths. This is one of the most useful features of rattans for their identifications. Mature sheath may bear a knee, a swelling below the petiole. This is one of the important characteristics in distinguishing genera in the sterile state.

b. Petiole: Petiole varies between species and age of the cane. Sometimes the petiole is absent in mature climbing individuals.

c. Laminar:(leaf lets): The leaf is pinnate and pinnae are roof shaped. The leaflets are arranged either regularly or irregularly. The leaflets arrangement is usually a very useful character for diagnosis. In Nepal, leaflets of rattans are found to be of regular and evenly spaced.

iv). Inflorescence: Two modes of flowering are observed in rattan-hapaxanthic and pleonathic. In **hapaxanthic mode**, the flowering is once and is characterized by simultaneous production of flowers after a period of vegetative growth. The flowering and fruiting is followed by the death of stems itself. The flowering occurs at the topmost nodes of the rattans.

In **pleonathic mode**, stems reaching maturity go on producing one to a few inflorescence every year, and the stem has the capability of unlimited growth.

(v) Flowers: Flowers are borne on the ultimate branches of the inflorescence. The branch bearing flowers is known as rachilla. Genus *Calamus* is dioecious i.e., male and female plants are separate.

(vi) Fruit: Rattan fruits are covered with vertical rows of reflexed scales. There is often a beak at the top of the fruit.

(vii) **Seed:** Inside the fruit, there is usually a single seed, but rarely there are two or three seeds. The seed has an outer fleshy layer, generally known as Sarcotesta; this is sweet, sour or intensely bitter in taste.

3. **Natural occurrence:**

Rattans thrive on well-drained soils, swamps and near perennial water holes, streams, in tropical and sub-tropical regions of Nepal below 2000m.

4. **Rattan distribution in Nepal:**

- According to International Network on Bamboo and Rattan (INBAR, 1996) suggests that two genera and eight species of rattans are endemic to Nepal.
- Rattan is distributed to evergreen, semi-evergreen and mixed Sal forests of the tropical and subtropical regions of the country. Their distributions are uneven within these ranges.
- *Calamus acanthospathus*, *C. leptospadix*, *C.tenuis*, *C.latifolius* is the most common rattan found throughout the Terai region.
- The altitude range of rattan availability in Nepal varies from 75m to 2000m.
- Height of canes has been found to vary from 10m to 30m.
- Of the five physiographic zones of Nepal, rattan is mostly distributed in the Terai and Siwalik. They are also found in the Middle Hills of Nepal. Rattans are not found in the High mountains and High Himal. Due to heavy biotic interference and habitat destruction, natural populations are severely depleted.

5. **Description of Rattans found in Nepal: (Family: Arecaceae, Palmae)**

| | |
|---------------------|--|
| Species (1) | L.N. :Gauri Bet, B.N: <i>Calamus acanthospathus</i> |
| Habitat | It is a climber occurring in the evergreen, semi-evergreen & moist deciduous forests of (Mainly) eastern Nepal. It is distributed from Terai to middle hills up to 2000m. It thrives in moist grey and red clay type of soil. |
| Associates | This species is associated mainly with trees such as <i>Dalbergia sissoo</i> , <i>Acacia catechu</i> , <i>Trewia nudiflora</i> , <i>Toona ciliata</i> , <i>Albizias</i> , <i>Bombax</i> & <i>Saccharum</i> species. |
| Uses | It is used for making baskets and containers. |
| Species (2) | L.N: Dhangre Bet, B.N: <i>Calamus leptospadix</i> |
| Habitat | It is also a climber, which is distributed mainly in the middle mountain of the country. It prefers moist places, having perennial water source. Swamps are its natural habitat. It also thrives well-drained soils. |
| Associates | It is mainly associated with evergreen trees such as <i>Syzgium cumini</i> . |
| Uses | It is used of making baskets, binding ropes. Fruits are edible when ripe. |
| Species: (3) | L.N: Pani Bet, B.N.: <i>Calamus tenuis</i> |
| Habitat | It is a common on climbing rattan found mostly in waterlogged and swampy areas and permanent water sources in along eastern Nepal (Jhapa 100m) and Bardiya (300m) in western Nepal. It is found in the tropical mixed sal forests. It grows in clumps from rhizomes. Flowering starts from June and fruiting in July–August. |
| Associates | This species is associated mainly with tropical mixed hardwoods such as <i>Acacia catechu</i> , <i>Trewia nudiflora</i> , <i>Bombax ceiba</i> , <i>Albizia spp.</i> and other species. |
| Uses | Use of making mats, baskets, and chair-seats. |
| Species: (4) | L.N: Pakre Bet, B.N: <i>Calamus latifolius</i> |

| | |
|-------------------|--|
| Habitat | It is found in the moist deciduous sal forests and in the foothills of Siwaliks. It is found mostly in Jhapa, Morang, Bara, Parsa and Kanchanpur districts. The altitude varies from 80 to 280m. In the Shuklaphanta wildlife reserve, this species is well protected and is found along permanent waterholes and streams. It thrives in well-drained soils. |
| Associates | This species is mainly associated with sal, <i>Trewia nudiflora</i> and <i>Syzigium cumini</i> . |
| Uses | Highly use for walking sticks, umbrella handles and for furniture making. |

6. Cultivation of rattans:

Calamus spp. grow in different situations such as marshy plains at sea-level and on the hills. The canes require a warm, moist atmosphere and copious watering but water-logged or frequently inundated areas are not suitable for their cultivation. The canes thrive best in sandy loams containing organic manure.

Artificial regeneration: Canes can be propagated through seeds and cutting of rhizoms, root-suckers and offsets.

Propagation of cane from fully mature seeds: Canes are generally propagated through fully mature seeds sown directly or by transplanting. Fully mature seeds should be collected. The seeds are removed from the pulp, rubbed with ash to prevent ants from destroying them and dried. Seeds should be sown fresh, as they lose their viability on ageing. The soil of the seed beds should be loosened carefully. The beds are covered with a light layer of soil and kept well watered; a light thatch also protects them, as too much sun is unfavourable for germination. The seeds start germinating in 14 days, the young leaves appearing 60 days thereafter. Normally, germination takes up to 6 months. The one-year old plants 15cm in height and bearing 4 -5 leaves can be transplanted during rains.

7. Diseases: The fungi *Sphaerodothis coiminatorica* are attacked on the leaves of *Calamus rotang*.

8. Harvesting of rattans:

- When the leaf-sheath loosening and the lowest part of the stem is exposed, the cane is considered ripe for harvesting.
- In some parts of Nepal, the canes are collected throughout the year and other parts during October to March.
- Fresh canes contain a high percentage of moisture. Rainy season or wet atmosphere is not proper for harvesting, as improper drying results in discolouration. Hence, the dry season is the best for harvesting.
- Growth in the first few years is slow; hence it takes 8-10 years for canes to reach maturity. Some canes may be harvested at the early age of six years depending upon the species or locality.
- The canes are cut at the base without damaging or killing the clumps and dragged down from the supporting trees. The first harvest is not of the best quality but subsequent ones are of better quality.
- After the canes have been removed from the supporting trees, the leaves and leaf-sheath are removed.
- In Nepal, the traditional method of harvesting of rattans is still practiced. Local farmers in Bardiya and Kailali districts cut the stems using a sickle. They cut the rattan clump nearly at breast height. Sometimes they cut at ground level and pull the cut stuff. This practice has severe effect on the remaining clump because the flagellum, which has to support the rattan for climbing, drops down on earth thereby reducing the overall

growth. Farmers do not pay attention regarding the damage caused to the other young rattan plants during harvesting. Moreover, they seem to ignore the optimum season for harvesting, and stump height.

9. Drying and storage:

The canes are cut into some definite lengths according to their strength, thickness and uses. They are dried under the sun or over the fire. The undried canes deteriorate rapidly.

10. Processing: The quality of canes can be improved considerably by proper processing.

11. Bleaching and polishing: Bleaching is generally done by fumigation with burning sulfur which makes it less liable to insect-attack. Natural lustre of the cane is lost during bleaching and is restored by polishing.

12. Smoking and treatment of green canes: The canes for walking-sticks are smoked over fire and polished with coconut oil. This gives them a fine reddish brown colour.

13. Grading: After processing, the canes are graded, depending upon the colour, texture, size, length between the nodes, thickness and utility. The best rattans should be strong, light, flexible, have uniform thickness, smooth surface, light yellow colour and resistance to breaking and splitting when twisted or bent.

14. Utilization of rattans:

- Rattan is an ideal raw material for cottage industries. Its industrial use is in for furniture, walkingsticks, polo sticks, umbrella handles, basket making, mats, ropes, and various other articles.
- They are frequently used as cables for suspension bridges. They are used in all kinds of forest works, and are unsurpassed for basketwork.
- Rattans are being mainly used for furniture items such as chair, sofa, cases, television stands, baby carriers, baskets and mats.
- Ornamental value of rattan goods is also highly appreciable.
- The pith is used for making a variety of articles such as handbags and fancy decoration pieces.
- Buds of some rattan species such as *Calamus erectus* are edible. The ripe, cooked fruits of some species are eaten.
- **Ethnic value:** Tharu people believe that rattan is a holy and capable of warding off evil spirits and use rattan stick in temples.
- Cane is also one of the most important items needed in constructing the chamot of Rato Machhendranath, which is being pulled in the Kathmandu valley.

15. Promotions of rattans:

- Rattans are mainly distributed in the Terai, Siwaliks and mid-hills. These physiographical zones are under-pressure of habitat destruction of rattan due to over-exploitation of forestland.
- Of the four species in Nepal, three *Calamus acanthospathus*, *C.leptospathix* and *C. latifolius* have been listed as threatened.
- Cultivation of rattans in large scale in farmland and conservation of natural habitat of rattans are the best way for promotion of rattans.

IMPORTANT EXOTIC TREE SPECIES IN NEPAL

①

| | |
|------------------------------|--------------------|
| <i>Acacia auriculiformis</i> | Family: Mimosaceae |
|------------------------------|--------------------|

1. Natural occurrence: It is native to Papua New Guinea and Northern Australia.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are pinnate, rachis modified into a phyllode. |
| Flower | Flowers are white to rich yellow, fragrant, in slender, axillary spikes. |
| Fruit | Pods are hard, coiled at maturity. |
| Bark | Bark is smooth, white and somewhat fissured. |

3. Silvicultural characteristics:

| | |
|---------------------------------|--|
| Light | Strong light demander |
| Frost | Frost tender. |
| Drought | It is more droughts sensitive. |
| Fire | Fire sensitive. |
| Soil | Its best growth on the alluvial soil. |
| Coppice | It coppices well. |
| Tree nature | It is unpalatable to browsing. |
| Meteor. condⁿ | It is a straight medium sized evergreen tree with slightly angular branchlets. |
| Other | It is a fast growing tree with high germinative capacity. |

4. Artificial regeneration:

| | |
|--------------------------------------|---|
| Preferred propagⁿ | Direct sowing, entire planting, stump planting. |
| Seed collectⁿ time | December-February. |
| No. of seed kg⁻¹ | 40,000 to 57,000 seeds kg ⁻¹ . |
| Seed extraction | The pods are dried in the sun and beaten to extract the seed. |
| Seed storage | After drying the seed in sun, it can be kept in sealed container. |
| Viability of seed | Viability of seeds remains for 6-12 months. |
| Seed treatment | The seed is treated by soaking in hot water at 80 ⁰ c and leaving to cool for 15-20 hours. |
| Seed sowing time | Seed should be sown in March. |
| Duration of germⁿ | Germination takes 4-5days. |
| Germination (%) | Germination is above 60%. |
| Nursery period | Seedling: It will be prepared for July planting. |
| Best planting size | 20-30cm tall seedlings. |

6. Forest pathogens: Tree is attacked by *Ganoderma lucidum* and *Stereum nitidulum* fungi and by angiospermic parasites, *Loranthus longiflorus* and *Dendrophthoe falcata*.

7. Wood properties: Weight of wood: about 25,000 KJkg⁻¹.

8. Uses:

| | |
|-------------------------|--|
| Timber | It is widely used for furniture. |
| Fuel wood | It is a good fuel wood. It burns slowly with no harmful effects apart from some crackling. It makes a good charcoal. |
| Fodder | It is not browsed by cattle so it is a poor quality fodder. |
| Tannin | Bark contains 12-16% tannin, content of tannin being more in younger trees. |
| Ecological Value | It is a good substitute for species of <i>Eucalyptus</i> in semi-arid sites, is useful sand binder and is also grown as an ornamental tree. It may be cultivated for lac host. |

(2)

| | |
|--------------------------------|--|
| Local name: Kalki phool | English name: Bottle brush tree |
| <i>Callistemon citrinus</i> | Family: Myrtaceae |

1. Natural occurrence: It is native to Australia & can grow successfully from Terai to 1800m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves which are alternately arranged on the twigs have short stalks. Leaves tend to be spirally crowded towards the rather slender branchlets, which hang vertically downwards. |
| Flower | The red flowers are very distinctive being arranged in bunches towards the ends of hanging branch lets. |
| Fruit | Fruit is a small, stalkless capsule, containing masses of very fine, red colored seeds. |

3. Silvicultural characteristics: i) Soil: It is more suited to swampy ground or seasonally flooded areas.

4. Artificial regeneration:

| | |
|---|--|
| Preferred propagⁿ | Seedlings, cuttings. |
| Seed collection time | Seeds ripen between September and March. |
| No. of seed kg⁻¹ | There is about 850,000 seeds kg ⁻¹ . |
| Seed extraction | By drying the capsules in the sun on paper sheets, the valves open up and fine red seed is shed. |
| Seed storage | Orthodox seed. It should be dried and stored in sealed containers. |
| Viability of seed | Viability of seed remains at least 12 months. |
| Seed treatment | The hard wood capsules are removed between September and March. |
| Seed sowing time | <1000m: March to April, > 1000m: September to October. |
| Duraⁿ of germⁿ | Germination takes place in seven days. |
| Germination (%) | 30-40%. |
| Nursery period | Seedling: Seedlings are planted by the on set of monsoon. |
| Best planting size | 20-30cm tall seedlings. |

5. Wood properties:

| | |
|-------------------|------------------------------------|
| Wood color | Wood is reddish or brown in color. |
| Hardness | Wood is hard and close grained. |

| | |
|------------------------|--|
| Working Quality | It is easy to saw and work well. |
| Weight | Wood weighs about 800kgm ⁻³ . |

6. Uses:

| | |
|-------------------------|---|
| Timber | Timber is used for tool handles. |
| Fuel wood | It can use for fuel wood. |
| Ecological value | Its flowers produce abundance of pollen nectar, suitable for bee keeping. |

(3)

| | |
|--------------------------------|-------------------------------|
| English name: iron wood | |
| <i>Cassia siamea</i> | Family: Caesalpinaceae |

1. **Natural occurrence:** it is native to South East Asia from Burma to Indonesia.

2. Silvicultural characteristics:

| | |
|--------------------|---|
| Light | Strong light demander. |
| Frost | Frost tender. |
| Drought | Seedlings: drought sensitive, Mature trees: fairly drought resistant. |
| Fire | It is fire sensitive, but it recovers soon. |
| Soil | It prefers well-drained, deep, fertile soils. It can grow on shallow soil, but the rate of growth is stunted. It does not thrive on swampy sites or in areas with heavy growth of <i>Imperata</i> . |
| Coppice | It coppices freely and produces root sucker. |
| Browsing | It is not eaten by cattle, i.e., unpalatable spp.so it escapes injury from browsing. |
| Tree nature | It is moderate sized evergreen tree with a spreading crown and many branches. |
| Other | It does not form root nodules with <i>Rhizobium spp</i> and does not fix N ₂ . |

3. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Direct sowing, entire planting, stump planting |
| seed collectⁿ time | Seeds ripen between December-April. |
| No. of seed kg⁻¹ | 30,000-40,000 seeds kg ⁻¹ . |
| Seed extraction | Seeds are extracting by drying the pods in the sun and then beating them with sticks. |
| Seed storage | After drying the seed in sun, it can be kept in sealed container. |
| Viability of seed | Viability of seed retains for many years. |
| Seed treatment | For small quantities: manual scarifications of seed. For large quantities: hot water treatment for 15-30sec. & then soaked in cold water for 24 hours. |
| Seed sowing time | Seed should be sown in February-March. |
| Duration of germⁿ | Germination begins after sowing and completes eight days later. |
| Germination (%) | Scarified seed treatment: 72%, hot water treatment: 45%. |
| Nursery period | Seedling: Seedling will be prepared for July planting. |

4. Wood properties:

| | |
|-------------------|---|
| Wood Color | Sapwood and heartwood are distinct. Sapwood: Pale yellowish white to greyish brown. Heartwood: dark brown to black. |
| Hardness | Moderately hard to hard wood. |

| | |
|-------------------|---|
| Weight | Wood is moderately heavy-to-heavy about 470 kgm ⁻³ . |
| Durability | Heartwood is exceedingly durable. |

5. Uses:

| | |
|-------------------------|--|
| Timber | It is used for walking sticks, mallets, also for bridges and posts. |
| Fuel wood | It is chiefly used as fuel wood. It also makes a good charcoal. |
| Fodder | Leaves are eaten by cattle, sheep and goats and form a good fodder. |
| Edible food | Flowers can be eaten as a vegetable in curries. |
| Tannin | Pods, leaves and barks contain 6%, 7% and 9% tannin respectively. |
| Ecological value | It is considered to be a very desirable host for <i>santalum album</i> . |
| Other | It is planted as an ornamental and roadside avenue tree. |

(4)

| | |
|--------------------------------|---------------|
| <i>Casuarina equisetifolia</i> | Casuarinaceae |
|--------------------------------|---------------|

1. Natural occurrence: It is native to Australia, Indonesia and Polynesia. It is also common on sandy sea-shores in Bangladesh and south-East Asia. It can be grown up to an altitude of 1500m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are whorled, reduced to minute scales or spine like. |
| Flower | Flowers are dioecious; male: in slender, terminal spikes; Female: in ovoid or cone like heads. |
| Fruit | Fruits are echinate, and hard. |
| Seed | Seeds are light, membranous. |
| Bark | Bark is grey, rusty brown, peeling off in vertical strips. |

3. Silvicultural characteristics:

| | |
|---------------------------------|---|
| Light | Strong light demander |
| Frost | Frost tender |
| Drought | Drought hardy. |
| Coppice | It does not coppice. |
| Tree nature | It is a tall, straight stemmed and evergreen tree |
| Meteorological condition | It can withstand low temperature. The tree remains unaffected even by cyclones in coastal areas. Temperature is in the range of (7-47 ⁰ c); average annual rainfall (870-3800mm). It needs full bright sunshine. |

Soil: The tree thrives best on loose, sandy loams and also on laterite, rich loam soils where the pH varies between 4.8 and 8.4. It can also grow in saline and alkaline soils. heavy and clayey Soils and soils with poor drainage are harmful to the growth. It can grow on poor soil because of the presence of N₂ fixing organism in root nodules.

4. Artificial regeneration:

| | |
|--------------------------------------|--|
| Preferred propagⁿ | Direct sowing, entire planting, air layering, root suckers. |
| Seed collectⁿ time | Seeds are collected between June and September. |
| No. of seed kg⁻¹ | 200,000 and 3 million seeds kg ⁻¹ . |
| Seed storage | Dried seed of the most species can be stored in sealed containers for long |

| | |
|-------------------------------------|--|
| | period, without loss of viability. |
| Viability of seed | Viability of proper stored seed can remain for many years. |
| Seed treatment | Soak the seed in water for 24 hours. |
| Seed sowing time | January-February. |
| Duration of germⁿ | Germination begins 3 to 4 days after sowing. |
| Germination (%) | Germination can achieve 70%. |
| Nursery period | Seedling: About 4 month is enough for Terai. |

5. Diseases, pests and parasites of Casuarina:

i.) **Stem wilt:** caused by *Trichosporium vesiculosum*. ii). **Root rots:** *Ganoderma lucidum*, *Phytophthora cambivora* etc. iii). **Pathogenic seedling diseases:** a). **Seedling Blight:** caused by *Pellicularia rolfsii* b). **Bacterial wilt:** caused by *Pseudomonas solanacearum* iv). **Heart rot:** caused by *Fomes fastuosus*, etc. v). **Witches broom:** caused by many pathogens. vi). **Leaf spot:** by *Phoma casuarina*. vii). Phanerogamic parasites affecting *Casuarinas* are *Cuscutta campestris*, *Dendrophthoe falkata*, *D. lanosa* etc.

6. Wood properties:

| | |
|------------------------------|--|
| Wood Color | Sapwood: orange yellow or pale brown. Heartwood: light to dark reddish brown. |
| Hardness | Wood is hard, close and straight grained and medium to fine-textured. |
| Working Quality | It works to a hard, smooth surface with care, but requires sharp tools and takes good polish. |
| Weight & Strength | Wood is heavy to very heavy. Wood is strong. |
| Calorific value | Calorific value of wood is 4950 kcal/kg. |
| Durability | Timber is moderately durable both in contact with water and under cover. It is resistant to termites and wood-rotting fungi. |
| Preservative treat. | Heartwood is partially treatable. |
| Seasoning | It is difficult to season and is liable to split. |

7. Uses:

| | |
|-------------------------|---|
| Timber | It is used for furniture, construction works, plywood, veneer etc. |
| Fuel wood | One of the best firewood extensively used as fuel and charcoal. It also burns when green. The ashes retain the heat for a long time. |
| Fodder | Needles are used in compost and are used as manure. |
| Tannin | The stem bark and root bark contains an appreciable amount of tannin. It dyes wool and silk fabric yellow. |
| Gum & resin | It is extensively used in reclamation of soil and erosion control. <i>Casuarina</i> is noduled by an actinomycete, <i>Frankia spp.</i> , and fixes atmospheric N ₂ . |
| Ecological value | It is used as a wind break, soil- binder, ornamental and hedges. |
| Medicinal value | Bark is a tonic and astringent and is useful in diarrhoea and dysentery. The extract of needles exhibits anti-cancer activity. |
| Paper & pulp | Wood is suitable for the manufacture of paper for writing, printing, and wrapping. |
| Other | It is recommended for agro- and social forestry. |

(5)

| | |
|-------------------------------|---------------------------------|
| Local name: Kapok | English name: White silk |
| <i>Ceiba pontandra</i> | Family: Bombacaceae |

1. Natural occurrence: Tree is native to American tropics (mainly South America), is naturalized and distributed throughout tropical countries.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are digitately compound divided into 5-8 leaflets. |
| Flower | Flowers are creamy white, in axillary fascicles. |
| Fruit | Fruit: a hanging capsule, filled with floss enveloping the seeds. |
| Seed | Seeds are numerous & black. |
| Bark | Bark is greyish brown. |

3. Silvicultural characteristics:

| | |
|--|---|
| Light | Strong light demander. |
| Frost | It can withstand slight frost. |
| Drought | It can withstand long periods of drought. |
| Soil | Although it grows in poor soils, it prefers good deep, permeable soils for good yields. Laterite & heavy clays are not tolerated. It is highly sensitive to soil salinity. |
| Tree nature | It is a large deciduous tree, 20-30cm in height with a clear bole of 12m, horizontal branches, and stem often with stout woody conical prickles. It can be planted throughout the hotter region of Nepal. |
| Meteorological condⁿ | It requires abundant rains during the growing period and a dry period during flowering. It is a fast growing tree. |

4. Artificial regeneration:

| | |
|-------------------------------------|--|
| Preferred propagⁿ | From seed, stem cuttings, branch cuttings. |
| Seed collection time | Fruit ripens between March and May. |
| No. of seed kg⁻¹ | There are about 16,000 seeds kg ⁻¹ . The tree begins to yield fertile seed in the third or fourth year. |
| Seed extraction | Fruits are dried in the sun, the seed being separated from the floss by shaking the dehiscent fruits in a bag. |
| Seed storage | Orthodox seed. Seeds are stored in a sealed container. |
| Viability of seed | Seeds are viable for a year. |
| Seed sowing time | Seeds are sown in nursery during rainy season or in March. |
| Duration of germⁿ | Seeds germinate in a week and seedlings require shade for 5-6 weeks. |
| Germination (%) | Germination takes place 89%. |
| Nursery period | Seedling: It is suited to be planted after 8-10 months. |
| Other | Seedling grow 90-120cm tall in six months. |

5. Forest pathogens: Leaf spot disease: caused by a bacterium *pseudomonas pentandrum*.

6. Wood properties:

| | |
|------------------------|---|
| Wood Color | Wood is greyish white or grey without any sharp distinction into heartwood & sapwood. |
| Hardness | Wood is extremely soft, straight grained, even, coarse-textured. |
| Working Quality | It is easy to saw and work. |
| Weight | Wood is light, weight 453 kgm ⁻³ . |

| | |
|-------------------|--|
| Durability | It is not durable and is likely to discolor and rot in the log form and is susceptible to insects. |
| Seasoning | It cannot be seasoned in the log: it requires quick conversion followed by proper air or kiln seasoning. |

7. Uses:

| | |
|-------------------------|--|
| Timber | Timber can be used for packing cases, boxes, fence-posts, veneers, matches, furniture, and for violin. |
| Fuel wood | It is medium quality firewood. |
| Edible food | Young fruits are eaten raw or cooked into a vegetable. |
| Tannin | Bark is rich in tannin and is used in tanning leather. |
| Gum & Resin | The tree yields a dark almost opaque gum, which is given in bowel complaints, painful micturition and gonorrhoea. |
| Ecological Value | Kapok seeds are rich in protein. They contain higher amounts of digestible protein. They are rich in edible oil, which is also used for burning & in soap making. Seed cake, obtained after extraction of oil, is rich in protein for livestock. |
| Medicinal Value | Various parts of trees are reputed in indigenous medicine. The roots are stimulant, tonic, diuretic, emetic, and antispasmodic. Roots are useful in diabetes, dysentery and gonorrhoea. Flowers are demulcent and useful in leucorrhoea. |
| Paper & Pulp | Woos is used for bleached pulp which is used for making ordinary paper. The main use of Kapok is for insulating and stuffing purposes in life-belts and life-jackets, in clothing for aviators and sailors. |
| Others | The floss is obtained from Kapok, which is superior to <i>Bombax ceiba</i> . |

6

| | |
|----------------------------|-----------------------------------|
| Local name: Kapur | English name: Camphor tree |
| <i>Cinnamomum camphora</i> | Family: Lauraceae |

1. Natural occurrence: It is native of China, Japan, and Taiwan. In Nepal it is planted up to about 2,000m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | The leathery and shiny alternate leaves have long, pink brown stalks. The leaves smell strongly of camphor when crushed. |
| Flower | The small, white or green flowers, are borne in bunches either in leaf axils or at the ends of branchlets. |
| Fruit | Fruit is a round, one seeded berry. The young fruit is dark green, later turning black as it ripens. |
| Bark | The bark of old trees is rough and brown, develops long, vertical flat, topped ridges. |

3. Silvicultural characteristics:

| | |
|----------------|-----------------------------|
| Light | Light demander. |
| Frost | Frost hardy. |
| Drought | It is sensitive to drought. |

| | |
|---------------------------------|--|
| Soil | Its best growth is on moist, deep sandy loams, such as alluvial soil near streams. Its growth on poor soil is stunted. |
| Coppice | It coppices vigorously and shoots grow rapidly. |
| Meteor. condⁿ | It is medium to large, evergreen, and handsome tree with often much branched tree with a dense mass of foliage. |

4. Artificial regeneration:

| | |
|--|--|
| Preferred propagation | i). Entire planting, ii). Layering: air layering requires gallic acid treatment which gives 75% rooting. iii). Branch and root cutting: Root cutting possesses good buds, have proved very successful. |
| Seed collectⁿ time | Fruits ripen between September–November. |
| No. of seed kg⁻¹ | 3,500 seeds kg ⁻¹ . |
| Seed extraction | Pulp is removed and seeds are dried in the sun. |
| Seed storage | After drying the seed in sun, it can be kept in sealed container. |
| Viability of seed | 6 months. |
| Seed treatment | Seeds are soaked in lucked water for 24 hours. |
| Seed sowing time | Seed should be sown soon after collection since fresh seed gives high percentage of germination. |
| Duratⁿ of germⁿ | Seed germinates after 4-5 months. |
| Germination (%) | 55% when fresh, falling to 25% at 6 months and nil at 12 months. |
| Nursery period | Seedling: 20 months. |

5. Wood properties:

| | |
|---------------------------------------|---|
| Wood Color | Wood is greyish white. |
| Hardness & weight | Wood is moderately hard. Wood weighs about 600kgm ⁻³ . |
| Working Quality & Strength | It is easy to saw and work well. Wood is moderately strong. |

6. Uses:

| | |
|-------------------------|---|
| Timber | Wood can be used for cheaper grades of furniture, chess, and tea-boxes, coffins, cabinets & lighter forms of construction such as rafters, scantlings, planking etc. |
| Ecological value | It is an excellent ornamental and shade tree in parks and gardens. |
| Medicinal value | Fruits show anti-microbial activity. Bark is used as sedative, antispasmodic, diaphoretic and anthelmintic. |
| Others | It is a source of camphor obtained from distillation of wood, leaves, roots, branches, twigs, and even from fallen leaves. Camphor can be used in the pharmacy, drugs, insecticide etc. Kernels yield oil which is used for soap making & also substitute for palm oil. |

(7)

| | |
|------------------------------------|----------------------------------|
| Local name: Dhupi salla | English name: Cryptomeria |
| <i>Cryptomeria japonica</i> | Family: Coniferae |

1. Natural occurrence: It is native to the mountainous country of China and Japan. It can grow well between 1500m and 2400m. It is the most suited to cooler, northerly aspects.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are short, stiff, pointed and shaped like an awl. Leaves are arranged spirally on the branchlets in five ranks. |
| Flower | Male flower: clustered at the ends of branchlets. Female flower: cone like, rounded and covered with very small leaves. |
| Fruit | The cones are woody, round, brown and covered with scales. |
| Bark | Bark is reddish in color and peels off long strips. |

3. Silvicultural characteristics: Tree nature: It is an evergreen, attractive tree, much branched with distinct whorls.

4. Artificial regeneration:

| | |
|--------------------------------------|---|
| Preferred propⁿ | Direct sowing, bare-root seedling planting, polytube seedling planting. |
| Seed collectⁿ time | Small cones are collected between August and December. |
| No. of seed kg⁻¹ | 300,000 seeds kg ⁻¹ , 1650 cones per kg, 8kg of cones yield 1 kg of seed. |
| Seed extraction | Cones are dried to release the seed. |
| Seed storage | Orthodox seed. Seed should be dried in sun and stored in either calico bags or sealed container or in cold storage. |
| Viability of seed | Only 5 months when stored in calico bags or up to 2 years in sealed container, or even four years in cold storage at 2 ^o c. |
| Seed sowing time | Seed is sown immediately onto open beds. |
| Germination (%) | 80% when fresh seed. |
| Nursery period | Seedling: During the second wet season, the seedlings can be planted out bare-rooted in plantation or transferred to containers. |
| Best planting size | 20-30cm tall seedlings. |

5. Uses:

| | |
|-------------------------|---|
| Timber | The scented wood is used for tubs, casks, tea boxes, and ornamental chests and in sometimes for building. |
| Fuel wood | It is also used as fuel wood. |
| Ecological value | It is mainly planted in Nepal as ornamental tree. |

(8)

| | |
|-----------------------------|--|
| Local name: Gulmohar | English name: Gold Mohur |
| <i>Delonix regia</i> | Family: Leguminosae, Caesalpinaceae |

1. Natural occurrence: It is native to Malaysia. It is the best suited from Terai to 1000m in Nepal.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are alternately arranged on the twigs, bipinnate, 15-25 pairs pinnae each pairs have 25 pairs of leaflet. |
| Flower | Flowers appear soon after the new leaves, which are extremely beautiful. Petals are red on inside, greenish outside and yellowish on curling margins. |
| Fruit | The stout, woody, reddish brown or black pods are very long. |
| Seed | Pods contain many yellowish, mottled seeds. |
| Bark | The smooth grey bark has vertical lines of pale brown corky spots called lenticels. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Light demander. |
| Frost | Frost sensitive. It is difficult to grow in places where heavy frosts occur. |
| Drought | It grows on a variety of soils. It is suited to moist as well as dry region. |
| Coppice | It coppices well. |
| Browsing | Grazing and browsing sensitive. |
| Tree nature | It is fairly large deciduous ornamental tree with broad spreading umbrella shaped crown. |
| Others | It has a shallow root system, which makes it susceptible to blow down by winds. |

4. Artificial regeneration:

| | |
|-------------------------------------|--|
| Preferred propagⁿ | Direct sowing, entire planting. |
| Seed collection time | Pods are collected during January and February. |
| NO. of seed kg⁻¹ | 2000 seeds kg ⁻¹ . |
| Seed storage | Orthodox seed, it should be dried and stored in sealed containers. |
| Viability of seed | Viability of seed remains for at least 5 years in sealed tins. |
| Seed treatment | Seeds require soaking in hot water for 10 minutes. |
| Seed sowing time | Seeds are sown during May & June. |
| Germination (%) | Germination can achieve over 80%. |
| Duration of germⁿ | 12 months. |
| Best planting size | 20-30cm tall seedlings. |

5. Forest pathogens: **Root rot:** caused by fungi *Ganoderma lucidum*.

6. Wood properties:

| | |
|-----------------------------|--|
| Wood Color | Wood is white. |
| Hardness& Weight | Wood is soft and open grained. Wood weighs about 440 kgm ⁻³ . |

7. Uses:

| | |
|-------------------------|---|
| Fuel wood | It can be used for fuel wood. |
| Ecological value | It is mainly planted as an ornamental tree. |
| Others | It is grown extensively for shade. |

(9)

| | |
|---------------------------------|------------------------------|
| Local name: Masala | English name: Red gum |
| <i>Eucalyptus camaldulensis</i> | Family: Myrtaceae |

1. **Natural occurrence:** It is native to Australia, grows quite well from the Terai up to about 1500m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Adult leaves are lance shaped, dull and pale colored on both sides, thin long stalked and have conspicuous veins. |
| Flower | Flowers are borne in arrangements like the spokes of an umbrella (umbels), each spoke having 5 and 10 flowers at the end of slender stalks. |
| Seed | The seed capsule is shaped like half a globe and is stalked. |
| Bark | Bark is smooth, whitish or pale grey or reddish patches. It peels off in strips or in long irregular flakes, but is usually persistent at the base. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Light demander. |
| Frost | Frost hardy. |
| Drought | It can tolerate winter drought. |
| Fire | Fire tender: when young; fire resistant: when old. |
| Soil | Eucalyptus prefers deep, fertile soil, with adequate rainfall. It is one of the best species plantations for waterlogged areas. |
| Coppice | It coppices well. |
| Associates | It can be planted mixed with <i>Dalbergia sissoo</i> , <i>Tectona grandis</i> , <i>Leucaena leucocephala</i> , etc. either on farm forestry, agro forestry or social-forestry. |
| Browsing | Leaves can be eaten by cattle so seedlings are severely affected by browsing. |
| Tree nature | These are aromatic, evergreen and generally tall trees, with large trunk and massive, spreading crown. |
| Other | Intolerant of competition by grass. It has a mycorrhizal association with fungi. |

4. Artificial regeneration:

| | | |
|---|--|--|
| Preferred propⁿ | Entire planting, stump planting. | |
| Time of seed collectⁿ | Seeds are collected between April and May. | |
| No. of seed kg⁻¹ | 600,000 to 700,000 viable seeds kg ⁻¹ | |
| Seed extraction | Capsules are dried in the sun until they open. Seeds are removed from capsules by shaking. | |
| Seed storage method | Orthodox seed, put thoroughly dried seed in a polythene bag, seal tightly and keep in a cool place. | |
| Viability of seed | Viability of seed remains for several years. | |
| Seed treatment | It is not required. | |
| Seed sowing time | Terai: first two weeks of May, Inner Terai and Bhabar: last two weeks of April for planting in mid-July. | |
| Duration of germⁿ | Germination starts 4-5 days after sowing and completes a week later. | |
| Nursery period | Seedling | Terai: 8-10 weeks, inner Terai: 10-12 weeks. |
| | Stump | One-year-old seedling is suitable for stump preparation. |
| Best planting size | 15 to 25cm tall seedling with 3mm or more root collar diameter. | |

5. Diseases Pests and Parasites of Eucalyptus

(A) **Nursery diseases: Damping off:** caused by *Fusarium*, *Rhizoctonia*, *Phytophthora* and *Pythium* etc., (B) **Plantation diseases. (1) Stem diseases (a) Root collar canker, (b) pink diseases (c) Stem canker (d) Other cankers. (2) Root diseases (i) Ganoderma root rot:** caused by *Ganoderma lucidum* (ii) **Cylindrocarpum root rot:** caused by the *Cylindrocarpum lucidum* (iii) **Fusarium wilts:** caused by *Fusarium oxysporum*. (3) **Bacterial diseases: Crown gall:** caused by *Agrobacterium radiobacter*. (4) **Physiological disorders: (i) Gummosis:** caused by physiogenic, pathogenic or biotic factors. (C) **Insects, pests and parasites of Eucalyptus: (1) Root feeders:** caused by termites which is damaged to seedlings and young plantations.

6. Wood properties:

| | |
|--------------------------------|--|
| Wood Color | Heartwood is red. |
| Hardness & Strength | Wood is hard & strong wood. |
| Working Quality | It saws and works well, it takes a good polish. |
| Weight | Heavy wood, 50lb/cu ft. at 12% moisture; sp. gr. is 0.697 kg/cm ² . |

| | |
|----------------------------|--|
| Calorific value | c.v. ranges between 19,700 and 21,000 kJkg ⁻¹ . |
| Durability | Durable wood. |
| Preservative treat. | Treated timber can be used for longer period. |
| Seasoning | It is highly refractory timber liable to develop severe cracks, warping, twisting. |

7. Uses:

| | |
|-------------------------|---|
| Timber | It is used for inexpensive construction such as doors, purlins, and window frames. It is also used for manufacture of packing cases, ballies for scaffolding and electric transmission poles; use for parquet flooring and veneering. |
| Fuel wood | Provides a good fuel. Saw dust, lops and tops, leaves & bark are used as firewood. |
| Fodder | Leaves are not severely eaten by goats and cattle. |
| Edible food | Root, seeds and nectars are a source of food. Bees make a light colored, fine testing honey. |
| Tannin | Barks are used for tannin. |
| Ecological value | It is planted as ornamental tree and land reclamation for ravine land, denuded hill slope, canal bank, abandoned cultivated land, grass-land, water-logged areas, and colonization of river banks. It is also planted for shelter belts and wind break. |
| Medicinal value | Leaves contain oil, which is obtained by distillation; the oil is used for medicinal, industrial, and perfumery purposes. Industrial oil is a useful solvent for varnish, resins, grease, rubber etc. |
| Pulp& paper | Eucalyptus pulps have long fiber, so it is widely used in the manufacture of paper. |

10

| | |
|----------------------------|---------------------------------|
| Local name: Kangiyo | English name: Silver oak |
| <i>Grevillea robusta</i> | Family: Proteaceae |

1. Natural occurrence: It is native to Queens land and New South Wales, Australia. In Nepal it can be planted up to 1500m.

2. Morphological characteristics:

| | |
|---------------|---|
| Leaf | Leaves are alternate, fern-like, dark green above and silvery below. |
| Flower | Flowers are orange colored, solitary or several together, borne in racemes. |
| Fruit | Fruit is an oblique, coriaceous follicle. |
| Seed | It contains 1or 2 seeds, which are, brown, flat and winged. |
| Bark | Bark is dark grey, deeply fissured into long narrow scales. |

3. Silvicultural characteristics:

| | |
|----------------|---|
| Light | Light demander. |
| Frost | Seedlings are susceptible to damage by frost; mature trees are fairly resistant to frost. |
| Drought | It is resistant to drought. |
| Soil | It prefers deep, fertile, moist, well-drained soils. |
| Coppice | It does not coppice well but pollards well. |

| | |
|--------------------|---|
| Associates | It is generally not lopped for fodder, it is unpalatable to cattle. |
| Tree nature | It is an evergreen tree with a long conical crown and a straight stem. |
| Others | It is very sensitive to boron deficiency. Branches are liable to damage by winds. |

5. Artificial regeneration:

| | |
|--------------------------------------|---|
| Preferred propagⁿ | Seedlings. |
| Seed collectⁿ time | June-September, it produces a good seed every year. |
| No. of seed kg⁻¹ | 10,000 seeds kg ⁻¹ . |
| Seed extractⁿ | The capsules are dried in the sun and beaten to extract the seed. |
| Seed storage | After drying the seed in sun, it can be kept in sealed container. |
| Viability of seed | Viability of seed remains for one year, but germination percent is heavily dropped. |
| Seed treatment | It is not required. |
| Seed sowing time | >1000m: Aug-Sep.<1000m: Feb-Mar. Seed is sown in beds or trays. |
| Duration of germⁿ | Germination begins 2-3 weeks after sowing & completes after two weeks later. |
| Germination (%) | Germination takes place 60-70%. |
| Nursery period | Seedling: >1000m: next monsoon, <1000m: Just coming monsoon. |

6. Wood properties:

| | |
|------------------------------------|--|
| Wood Color | Wood is reddish brown in color. |
| Hardness & Weight | Wood is hard. Wood weighs about 570 kgm ⁻³ .It is light wood. |
| Calorific value | Sapwood: 4,904 calories; heartwood: 4,914 calories. |
| Durability & Elasticity | Wood is durable & wood is elastic. |
| Seasoning | It requires careful seasoning. |

7. Uses:

| | |
|-------------------------|---|
| Timber | It is used for ornamental panelling, paraquet floors, furniture, toys, veneering & plywood. |
| Fuel wood | It is a moderately good fuel wood. |
| Tannin | The bark contains tannin. The bark also yields a yellow gum, which have medicinal uses. |
| Paper & pulp | It is suitable for paper and pulp. |
| Other | It is cultivated as a shade tree in tea & coffee plantations and is commonly planted in garden and avenues. The flowers attract honey and bees. |

(11)

| | |
|------------------------------|-----------------------------|
| <i>Jacaranda mimosifolia</i> | Family: Bignoniaceae |
|------------------------------|-----------------------------|

1. **Natural occurrence:** It is native to Brazil; it can be planted form Terai up to about 1600m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are opposite, bipinnate, pinnae in many pairs, each with 10-24 or more pairs of leaflets. |
| Flower | Flowers are bluish violet, in loose panicles. |
| Fruit | Fruit is round, woody and flattened. |

| | |
|-------------|--|
| Seed | Fruit contains numerous seeds. |
| Bark | Bark is creamy brown in color, furrowed vertically and cracked horizontally. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | It is a light demander tree. |
| Frost | It recovers rapidly from frost damage so it is useful for avenues. |
| Soil | The plant thrives in well-drained soil and does not tolerate damp situations. |
| Tree nature | It is an elegant shrub or medium sized deciduous tree, commonly planted in gardens as an avenue and ornamental tree. |

4. Artificial regeneration:

| | |
|-------------------------------------|---|
| Preferred propagation | i) Broadcast seed sowing, ii) suckers: it can be propagated from the suckers arising from the base of stem. |
| Seed collection time | Fruits ripen in winter season as collected in February and March. |
| No. of seed kg⁻¹ | There are about 50,000 seeds kg ⁻¹ . |
| Seed extraction | Fruits are dried in the sun and seeds are thrashed out. |
| Seed storage | Orthodox seed, it should be dried and stored in sealed containers. |
| Viability of seed | Seeds can be stored for up to 2 years. |
| Seed treatment | It is not required. |
| Seed sowing time | Seeds are sown in nursery bed in November and December. |
| Germination (%) | About 50%. |
| Duration of germⁿ | Germination starts in a couple of days. |
| Nursery period | Seedlings: Seedlings can be planted in monsoon rain. |
| Best planting size | 20-30cm tall seedlings. |

5. Forest pathogens: It is affected by white spongy rot caused by *Palystictus hirsutus*.

6. Wood properties:

| | |
|------------------------------|---|
| Wood Color | Wood is beautiful and fragrant |
| Hardness & weight | Wood is moderately hard and fine-textured. Wood is heavy. |
| Working Quality | It is easy to saw and work. |

7. Uses:

| | |
|-------------------------|--|
| Timber | Timber is useful for tool handles. |
| Fuel wood | Wood can be used for fuel. |
| Ecological value | It is a host plant for the Indian lac insect. |
| Medicinal value | In South America, bark is used in the treatment of skin diseases and glandular complaints. |

(12)

| | |
|-------------------------------------|--------------------------------|
| Local name: Ipil Ipil | English name: Ipil Ipil |
| <i>Leucaena leucocephala</i> | Family: Mimosaceae |

1. **Natural occurrence:** It is native to Central America, from Mexico to Honduras and also occurs in Peru.

2. Morphological characteristics:

| | |
|-------------|--|
| Leaf | Leaves are bipinnate, 4 -8 pairs of pinnae, linear and oblong. |
|-------------|--|

| | |
|---------------|--------------------------------|
| Flower | Flowers are small and whitish. |
| Fruit | Pods are straight and flat. |
| Seed | Seeds are 15-25. |
| Bark | Bark is brownish. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Light demander. |
| Frost | Frost tender. |
| Drought | It is drought resistant over longer periods. |
| Fire | It is fairly resistant to fire. |
| Soil | It is sensitive to soil pH and does not grow well in acidic soils. It requires inoculation with the N ₂ fixing bacteria, <i>Rhizobium</i> . It is also sensitive to soil fertility. It prefers deep clayey soils. |
| Coppice | It coppices strongly. |
| Browsing | Leaf is highly proteinous and nutritious. So, it is severely damaged by browsing. |
| Tree nature | It is a large shrub or small evergreen tree up to 20m in height; it sheds leaves during prolonged drought or frost for short period. |
| Others | In Nepal, it generally successes well on Bhabar Terai soil but have failed on very gravelly and bouldery soils near rivers. Seedlings and older trees have very strong taproots. |

4. Artificial regeneration:

| | |
|--|--|
| Preferred propagⁿ | Direct sowing, entire planting, stump cutting. |
| Seed collection time | November-January. |
| No. of seed kg⁻¹ | 20,000 to 26,000 seeds kg ⁻¹ or 38-50gm/1000 seeds. |
| Seed extraction | Pods should be dried in sun and then seeds can be extracted by beating. |
| Seed storage | Orthodox seed. It should be dried and stored in sealed containers. |
| Viability of seed | Seed can be stored for many years without losing its viability. |
| Seed treatment | Immerse seed in hot boiling water for 2-3 minutes & then 24 hours in cold water. |
| Seed sowing time | Terai: First two weeks of May. Above Terai: Last two weeks of April. |
| Duratⁿ of germⁿ | Germination begins after 3-4 days. |
| Nursery | Seedling Seedling can be ready for July planting. |
| Period | Stump Stump can be prepared from one-year-old seedling. |
| Best planting size | 20-30cm tall seedlings with 4-5 mm root collar diameter. |

5. Diseases, pests and parasites of Ipil Ipil (i). *Psyllid, Heteropsylla cubana*: causes severe damage to newly developing shoots and young leaves throughout Nepal. (ii). *Ganoderma endochroum*: causes high mortality in plantations. (iii). **Gummosis**: caused by *Fusarium semitectum*.

6. Wood properties:

| | |
|------------------------|--|
| Hardness | Wood is hard, medium textured, and closed grained. |
| Weight | Wood weighs about 540 kgm ⁻³ . |
| Strength | Wood is strong. |
| Calorific value | Calorific value of wood is 3895 cal/gm. C.v, of charcoal is 7250 cal/gm. |

7. Uses:

| | |
|-------------------------|--|
| Timber | Wood can be used for poles. |
| Fuel wood | It is used as a good fuel wood and makes a good charcoal. |
| Fodder | Tops, leaves, pods and seeds of the plant are eaten by cattle, sheep and goats. |
| Edible food | Young shoots and immature pods are eaten as vegetable, fodder contains 15 to 21 % crude protein. |
| Tannin | Leaves and bark contain tannin as 3% and 16.3% respectively. |
| Ecological value | It is used as shade and cover plantation in tea, coffee, cocoa, rubber, teak, sal etc. Leaves and twigs are rich in N ₂ and K salts, are used in composting. It is used for afforesting in grass-land, also wind-break and shelter-belt. It fixes large amount of N ₂ and improves the soil fertility. |
| Medicinal value | It is used to be a worm repellent and also a fish poison. |
| Paper and pulp | It is used as raw material for paper pulp. |
| Others | When consumed in excessive quantities, all parts of Ipil Ipil are toxic to monogastric animals like horses, pigs, rabbits and chickens cause great loss of hair, regeneration. |

(13)

| | |
|---------------------------------|-------------------------|
| Local name: Patula salla | |
| <i>Pinus patula</i> | Family: Pinaceae |

1. Natural occurrence: It is native to the mountains of eastern Mexico between 1650 and 3000m. In Nepal; it is best suited for planting between 1500 and 2500m.

2. Morphological characteristics:

| | |
|--------------|--|
| Leaf | A three-needle pine. Leaves are very slender, hanging down on each side of the branches. |
| Fruit | Cones are oblique, curve, shining pale brown. |

3. Silvicultural characteristics:

| | |
|---------------------------------|--|
| Light | Light demander. |
| Frost | Seedling: frost tender, mature trees: frost hardy. |
| Fire | Fire sensitive due to thin bark. |
| Soil | It is fairly tolerant of poor soils if they are acidic; it is very sensitive to boron deficiency. |
| Coppice | It is a non-coppicer. |
| Browsing | Leaves are unpalatable so seedlings are not much suffered from browsing. |
| Tree nature | It is an evergreen tall tree. |
| Meteorological condition | In its native country, rainfall ranges from 1000 to 1500mm which occurs mainly in summer season, with a relatively short dry season. |

4. Artificial regeneration:

| | |
|-------------------------------------|---|
| Preferred propagⁿ | Direct sowing, entire planting. |
| No. of seed kg⁻¹ | There are about 100,000 to 150,0000 seeds kg ⁻¹ . |
| Seed storage | Orthodox seed, the well-dried seed can be stored in sealed plastic bags. |
| Viability of seed | Viability of seed remains more than 1 year without serious loss of viability. |

| | |
|-------------------------------------|---|
| Seed sowing time | <1500m: September, >1500m: March. |
| Duration of germⁿ | Germination begins after 2-3 days and is completed 10-20 days later. |
| Germination (%) | 80%. |
| Nursery period | For seedling, <1500m: next monsoon, >1500m: 15-16 months. |
| Best planting size | 20-30cm tall seedlings with 4-5 mm root collar diameter. |

5. Diseases, pests and parasites of Patula Salla: i). **Brown needle diseases:** more susceptible to damage by it. ii). **Three weak pathogenic fungi**, *Potebniamyces coniferanum*, *Coniothyrium fuckelii*, *Phomopsis oculata* were found on dead and dying shoots. iii). **Die-back:** due to boron deficiency.

6. Wood properties:

| | |
|-----------------|--|
| Weight | Wood weighs about 370 to 600 kgm ⁻³ . |
| Strength | The wood near the core of tree tends to be rather weak and soft than outer wood, which has better strength properties. |

7. Uses:

| | |
|------------------|---|
| Timber | Wood is used for boxes, cheap joinery and construction. |
| Fuel wood | Its wood burns rapidly but produces a lot of smoke. |

(14)

| | |
|-------------------------------|------------------------------|
| L.N: Bangikot | E.N: Himalayan poplar |
| <i>Populus ciliata</i> | Family: Solisaceae |

1. **Natural occurrence:** It is indigenous to Nepal. In Nepal, it grows between 2000-3000m, common in western Nepal, not found in central Nepal.

2. **Morphological characteristics:** ~ are similar as *Populus deltoides*.

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Light demander. |
| Frost | Frost hardy. |
| Drought | It withstands drought well and can grow on dry hill- sides. |
| Fire | Young trees are sensitive while old trees are tolerant to fire. |
| Soil | It thrives best in ravines on well-drained and porous soils. Grow best in soil with pH (5.5-7.5). |
| Coppice | It does not coppice well but pollards well. |
| Associates | Coniferous forest: blue pine, deodar, spruce, silver, fir etc.; mixed broad leaf forest in ravines: <i>Aesculus indica</i> , <i>Prunus</i> , <i>Cedrela</i> , Oaks, Maples, etc. |
| Tree nature | It is a moderate to large deciduous tree with a tall clean straight bole. |
| Browsing | It is locally an important fodder for goats so seedlings are severely damaged by browsing. |

4. **Natural regeneration:** Natural regeneration takes place by seeds during the early rains. Seeds ripen in May and June. Seeds are dispersed by wind. Natural regeneration through suckers is also very common.

5. **Artificial regeneration:** ~ may be done through stem cuttings or root suckers, but give the best results.

6. Diseases, pests and parasites of poplars:

A. Diseases of poplars:

1. Root diseases:

a. White root rot diseases: caused by the pathogen *Rosellinia necatrix*. **b. Root rot diseases:** caused by the pathogen: *Ganoderma lucidum* **c. Brown root rot diseases:** caused by the Pathogen *Phellinus noxius*. **d. Rhizoctonia damping off and root rot:** caused by pathogen *Rhizoctonia solani*.

2. Stem diseases:

a. Pink diseases: caused by *Corticium salmonicolo* **b. Cytospora canker:** caused by *Cytospora chrysosperma*

3. Foliage diseases:

a. Cladosporium leaf spot: caused by *Cladosporium humile*. **b. Pollaccia blight:** caused by *Pollaccia elegans*. **c. Melampora leaf rust:** caused by *Melampsora ciliata*.

B. Pests of poplars: many borers and defoliators cause considerable damage, while some other insects produce galls on leaves and branches.

7. Wood properties:

| | |
|----------------------------|--|
| Wood Color | Sapwood: nearly white, broad; heartwood: yellowish white when first exposed, turning yellowish grey or brownish grey with age. |
| Hardness | Wood is moderately soft. |
| Working Quality | It saws and works easily. |
| Weight | Lightwood, specific gravity is 0.456 and average weight is 449kgm ⁻³ . |
| Durability | It is moderately durable under cover and in contact with water, but is liable to insect attack. |
| Preservative treat. | Treated timber can be used for longer period. |
| Seasoning | It seasons well and quickly. |

8. Uses:

| | |
|-------------------------|---|
| Timber | Timber is suitable for veneers, matchboxes and splints. |
| Fuel wood | Wood is used as fuel. |
| Fodder | Leaves are used as fodder for goats. |
| Ecological value | It is used as an avenue tree, can be used for soil stabilization on slopes. |
| Medicinal value | Bark is used as a tonic, stimulant and blood purifiers. |
| Paper & pulp | Wood is suitable for making paper pulp. The pulps have satisfactory strength properties for use in manufacture of writing & printing paper. |

(15)

| | |
|--------------------------------|-----------------------------------|
| Local name: Lahre pipal | English name: Black poplar |
| <i>Populus deltoides</i> | Family: Salicaceae |

1. Natural occurrence: It is an exotic species for Nepal. Its provenance is North America. It seems to be suited for an altitude of 1600m.

2. Morphological characteristics:

| | |
|---------------|--|
| Flower | Leaves are broadly oval, have a pointed tip, toothed edges and a heart shaped base. |
| Seed | The male and female flower (catkin) grows on different trees before the new leaves. The catkins are pendulous and light yellow. The female catkins are slightly longer |

| | |
|-------------|---|
| | and stiffer than the male ones. |
| Bark | Young tree: Usually smooth and shiny; Older tree: grey or grey-black, rough, quite deeply furrowed. |

3. Artificial regeneration: ~ may be done through stem cuttings or root suckers; but root suckers give the best results.

(16)

| | |
|-------------------------------|-------------------------------|
| English name: Mesquite | Family: Leguminosae |
| <i>Prosopis juliflora</i> | Sub-Family: Mimosaceae |

1. Natural occurrence: It is native to America. It can be grown tropical and sub-tropical parts of arid and semi-arid regions.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are bipinnate with two to four pairs of pinnae. |
| Flower | Flowers are small, yellowish in dense spikes. |
| Fruit | Pods are yellow, straight, and cylindrical. |
| Seed | No. of seeds are 10-30 in a pod. |
| Bark | Bark is greyish brown. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | Light demander. |
| Drought | It is tolerant of very arid conditions (drought resistant). |
| Soil | It is suitable for dry calcareous (usar) sites in lowland. |
| Coppice | It possesses excellent coppicing power. |
| Browsing | Leaves are unpalatable, so the tree is resistant to browsing. |
| Tree nature | It is a small, evergreen, spiny tree or shrub with drooping branches, not a common planted tree spp. of Nepal. |
| Others | It is a fast growing tree spp introduced in Nepal. |

4. Artificial regeneration:

| | |
|---------------------------------------|--|
| Preferred propagⁿ | Direct sowing, entire planting stump planting. |
| Seed collectiⁿ time | Seeds are collected in May and June in northern India. |
| No. of seed kg⁻¹ | 12,500 seeds kg ⁻¹ . |
| Seed extraction | Pods should be dried in sun and then seeds can be extracted by beating. |
| Seed storage method | Orthodox seed. It should be dried and stored in sealed containers. |
| Viability of seed | Viability of seed remains for long lived, (1 to 2 years) to very long period. |
| Seed treatment | Since the seed is hard-coated, either scarification is needed or soaks the seed in hot water also gives good result. |
| Seed sowing time | Seed should be sown in March, and in sunken beds. |
| Duration of germⁿ | Germination completes within 14 days. |
| Germination (%) | Germination takes place 85-95%. |
| Nursery Period | Seedling One-year-old seedling is preferable for transplanting. |
| | Stump At least one-year-old seedling is better for stump. |

| | |
|---------------------------|--|
| Best planting size | 20-30cm tall seedlings with 4-5mm diameter of root collar. |
|---------------------------|--|

5. Wood properties:

| | |
|------------------------|---|
| Wood Color | Woos is dark brown in color. |
| Hardness | Wood is very hard with irregularly grained, coarse-textured. |
| Working Quality | Easy to saw and work, finishes to a smooth surface and takes a fine polish. |
| Weight | Wood is heavy. (Weight 768-929 kgm ⁻³). |
| Strength | Wood is strong. |
| Durability | Wood is durable. |

6. Uses:

| | |
|------------------------|--|
| Timber | It is used for fence posts, house building, railway crosssties, furniture & turnery. |
| Fuel wood | Wood is an excellent fuel and makes a first quality charcoal. |
| Fodder | Pods are an excellent fodder, are eaten during famine. |
| Edible food | The spongy wall of ripe pods is highly nutritive, a fair source of protein, are edible. |
| Gum& resin | Tree exudes a gum, which forms somewhat adhesive mucilage and used as an emulsifying agent. |
| Ecolo. value | Plants are rich in (N, P, and K) nutrients hence it is used for green manuring. |
| Medicinal value | Aqueous & alcoholic extract of leaves show a marked anti-bacterial activity against <i>Bacillus coli</i> . |
| Others | Leaves contain 0.8 % of a dark green wax. Flowers are a source of nectar for bees. |

(17)

| | |
|-------------------------|------------------------------------|
| Local name: Asok | |
| <i>Saraca indica</i> | Leguminosae, Caesalpinaceae |

1. Natural occurrence: It is indigenous to India. It can be grown almost throughout Nepal between Terai to 750m.

2. Morphological characteristics:

| | |
|---------------|--|
| Leaf | Leaves are paripinnate, leaflets 6-12, oblong or oblong-lanceolate. |
| Flower | Flowers are orange or orange-yellow, very fragrant, in dense axillary corymbs. |
| Fruit | Pods are flat & leathery. |
| Seed | Seeds are 4-8. |
| Bark | Bark is dark brown to grey or almost black. |

3. Silvicultural characteristics:

| | |
|--------------------|--|
| Light | It is a shade bearer. |
| Coppice | It has a good coppicing capacity. |
| Tree nature | It is a small evergreen tree, found wild along streams or in the shade of evergreen forests. |

4. Artificial regeneration:

| | |
|-------------------------------------|--|
| Preferred propagⁿ | Direct sowing, entire planting. |
| Seed collection time | Seeds are collected in September, soon after ripening. |
| No. of seed kg⁻¹ | 97 seeds kg ⁻¹ . |

| | |
|--------------------------|---|
| Viability of seed | Seeds viable for only about two months. |
| Seed sowing time | Seed should be sown as soon as possible after collection. |
| Germination (%) | Germination is about 100% if the seeds are sown within a month of collection. |

5. Wood properties:

| | |
|-------------------|---|
| Wood Color | Wood is light reddish brown. |
| Hardness | Wood is soft. |
| Weight | Wood weighs about 576 kgm ⁻³ . |

6. Uses:

| | |
|-------------------------|--|
| Timber | Timber is used for ploughs and shafts. |
| Fuel wood | Wood can be used as fuel wood. |
| Edible food | Pods are used to make very good forage for cattle. |
| Tannin | Bark contains 6% tannin. |
| Ecological value | It is frequently cultivated as ornamental and avenue tree. |
| Medicinal value | Bark: cures biliousness, dyspepsia, dysentery, colic, piles, ulcers & pimples. Leaf: possesses blood-purifying properties. Flowers: flowers pounded in water are used in haemorrhagic dysentery and the dried flowers in diabetes. Flowers are considered to be an excellent uterine tonic. |
| Religious value | Plant is one of the most sacred trees of the Hindus and Buddhists, flowers being much used for religious ceremonies and temple decorative. |

(18)

| | |
|-------------------------------|----------------------------|
| Local name: Sagawan | English name: Teak |
| <i>Tectona grandis</i> | Family: Verbenaceae |

1. Natural occurrence: Provenance: It is indigenous to India, Burma, Java, Indonesian islands and Thailand. It grows from Terai to 700m elevations in areas, where the vegetation is open and there is good drainage.

2. Morphological characteristics

| | |
|---------------|---|
| Leaf | Leaves are broadly elliptic or obovate. |
| Flower | Flowers are small, white, sweet scented & numerous. |
| Fruit | Fruit is hard, bony, irregularly globose, somewhat pointed at the apex. |
| Seed | Seeds are 1-3 rarely 4 in a fruit. |
| Bark | Bark is fibrous, light brown or grey, exfoliating in long, thin strips. |

3. Silvicultural characteristics:

| | |
|-------------------|--|
| Light | Strong light demander. |
| Frost | Frost tender. |
| Drought | Drought tender. |
| Fire | Very resistant to fire. |
| Soil | Best growth on deep, well-drained, loamy to sandy loam soils. It does not tolerate water-logging. It is not planted in pure plantations on sloping erodible sites. |
| Coppice | It coppices as well as pollards very well. |
| Associates | Teak normally occurs in the mixed deciduous forests in India. The common |

| | |
|--------------------|---|
| | associates are <i>Acacia catechu</i> , <i>Adina cordifolia</i> , <i>Cassia fistula</i> , <i>Gmelina arborea</i> . The bamboos found in association with teak are <i>Dendrocalamus strictus</i> , and <i>Bambusa arundinacea</i> . |
| Browsing | It is not readily browsed by browsing animals. |
| Tree nature | It is a large deciduous tree with rounded crown, clean and cylindrical bole, the stem becomes more fluted and buttressed at the base. |
| Other | It suppresses all under growth, leaving a bare floor. It is not sensitive to pH. It is moderately wind firm in coastal areas. Teak is uprooted during cyclonic storms. |

4. Artificial regeneration:

| | |
|--------------------------------------|---|
| Preferred proppⁿ | Direct sowing, entire planting, stump planting. |
| Seed collectⁿ time | Seeds are collected between November & January. |
| No. of seed kg⁻¹ | 1200-3100 drupes kg ⁻¹ . |
| Seed storage | Orthodox seed .Put thoroughly dried seed in a polythene bag, seal tightly and keep in a cool place. |
| Viability of seed | Viability remains for 12 months in calico bags, but up to 10 years in sealed container. |
| Seed treatment | (i) Hot treatment seed either for 1-2 weeks at 50 ^o C, or up to two days at 80 ^o C, (ii) Fruits are put into jute sacks and left in running water overnight, then spread in the sun to dry the following day. This process of immersion and drying is repeated for 15 days .The fruits are then sown into open raised beds. |
| Seed sowing time | Seeds are sown between March and April. |
| Duration of germⁿ | Germination starts after two weeks and tapering off after six weeks & can continue for six months. |
| Germination (%) | 60-80%, germination is epigeous. At 12 months, germination is better than when fresh. |
| Nursery period | Seedling Seedlings can be planted during monsoon. (4 -5 months after seed sown.) |
| | Stump Stumps can be prepared from one-year-old seedlings. |
| Best planting size | 20-30cm tall seedlings with 4-5mm root collar diameter. |

5. Diseases, Pests and Parasites of Teak: (1) **diseases** (i) **wilt diseases:** caused by *Pseudomonas solanacearum* in seedling as well as old transplants. (ii) *Peniophora rhizomorpha-sulphurea* and *Polyporus zonalis* causes root rot (iii) *Corticium salmonicolor* causes pink diseases. (2) **Important pests:** by two defoliators: (i) **Teak skeletonizer:** caused by *Hapalia machaeralis* (ii). **Teak defoliator:** caused by *Hyblaea puera*.

6. Wood properties:

| | |
|------------------------|---|
| Wood Color | Sapwood: white to pale yellowish brown; heartwood: golden yellow. |
| Hardness | Timber is moderately hard. |
| Working Quality | It is easy to saw and work; it can be planted and sanded to a smooth surface which takes a good polish. |
| Weight | Wood weighs about 720 kgm ⁻³ , medium heavy woods, sp. gr are (0.55 to 0.70). |
| Strength | Wood is strong. |
| Calorific value | Calorific value is high; sapwood: 4,989 calories, heartwood: 5,535 |

| | |
|-------------------------------|--|
| | calories, for completely dried wood. |
| Durability | Heartwood is one of the most durable woods, but the sapwood is not so much durable, perishable and quickly destroyed by rot, white ants. |
| Preservative treatment | It is very refractory wood to treatment, penetration being practically nil from sides or ends. |
| Seasoning | Teak is a model wood for air seasoning; it dries quickly and with little or no depreciation. It can be kiln seasoned easily but care is required to avoid discoloration of wood. |
| Other | It is almost immune to the attack of white ants, other insects and fungi; it has a good resistance to acids. |

7. Uses:

| | |
|-------------------------|--|
| Timber | Timber is widely used for house building, ships and boats, furniture, railway slippers, high quality veneers etc. |
| Fuel wood | It is an excellent fuel. |
| Tannin | Leaves contain about 6% tannin and a yellow or red dye, is used for dyeing silk yellow, olive or related shades. Bark contains 7.14% tannin. |
| Medicinal value | The oily product is obtained by distillation of wood-chips for the treatment of eczema and ringworm. Extract of the leaves showed complete inhibition of <i>Mycobacterium tuberculosis</i> . |
| Paper & pulp | As timber is highly valuable, wood waste and small sized material is only used for pulping which can be used to make writing and printing papers. |
| Other | The kernels yield 44.5% of fatty oil, which is used to promote the growth of hair, and also in scabies. |

CHAPTER: VIII

Glossary of medicinal terms used in the Compilation

- Abscesses** : Localized collection of pus in a cavity caused by disintegration of body tissues.
- Acrid** : Bitterly pungent.
- Alexileric** : Any of certain substances is normal blood serum which destroy bacteria.
- Alterative** : Gradually restoring the healthy bodily function.
- Amenorrhoea** : Absence of menstruation.
- Anaemia** : Quantitative defficiency of the haemoglobin.
- Anaphrodisiac** : Capable of diminishing sexual desire.
- Anthelmintic** : Causing removal of worms in the body.
- Antibactetial** : Preventing germicidal causes.
- Antiperiodic** : Preventing the return of those diseases which recur, such as Malaria.
- Antiscobutic** : Preventing worn.
- Antiseptic** : Preventing toxication.
- Antispasmodic** : Preventing or curing epilepsy.
- Antiviral** : Preventing or curing viral attack.
- Aperient** : Producing a natural movement of the bowels.
- Aphrodisiac** : Stimulating the sexual organs.
- Appetizing** : Causing the desire for food.
- Asthma** : Chronic disease that causes difficulty in breathing.
- Astringent** : Causing contraction of the tissue.
- Bilious** : Suffering or caused by some trouble with bile or the liver.
- Bronchitis** : Inflammation of the lining of the bronchital tubes.
- Cardiotonic** : The agents which are used to restore cardiac efficiency and bring about an improvement of the circulation.
- Carminative** : Expelling gas from the stomach and intestine.
- Catarrhal** : Inflammation of a mucus membrane, especially of the respiratory tracts.
- Cathartic** : Evacuating the bowels.
- Caustic** : Capable of buring , corroding or destroying living tissues.
- Chlorosis** : A type of iron deficiency marked by a pale yellow green complexion.
- Demulcent** : Protecting an irritated mucus membrane.
- Delirium** : A more or less temporary disorder of the mental faculties.
- Depilatory** : Capable of removing hair.
- Diuresis** : Excessive discharge of urine.
- Diuretic** : Increasing the volume of the urine.
- Elephantiasis** : Cronic disease due to lymphatic obstruction.
- Embrocation** : Act of embrocating a bruised or diseased part of the body.
- Emollient** : Having the power of softening or relaxing living tissues.
- Emetic** : Applied to drugs which cause vomiting.
- Epilepsy** : A chronic nervous diseases whose attacks cause upset and unconsciousness.
- Erysipelas** : Acute febrile infectious diseases.
- Expectorant** : Promoting expectoration and removing secretions form the bronchial tubes.
- Febrifuse** : Reducing fever.
- Galactagogue** : Increasing the amount of milk.

----- Thank You -----

As human population is increasing rapidly, natural resources particularly forest are being severely depleted due to deforestation results in desertification and change in land use pattern especially conversion of forest land into problematic and difficult sites like denuded hill slopes, abandoned cultivation land, landslide and erosion, road slope failure, etc.

Foresters' main duty is now to conserve the existing forest as well as to launch afforestation program, to increase the productivity of forest and to search alternatives for fulfillment of basic needs of human beings.

This compilation covers widely information on tree species about afforestation techniques, diverse uses, silvicultural and morphological characteristics, wood properties, agro forestry application, silvicultural system etc, that's why, this compilation is quite useful for forestry students, forestry professionals and other natural resource managers.
