## **TABLE OF CONTENTS**

### **1 Introduction**

### **2 Determination and floristic composition of EUNIS grassland habitat types on the basis of in situ vegetation measurements throughout Europe**

- 2.1 Background
- 2.2 Vegetation-plot data as a scientific basis for habitat classification
- 2.3 Update of crosswalks between EUNIS grassland habitat types and EuroVegChecklist
- 2.4 The floristic composition of EUNIS grassland habitat types at the level of alliances of the EuroVegChecklist

### **3 Reviewing the EUNIS grassland habitat types**

- 3.1 Background
- 3.2 Review of the EUNIS grassland habitat types
- 3.3 Proposed changes in the EUNIS grassland habitat types

### **4 Description and distribution of the revised EUNIS heathland, scrub and tundra habitat types**

- 4.1 Background
- 4.2 Indicator species of the revised EUNIS heathland, scrub and tundra habitat types
- 4.3 Update of indicator species of the revised EUNIS woodland habitat types
- 4.4 Description in a standard format of the revised EUNIS heathland, scrub and tundra habitat types
- 4.5 Maps of distribution of phytosociological relevés and probability of occurrence based on distribution models for each of the revised EUNIS heathland, scrub and tundra habitat types

### **5 Recommendations and roadmap for a EUNIS environmental parameter framework**

- 5.1 The existing state of EUNIS habitat parameterisation
- 5.2 Other relevant sources for environmental references

- 5.3      Glossaries for habitat description and parameterisation
- 5.4      Environmental parameters in noise for recording habitats
- 5.4.1    The Global Index of Vegetation Plot Databases
- 5.4.2    Environmental recording among current practitioners
- 5.4.3    Environmental data in the European Vegetation Archive and TURBOVEG
- 5.5      A roadmap for a EUNIS environmental parameter frame

## **6     Recommendations and future prospects**

- 6.1    Further steps to collect European wide in-situ data to assess other EUNIS habitat types
- 6.2    Development of a EUNIS parameter framework
- 6.3    Linkages between EUNIS and the 'Red List of European habitats' project

## **7     References**

**Appendix H:** List of data providers

**Appendix I:** Preliminary distribution and suitability maps of the revised EUNIS heathland, scrub and tundra habitat types

## **1 Introduction**

Documenting, monitoring and assessing habitats in a comparable manner across Europe is required for reporting under the EU Habitats Directive and Bern Convention, within the frame of the Common Agricultural Policy and Regional Development Funds, and for the implementation of the INSPIRE Directive. The EUNIS Habitat Classification (Davies & Moss 1999) provides a pan-European reference set of units for meeting such requirements for particular policy objectives and for supporting applications that relate to biodiversity monitoring and reporting.

Enhanced capability in such operations is expected under the EU and global biodiversity targets for 2020. The European Environment Agency (EEA) hosts and maintains the biodiversity data centre, where European data sets and information on sites, species and habitats of Europe are published. Together with data sets provided by other environmental data centres, these data sets support the assessment of progress in achieving biodiversity targets as shown in the Biodiversity Information System for Europe (BISE). BISE, along with the Water Information System for Europe (WISE), anticipates an integration of ecosystem assessment across Europe.

The EEA has developed the EUNIS habitat classification and maintains it as part of the biodiversity data centre. The aim of the EUNIS habitat classification is to provide a pan-European reference set of habitat units with a common unit description within a hierarchy aiming to fulfil specific objectives and support specific applications related to biodiversity monitoring and reporting at the European scale. Such applications include reporting for the implementation of the EU Habitats Directive and the Bern Convention, as well as providing information in the context of the Common Agricultural Policy and the Regional Development Funds. A European standard list of habitat types is also necessary for the implementation of the INSPIRE Directive, to which other national or regional classifications will have to make reference so as to be comparable.

Further to the above, the EEA is participating in MAES (Mapping and Assessment of Ecosystems and their Services), an activity within the framework of the EU Biodiversity Strategy. Relevant to this activity and in support of the ecosystem assessment of Europe, is the development of a baseline for documenting, monitoring and assessing the quality of habitats across Europe, by analysing existing in situ vegetation monitoring data in accordance with the EUNIS habitat classification.

Such monitoring data, in accordance with the EUNIS habitat classification, will support the development of a baseline for documenting, monitoring and assessing the quality of habitats across Europe, in the framework of the ecosystem assessment and Copernicus (former GMES) activities in which the EEA is participating. In this context, as part of the current review of

information relating to habitat types and ecosystems, the EEA anticipates a revision of the existing scientific basis for the EUNIS Habitat Classification. In 2012, a project was carried out to revise the crosswalk of EUNIS to phytosociological syntaxa (Rodwell et al. 1998, 2002) and to inform on the capacity of *in situ* vegetation recording for demonstrating trends in habitat diversity and quality (Schaminée et al. 2012). The outcome of this project, coordinated by the present consortium, offered the ground for a next step, the actual underpinning of the EUNIS classification with *in situ* vegetation plot data. As a first group of habitat types the forests were considered, resulting in the EEA technical report "Review of EUNIS forest habitat classification", presented by the same team (Schaminée et al. 2013). A second group of habitat types (heathland, scrub and tundra vegetation) was the subject of an EEA project that was carried out in 2014 (Schaminée et al. 2014). This project also provided revised text descriptions of the proposed EUNIS forest habitat types (now renamed 'woodland') as well as maps of distribution of phytosociological relevés and probability of occurrence based on distribution models for each of these types.

Now it is proposed that a third group of habitat types should be examined, resulting in a review – on the basis of *in situ* vegetation measurements across Europe – of the description and classification of habitat group E of EUNIS (Grasslands) as well as grasslands included under habitat group B (B1.4 Coastal stable dune grassland and B1.9 Machair grassland). Grasslands are of great importance in European nature policy, of widespread distribution, housing a large proportion of the biodiversity in this part of the world, and everywhere under threat. The existing descriptions are insufficient and inadequately supported by *in situ* vegetation data which limit the usability of the EUNIS habitat classification.

As standardisation of environmental references greatly enhances the recording of habitat character and condition, the harmonisation of environmental data sources and the delivery of habitat protection and other environmental policies, it was asked to provide recommendations and a roadmap for the further development of a EUNIS habitat parameter framework. The value of such harmonisation was trialled in an early attempt to encourage common data standards in the recording of relevés (Mucina et al. 2000) and in an unpublished crosswalk between a suite of possible phytosociological parameters and those of EUNIS at that time (Rodwell et al. 2001), but it remains a pressing challenge.

A further focus of the project is to provide descriptions and maps for each of the revised heathland, scrub and tundra habitat types as described in the 2014 EUNIS report (Schaminée et al. 2014). The maps will present the distribution of phytosociological relevés attributed to each EUNIS habitat type. Additionally, the suitability distribution of each habitat type based on distribution modelling by the ETC/BD will be presented.

The objectives of this project were specified as tasks in the Annex I of the project specification (EEA/NSV/15/005) and elucidated in the Inception Report (September 2015, Service Contract No. 3417/B2015/EEA.56197):<sup>1</sup>

## WP 1

**Task 2** To determine and provide the floristic composition of European grassland habitat types of Level 3 of the EUNIS classification using the available vegetation databases and published sources of vegetation syntaxa at the level of alliances of the EuroVegChecklist.

**Task 3** Based on the results of Task 2, review (level 3) and propose improvements of delimitation of the grassland habitat types included under habitat group E, specifically subgroups E1, E2, E3 and E4 and, if appropriate, subgroups E5 and E6, as well as grassland included under habitat group B subgroups B1.4: Coastal stable dune grassland and B1.9: Machair of the EUNIS habitats classification. To provide input for relevant updates in relation to grasslands to the 'Crosswalk EUNIS-EuroVegChecklist' for each alliance of the EuroVegChecklist, and also to provide recommendations on how the work carried out would contribute to organising a further European-wide in situ data collection for assessment of grassland ecosystems, e.g. distribution mapping for grassland habitats.

**Task 4** To provide recommendations and a roadmap for the further development of a EUNIS habitat parameter framework based on a scoping exercise on data sources, user needs and database structures.

## WP 2

**Task 2** To deliver lists of indicator species of all heathland, scrub and tundra habitat types at level 3, taking into account the outcome of Schaminée et al. (2014), based on vegetation database analyses.

**Task 3** To deliver maps of distribution of phytosociological relevés for each of the heathland, scrub and tundra habitat types as described in Appendix D of Schaminée et al. (2014).

**Task 4** To provide descriptions in a standard format for each of revised the heathland, scrub and tundra habitat types as presented in Schaminée et al. (2014), and to provide input for relevant updates in relation to heathland/scrub for each alliance of the EuroVegChecklist to the EUNIS-EuroVegChecklist crosswalks of 2012 (in case changes have been introduced to the latter).

---

<sup>1</sup> Task 1 of both Work Packages concerned the preparation and presentation of the Inception Report.

## **2 Determination and floristic composition of EUNIS grassland habitat types on the basis of in situ vegetation measurements throughout Europe**

### **2.1 Background**

The present study is based on cross-walking two different European classification systems, which were developed more or less independently and for different purposes. On the one hand, there is the classification of vegetation types provided by phytosociology, the tradition which uses fine-scale vegetation-plot data on plant species composition and cover for 'bottom-up' fine-grained delimitation and characterisation of plant associations (Braun-Blanquet 1928; Tüxen 1937). On the other hand, there is the classification of habitat types, providing a pan-European reference system for policy making with a common unit description within a hierarchical classification, presently known as the EUNIS habitat classification (Davies & Moss 1999; Davies et al. 2004; Moss 2008).

The vegetation classification in particular is facing a new era, as a result of the availability nowadays of high-capacity computers and software packages for processing phytosociological data. During the last century, numerous studies have resulted in a large number of formally described associations, alliances, orders and classes throughout Europe, but their delimitation usually remained incomplete and contentious due to various theoretical constraints and methodological problems. In an attempt to achieve a respectable level of stability, the European Vegetation Survey (EVS) developed in the early years of the 21st century the first overview of European vegetation units at the levels of alliances, orders and classes, published as *The Diversity of European Vegetation* (Rodwell et al. 2002). From that moment onwards, the overview of European syntaxa has undergone substantial expert revision by a team under the leadership of Professor Ladislav Mucina. The new product, the EuroVegChecklist, is more comprehensive (covering all Europe as well as territories such as the Azores, Canary Islands, Cyprus, Caucasus and Greenland), scientifically robust, better grounded within current phytosociological understanding, and more meaningful for application within the user community. The 2013 version of this EuroVegChecklist was used for the EUNIS woodland habitat revision (Schaminée et al. 2013) and, after further revision, was submitted to the journal Applied Vegetation Science for publication in 2013 and resubmitted after review in June 2014 (Mucina et al. 2014).

## **2.2 Vegetation-plot data as a scientific basis for habitat classification**

As described in the project plan (*Research proposal EEA/NSV/15/005*), plot samples as collected by phytosociologists (Braun-Blanquet 1928, Mueller-Dombois & Ellenberg 1974) provide the most numerous and widely dispersed in-situ records of vegetation across Europe. Comprising at minimum a list of vascular plant species with an estimate of cover-abundance in plots ranging from less than 1 m<sup>2</sup> to a few hundreds m<sup>2</sup> (Chytrý & Otýpková 2003), such samples are usually dated and spatially located in a way that gives a record of the composition of vegetation at a particular time and place. In phytosociology, they have formed the basis of the classification of vegetation into associations organised into hierarchical systems, and have thus helped furnish inventories and maps of sites and accounts of the vegetation of countries and regions (e.g. Rodwell 1991 et seq.; Mucina et al. 1993; Schaminée et al. 1995 et seq.; Valachovič et al. 1995 et seq. Chytrý 2007 et seq.).

Various enquiries within and outside the EVS (Ewald 2001; Schaminée et al. 2009) have provided an insight into the patterns of accumulation of vegetation plots across Europe over the past 90 years. The latest estimates (based on data from 32 countries) suggest that more than 4.3 million vegetation descriptions have been recorded. Most of plots have been made in the countries of central and western Europe, particularly Germany, the Netherlands and France, but considerable numbers were also estimated for Poland, Spain, the Czech Republic, Italy, the United Kingdom and Austria (Schaminée et al. 2009).

The development of compatible software tools, one of the EVS core work objectives, has greatly encouraged the development of national and regional vegetation databases and fostered the creation of a network facilitating data exchange and research collaborations, and assisted the emergence of supranational vegetation revisions and overviews over the last twenty years. The major software tool for database development has been TURBOVEG (Hennekens & Schaminée 2001), now accepted as an international standard for data input, storage, management and retrieval, and installed in over 30 countries in Europe and beyond. Complementary to TURBOVEG, the JUICE program (Tichý 2002) has added a wide range of analytical tools for data sets that can comprise thousands of relevés.

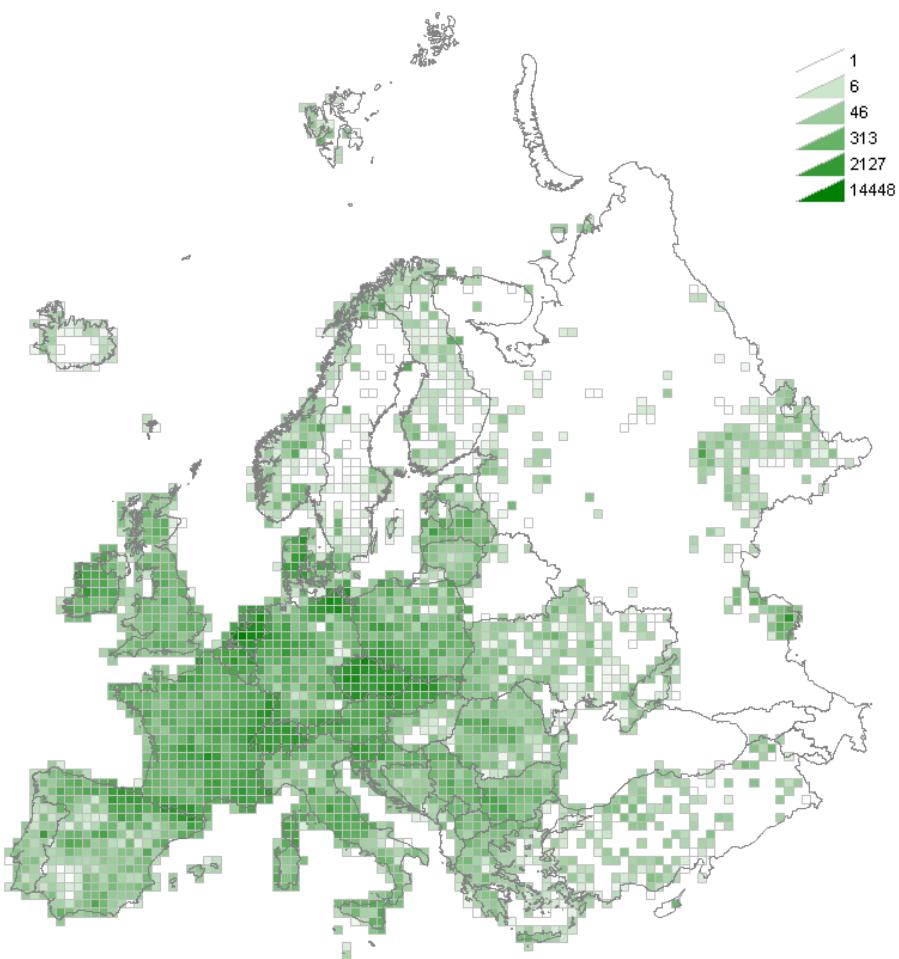

The most recent study designed to collect estimates of the total number of vegetation plots in Europe (Schaminée et al. 2009), revealed that more than 1.8 million relevés had been already computerised, 75% of which were found in centralised databases of countries or regions. Of all captured relevés, 59% were available in TURBOVEG format. Further key steps have now been taken

by many EVS members to locate and capture additional plots, and to centralise data storage of such plots. In 2011, the Global Index of Vegetation-Plot Databases platform (GIVD) was launched (Dengler et al. 2011) to provide a meta-resource of electronic databases whose hosts are willing in principle to share the captured data. At present (18 Feb 2016; <http://www.givd.info/>), 237 databases with 3,160,243 vegetation plots have been registered, a large proportion of them providing records of European vegetation. The GIVD platform also assists in revealing gaps in the coverage and/or availability of the vegetation plot data.

Another young initiative – the European Vegetation Archive (EVA) – yielded a centralised database of vegetation plots by storing copies of national and regional databases on a single software platform using a unified taxonomic reference database. Data storing in EVA does not affect the ongoing independent development of the source databases. EVA Data Property and Governance Rules ([www.euroveg.org/eva-database](http://www.euroveg.org/eva-database)), approved in 2012, guarantee that data property rights of the original contributors are respected. By December 2015, 62 databases from all European regions, including the largest examples, joined EVA. The centralised database contained in total 1,126,004 vegetation plots from most European regions, especially from western, central and southern Europe (see Figure 2.1). However, there is a remarkable lack of data from Scandinavia and eastern European countries, i.e. European regions with less strong or interrupted phytosociological traditions. The majority of these plots (87%) have geographic coordinates. The vegetation-plot records are stored in EVA in three access regimes: free (available to anybody), semi-restricted (available in principle to the group of other data contributors) and restricted (available in principle to the group of other data contributors based on specific consent). These three access regimes are represented respectively by 6%, 82% and 12% of the total EVA database (Chytrý et al. 2016).

A prototype of the database management software TURBOVEG 3 was developed for joint management of multiple databases that use different species lists. This software also includes procedures for handling data requests, selections and provisions according to the approved EVA Rules. A specific challenge for EVA is combining multiple species lists based on different taxonomies used in national and regional databases. This is managed using the SynBioSys Taxon Database, which was initially established for the purposes of the *SynBioSys Europe* project and is now further developed and extended within the framework of EVA. Each relevé in EVA has a unique Global Unified Identifier (GUID) and version control will be used to keep track of date changes. Several specific projects devoted to detailed diversity assessment of selected vegetation types started within the EVA initiative in 2014. A prototype project for the EVA initiative is the Braun-Blanquet Project, aiming at the compilation and analysis of floristic and geographical information on European vegetation types. The project, led by Dr. Borja Jiménez-Alfaro, is dedicated to Josias Braun-Blanquet, whose legacy has been

the inspiration for collecting large datasets of vegetation-plot data in Europe ([http://www.sci.muni.cz/botany/vegsci/braun\\_blanquet.php?lang=en](http://www.sci.muni.cz/botany/vegsci/braun_blanquet.php?lang=en)).

*Figure 2.1. Density of georeferenced plots in 50 x 50 km grid cells.*

The vegetation-plot data used in the Braun-Blanquet Project form the basis for determining and providing the floristic composition of grassland vegetation data, in a similar fashion as in the EEA 2014 project on heathland, scrub and tundra habitat types (Schaminée et al. 2014), and in the EEA 2013 project on woodland habitat types (Schaminée et al. 2013). As indicated before, the main input has come from computerized databases set up at many places throughout Europe.

The task to revise the EUNIS grassland habitat types is based on the current version of EUNIS level 3 and the 2013 version of the EuroVegChecklist, as presented at the Annual Symposium of the International Association for

Vegetation Science (IAVS) in Perth in September 2014 and submitted to the international journal *Applied Vegetation Science* for publication.

## 2.3 Update of crosswalks between EUNIS grassland habitats and EuroVegChecklist

The crosswalk between the EUNIS habitat types and phytosociological alliances, prepared for the 2012 report on the development of vegetation syntaxa crosswalks to EUNIS habitat classification (Schaminée et al. 2012),

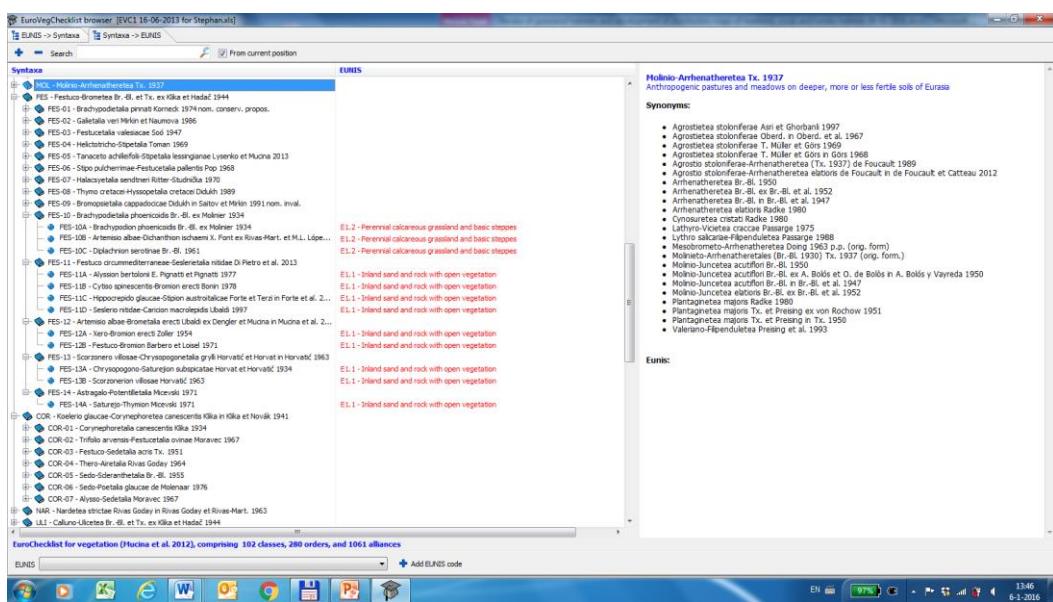

Figure 2.2. EuroVegChecklist browser with tab "Syntaxa -> EUNIS" open, based on the 2013 version of the EuroVegChecklist.

was based on a version of the EuroVegChecklist from July 2012 but this was subjected to further modifications after that date until it was ultimately submitted for publication on 30 March 2013. In the process of peer reviewing, the checklist has been further updated, based on the latest syntaxonomic discussions and insights. The submitted version of EuroVegChecklist recognizes 101 classes, 279 orders and 1,052 alliances. The document comprises 274 pages of text and several electronic appendices, including indicator species of classes, glossary of terms, bibliographic appendices, desktop browser and analytical tools. There are 32 authors from 16 countries. The overview also includes more than 4,000 scientific synonyms that provide

the connection with vegetation types published in the past (Mucina et al. 2014).

In order to work with the updated version of European vegetation classification in the current project, we revised the EUNIS-syntaxa crosswalk to match the submitted version of EuroVegChecklist. Ladislav Mucina, the senior author of EuroVegChecklist, took part in this revision. This revision reflected the merging of some alliances, the splitting of others, the introduction of new alliances and changes in the delimitation of some alliances that influenced established matches to the EUNIS habitat types.

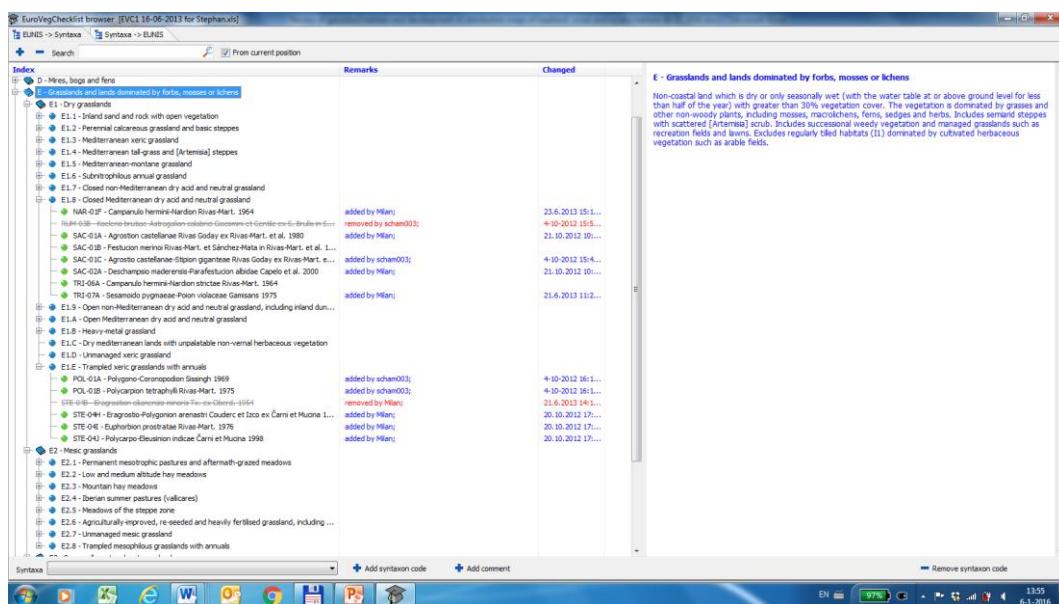

Figure 2.3. EuroVegChecklist browser with tab "EUNIS -> syntaxa" open, based on the 2013 version of the EuroVegChecklist.

To ease the workflow, a tool, called the EuroVegChecklist browser (see Figure 2.2 and Figure 2.3), has been developed for linking EUNIS habitats to alliances.

In relation to the definition of grasslands, the following EUNIS habitat types have been taken into account for the current task: B1.4 (Coastal stable dune grassland), B1.9 (Machair), and E (Grasslands and lands dominated by forbs, mosses or lichens). The syntaxa of the EuroVegChecklist that have been considered were selected on the basis of the crosswalks. The EUNIS categories E7 (Sparsely wooded grasslands) were not dealt with, as these types are complexes of different vegetation types. Some habitat types were omitted as they are not grasslands, such as E1.C (Dry mediterranean lands with unpalatable non vernal herbaceous vegetation) and E5.3 (*Pteridium*

*aquilinum* fields), having not a clear definition, such as E1.D (Unmanaged xeric grassland), E2.7 (Unmanaged mesic grassland) and E2.8 (Trampled mesophilous grasslands with annuals), or are anthropogenic/agricultural habitats, such as E1.6 (Subnitrophilous annual grasslands), E2.6 (Agriculturally-improved, re-seeded and heavily fertilised grassland, including sports fields and grass lawns), E1.E (Trampled xeric grasslands with annuals) and E5.1 (Anthropogenic herb stands). In total, 32 EUNIS grassland habitat types were considered as target habitat types.

## **2.4 The floristic composition of EUNIS grassland habitat types at the level of alliances of the EuroVegChecklist**

The floristic composition of the EUNIS grassland types has been determined on the basis of the floristic composition of the corresponding phytosociological alliances, according to the revised crosswalk EUNIS-syntaxa (Appendix A). As a basis for the analysis, a database of 1,190,000 relevés has been compiled, in TURBOVEG format (see Paragraph 2.2), of which 370,000 relevés could be assigned to grasslands. The database for grasslands contains datasets from a wide range of data providers throughout Europe (Appendix H).

The procedure consists of two steps. In a first step, the relevés of these – regional and national – datasets were classified at the level of alliances of the 2013 EuroVegChecklist (submitted version). This was done by matching the original assignment of the relevés to alliances (in most cases reflecting the national or regional classification systems) to the syntaxonomical criteria applied in the European overview. At present, about 57% of the 1,190,000 relevés could be assigned to one of the alliances accepted in the 2013 EuroVegChecklist, 31% of which belong to grasslands. In a second step, the assignment to the EUNIS grassland habitat types was performed by merging the data of the alliances to the corresponding EUNIS type (according to the EUNIS-syntaxa crosswalk) and by averaging based on national constancy columns (not by simply adding up). Here we give an example to illustrate this. Let us presume that we have data from two countries for a certain alliance, from the Czech Republic and Spain. If the occurrence of species A is 50% of Czech relevés from a total of 1,000 (=500) and 10% of Spanish relevés from a total of 100 (=10), then by simple taking the total number of relevés, a total frequency of 46% (510 relevés from a total of 1,100) would be the outcome, which is mainly determined by the larger dataset of the Czech Republic. If we apply average frequencies, the result would be a mean frequency of 30%, which probably is more representative across a broader region of Europe. For Russia, separate constancy columns were made for different regions before averaging, not for the whole country, because it is extremely large.

In the crosswalk, 366 grassland alliances of the EuroVegChecklist have been assigned to one of the 32 EUNIS habitat types. At present, there are relevés for 242 of these alliances (i.e. 66%). Nevertheless, all 32 EUNIS grassland habitat types have been covered by real data (100%), in most cases providing a representative number of relevés in relation to the geographic distribution and commonness of each habitat type. The reasons for having no in-situ vegetation data for certain alliances are the following:

- (1) Alliances from regions with general lack of phytosociological data. Some areas are still not well covered in the vegetation databases available for the Braun-Blanquet project, like the Boreal zone of Scandinavia and Russia, Ukraine, Caucasus, parts of Balkan, and Cyprus.
- (2) Alliances recently described for the work developed in the EuroVegChecklist which have not been used before. Thus, the corresponding relevés in the original databases are not classified and correct assignment is difficult. This is the case especially for grassland alliances from Italy and the Balkans.

### **3 Reviewing the EUNIS grassland habitat types**

#### **3.1 Background**

The development of the EUNIS Habitat Classification (Davies & Moss 1999) afforded a fresh opportunity to provide a sound scientific cross-reference between widely accepted classification of European habitats and phytosociological definitions of vegetation types, as indicated in the *Introduction* (Chapter 1). Some 15 years ago, a team of the European Vegetation Survey (EVS) developed a crosswalk between phytosociological units to the level of the alliance and EUNIS habitats at level 3. *The Scientific Background to the EUNIS Habitat Classification* (Rodwell et al. 1998) provided the first overview of European vegetation types to the level of alliance, after which, in 2002, the booklet *The Diversity of European Vegetation* provided crosswalks from the EUNIS Level 3 habitats to the syntaxa and vice versa, accompanied by brief verbal descriptors of the vegetation units (Rodwell et al. 2002). In a recent EEA project, these crosswalks have been revised and updated (Schaminée et al. 2012).

Since the original crosswalk was developed (Rodwell et al. 2002), there have been only relatively modest changes to the terrestrial sections of the EUNIS Habitat Classification (Evans, personal communication). However, the overview of European syntaxa has undergone substantial expert revision, as discussed in Chapter 2. In Paragraph 2.3, information has been provided on the update of the EuroVegChecklist (version 2013) and the crosswalks between the EUNIS classification and this checklist.

#### **3.2 Review of the EUNIS grassland habitat types**

As mentioned above (Par. 2.3), the following EUNIS grassland habitat types were reviewed: B1.4 (Coastal stable dune grassland), B1.9 (Machair), and E (Grasslands and lands dominated by forbs, mosses or lichens). Within the E group, exceptions were made for E1.6, E1.C, E1.D, E1.E, E2.6, E2.7, E2.8, E5.1, E5.3 and E7, whereas for some other habitat types the proposal is made to merge them with types from other groups. The latter concerns the habitat types E1.4, E2.5 and E4.2 (see Table 3.1 and Appendix C for explanation). The reasons for exclusion are further explained in Paragraph 2.3; some of the types are not grasslands, others anthropogenic or vegetation complexes.

In line with the recommendations for improving the EUNIS forest habitat classification (Schaminée et al. 2013) and the heathland, tundra and scrub classification (Schaminée et al. 2014), similar conclusions can be drawn for the grasslands. They will involve two types of recommendations, one concerning the classification itself, with recommendations for new units, splitting and merging existing units, and one dealing with their naming (see the EEA 2013 report for further details).

Our main conclusion is that the EUNIS habitat types are generally too broad and therefore should be divided. The proposed revision is mainly based on floristic composition, whereas EUNIS sometimes follows a division based on vegetation structure (for example open and closed grassland). Especially the order level in syntaxonomy proves to be appropriate for making distinctions. The proposed classification based on species composition brings grasslands together with a similar soil, hydrology and management. Quite often these grasslands are zonal and confined to a specific geographic region, which can be reflected in the name (boreal, continental, submediterranean, and so on). The term 'ultramafic' relates to serpentine rocks and related rocks with high concentrates of metals. The term 'annual grassland' is used for grasslands containing a large amount of annual species, in contrast with the term 'perennial grassland' for grasslands harbouring many perennial species.

**Classification** By comparing the existing EUNIS classification with the floristic composition of the assigned syntaxa, we found strong grounds for revising the EUNIS types B1.4, B1.9, E1.1, E1.2, E1.3, E1.5, E1.7, E1.8, E1.9, E2.1, E3.1, E3.2, E3.4, E3.5, E4.3, E4.4, E5.2, and E5.4. We further propose to add one new EUNIS habitat type, occurring on the Azores (E1.F Azorean open, dry, acid to neutral grassland), and to define the temperate inland salt marshes as an additional habitat type E6.3 within subgroup E6 (Inland salt steppes). Furthermore some changes in names are proposed (see Paragraph 3.3 and Table 3.1). Special attention is paid to B1.9 (Machair), as this habitat type might be concerned as a vegetation complex as well as – more restricted – grassland habitat type (see below).

Proposal for improvement of the EUNIS types:

*EUNIS B1.4 Coastal dune grassland.* These stable dune grasslands (grey dunes) should be split into three types, according to their geographic position, and distinguished by different species composition: B1.4a Atlantic and Baltic coastal dune grasslands, B1.4b Mediterranean and Macaronesian coastal dune grasslands, and B1.4c Black Sea coastal dune grasslands.

*EUNIS B1.9 Machair.* This habitat type actually is a complex of various habitat types that on themselves are already recognized within the EUNIS classification (X27). Nevertheless, because of their specific position in the coastal landscape and the strong interest for nature conservation (Machairs are a priority habitat type within Natura 2000, H21A0), machairs might be

considered as a separate EUNIS habitat type within Group B, referring to the grassland part of the machairs, that are generally considered as separate ecosystems (e.g. Ritchie 1976, Angus 2004). To indicate that only the grassland part of the machairs is considered within Group B, we propose to rename the habitat type into B1.9a Machair grasslands. Floristically these grasslands have the same content as the Irish and Scottish representatives of B1.4a Atlantic and Baltic coastal dune grasslands.

*EUNIS E1.1 Inland sand and rock with open vegetation.* EUNIS makes a high level distinction based on a sand and rock substrate, so there is a duplication of such grasslands with E1.9, where they figure as non-Mediterranean types of dry acid and neutral open grassland. From the lower level EUNIS types, it is clear that inland dunes (mobile sands fluvial dunes) better fit under E1.9, while vegetation on skeletal soil (rocks) and sandy steppes fit better here. We propose a division in ten types: E1.1a Pannonian and Pontic sandy steppe, E1.1b Temperate and boreal pioneer grassland on shallow soils on siliceous rock outcrops, E1.1c Boreal open, sub-thermophilous grassland on shallow soils on siliceous rocky outcrops, E1.1d Submediterranean and temperate pioneer grassland on calcareous and ultramafic rocky outcrops, E1.1e Submediterranean xeric open grassland of skeletal calcareous and ultramafic soils, E1.1f Continental dry rocky steppic grassland and dwarf scrub on chalk outcrops, E1.1g Perennial grassland on rocky outcrops at low altitudes in Central and Southeastern Europe, E1.1h Submontane to supramontane ultramafic rocky grassland of the Balkans, E1.1i Subatlantic and submediterranean perennial grassland on calcareous shallow soils, and E1.1j Dry steppic, submediterranean pasture of South-Eastern Europe.

*EUNIS E1.2 Perennial calcareous grassland and basic steppes.* This habitat type could be split into two types, representing grasslands of different floristic composition and occurring in different geographic regions: E1.2a Semi-dry perennial calcareous grassland and E1.2b Continental dry steppe. The first refer to the order *Brometalia*, the latter represents the order *Festucetalia valesiacae*.

*EUNIS E1.3 Mediterranean xeric grassland.* This habitat type could be split according to geographical distribution and floristic composition, reflected at the class level. The first two types refer to closely grazed (*Poetea bulbosae*) and perennial grasslands (*Thero-Brachypodietea*), the third to annual-rich grasslands (*Stipo-Trachynietea distachyi*): E1.3a Mediterranean closely grazed dry grassland, E1.3b Mediterranean tall perennial dry grassland, and E1.3c Mediterranean annual-rich dry grassland.

*EUNIS E1.5 Mediterranean montane grassland.* This habitat type, with many endemic species, could be split into five types according to geographical distribution and the floristic composition. As such, there are different habitat types for the Iberian, Corsican and Sardinian, Greek and Anatolian, and Madeiran region, with a further split of the Iberian communities for siliceous

and basiphilous communities: E1.5a Iberian oromediterranean siliceous dry grassland, E1.5b Iberian oromediterranean basiphilous dry grassland, E1.5c Corsican and Sardinian oromediterranean siliceous dry grassland, E1.5d Greek and Anatolian oromediterranean siliceous dry grassland, and E1.5e Madeiran oromediterranean siliceous dry grassland.

*EUNIS E1.7 Closed non-Mediterranean dry acid and neutral grassland.* For this habitat type we propose a change of content and consequently a change of name. Excluded are specific boreal grasslands (E4.3) and steppic grassland (E1.2). The newly proposed type is more restricted: E1.7a Lowland to submontane, dry to mesic *Nardus* grassland.

*EUNIS E1.8 Mediterranean dry acid and neutral closed grassland.* Because of large overlap with other (oromediterranean) habitat types (E1.5, E1.7 and E1.A) we propose to restrict this habitat type to specific Iberian communities, belonging to the the order *Jasiono sessiliflorae-Koelerietalia crassipedis*. In line with this change in content we propose a change of name: E1.8a Open Iberian supra-mediterranean dry acid and neutral grassland.

*EUNIS E1.9 Non-Mediterranean dry acid and neutral open grassland, including inland dune grassland.* We propose to restrict this habitat type to inland dune grasslands, and to split off the mobile sand communities (mainly *Corynephorion canescens*) as a separate habitat type, in line with the Habitats Directive (H2330): E1.9a Oceanic to subcontinental inland sand grassland on dry acid and neutral soils, and E1.9b Inland mobile sand and dune with siliceous grassland.

*EUNIS E2.1 Permenant mesotrophic pastures and aftermath-grazed meadows.* We propose a change of content as the aftermath grazed meadows should be included in E2.2 and E2.3. Consequently, there will be a change in name: E2.1a Mesic permanent pastures of lowlands and mountains.

*EUNIS E3.1 Mediterranean tall humid grassland.* This habitat type should be restricted to the inland areas, as the coastal communities belong to habitat type B1.8 (Moist and wet dune slacks). Therefore we also propose a change of name: E3.1a Mediterranean tall humid inland grassland.

*EUNIS E3.2 Mediterranean short humid grassland.* This habitat type could be divided into two types, one of the lowlands and one for the mountains, going along with differences in floristic composition: E3.2a Mediterranean short moist grassland of lowlands, and E3.2b Mediterranean short moist grassland of mountains.

*EUNIS E3.4 Moist or wet mesotrophic to eutrophic grassland.* This habitat type could be split into two types, according to management (mowing versus grazing), and coinciding with a different species composition: E3.4a Moist or

wet mesotrophic to eutrophic hay meadow, and E3.4b Moist or wet mesotrophic to eutrophic pasture.

*EUNIS E3.5 Moist or wet oligotrophic grassland.* We propose to restrict these wet oligotrophic grasslands to the non-Mediterranean regions, and consequently propose a new name: E3.5a Non-Mediterranean moist or wet oligotrophic grassland.

*EUNIS E4.3 Acid alpine and subalpine grassland.* We propose to split this habitat type into two types, according to their distinct geographical occurrence in the boreal-arctic and alpine zone respectively: E4.3a Boreal and arctic acidophilous alpine grassland, and E4.3b Temperate acidophilous alpine grassland.

*EUNIS E4.4 Calcareous alpine and subalpine grassland.* This habitat type could be split into two types, according to floristic composition and geographical distribution. The arctic-alpine grasslands belong to the orders *Carici-Kobresietea* and *Seslerietalia caerulea*, the alpine-subalpine grasslands of the Balkan and Apennines to the orders *Seslerietalia tenuifoliae* and *Onobrychido-Seslerietalia*: E4.4a Arctic-alpine calcareous grassland, and E4.4b Alpine and subalpine calcareous grasslands of the Balkan and Apennines.

*EUNIS E5.2 Thermophile woodland fringes* could be split into three types, according to floristic composition, going along with geographical distribution (Macaronesia) and soil characteristics (baserich versus acidic): E5.2a Thermophile woodland fringe of baserich soils, E5.2b Thermophilous woodland fringe of acidic soils, and E5.2c Macaronesian thermophile woodland fringe.

*EUNIS E5.4 Moist or wet tall-herb and fern fringes and meadows.* We propose to restrict this habitat type to the lowlands and to exclude anthropogenic stands. Therefore, a change of name is proposed: E5.4a Moist or wet tall-herb and fern fringe of the lowlands. The mountain forms of such stands are assigned to E5.5.

Naming: With regard to the names of the EUNIS grassland habitat types we could derive a set of general recommendations, which we have applied to the existing classification. Where relevant, we have clarified our suggestions by one or more examples.

General recommendation 1: Adopt brief and clear names for the habitat types.

General recommendation 2: Names within a group of related habitat types should be mutually exclusive with regard to, for example, biogeographic zone. Example: Atlantic and Baltic coastal dune grassland (B1.4a) versus Mediterranean and Macaronesian coastal dune grasslands (B1.4b) and Black Sea coastal dune grassland (B1.4c).

General recommendation 3: Do not use square brackets to indicate scientific names. If included, scientific taxon names should be in italics. This only concerns one habitat type within group E: E5.3 [*Pteridium aquilinum*] fields, a habitat type that we will not consider as these bracken fields are no grassland. In the web version of the EUNIS classification this change has already been made.

General recommendation 4: Use a standardized naming. Example: use only the name grassland instead of alternatively grasslands or grassland, like in E2 Mesic grasslands and E2.8 Trampled mesophyloous grasslands versus E2.7 Unmanaged mesic grassland. We propose to use singular instead of the plural for terms like steppe, meadow and stand.

### **3.3 Proposed changes in the EUNIS grassland habitat types**

Applying these recommendation with regard to content and naming would result in the following updated list of EUNIS grassland habitat types (habitat types with just changes in names – without splitting and/or change of content – are indicated with an \*; in such case, the existing name is put within brackets behind the proposed new name):

- ▶ B1.4 Coastal dune grassland could be divided into three types, according to geographical distribution:
  - ▶▶ B1.4a Atlantic and Baltic coastal dune grassland
  - ▶▶ B1.4b Mediterranean and Macaronesian coastal dune grassland
  - ▶▶ B1.4c Black Sea coastal dune grassland
- ▶ B1.9 Machair should be restricted to the grassland part of the habitats and accordingly renamed:
  - ▶▶ B1.9a Machair grasslands\*
- ▶ E1.1 Inland sand and rock with open vegetation is much too general and could be divided into ten types, mainly based on different regions and floristic composition
  - ▶▶ E1.1a Pannonic and Pontic sandy steppe
  - ▶▶ E1.1b Temperate and boreal pioneer grassland on shallow soils on siliceous rocky outcrops

- ▶▶ E1.1c Boreal open, sub-thermophilous grassland on shallow soils on siliceous rocky outcrops
- ▶▶ E1.1d Submediterranean and temperate pioneer grassland on calcareous and ultramafic rocky outcrops
- ▶▶ E1.1e Submediterranean xeric open grasslands of skeletal calcareous and ultramafic soils
- ▶▶ E1.1f Continental dry rocky steppic grassland and dwarf scrub on chalk outcrops
- ▶▶ E1.1g Perennial grassland on rocky outcrops at low altitudes in Central and Southeastern Europe
- ▶▶ E1.1h Submontane to supramontane ultramafic rocky grassland of the Balkans
- ▶▶ E1.1i Subatlantic and submediterranean perennial grassland on calcareous shallow soils
- ▶▶ E1.1j Dry steppic, submediterranean pasture of South-Eastern Europe
- ▶ E1.2 Perennial calcareous grassland and basic steppes could be split into three types, according to floristic composition and geographical distribution:
  - ▶▶ E1.2a Semi-dry perennial calcareous grassland
  - ▶▶ E1.2b Continental dry steppe
- ▶ E1.3 Mediterranean xeric grassland could be split into three types, according to floristic composition and geographical distribution:
  - ▶▶ E1.3a Mediterranean closely grazed dry grassland
  - ▶▶ E1.3b Mediterranean tall perennial dry grassland
  - ▶▶ E1.3c Mediterranean annual-rich dry grassland
- ▶ E1.5 Mediterranean-montane grassland could be split into five types, according to floristic composition and representing different regions:
  - ▶▶ E1.5a Iberian oromediterranean siliceous dry grassland
  - ▶▶ E1.5b Iberian oromediterranean basiphilous dry grassland

- ▶▶ E1.5c Corsican and Sardinian oromediterranean siliceous dry grassland
- ▶▶ E1.5d Greek and Anatolian oromediterranean siliceous dry grassland
- ▶▶ E1.5e Madeiran oromediterranean siliceous dry grassland
- ▶ E1.7 Closed non-Mediterranean dry acid and neutral grassland. Change of content and consequently change of name:
  - ▶▶ E1.7a Lowland to submontane, dry to mesic *Nardus* grassland
- ▶ E1.8 Mediterranean dry acid and neutral closed grassland. Change of content and consequently change of name:
  - ▶▶ E1.8a Open Iberian supra-mediterranean dry acid and neutral grassland
- ▶ E1.9 Non-Mediterranean dry acid and neutral open grassland, including inland dune grasslands, has to be more restricted to these dune systems and could be divided over two types according to floristic compision and geomorphology:
  - ▶▶ E1.9a Oceanic to subcontinental inland sand grassland on dry acid and neutral soils
  - ▶▶ E1.9b Inland mobile sand and dune with siliceous grassland
- ▶ E1.A Mediterranean to Atlantic open, dry, acid and neutral grassland\* [Mediterranean dry acid and neutral open grassland]
- ▶ E1.B Heavy metal grassland
- ▶ E1.F Azorean open, dry, acid to neutral grassland
- ▶ E2.1 Permenant mesotrophic pastures and aftermath-grazed meadows. Change of content and consequently change of name:
  - ▶▶ E2.1a Mesic permanent pasture of lowlands and mountains
  - ▶▶ E2.2 Low and medium altitude hay meadow\* [Low and medium altitude hay meadows]
  - ▶▶ E2.3 Mountain hay meadow\* [Mountain hay meadows]
  - ▶▶ E2.4 Iberian summer pasture (vallicar)\* [Iberian summer pastures (vallicar)]

- ▶ E3.1 Mediterranean tall humid grassland. Change of content and consequently change of name:
- ▶▶ E3.1a Mediterranean tall humid inland grassland
- ▶ E3.2 Mediterranean short humid grassland could be split into two types, according to altitude:
  - ▶▶ E3.2a Mediterranean short moist grassland of lowlands
  - ▶▶ E3.2b Mediterranean short moist grassland of mountains
- ▶ E3.3 Sub-mediterranean moist meadows
- ▶ E3.4 Moist or wet mesotrophic to eutrophic grassland could be split into two types, according to management:
  - ▶▶ E3.4a Moist or wet mesotrophic to eutrophic hay meadow
  - ▶▶ E3.4b Moist or wet mesotrophic to eutrophic pasture
- ▶ E3.5 Moist or wet oligotrophic grassland has to be renamed as we propose to restrict this grassland to the non-Mediterranean regions:
  - ▶▶ E3.5a Non-Mediterranean moist or wet oligotrophic grassland
- ▶ E4.1 Vegetated snow-patch
- ▶ E4.3 Acid alpine and subalpine grassland could be split into two types, according to their geographical distribution:
  - ▶▶ E4.3a Boreal and arctic acidophilous alpine grassland
  - ▶▶ E4.3b Temperate acidophilous alpine grassland
- ▶ E4.4 Calcareous alpine and subalpine grassland could be split into two types, according to floristic composition and geographical distribution:
  - ▶▶ E4.4a Arctic-alpine calcareous grassland
  - ▶▶ E4.4b Alpine and subalpine calcareous grassland of the Balkan and Apennines
- ▶ E5.2 Thermophile woodland fringes could be split into three types, according to geographical distribution and soil characteristics:
  - ▶▶ E5.2a Thermophile woodland fringe of baserich soils

- ▶▶ E5.2b Thermophilous woodland fringe of acidic soils
- ▶▶ E5.2c Macaronesian thermophile woodland fringe
- ▶ E5.4 Moist or wet tall-herb and fern fringes and meadows. Change of content and consequently change of name:
  - ▶▶ E5.4a Moist or wet tall-herb and fern fringe of the lowlands
  - ▶ E5.5 Subalpine moist or wet tall-herb and fern stand\* [Subalpine moist or wet tall-herb and fern stands]
  - ▶ E6.1 Mediterranean inland salt steppe\* [Mediterranean inland salt steppes]
  - ▶ E6.2 Continental inland salt steppe\* [Continental inland salt steppes]
  - ▶ E6.3 Temperate inland salt marsh
  - ▶ E7.1 Temperate and hemiboreal wooded pasture and meadow\* [Altantic parkland]
  - ▶ E7.2 Hemiboreal and boreal wooded pasture and meadow\* [Sub-continental parkland]
  - ▶ E7.3 Mediterranean wooded pasture and meadow\* [Dehesa]

*Table 3.1. Overview of old and revised EUNIS habitat types.*

EUNIS code new	EUNIS-3 habitat name new	EUNIS code old	EUNIS-3 habitat name old
B1.4a	Atlantic and Baltic coastal dune grassland (grey dunes)	B1.4	Coastal stable dune grassland
B1.4b	Mediterranean and Macaronesian coastal dune grassland (grey dunes)		
B1.4c	Black Sea coastal dune grassland (grey dunes)		
B1.9	Machair grassland	B1.9	Machair
E1.1a	Pannonic and Pontic sandy steppe	E1.1	Inland sand and rock with open vegetation
E1.1b	Temperate and boreal pioneer grassland on shallow soils on siliceous rock outcrops		
E1.1c	Boreal open, sub-thermophilous grassland on shallow soils on siliceous rock outcrops		
E1.1d	Submediterranean and temperate pioneer grassland on calcareous and ultramafic rock outcrops

E7.3	Mediterranean wooded pasture and meadow	E7.3	Dehesa

## **4 Description and distribution of the revised EUNIS heathland, scrub and tundra habitat types**

### **4.1 Background**

In the 2014 report (Schaminée et al. 2014), vegetation plots (phytosociological relevés) representing habitat types of heathlands, scrub or tundra were identified in the databases of the the Braun-Blanquet project and EVA using a crosswalk between syntaxa (phytosociological alliances) and EUNIS habitat types (Schaminée et al. 2012, with later updates). This work was very important for identifying gaps in the data and subsequent targeted gap filling. It also made it possible to identify the preliminary lists of constant species for each of these types (Schaminée et al. 2014).

Here we present the next step of the analysis, which includes two significant improvements:

- 1) A computer expert system for heathland, scrub and tundra habitats was developed. It contains formal definitions of individual habitats and uses them to identify vegetation plots belonging to these habitats in the databases. Thus it (i) applies habitat classification consistently across Europe, unlike classification based on expert assignments to phytosociological alliances, which depend on subjective judgement of various experts; (ii) enables identification of vegetation plots that have not been labelled by the alliance names; (iii) can be used to classify any vegetation plot obtained in the future using the same criteria.
- 2) The lists of constant species were supplemented by the lists of diagnostic and dominant species. These three categories of indicator species have different meaning and together they provide a comprehensive characterization of the habitat's species diversity. Diagnostic species are species with occurrences concentrated in the habitat, being absent or rare in other habitats. As such they are good positive indicators of the habitat, but they do not need to occur in every location of the habitat. Constant species are species that frequently occur in the habitat, but they may include generalist species that are also frequent in other habitats. Dominant species are those that often reach high cover in the habitat, thus determining the habitat physiognomy. Species lists for all of these categories were computed based on the groups of vegetation plots classified by the expert system, using consistent numerical criteria.

## **4.2 Indicator species of the revised EUNIS heathland, scrub and tundra habitat types**

The initial dataset used for the analysis was compiled from the EVA database and the Braun-Blanquet project database. This data set contained a total of 1,126,004 vegetation plots from Europe, including a small number of plots from adjacent regions such as Greenland, Siberia, Anatolia and the Mediterranean coast of North Africa. This dataset was imported to the JUICE 7.0 program (Tichý 2002), in which the subsequent analyses were performed. In this data set, plots identified as belonging to heathland, scrub and tundra habitat types were identified based on the assignments provided by Schaminée et al. (2014). New plots, especially those added to the source databases over the past year, were assigned to these habitat types based on the classification to the alliances by their original authors or expert judgement. These groups of plots belonging to respective habitat types were used as a basis for developing the formal definitions of habitat types for the expert system.

A database of European trees and shrubs developed in 2014 was further extended and revised and dwarf shrubs were added as a separate category. A refined ecological and morphological classification of these species was introduced.

Species groups were created using our expert judgement based on the lists of indicator species for EUNIS habitat types from Schaminée et al. (2014), descriptions of habitat types in European phytosociological literature, and lists of trees and shrubs. These species groups were defined in such a way that they can clearly separate the EUNIS habitat types based on their occurrence and total cover of their species. In general, some species groups included tree species, other groups included shrub species and yet others included the herb-layer species. Each group consisted of species of similar ecology and distribution.

These species groups were combined to create formal definitions of all habitat types of heathlands, scrub and tundra at EUNIS Level 3, with modifications proposed by Schaminée et al. (2014) and in the project of the Red List of European habitats. These formal definitions consist of formulas that combine covers of individual species, total covers of species groups, and numbers of co-occurring species of individual species groups using the logical operators AND, OR and AND NOT, following the proposals of Bruelheide (1997), and also relational operators GR (=greater than). Total covers of each species group were calculated assuming the random overlap of covers of their individual species based on the approach proposed by Chytrý et al. (2005) and formally described by Fischer (2015). Details of this procedure are described in Landucci et al. (2015). Some new software functions were not

previously available and had to be developed by L. Tichý specifically for this project for the purpose of defining some types of scrub and dwarf scrub.

As an example, the formal definition of the habitat type F7.1 *Western Mediterranean spiny heath* is represented by the following logical formula:

```
(<#TC W-Mediterranean-coastal-spiny-shrubs GR25> AND <#TC W-Mediterranean-coastal-spiny-shrubs GR #TC Shrubs|#TC Dwarf-shrubs|#TC Garrigue-phrygana-shrubs EXCEPT #TC W-Mediterranean-coastal-spiny-shrubs>) NOT <#TC Trees GR10>,
```

which means that the total cover (#TC) of the species group of the Western Mediterranean coastal spiny shrubs is greater than 25% (GR25) and at the same time the total cover of this group is greater than (GR) the total cover of other groups of shrub species (Shrubs, Dwarf shrubs and Garrigue-phrygana shrubs) and at the same time the total cover of trees is not greater than 10%.

A total of 52 definitions of habitat types was developed and included in the expert system (Appendix E). Some of them were defined more narrowly than the EUNIS habitat types used in the final output. These narrower definitions make it possible to create finer classification whenever needed, but the habitat types they define are perfectly nested within the target EUNIS habitat types. This means that EUNIS habitat types can be defined by simply merging the narrower units of the expert system. In contrast, some habitat types defined mainly by geographic criteria, but having very similar species composition in different areas, had a common definition, namely the arctic-alpine and boreo-mountain-temperate types.

The species composition of all 1,126,004 vegetation plots was compared with all the formal definitions. This procedure was computationally very intensive, taking several days on a cloud computer. As a result, plots belonging to some of the 52 habitat types of heathlands, scrub or tundra were identified. These plots were checked for species composition, mapped, and based on the results, formal definitions were adjusted and errors in the input database were corrected. This procedure was repeated several times until an optimal solution was achieved. At the end 40,885 plots were classified to heathland, scrub or tundra habitat types.

The group of plots assigned to EUNIS habitat types were used to prepare distribution maps. The plots assigned by a common definition to groups representing more than one geographically conceived habitat type were subsequently separated to these habitat types based on the occurrence in Ecoregions as defined by Olson et al. (2001). Coastal scrub habitat types belonging to the habitat group B of EUNIS were defined by intersecting plot assignment to scrub habitat types and occurrence on coastal dunes, defined according to the coastal dune area of the Map of the Natural Vegetation of Europe (Bohn et al. 2000-2004) with a buffer of 1 km.

Three groups of indicator species were defined for each EUNIS habitat type based on the groups of vegetation plots assigned to this type using the procedure described in the previous chapter. These groups included diagnostic, constant and dominant species.

An important issue that had to be solved before computing indicator species was the geographical stratification of the vegetation-plot dataset (Knollová et al. 2005). This was needed in order to remove the effect of geographically unbalanced sampling effort across Europe, which meant that some relatively small areas had a high concentration vegetation plots, while other (often large) areas were represented by few or no plots, even though the habitat type most probably occurs there.

For the purpose of the stratified resampling the data set was divided into two parts – plots classified as heathland, scrub and tundra habitat types and plots of other types. Aquatic vegetation plots and vegetation plots from Greenland, North Africa and Asia east of 60° E were deleted prior to the stratification. Geographical stratification of the classified part of the data set was performed in a grid of 3 x 5 minutes. If a cell of this grid contained more than 1 plot belonging to the same habitat type, one plot was selected randomly and the other plots were deleted. Geographical stratification of the unclassified part of the data set (plots with geographical coordinates) started with its random division to 10 subsets with equal number of plots. Within each subset, one randomly selected plot from each grid cell of 3 x 5 minutes (approximately 5.5 x 6 km at 50° N) was included in the stratified file, while others were deleted. In this way, up to 10 times more unclassified plots were selected from each grid cell, which is justified by the fact that unclassified plots belonged to many habitat types, while for the classified plots selection was always made from a single habitat type.

As a result of stratified resampling, a dataset was prepared that contained 11,727 plots belonging to heathland, scrub and tundra habitat types and 279,741 plots belonging to other habitat types. The number of plots was much smaller than the total number of plots of these habitats available, but the advantage of this dataset was that it was more representative. Plots of the other types had to be retained in the dataset to provide a background for calculating the degree of concentration of species occurrences within the target vegetation type in the computation of diagnostic species. For computation of indicator species of coastal dune scrub habitats, a separate file had to be created, because the coastal dune habitats were represented by the same plots as some scrub habitats of group F. A total of 894 plots belonging to coastal dune scrub and 242,236 plots of other habitats were included in this dataset.

Diagnostic species were determined based on the degree of concentration of their occurrences in groups of plots representing each EUNIS habitat type. This degree of concentration was calculated using the phi coefficient of

association (Sokal & Rohlf 1995) standardized for the identical number of relevés across all groups, which was arbitrarily set to 1% of the total data set (Tichý & Chytrý 2006). The species with a value of phi for the particular habitat higher than 0.15 were considered as diagnostic for this habitat type. However, for some habitat types represented by a low number of plots in the stratified dataset, the concentration of species occurrence within the type may not have been statistically significant. Therefore statistical significance of the species-habitat type association was tested using the Fisher's exact test (Sokal & Rohlf 1995) and if this association was not significant at  $P < 0.05$ , the species was excluded from the list of diagnostic species (Tichý & Chytrý 2006).

Constant species were defined as those with constancy (= percentage occurrence frequency) in the target habitat type at least 10%.

Dominant species were defined as those that occurred with a cover higher than 25% in at least 5% of vegetation plots. This means that a species is considered as dominant even if it does not belong to the highest vegetation layer, and a single plot can have more than one dominant species, or no dominant species if vegetation is very sparse or if cover values of all species are lower than 25%.

Records of species identified only to the genus level and records of epiphytic lichens were removed from the lists of indicator species.

The resulting lists of indicator species for EUNIS heathlands, scrub and tundra habitat types, including diagnostic, constant and dominant species, are presented in Appendix F. After excluding a few habitat types for which no or less than 10 vegetation plots were available, indicator species were defined for the following 41 types:

B1.5a	Atlantic and Baltic coastal Empetrum heath
B1.5b	Atlantic coastal Calluna and Ulex heath
B1.6a	Atlantic and Baltic coastal dune scrub
B1.6b	Mediterranean and Black Sea coastal dune scrub
F1.1	Shrub tundra
F1.2	Moss and lichen tundra
F2.1	Subarctic and alpine dwarf Salix scrub
F2.2a	Alpine and subalpine ericoid heath
F2.2b	Alpine and subalpine Juniperus scrub
F2.2c	Balkan subalpine genistoid scrub
F2.3	Subalpine deciduous scrub
F2.4	Subalpine Pinus mugo scrub
F3.1a	Lowland to montane temperate and submediterranean Juniperus scrub
F3.1b	Temperate Rubus scrub

F3.1c	Lowland to montane temperate and submediterranean genistoid scrub
F3.1d	Balkan-Anatolian submontane genistoid scrub
F3.1e	Temperate and submediterranean thorn scrub
F3.1f	Low steppic scrub
F3.1g	<i>Corylus avellana</i> scrub
F3.1h	Temperate woodland clearing scrub
F4.1	Wet heath
F4.2	Dry heath
F5.1-2	Mediterranean maquis and arborescent matorral
F5.3	Submediterranean pseudomaquis
F5.4	<i>Spartium junceum</i> scrub
F5.5	Thermomediterranean scrub
F6.1a	Western basiphilous garrigue
F6.1b	Western acidophilous garrigue
F6.2	Eastern garrigue
F6.6	Supramediterranean garrigue
F6.7	Mediterranean gypsum scrub
F6.8a	Mediterranean halo-nitrophilous scrub
F6.8b	Caspian halo-nitrophilous scrub
F7.1	Western Mediterranean spiny heath
F7.3	Eastern Mediterranean spiny heath (phrygana)
F7.4a	Western Mediterranean mountain hedgehog-heath
F7.4b	Central Mediterranean mountain hedgehog-heath
F7.4c	Eastern Mediterranean mountain hedgehog-heath
F9.1a	Arctic, boreal and alpine riparian scrub
F9.1b	Temperate riparian scrub
F9.2	<i>Salix</i> fen scrub
F9.3	Mediterranean riparian scrub

In contrast, due to lack of data, indicators could not be defined for the following five habitat types:

B1.6c	Macaronesian coastal dune scrub
F4.3	Macaronesian heath
F7.4d	Canarian mountain hedgehog-heath
F8.1	Canarian xerophytic scrub
F8.2	Madeiran xerophytic scrub

### **4.3 Update of indicator species of the revised EUNIS woodland habitat types**

The new approach developed here to define indicator species of heathland, scrub and tundra habitats was also applied to woodlands. The expert system for EUNIS woodland habitats developed in a previous report (Schaminée et al. 2014) was refined, using the updated species groups and new software functions developed for the work on heathlands/scrub/tundra. Based on this, refined classification of woodlands was prepared and diagnostic, constant and dominant species were also computed for woodlands. This new species list represents a substantial improvement of the species list for woodlands developed by Schaminée et al. (2013) and can replace it.

The stratified dataset for woodland habitat types contained 37,988 plots belonging to the types of group G and 253,405 plots belonging to other habitat types. The startified dataset for coastal woodlands contained 559 plots belonging to these habitat types and 242,571 plots belonging to other types.

The resulting lists of indicator species for EUNIS woodland habitat types, including diagnostic, constant and dominant species, are presented in Appendix D. After excluding a few habitat types for which no or less than 10 vegetation plots were available, indicator species were defined for the following 40 woodland habitat types:

B1.7a	Atlantic and Baltic broad-leaved coastal dune woodland
B1.7c	Baltic coniferous coastal dune woodland
B1.7d	Mediterranean coniferous coastal dune woodland
G1.1	Temperate and boreal softwood riparian woodland
G1.2a	<i>Alnus</i> woodland on riparian and mineral soils
G1.2b	Temperate and boreal hardwood riparian woodland
G1.3	Mediterranean and Macaronesian riparian woodland
G1.4	Broadleaved swamp woodland on non-acid peat
G1.5	Broadleaved bog woodland on acid peat
G1.6a	<i>Fagus</i> woodland on non-acid soils
G1.6b	<i>Fagus</i> woodland on acid soils
G1.7a	Temperate and submediterranean thermophilous deciduous woodland
G1.7b	Mediterranean thermophilous deciduous woodland
G1.8	Acidophilous <i>Quercus</i> woodland
G1.9a	Boreal-nemoral mountain <i>Betula</i> and <i>Populus tremula</i> woodland on mineral soils
G1.9b	Mediterranean mountain <i>Betula</i> and <i>Populus tremula</i> woodland on mineral soils
G1.Aa	<i>Carpinus</i> and <i>Quercus</i> mesic deciduous woodland
G1.Ab	Ravine woodland

G1.Ba	Alnus cordata woodland
G2.1	Mediterranean evergreen Quercus woodland
G2.2	Mainland laurophylloous woodland
G2.3	Macaronesian laurophylloous woodland
G2.5a	South-Aegean Phoenix grove
G2.6	Ilex aquifolium woodland
G3.1a	Temperate mountain Picea woodland
G3.1b	Temperate mountain Abies woodland
G3.1c	Mediterranean mountain Abies woodland
G3.2-3	Temperate subalpine Larix, Pinus cembra and Pinus uncinata woodland
G3.4a	Temperate and continental Pinus sylvestris woodland
G3.4b	Temperate and submediterranean montane Pinus sylvestris-nigra woodland
G3.4c	Mediterranean montane Pinus sylvestris-nigra woodland
G3.6	Mediterranean and Balkan subalpine Pinus heldreichii-peuce woodland
G3.7	Mediterranean lowland to submontane Pinus woodland
G3.9a	Taxus baccata woodland
G3.9b	Mediterranean Cupressaceae woodland
G3.A	Picea taiga woodland
G3.B	Pinus sylvestris taiga woodland
G3.C	Larix sibirica taiga woodland
G3.Da	Pinus bog woodland
G3.Db	Picea bog woodland

In contrast, due to lack of data, indicator species could not be defined for the following 13 habitat types:

B1.7b	Black Sea broad-leaved coastal dune woodland
G1.C	Highly artificial broadleaved deciduous forestry plantations
G1.D	Fruit and nut tree orchards
G2.4	Olea europaea-Ceratonia siliqua woodland
G2.5b	Canarian Phoenix grove
G2.7	Macaronesian heathy woodland
G2.8	Highly artificial broadleaved evergreen forestry plantations
G2.9	Evergreen orchards and groves
G3.4d	Mediterranean montane Cedrus woodland
G3.8	Pinus canariensis woodland
G3.9c	Macaronesian Juniperus woodland
G3.Dc	Larix sibirica bog woodland
G3.F	Highly artificial coniferous plantations

## **4.4 Description in a standard format of the revised EUNIS heathland, scrub and tundra habitat types**

### **4.4.1 The existing EUNIS habitat text descriptions**

From the start, the aim of a European habitat classification has been to provide a comprehensive and definitive reference list that is scientific, unambiguous and easily understood (Moss & Roy 1998, Moss 2008). To this end, an integral feature of the EUNIS Habitat Classification is the habitat text descriptions which are incorporated into the underlying database, accessible as an interface via the EUNIS website portal and available in the hard-copy download of the classification published as Davies *et al.* (2004).

Such text descriptions were not at first included for the CORINE Biotopes that were the forerunner of EUNIS, simply English language titles of the habitats (Internal Technical Handbook 1988, partially updated 1989, see Moss & Roy 1998). The later development of the CORINE Biotopes Manual (Devillers *et al.* 1991) included a descriptive text for each habitat, together with phytosociological and scientific references. When the classification was expanded to the whole Palaearctic, the published version of the classification (Devillers & Devillers-Terschuren 1996) did not include text descriptions, simply habitat codes and titles, but in 1995 these were added to the underlying PHYSIS database which had first been released the previous year.

The development of the existing text descriptions in the EUNIS Habitat Classification from earlier versions is detailed in Hill *et al.* (2004a, 2004b). The text descriptions are variable in length, detail and content: they often include some kind of general statement about the structure of the habitat, many mention particular characteristic species, sometimes highlighting endemic floras, and references to climatic, terrain and soil characteristics vary in detail and order, often being summarised using broad categories or terms.

There is a glossary appended to the EUNIS Habitats Classification (Davies *et al.* 2004, since been updated in 2006, version supplied by Doug Evans of the ETC-BD) and this has been derived from various sources, detailed in section 5.1.2 of this report, to be delivered in the next stage of the work. In fact, many of the terms in the Glossary, particularly more specific geographical and topographic terms, are redundant, never figuring in the text descriptions.

#### **4.4.2 Other considerations and sources for describing European habitats**

The Habitats Directive provides 'a common framework for the conservation of wild animal and plant species and natural habitats of Community importance' (CEC 2003) and the definitions provided in the *Interpretation Manual of European Union Habitats* (European Commission 2013) include a text description derived from the CORINE Biotopes Manual (Devillers et al. 1991). For each priority habitat (and some non-priority habitats) in the EUR-12, this description was later incorporated into more formalised descriptive sheet which established 'clear, operational, scientific definitions of habitat types using pragmatic descriptive elements and taking into account regional variation' and a 'minimal interpretation' was provided for the remaining non-priority habitats based on CORINE. Text descriptions for new habitats and revisions of existing habitat definitions were made for EUR15, EUR25, EUR 27 and EUR28 with the accession of new countries in 1995, 2004, 2007 and 2013, mostly using the PHYSIS database which gives access to descriptions at EUNIS-4 and -5. Although there is a simple 1:1 correspondence between EUNIS-3 Heath, scrub and tundra types and Annex 1 habitats in only a minority of cases (21%), a further 24 heath and scrub types figure among the Annex 1 habitats and the information at these lower levels of equivalence could allow the often complex relationships between the remainder to be explored. Unlike the definitions of the EUNIS habitats, the interpretations of the Annex 1 habitats have acquired legislative force through the implementation of the Habitats Directive.

*The Diversity of European Vegetation* (Rodwell et al. 2002) established the idea of a simple descriptor for each alliance which included, as far as possible, standardised references to the vegetation type, the typical physiography and the geographical range, though these were not based on explicit standards nor summarised in a glossary. And the crosswalk to EUNIS-3 (Schaminée et al. 2012) enables such tags to be used to interpret those habitats. In the more ambitious EuroVegChecklist (Mucina et al. in press), such descriptors have been provided for the more comprehensive range of alliances using terminology summarised in a glossary appended to the typology. This has been compiled bottom-up from the definitions provided by contributors to the EuroVegChecklist, so no terms are redundant.

The current 'Red List of European Habitats' project funded by DG Environment uses as its typology a modified version of EUNIS at level 3 (Rodwell et al. 2013) which incorporates, with some further very minor modifications, the changes for heath, scrub and tundra habitats recommended in Schaminée et al. (2014). Discussions between the EEA, the ETC-BD and the Red List project team could from now on ensure that there is a harmonisation between the developing EUNIS-3 habitat typologies. Moreover, and very relevant to the current task of providing revised descriptions of EUNIS habitats is the fact that much more detailed Red List Habitat Definitions are being prepared by

experts for the territorial assessments of extent and quality. These Definitions include an audit trail from EUNIS, a detailed text description, crosswalk to the EuroVegChecklist and other typologies, species lists and further details relevant to the character and status of habitats across Europe and images. Though they have not yet been edited into a standardised and harmonious format, we have been able to draw upon these definitions for the current task of providing brief revised descriptions of heath, scrub and tundra habitats

#### **4.4.3 Description in a standard format of the revised EUNIS Heath, scrub and tundra habitat types**

Like the existing EUNIS habitat and Annex I habitat descriptions and the EuroVegChecklist descriptors, the Red List Habitat definitions sit rather lightly to the questions of explicit standardised terminology and parameter frames; and there are unresolved questions about the compatibility of terms in the various glossaries that are currently applied to the description of habitats. Furthermore, there is actually no accepted standard format for the description of a EUNIS habitat. Here we therefore provide only a provisional response to the challenge of what such brief descriptions should look like.

As with the work on woodland habitats provided in Schaminée (2014), what we would recommend is that the descriptions are regarded essentially as definitions: they should provide, as accurately, briefly and precisely as possible, the key distinguishing features of the habitat. They are not the place for small essays in ecology or status, particularly where the habitat is more recognisable. In general, the detail provided should reflect the variability in the habitat, not its richness or structural complexity.

The descriptions we provide have a roughly standardised shape:

- ▶ we have used the terms 'heath' and 'scrub' in the singular throughout;
- ▶ we include a general reference to the character of the vegetation but, with details of species composition now available through analysis of constituent relevés for the alliances of each habitat, we believe that there is no need to repeat this information in the description unless particular species are absolutely definitive;
- ▶ we mention vegetation structure or species-richness only when it is a diagnostic feature of the woodland type;
- ▶ we use non-technical terms as far as possible to describe terrain, soil types, altitudinal belts;

- we use the biogeographic zones from the Habitats Directive but otherwise avoid any specialised terminology to describe climatic relationships or broad geographical distribution.
- for the sake of simplicity, we have used lower case for the names of all regions, zones and belts, retaining them only for strictly geographic terms, like the names of countries and seas, and omitted hyphens in such terms, except where they are split.

The new descriptions along with the originals are attached as Appendix E.

## **4.5 Maps of distribution of phytosociological relevés and probability of occurrence based on distribution models for each of the revised EUNIS heathland, scrub and tundra habitat types**

### **4.5.1 Habitat suitability modelling**

For the habitat suitability modelling, the widely used software Maxent for maximum entropy modelling of species' geographic distributions was used. Maxent is a general-purpose machine-learning method with a simple and precise mathematical formulation, and has a number of aspects that make it well-suited for species distribution modelling when only presence (occurrence) data but not absence data are available (Philips et al. 2006). Because EUNIS habitats have a particular species composition, they are assumed to respond to specific ecological requirements, allowing us to generate correlative estimates of geographic distributions. Modelling habitats that have been floristically defined is a well-known procedure for ecological modelling at local scales, and a promising technique to be applied also at the continental level.

The Maxent method considers presence data (known observations of a given entity) and the so-called background data. Background data comprise a set of points used to describe the environmental variation of the study area according to the available environmental layers. It is assumed that these layers represent well the most important ecological gradients on a European scale. These layers were selected from meaningful environmental predictors commonly used for modelling non-tropical plant and vegetation diversity, and are not mutually strongly correlated.

As environmental data (and their sources) the following climate and soil layers have been used:

- Potential Evapotranspiration  
<http://www.cgiar-csi.org/data/global-aridity-and-pet-database>

- Solar radiation  
<http://www.worldgrids.org/doku.php?id=wiki:inmsre3>
- Temperature Seasonality (standard deviation \*100)  
<http://www.worldclim.org/bioclim>
- Mean Temperature of Wettest Quarter  
<http://www.worldclim.org/bioclim>
- Annual Precipitation  
<http://www.worldclim.org/bioclim>
- Precipitation Seasonality (Coefficient of Variation)  
<http://www.worldclim.org/bioclim>
- Precipitation of Warmest Quarter  
<http://www.worldclim.org/bioclim>
- Distance to water (rivers, lakes, sea)  
derived from the shapefile 'Inland\_Waters.shp'
- Bulk density of the soil (kg/m<sup>3</sup>)  
Hengl et al. 2014
- Cation Exchange Capacity of the soil  
Hengl et al. 2014
- Weight in % of clay particles (<0.0002 mm)  
Hengl et al. 2014
- Volume % of coarse fragments (> 2 mm)  
Hengl et al. 2014
- Soil organic carbon content (%o)  
Hengl et al. 2014
- Soil pH (water)  
Hengl et al. 2014
- Weight in % of silt particles (0.0002-0.05 mm)  
Hengl et al. 2014
- Weight in % of sand particles (0.05-2 mm)  
Hengl et al. 2014

Compared with the habitat suitability models set up for the EUNIS forest types (Schaminée et al. 2014) we have now included 8 recently published soil parameters (Hengl et al 2014), instead of only one (soil pH).

Maxent is expected to perform well for estimating the geographic distribution of EUNIS habitats in Europe. However, as with any other modelling techniques this method is sensitive to sampling bias, i.e. when the spatial distribution of presence data is reflecting an unequal sampling effort in different geographic regions. In Maxent, it has been proposed that the best way to account for sampling bias (when bias is known or expected to occur) is to generate background data reflecting the same bias of the presence data. When a complete set of presence data is available, a general recommendation is to

generate background points from the occurrences of other species/communities that were sampled in a similar way (Elith et al. 2011).

Two different approaches have been followed for the selection of a maximum of 5,000 locations for the background data, assuming biased and non-biased presence data. For the first approach, 5,000 locations were randomly selected from the heathland, scrub and tundra plot pool, assuming that they reflect the general geographic bias of heathland, scrub and tundra sampling in Europe. The second approach concerns a random selection of 5,000 background points in the whole study area, assuming that the presence data describe a representative subset of the real distribution range of the target habitat.

In contrast to the suitability maps prepared for the EUNIS forest types (Schaminée et al 2014) we now excluded the eastern part of Europe (e.g. Russia, Ukraine), because the plot database shows large gaps in this region. Including this area would cause even more bias than there already is in the available data. An exception was made for F1.1 (Shrub tundra) because the optimal environmental conditions for this type are more or less restricted to the north-eastern part of Europe.

In Appendix I the preliminary results of the analysis are presented. The two modelling approaches (assuming biased and non-biased data) were evaluated for each of the EUNIS habitat types in order to estimate which assumption is more likely. This evaluation was based on the expert knowledge of the team members in the distribution of heathland, scrub and tundra types by assessing (i) the distribution of the available presence data as an estimate of geographic bias, (ii) the realism of the habitat suitability maps to reflect known distribution of heathland, scrub and tundra, and (iii) the environmental predictors that contribute most substantially to the models. The best performing model was then selected by consensus of the expert team for each habitat type. In the overview of EUNIS types on the first page of the Appendix, the preference for one of the two outputs is indicated in the column 'Background data pool used'.

For each EUNIS heathland, scrub and tundra type the following data are presented:

- A distribution map showing the location of the relevés that have been assigned to the EUNIS type concerned and therefore used as presence data.
- A habitat suitability map with colours varying from gray, through green to red, indicating increasingly favourable ecological conditions for the type (expressing the logistic output of the model between 0 and 1).
- AUC, or the Area Under the Curve, as a general estimate of model performance. This is the probability that the classifier correctly orders two points (a random positive example and a random negative example). In general, AUC values in the range 0.5-0.7 were considered

low, 0.7-0.9 were moderate and >0.9 were high, suggesting poor, good and very good model performances, respectively. We provide two estimates of the AUC as calculated by Maxent. 'AUC training' reflects the internal fit between observed and predicted occurrences in the computed model. 'AUC test' provides the mean AUC obtained from a 10-fold cross-validation procedure in which ten different models were computed with a random selection of 90% of data (calibration data set) and 10% for testing the model (validation data set).

- Contribution variables to the Maxent model (%). Indicates to what extent the environmental variables contribute to the model.

The habitat suitability maps will be further reviewed and processed in the ETC/BD Task 1.7.5.C: 'Ecosystem mapping and assessment' in which the maps will be further downscaled to the actual land cover situation.

## **5 Recommendations and roadmap for a EUNIS environmental parameter framework**

### **5.1 The existing state of EUNIS habitat parameterisation**

The 1995 Paris Workshop on the CORINE Biotopes Sites Database and Habitat Classification initiated the development of the EUNIS Habitat Classification and recognised the value of a multi-faceted approach in which parameters other than vegetation alone could be used for habitat definition (Moss & Roy 1995, 1998). It also saw the value of a user-friendly software tool for accessing and displaying the classification through various search options in which such parameters could be interrogated.

The parameterisation task was scoped then in terms of a generalisation of the parameter framework that had already been developed for the Nordic Vegetation Classification (Påhlsson 1994) where information on biogeography, geomorphology, climate, soils and water could be included alongside floristic and structural data and relationships of the habitat types to other classification schemes including phytosociology (Moss & Roy 1998 where an example was scoped by Pierre Devillers).

Subsequently a parameter framework was designed for the EUNIS database comprising a central habitats table, a set of parameter tables (one for each parameter) and a set of associated look-ups (one for each code to be documented). The database design allowed each parameter to be treated independently with regard to data type and meta-data, and for some parameters to be fully complete while information for others remained unavailable (Dorian Moss unpublished documentation summarised in Dring 2001 and Rodwell & Dring 2001). The various tables and their descriptions, including those relevant, at that stage, to marine habitats, are shown in Table 5.1.

When first proposed, it was considered that full parameterisation of the EUNIS habitats would take many years to complete (Moss & Roy 1995, 1998) but partial parameterisation was undertaken for incorporation into the EUNIS database and the hard-copy *EUNIS Habitat Classification* (Davies et al. 2004). A *Guide for Users* was produced to assist in interrogating the EUNIS website as it stood in 2008 (Moss 2008) and this outlined the various query routines which could give access to a limited number of parameters included on the factsheet for each habitat. These parameters were: habitat name and description, audit trail to CORINE and the Palaearctic Habitats Classification, geographical distribution by country and biogeographic region, legal instruments, a crosswalk to syntaxa (based on Rodwell et al. 2002), sites

where recorded, species, references and other information, where a limited number of entries for various environmental parameters were indicated. Other search options available in the 2008 version of the EUNIS website allowed interrogation by species, site, country, biogeographic region but not by environmental parameters.

The environmental parameters encoded in the database are listed, along with the habitat text description, as 'Descriptive and diagnostic parameters' under each habitat in the *EUNIS Habitat Classification* (Davies et al. 2004). What appears to remain of the database entries themselves were supplied for this contract by the EEA as an extract dump spreadsheet though this appears to be incomplete, to include EUNIS habitats at various levels and to be around 60% concerned with marine habitats. A small and varying number of the most relevant parameters have been filled for each habitat - for the grasslands included, there are between one and six parameters. A varying

categories per look-up is included and not always with a text explanation. As an example of the status quo, Table 5.2 and Figure 5.1 show the entry in the 2008 database dump spreadsheet and fact sheet from the *EUNIS Habitat Classification* (Davies et al. 2004) for E2.3 Mountain hay meadows.

*Table 5.2. Entry for E2.3 Mountain hay meadows in the 2008 EUNIS database dump.*

ID_HAB	SCIENTIFIC_NAME	LOOKUP_TYPE	NAME	DESCRIPTION
170	Mountain hay meadows	ALTITUDE	Montane (sensu stricto)	Middle altitudinal level of high mountains and upper altitudinal level of high hills
170	Mountain hay meadows	IMPACT	Mowing/cutting	NULL
170	Mountain hay meadows	COVER	Vegetation >30%	Vegetation cover exceeds 30%
170	Mountain hay meadows	HUMIDITY	Moist/mesic	Conditions of medium water supply, neither extremely wet (hydric) nor extremely dry (xeric)
170	Mountain hay meadows	USAGE	Active management	NULL
170	Mountain hay meadows	LIFE_FORM	Herbs	Non-woody, seed-bearing plants
170	Mountain hay meadows	LIFE_FORM	Grasses	Flowering plants with very narrow leaves and small greenish petal-less flowers in heads or spikes belonging to the family Graminae
170	Mountain hay meadows	LIFE_FORM	Low-growing herbs	Low-growing non-woody, seed-bearing plants

Database and published factsheet should not be confused with the so-called 'Defining parameters' used as criteria for the keys to the habitats for the upper 3 hierarchical levels of EUNIS (Davies et al. 2004). These again can refer to biogeographic zones, substrate type, hydrology and biotic impacts, so that E2.3 Mountain hay meadows can be identified through the following steps of the decision tree:

Significant tree presence? NO  
 Saline? NO  
 Tall forbs and ferns dominant? NO  
 Alpine? NO  
 Mesic, Dry or wet? MESIC

EUNIS habitat code and names	E2.3	Mountain hay meadows
Description		
Often species-rich hay meadows of the montane and subalpine levels of higher mountains of the nemoral and southern boreal zones.		
Source Hill, M.O., Moss, D. & Davies, C.E. (2004a)

Figure 5.1. Habitat fact sheet for E2.3 mountain hay meadows in Davies et al. (2004)

Heavily managed? NO

Steppe zone? NO

Unmanaged? NO

Pasture, possibly mown or predominantly hay meadow? PREDOMINANTLY HAY MEADOW

Low-medium altitude or montane? MONTANE

Negotiating the fuzzy boundaries that often exist between habitats is aided in the keys by the use of extensive and detailed footnotes to the decision points: here, for example, 'Alpine' is defined in a footnote as a climate zone typically found at or above the tree limit, while 'Montane' is an altitudinal belt normally above 600m.

While information from the original environmental parameterisation is still available (apparently only in part) from the datadump and summarised as 'Descriptive and diagnostic parameters' in the *EUNIS Habitat Classification* (Davies et al. 2004), it is not shown on the current fact sheet for the habitats (See Figure 5.2). There, along with the original text description, there is a key navigation facility which uses the original 2008 'Defining parameters' to

identify habitats and a limited number of query tabs for interrogating legal status, vegetation types (now incorporating a crosswalk to the provisional EuroVegChecklist), species (empty), other classifications and historical relationships to CORINE and the Palaearctic Habitats Classification.

The screenshot shows the EUNIS website interface. At the top, there's a blue header bar with the EEA logo and navigation links for Networks, Subscriptions, Mobile, Contact us, and EEA homepage. Below the header, there's a search bar and a link to the A-Z Glossary. The main content area has a dark blue navigation bar with links for Topics, Data and maps, Indicators, Publications, Media, and About EEA. The About EEA section includes a note that 'The EEA is an agency of the European Union'. The main content area is titled 'EUNIS - factsheet for Mountain hay meadows'. It shows the English name 'Mountain haymeadows' and its EUNIS code 'E2.3 - Mountain hay meadows'. There are sections for 'Quick facts', 'Description (English)', and 'EUNIS habitat type'. Under 'Description (English)', it says: 'Often species-rich mesotrophic to eutrophic hay meadows of the montane and subalpine levels of higher mountains of the nemoral and southern boreal zones.' Under 'EUNIS habitat type', it lists 'code E2.3', 'Bern Convention', 'Resolution 4 habitat type (used for designation of Emerald sites)', and 'Annex I habitat types (EU Habitats Directive)'. Below this, there are sections for 'Legal status', 'Vegetation types', 'Species mentioned in habitat description', 'Other classifications', and 'History', each with a small icon and a 'View details' button.

*Figure 5.2. Habitat fact sheet for E2.3 Mountain hay meadows on the current EUNIS web pages.*

**Recommendation:** A decision needs to be made about whether to return to the original vision of an environmental parameter frame for EUNIS habitats (Moss & Roy 1998) and to consider what are the implications for the structure, format and functionality of the EUNIS database and webpages.

## 5.2 Other relevant sources for environmental references

From the start, an integral feature of the EUNIS Habitat Classification has been the habitat text descriptions which are incorporated into the underlying database, accessible as an interface via the EUNIS website portal and available in the hard-copy download of the classification published as Davies

et al. (2004). Such text descriptions were not at first included for the CORINE Biotopes that were the forerunner of EUNIS, simply English language titles of the habitats (Internal Technical Handbook 1988, partially updated 1989; see Moss & Roy 1998). The later development of the CORINE Biotopes Manual (Devillers *et al.* 1991) included a descriptive text for each habitat, together with phytosociological and scientific references. When the classification was expanded to the whole Palaearctic, the published version of the classification (Devillers & Devillers-Terschuren 1993) did not include text descriptions, simply habitat codes and titles, but in 1995 these were added to the underlying PHYSIS database that had first been released the previous year. The development of the existing text descriptions in the EUNIS Habitat Classification from earlier versions is detailed in Hill *et al.* (2004a, 2004b). The original descriptions vary in length and detail but often contain further references to parameters such as vegetation structure, species composition, biogeographic region, altitude, climate, terrain and soils. Qualifiers can indicate what kind of vegetation is excluded from the habitat.

Similar text descriptions and other parameter frames for habitats provide further sources of environmental references. The Habitats Directive provides 'a common framework for the conservation of wild animal and plant species and natural habitats of Community importance' (CEC 2003) and the definitions provided in the Annex 1 Manual include a text description derived from the CORINE Biotopes Manual (Devillers *et al.* 1991). For each priority habitat (and some non-priority habitats) in the EUR-12, this was later incorporated into more formalised descriptive sheet which established 'clear, operational, scientific definitions of habitat types using pragmatic descriptive elements and taking into account regional variation' and a 'minimal interpretation' was provided for the remaining non-priority habitats based on CORINE (CEC 1995). Text descriptions for new habitats and revisions of existing habitat definitions were produced for EUR15, EUR25, EUR27 and EUR28 with the accession of new countries in 1995, 2004, 2007 and 2013. The new and revised descriptions were based on a mix of information from the PHYSIS database which gives access to descriptions at EUNIS-4 and EUNIS-5 and information in the proposals, then subject to negotiation with the existing Member States and accession countries (Evans 2012). However, unlike the definitions of the EUNIS habitats, the interpretations of the Annex 1 habitats have acquired legislative force through the implementation of the Habitats Directive.

*The Diversity of European Vegetation* (Rodwell *et al.* 2002) established the idea of a simple English language descriptor for each phytosociological alliance that included, as far as possible, standardised references to the vegetation type, the typical physiography and the geographical range, though these were not based on explicit standards nor were the terms used summarised in a glossary. The crosswalk to EUNIS-3 included in that overview enabled such tags to be used to interpret those EUNIS habitats. In the more ambitious EuroVegChecklist (Mucina *et al.* in press), such descriptors have been

provided for a more comprehensive and updated range of alliances. These descriptors include ecological and environmental categories of various frameworks for describing geographical regions, altitudinal levels and bioclimatic zones that have found widespread, though not always universal, favour. Some of these are more applicable to certain parts of Europe than others, like the World Bioclimatic Classification (Rivas-Martínez et al. 2012) which is especially valued around the Mediterranean.

For all the ultimate mapping units of the *Map of the Natural Vegetation of Europe* (including 338 forest types), there is a modular descriptive text including the vegetation characters and environmental parameters shown in Figure 5.3 (Bohn et al. 2000-2004). The legend also uses standard environmental classifications like the Walter & Leith climate types and the FAO soil classification.

Geographical distribution (countries, area in km <sup>2</sup> , number polygons)
Main syntaxa/plant communities
Structural features
Dominant & frequent species by layer
Diagnostic species
Ecological variants
Geographical variants
Natural accompanying vegetation
Adjacent climax communities
Land use
Site conditions (landscape, geomorphology, altitudinal belt, geology)
Soil conditions
Climate (Walter & Leith type, mean annual temperature, average annual precipitation, average temperature warmest month, average temperate coldest month, local peculiarities)
Importance for nature protection

Figure 5.3. Parameters used for the mapping units of the *Map of the Natural Vegetation of Europe* (Bohn et al. 2000-2004).

The current 'Red List of European Habitats' project funded by DG(Env) uses as its Habitats Typology a modified version of EUNIS-3 (Rodwell et al. 2013) which incorporates, with some further very minor modifications, the changes for Forests recommended in Schaminée et al. (2013), those for Heath, scrub and tundra habitats (Schaminee et al 2014) and those being currently developed for Grasslands. The Habitat Definitions that have been prepared by

experts for the territorial assessments of changes in extent and quality in the EU28 and EU28+<sup>2</sup> include a substantial habitat text description, associated floristic, structural and environmental parameters and crosswalks to other typologies. The Red List assessments include further information about a range of characteristics and parameters summarised in Figure 5.4.

**Recommendation:** If revision of the EUNIS environmental parameter frame is undertaken, this should include a review of other relevant frameworks, so that agreed parameters and categories could provide a comprehensive and harmonised basis for further development.

### **5.3 Glossaries for habitat description and parameterisation**

In both the text descriptions of the EUNIS habitats and in the units or categories of the look-ups in the parameter frame, there are frequent uses of a wide range of ecological and environmental terms. Appended to the *EUNIS Habitats Classification* (Davies et al. 2004, since updated in 2006, version supplied by Doug Evans of the ETC-BD) there is a glossary of such terms

---

<sup>2</sup> EU 28 plus West Balkans, Norway and Switzerland.

derived from various sources: for terrestrial and freshwater habitats, 28% of terms originate from the Institut Royal des Sciences naturelles de Belgique (presumably the Palaearctic Habitats Classification glossary that was also included in Moss & Roy (1998 as Annex III), 16% from the General Multilingual Environmental Thesaurus of EIONET and the remainder from a variety of published dictionaries of the environment, ecology or science and technology in general. In fact, many of the terms in the EUNIS Glossary, particularly more specific geographical and topographic terms, are redundant, never figuring in the text descriptions. And some terms in the *EUNIS Habitats Classification* (Davies et al. 2004) do not appear in the glossary. A spreadsheet version of the glossary supplied for this contract has abbreviated text for many terms, possibly because it has been derived by transfer from an Access database into an older edition of Excel with a limited number of characters per cell.

The forthcoming EuroVegChecklist (Mucina et al. in press) has a glossary of botanical, ecological and environmental terms used in the syntaxa descriptors, tagged with one or more broad heads such as Geography, Biogeography, Biome, Vegetation zone, Altitudinal zone, Topography, Geology, Soils, Habitat, Vegetation, Organism, Life-form. It has been compiled bottom-up by contributors, so no terms are redundant. A comparison undertaken for this contract reveals that only a minority of terms in this EuroVegChecklist glossary are common to the EUNIS glossary mentioned above (Davies et al. 2004, revised 2006) and, where terms are represented in both glossaries, the definitions are not always identical.

The *Map of the Natural Vegetation of Europe* (Bohn et al. 2000-2004) has a comprehensive and standardised glossary of phytogeographical terms, vegetation and climate zones, ecological and geobotanical terms, geological, geomorphological and edaphic terms. The current 'Red List of European Habitats' project funded by DG(Env) makes extensive reference to ecological and environmental terms in the Habitat Definitions but there has been, as yet, no editorial standardisation of these terms and there is no accompanying glossary.

From these sources and those used for the EUNIS glossary itself, it is clear that the problems of standardisation of terms are various and sometimes complex, some scientific or otherwise technical, some concerned more with norms of style, where the editorial policies of influential journals may also be relevant. Some terms are especially vexatious and illustrative of the challenge – like 'Mediterranean', which as well as being the name of a sea, has geographical, climatic, biogeographical and cultural references which are often not explicit and sometimes contentious. Then there is the question of what to do with derived terms like 'supra-Mediterranean', 'supraMediterranean' or 'supramediterranean'.

Recommendation: Revision of the EUNIS glossary should ensure that it is a sub-set, relevant to the task and with no redundancies, of more widely acceptable definitions of categories and terms, so as to maximise utility and limit confusion.

Recommendation: With a framework of agreed parameters, categories and terms to define the environmental characteristics of habitats, expert knowledge could be used to refine, revise and complete a parameterisation.

## 5.4 Environmental parameters in use for recording habitats

Increased availability of high quality point-source data such as relevés, with reliable crosswalks of phytosociological syntaxa to EUNIS, can make the distribution of habitats spatially explicit with an accuracy previously beyond reach. It is then possible to relate such distribution patterns, as points or via grids of various scales, to environmental variations on digital platforms of point-source, grid or envelope data for climate, terrain and soils. Clearly such maps have both descriptive and predictive value (Schaminée et al. 2013, 2014) in understanding present patterns and possible shifts in habitat character and range with environmental change.

Additional information of value for describing and interpreting the character and dependencies of habitats might also be available from point-source survey data themselves. Within the limited scope of this project, it was impossible to offer a comprehensive analysis of the various approaches to the recording of environmental data in the survey and definition of habitats or the full range of environmental parameters in use but we here summarise the current state of play in two major initiatives together with a snapshot of current activity among relevant practitioners.

### 5.4.1 The Global Index of Vegetation Plot databases

The Global Index of Vegetation Plot databases (GIVD) was launched in 2010 as an internet-based resource offering metadata on existing electronic databases (Dengler et al. 2011, Jansen et al. 2012). At present it comprises 237 databases with more than 3.1 million plots (<http://www.givd.info>), mostly from Europe but with some substantial contributions from elsewhere. Habitat types represented are broadly classified into formations with forests and semi-natural grasslands, heaths and scrub in the majority. GIVD Fact Sheets summarise key information about registered databases in a standardised fashion and include fields for geographical location (at 4 scales of precision) and environmental information under the nine heads shown in Table 5.3 (Glöckler et al. 2012). Other environmental data comprise 22

categories which can be broadly grouped into climate, geology, hydrology, management and conservation status.

Interrogations of 145 European databases in GIVD kindly carried out for this contract by Florian Jansen in November 2015 gave an indication of the size of the databases and the representation of these environmental data among them. The databases vary greatly in size, scope and purpose from just a few hundred plots to over 500000. 21 databases (14%) include no geo-reference nor any environmental data under the various categories, some of these with many hundreds of plots and totalling 121769 plots.

*Table 5.3. Environmental data represented in GIVD European databases.*

	% databases with any records	% positive with 100% Plots	No plots with 100% records	% positive with 50-99% plots	% positive with 25-49% plots	% positive with <25% plots
GPS 25 m or less	63	35	39858	41	17	7
Points to 1 km	49	12	54180	41	31	16
Small grid <10 km	35	14	39577	46	26	16
Coarser scale/territory	31	29	151198	35	10	26
Any geo-reference	84	37	284813			
Altitude	67	40	168796	34	9	17
Slope aspect	61	25	87055	44	15	16
Slope Inclination	64	27	84025	40	15	18
Microrelief	24	17	5734	37	20	26
Bare rock, soil, litter	39	32	171937	16	7	45
Soil pH	21	10	2759	37	30	23
Soil depth	10	23	8500	31	8	38
Other soil attributes	34	17	14573	30	16	37
Land use	36	42	95252	17	10	31

As an indication of the minimum number of plots which could provide environmental data in the categories listed, a calculation has been included showing the number of plots for those databases where 100% have a record.

### 5.4.2 Environmental recording among current practitioners

A recent questionnaire to members of the EVS and the European Dry Grassland Group used a framework of environmental parameters based on the original EUNIS categories to enquire what kind of environmental data were being recorded at the present time in field survey, which were mandatory and which optional. Supplementary questions asked what information was accessed from other secondary sources like grid maps, map envelopes or by interpolations from contours or point sources away from relevés; and which standard frames, typologies or look-ups are used to define, for example, soil types or climatic regimes.

A total of 77 responses was received from 35 countries across the wider Europe, varying from major national vegetation surveys to modest local research projects. Surveys were sometimes all inclusive or tightly focused on particular vegetation types or habitats and most involved the collection of traditional relevés, though of very variable plot size. Some ongoing work began in the early 20<sup>th</sup> century but the majority of data collected covered the period 1980 to the present.

Table 5.4 shows the % respondents recording the various environmental parameters and the % of recording which was mandatory, dark shading highlighting values over 75% and over, light shading 50-75%. Most of the more frequently recorded parameters were mandatory, many of the less frequently recorded relevant for particular vegetation types, like those of aquatic habitats, though even then often optional.

*Table 5.4. Environmental parameters recorded by EVS & EDGG practitioners.*

Parameter	% recording	% recording mandatory
HABITAT vegetation layers height	80	76
HABITAT vegetation layers cover	97	97
HABITAT microhabitat	29	33
HABITAT cover of bare rock	68	58
HABITAT cover of bare earth	76	60
HABITAT cover of litter	65	54
HABITAT cover of free water	41	50
HABITAT list of associated fauna	10	33
LOCATION biogeographic zone	25	69
LOCATION country	68	91
LOCATION province/cadaster	63	75
LOCATION settlement	60	71
LOCATION local topographic name	73	78
LOCATION lat/long georeference	78	80

LOCATION UTM grid reference	29	50
LOCATION other international grid	10	17
LOCATION national grid system	32	75
TERRAIN bedrock or superficial deposit	54	71
TERRAIN landform type	51	66
TERRAIN altitude/altitudinal belt	71	76
TERRAIN slope/inclination	79	82
TERRAIN aspect/orientation	76	83
TERRAIN microhabitat	32	50
CLIMATE climatic zone	14	66
CLIMATE regional climate	11	71
CLIMATE topoclimate/microclimate	3	50
CLIMATE precipitation	11	57
CLIMATE temperate	11	57
CLIMATE insolation	8	40
CLIMATE wind exposure	6	25
SOIL profile type	51	42
SOIL depth	49	32
SOIL moisture content/status	41	31
SOIL reaction	52	27
SOIL trophic state	27	35
SOIL salinity level	24	33
SOIL complete soil analysis	48	13
WATER substrate type	17	57
WATER depth	32	30
WATER length of inundation	21	31
WATER speed of flow	19	33
WATER reaction	11	43
WATER trophic state	14	44
WATER salinity level	16	20
MANAGEMENT grazing intensity	60	50
MANAGEMENT cutting frequency	59	46
MANAGEMENT burning frequency	35	27
MANAGEMENT degree of hemeroby	13	37

Among other parameters indicated in responses were a range usually related to the particular purpose of the survey such as measures of vegetation dynamics; dendro-metrics, age-structure and regeneration of woodlands; edaphic features in studies of soil-plant relationships; hydrological characteristics and processes in floodplains; specific management actions and conservation designations.

Data on geology and soils at survey points are frequently added but these are usually taken from secondary sources such as regional or national maps of bedrock, superficial deposits and soils at various scales. Climate data are

generally used for interpretation or modelling with habitat survey data and are taken from various international or national platforms with point or interpolation values, vector maps or climate models.

Edaphic categories used for habitat description originate mostly from regional or national typologies but occasionally from more general standards like the FAO or the Kubiena classification. Climatic/bioclimatic/biogeographic categories are sourced from the Rivas-Martinez 'Bioclimatic Map of Europe', various EEA or European Commission maps, the European Biodiversity Observation Network (EBONE), the Global Environmental Stratification (Metzger et al. 2005) or other regional or national zonings.

A wide variety of glossaries is used for text descriptions of environmental relationships among practitioners, often without explicit reference.

#### **5.4.3 Environmental data in the European Vegetation Archive and TURBOVEG**

The 62 databases registered in EVA as at December 2015 comprised in total over 1.1M plots of high quality point-source data on plant species composition from across Europe. They represent the most abundant and richest source of data which can be used, as here and in previous reports, for the interpretation of EUNIS habitats, to make spatially explicit their distribution and provide a basis for suitability modelling in association with environmental data from other platforms. However, though very many plots have associated environmental data, these have been encoded through headers of the database management software TURBOVEG under very diverse parameters, usually bespoke to the data source. A recent query of EVA data in TURBOVEG revealed the following degree of harmonisation among the plots:

Country code 99% plots  
Latitude/longitude geo-reference 80%  
Altitude 59%  
Slope inclination 35%  
Slope aspect 24%  
plus another 1100 parameters needing harmonisation.

Within the frame of another initiative, sPlot<sup>3</sup> (Puschke, O. et al. 2015), where EVA data are combined with international sources of plot data for addressing trait-environment relationships across world biomes, there is a programme for harmonisation of these diverse environmental fields in data stored in TURBOVEG that could add environmental value to the use of EVA data in relation to EUNIS.

**Recommendation:** Harmonisation of parameters used in capturing, storing and querying environmental data would bring great benefits for the availability and interpretation of existing and future point-source information

---

<sup>3</sup> [https://www.idiv.de/en/sdiv/working\\_groups/wg\\_pool/splot.html](https://www.idiv.de/en/sdiv/working_groups/wg_pool/splot.html).

on habitats, in particular for the development of the EUNIS database and habitat classification.

## 5.5 A roadmap for a EUNIS environmental parameter frame

The above recommendations can together provide a roadmap for developing a revised and expanded EUNIS environmental parameter frame (Figure 5.5). An institutional commitment to return to the original vision of EUNIS as a multi-faceted approach in which habitats were defined by parameters other than vegetation alone would be necessary to initiate this process and it would involve a thorough technical overhaul of the existing EUNIS database and the query routines offered on the EUNIS web portal. Expert knowledge could then revise the range of parameters and update a glossary within a wider frame of experience of environmental parameterisation and description. This would build in a wider appeal and applicability of the ultimate product.

	<b>Image</b>

Figure 5.5. A revised EUNIS habitat fact sheet (red indicates Red List source).

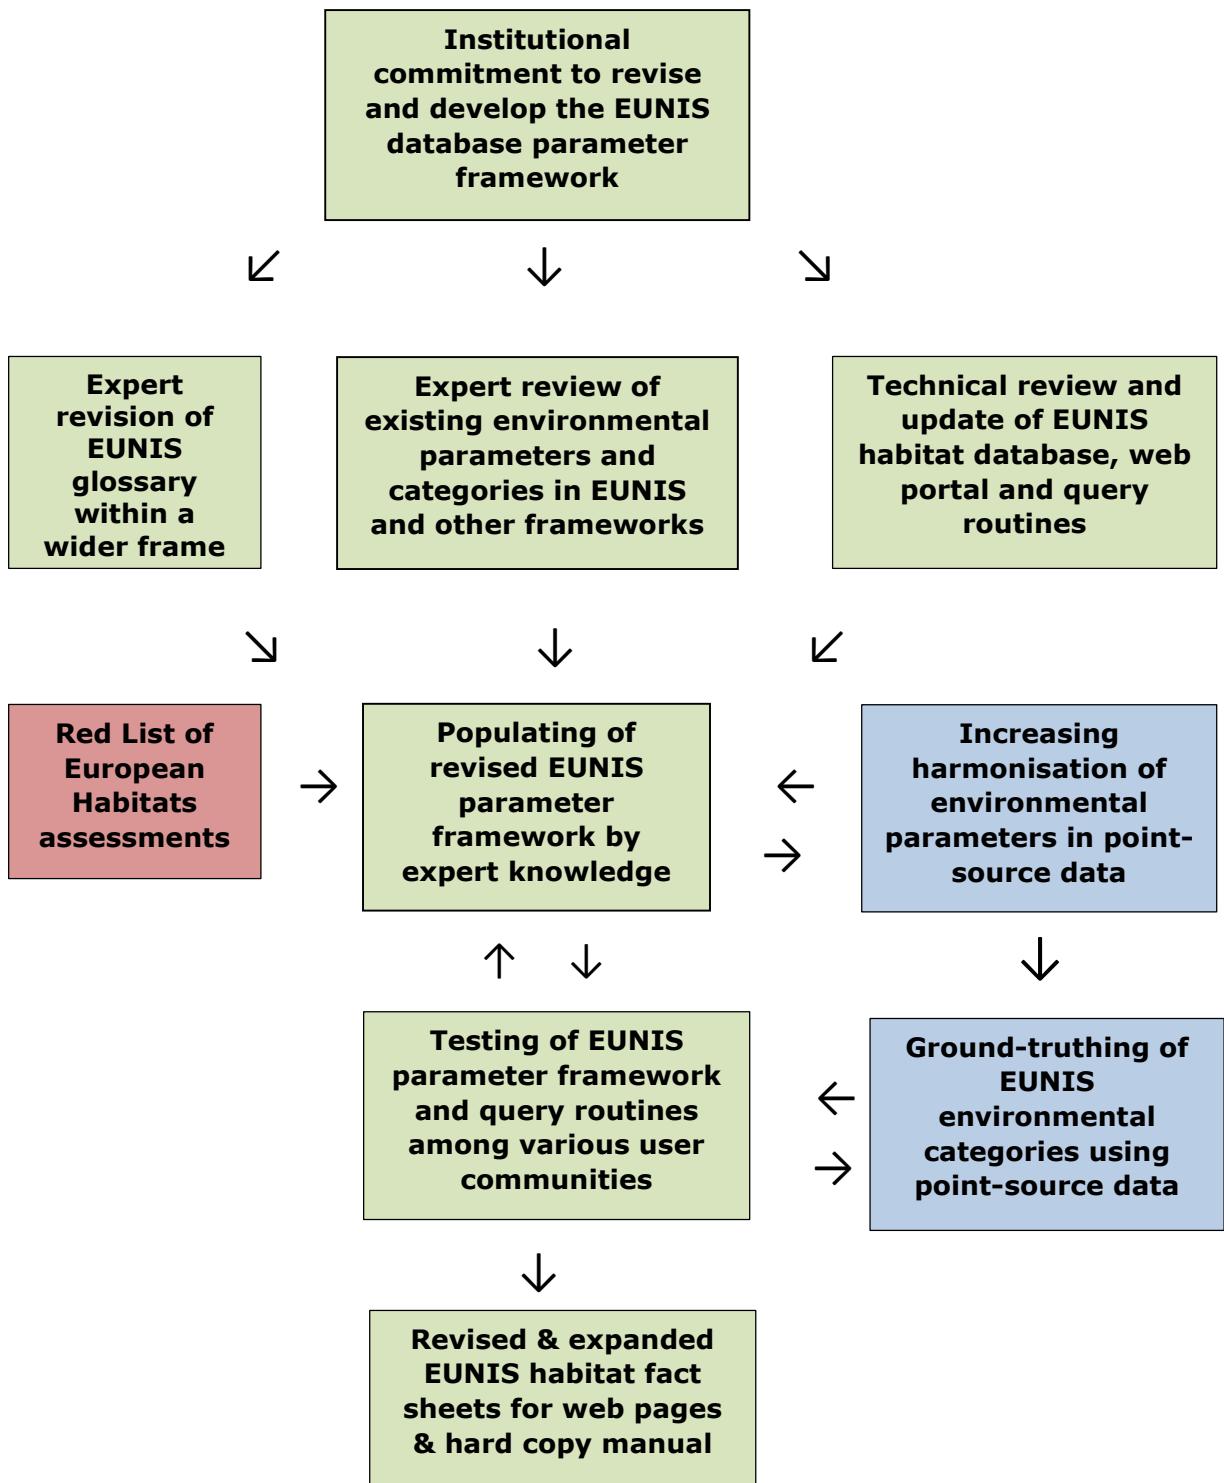

Figure 5.6. A roadmap for a EUNIS environmental parameter framework.

Populating the revised parameter frame with categorical values for the EUNIS habitats is also an expert task and could be greatly enriched by the upcoming products of the Red List of European Habitats project. Such a renewed parameter framework could then be widely tested among a variety of user communities for its application for habitat description and mapping, monitoring.

A parallel process among practitioners and database managers concerned with the recording, storage and querying of point-source vegetation and environmental data (shown blue in Figure 5.6) could help ensure some harmonisation in parameterisation and greatly enhance the content of a EUNIS parameter frame with ground-truthed data.

An ultimate end point of such a developing roadmap could be a more comprehensive and detailed fact sheet for each EUNIS habitat (Figure 5.5).

## **6 Recommendations and future prospects**

### **6.1 Further steps to collect European wide in-situ data to assess other EUNIS habitat types**

Three major European groups of habitats have been reviewed in 2013, 2014 and 2015-2016, the EUNIS G forest habitat types, EUNIS F the heathland, scrub and tundra habitat types, and the EUNIS E grassland habitat types, together with a few other closely associated habitats, based on the crosswalks between the EUNIS habitat classification and the EuroVegChecklist syntaxa. Of these habitats, the floristic composition has been determined on the basis of in-situ vegetation measurements across Europe (the work on grasslands will be completed this year in an additional EEA project). An obvious next step would be to analyse further EUNIS habitat groups, such as aquatic communities, peatlands, wetlands and anthropogenic vegetation.

Furthermore, mapping the distribution of phytosociological relevés and habitat suitability modelling as shown for the EUNIS forest habitat types, heathland, scrub and tundra habitat types and grassland habitat types in the present and earlier projects could be extended to other habitats. The same applies for the development of formal definitions for supervised classification and revision of EUNIS habitat descriptions.

To illustrate the importance of linking the EUNIS habitat classification with the EuroVegChecklist syntaxa (and all the underlying data) and harmonising with other existing EU data platforms and research initiatives, three examples of further steps of integration are discussed here, dealing with (1) standardised parameterisation of habitats, and (2) linkages between EUNIS and the Red List of European Habitats.

### **6.2 Development of a EUNIS parameter framework**

The roadmap for developing a EUNIS parameter framework is fairly straightforward but needs some clear institutional commitment before the process could start and funding to enable the necessary technical and expert assistance to be mobilised for the various stages. With tasks such as reviewing the EUNIS environmental parameters and categories, and developing a lexicon, the scope of consultation needs careful consideration so as to maximise ownership of the developing product. Which experts to involve in populating the parameter frame, and who constitutes the wider frame of testing, will also affect the potency and credibility of the result. Producing

some early provisional examples of revised EUNIS habitat fact sheets would demonstrate the ultimate value of one ultimate output of the roadmap.

An appealing web portal and simple query routines should be seen as an integral part of developing a parameter frame in a revised EUNIS database since this will broaden the user communities of the habitat classification. Demonstrations of benefits of different kinds of enquiries would be a valuable adjunct, maybe in a new version of EUNIS habitat classification – a guide for users (Moss 2008).

It is hoped that a parallel process of harmonisation of parameter frames in data-bases which hold considerable amounts of point-source environmental data will enable ground-truthing of the validity of the environmental categories in a revised EUNIS and stimulate future data capture so as to include more detailed information and reference of relevés and plots to the relevant EUNIS habitat. Data-capture software could be structured so as to promote such wider environmental benefits of surveyor-vegetation encounters.

### **6.3 Linkages between EUNIS and the 'Red List of European habitats' project**

The DG(Env) 'Red List of European Habitats' uses a modified EUNIS typology as a framework for assessment, at level 3 for terrestrial and freshwater habitats, at levels 4 and below for marine, across the EU28 and EU28+. It also compares the Red List threat categories for the habitats with the overall Conservation Status assessments for the nearest equivalent Annex 1 habitats. The completion of the Red List project in June 2016 presents an unparalleled opportunity to combine and harmonise its outputs with those of this current series of projects for the EEA, for the enhancement of the EUNIS habitat classification, its scientific meaning and applications.

A number of specific challenges remain: (1) to decide how far the existing EUNIS typology for terrestrial and freshwater habitats needs revision, and, in wider consultation, to enquire whether the proposals for changing codes, names and definitions used for the 'Red List' are acceptable; (2) to decide which particular elements of the Red List assessment are most relevant for enhanced EUNIS habitat fact sheets and how these might be combined within a single frame; (3) to harmonise environmental references within a single acceptable glossary.

The 'Red List' has also been able to draw upon an impressive community of experts across Europe, including from beyond the EU28, though, as with the experience of EVA, a Scandinavian contribution to the project has been incomplete. Nonetheless, the accessibility of such experts as potential participants in the development of a single parameter framework for EUNIS, selecting the parameters and their categories and populating the framework,

and integrating the products with the EEA EUNIS revision, is a considerable legacy of the 'Red List'.

## **Appendix C: Fact sheets EUNIS grassland habitat types**

### **B1.4 - Coastal stable dune grassland**

**Origin of data (countries):** BE, BG, CZ, DE, DK, ES, FR, GR, HR, HU, IT, LT, LV, NL, PL, PT, RO, RS, SK, TR, UA, UK

**List of alliances:** COR-01A - *Corynephorion canescens* Klika 1931, CRU-01A - *Euphorbio portlandicae-Helichryson stoechadis* Géhu et Tx. ex Sissingh 1974, CRU-01B - *Koelerion arenariae* Tx. 1937 corr. Gutermann et Mucina 1993, CRU-02A - *Crucianellion maritimae* Rivas Goday et Rivas-Mart. 1958, CRU-02B - *Helichryson picardii* (Rivas-Mart., Costa et Izco in Rivas-Mart. et al. 1990) Rivas-Mart. et al. 1999, CRU-03D - *Scabiosion ucranicae* Sanda et al. 1980, TUB-02A - *Linarion pedunculatae* Díez Garretas et al. in Díez Garretas 1984, TUB-02B - *Alkanno-Maresion nanae* Rivas Goday ex Rivas Goday et Rivas-Mart. 1963 corr. Díez Garretas et al. 2001, TUB-02C - *Laguro ovati-Vulpion fasciculatae* Géhu et Biondi 1994, TUB-02E - *Psammo-Vulpion Pignatti* 1953, TUB-02F - *Vulpio-Lotion Horvatic* 1963, TUB-02G - *Maresion nanae* Géhu et al. 1987, TUB-03A - *Anthyllido hamosae-Malcolmion lacerae* Rivas Goday 1958

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed division: B1.4a - Atlantic and Baltic coastal dune grassland (grey dunes), B1.4b - Mediterranean and Macaronesian coastal dune grassland (grey dunes), B1.4c - Black Sea coastal dune grassland (grey dunes)

#### **Floristic composition:**

<i>Corynephorus canescens</i>	47	<i>Rumex acetosella</i>	17
<i>Carex arenaria</i>	40	<i>Koeleria macrantha</i>	15
<i>Cerastium semidecandrum</i>	28	<i>Hypochaeris radicata</i>	15
<i>Festuca rubra</i> agg.	26	<i>Myosotis ramosissima</i>	14
<i>Hypnum cupressiforme</i>	24	<i>Jasione montana</i>	13
<i>Ammophila arenaria</i>	24	<i>Spergula morisonii</i>	13
<i>Phleum arenarium</i>	22	<i>Cladonia rangiformis</i>	12
<i>Cladonia foliacea</i>	21	<i>Dicranum scoparium</i>	12
<i>Polytrichum piliferum</i>	21	<i>Aira praecox</i>	11
<i>Sedum acre</i>	21	<i>Crucianella maritima</i>	10
<i>Cladonia furcata</i>	20	<i>Erophila verna</i>	10
<i>Cetraria aculeata</i>	18	<i>Senecio jacobaea</i>	10
<i>Galium verum</i>	17	<i>Veronica arvensis</i>	10
<i>Ceratodon purpureus</i>	17	<i>Calamagrostis epigejos</i>	10
<i>Erodium cicutarium</i>	17	<i>Brachythecium albicans</i>	10

## B1.9 - Machair

**Origin of data (countries):** AT, BE, BG, CH, CZ, DE, DK, ES, FR, GR, HR, HU, IE, IT, LT, LU, LV, MK, NL, NO, PL, PT, RS, RU, SE, SI, SK, UA, UK

**List of alliances:** AMM-01A - Ammophilion Br.-Bl. 1921, COR-02B - Armerion elongatae Pötsch 1962, COR-04A - Thero-Airion Tx. ex Oberd. 1957, CRU-01B - Koelerion arenariae Tx. 1937 corr. Gutermann et Mucina 1993, MOL-01C - Cynosurion cristati Tx. 1947, NAR-01C - Violion caninae Schwickerath 1944

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed to restrict to grassland part of the habitat and accordingly renamed to: Machair grassland

### Floristic composition:

Agrostis capillaris	38	Hieracium pilosella	17
Plantago lanceolata	38	Bellis perennis	16
Festuca rubra agg.	37	Ranunculus repens	16
Trifolium repens	34	Lotus corniculatus	15
Achillea millefolium agg.	33	Prunella vulgaris	15
Anthoxanthum odoratum	32	Ammophila arenaria	14
Holcus lanatus	29	Danthonia decumbens	13
Poa pratensis	24	Poa trivialis	13
Trifolium pratense	24	Leontodon autumnalis	12
Lolium perenne	23	Cerastium semidecandrum	12
Hypochaeris radicata	22	Galium verum	12
Cerastium fontanum subsp. vulgare	21	Nardus stricta	12
Cynosurus cristatus	21	Festuca pratensis	11
Ranunculus acris	20	Carex arenaria	11
Rumex acetosa	20	Elymus repens	11
Dactylis glomerata	19	Eryngium maritimum	11
Luzula campestris	19	Elymus farctus	11
Potentilla erecta	17	Taraxacum sect. Ruderalia	10
Rumex acetosella	17	Cirsium arvense	10

## **E1.1 - Inland sand and rock with open vegetation**

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed division: E1.3a - Mediterranean closely grazed dry grassland, E1.3b - Mediterranean tall perennial dry grassland, E1.3c - Mediterranean annual-rich dry grassland

### Floristic composition:

Dactylis glomerata	25	Sedum sediforme	14
Brachypodium retusum	22	Erophila verna	13
Poa bulbosa	22	Erodium cicutarium	12
Brachypodium distachyon	21	Eryngium campestre	12
Medicago minima	21	Filago pyramidata	12
Trifolium scabrum	20	Arenaria leptoclados	12
Desmazeria rigida	20	Bombycilaena erecta	12
Sherardia arvensis	18	Anagallis arvensis	12
Asterolinon linum-stellatum	18	Minuartia hybrida	11
Trifolium campestre	18	Stipa tenacissima	11
Euphorbia exigua	16	Sedum album	11
Linum strictum	15	Saxifraga tridactylites	11
Hornungia petraea	15	Hypochaeris achyrophorus	10
Plantago lanceolata	15	Leontodon taraxacoides subsp. longirostris	10
Thymus vulgaris	14	Reichardia picroides	10
Cerastium pumilum	14	Avenula bromoides	10

## **E1.4 - Mediterranean tallgrass and Artemisia steppes**

**Origin of data (countries):** ES, FR, GR, HR, IT, MC, PT

**List of alliances:** LYG-01A - Thero-Brachypodion retusi Br.-Bl. 1925, LYG-01B - Triseto velutini-Brachypodion boissieri Rivas-Mart. et al. 2002, LYG-01C - Festucion scariosae Martínez-Parras et al. 1984, LYG-01D - Stipion parviflorae De la Torre et al. 1996, LYG-01E - Leontodon tuberosi-Bellion sylvestris Biondi et al. 2001, LYG-02A - Cymbopogono hirti-Brachypodion ramosi Horvatic 1963, LYG-02B - Hyparrhenion hirtae Br.-Bl. et al. 1956, LYG-03A - Agropyro pectinati-Lygeion sparti Br.-Bl. et O. de Bolòs 1958 corr. Rivas-Mart. et al. 1999, LYG-03B - Stipion tenacissimae Rivas-Mart. 1984

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed to merge with other EUNIS types, partly with E1.3b and partly with F6.8a and F6.8b

### **Floristic composition:**

Brachypodium retusum	51	Helictotrichon filifolium	14
Dactylis glomerata	47	Avena barbata	14
Stipa tenacissima	29	Asphodelus ramosus	14
Avenula bromoides	23	Plantago lanceolata	14
Thymus vulgaris	21	Brachypodium distachyon	13
Reichardia picroides	20	Hypochaeris achyrophorus	13
Eryngium campestre	19	Trifolium campestre	13
Sedum sediforme	19	Fumana thymifolia	12
Medicago minima	19	Convolvulus cantabrica	12
Desmazeria rigida	18	Trifolium scabrum	11
Carlina corymbosa	18	Sherardia arvensis	11
Bituminaria bituminosa	16	Teucrium polium	11
Rosmarinus officinalis	16	Urospermum dalechampii	11
Hyparrhenia hirta	15	Stipa offneri	10
Koeleria vallesiana	15	Ruta angustifolia	10
Linum strictum	15		

## E1.5 - Mediterranean montane grassland

**Origin of data (countries):** AD, AL, BG, ES, FR, GR, IT, PT

**List of alliances:** GEN-01B - *Plantaginion insularis* Klein 1972, IND-01A - *Teesdaliopsio confertae-Luzulion caespitosae* Rivas-Mart. 1987, IND-01B - *Jasionion carpetanae* González-Albo 1941, IND-01C - *Ptilotrichion purpurei* Quézel 1953, IND-02A - *Hieracio castellani-Plantaginion radicatae* Rivas-Mart. et Cantó 1987, ONO-01A - *Ononidion striatae* Br.-Bl. et Susplugas 1937, ONO-01B - *Ononidion cristatae* Royer 1991, ONO-01C - *Festucion scopariae* Br.-Bl. 1948, ONO-01D - *Genistion lobelii* Molinier 1934, ONO-01H - *Avenion sempervirentis* Barbero 1968, ONO-02A - *Festucion burnatii* Rivas Goday et Rivas-Mart. ex Mayor et al. 1973, ONO-02B - *Minuartio-Poion ligulatae* O. de Bolòs 1962, ONO-02C - *Plantagini discoloris-Thymion mastigophori* Molina et Izco 1989, TRI-09A - *Trifolion parnassii* Quézel ex Quézel et al. 1992

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed division: E1.5a - Iberian oromediterranean siliceous dry grassland, E1.5b - Iberian oromediterranean basiphilous dry grassland, E1.5c - Corsican and Sardinian oromediterranean siliceous dry grassland, E1.5d - Greek and Anatolian oromediterranean siliceous dry grassland, E1.5e - Madeiran oromediterranean siliceous dry grassland

### Floristic composition:

Koeleria vallesiana	57	<i>Avenula pratensis</i>	13
<i>Anthyllis vulneraria</i>	37	<i>Poa ligulata</i>	13
<i>Carex humilis</i>	30	<i>Thymus vulgaris</i>	13
<i>Helianthemum oelandicum</i>	29	<i>Ononis striata</i>	13
<i>Festuca hystrix</i>	27	<i>Thymus nervosus</i>	13
<i>Coronilla minima</i>	23	<i>Sesleria coeruleans</i>	13
<i>Potentilla tabernaemontani</i>	22	<i>Asperula cynanchica</i>	12
<i>Anthyllis montana</i>	20	<i>Festuca rubra</i> agg.	12
<i>Festuca gautieri</i>	20	<i>Androsace villosa</i>	12
<i>Helianthemum canum</i>	19	<i>Lotus corniculatus</i>	12
<i>Seseli montanum</i>	17	<i>Eryngium campestre</i>	12
<i>Arenaria grandiflora</i> subsp. <i>grandiflora</i>	17	<i>Galium pyrenaicum</i>	12
<i>Teucrium chamaedrys</i>	16	<i>Arenaria aggregata</i>	11
<i>Sideritis hyssopifolia</i>	15	<i>Poa alpina</i>	11
<i>Helictotrichon sedenense</i>	15	<i>Ononis cristata</i>	11
<i>Helianthemum apenninum</i>	14	<i>Globularia repens</i>	11
<i>Bromus erectus</i>	14	<i>Aphyllanthes monspeliensis</i>	10
<i>Hieracium pilosella</i>	14	<i>Jurinea humilis</i>	10
<i>Fumana procumbens</i>	14	<i>Paronychia kapela</i>	10
<i>Hippocrepis comosa</i>	13		

## **E1.6 - Subnitrophilous annual grasslands**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** exclude from grasslands (anthropogenic)

**Floristic composition:**

No data

## E1.7 - Non-Mediterranean dry acid and neutral closed grassland

**Origin of data (countries):** AT, BE, BG, CZ, DE, DK, ES, FR, HR, HU, IE, IT, LT, LV, MK, NL, NO, PL, RS, SE, SI, SK, UA, UK

**List of alliances:** COR-02B - Armerion elongatae Pötsch 1962, COR-02C - Sedo-Cerastion arvensis Sissingh et Tideman 1960, COR-02E - Armerion junceae Br.-Bl. ex Br.-Bl. et al. 1952, COR-02F - Armerio-Potentillion Micevski 1978, NAR-01A - Potentillo-Polygonion vivipari Nordhagen ex Dierßen 1992, NAR-01C - Violion caninae Schwickerath 1944, NAR-01E - Nardo-Agrostion tenuis Sillinger 1933, NAR-01G - Achilleo-Arnicion Horvat et Pawłowski in Horvat 1960

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed change of content and consequently change of name: Lowland to submontane, dry to mesic Nardus grassland

### Floristic composition:

Agrostis capillaris	52	Rubus caesius	16
Festuca rubra agg.	48	Polygala vulgaris	16
Luzula campestris	46	Carex pilulifera	15
Plantago lanceolata	41	Pimpinella saxifraga	15
Anthoxanthum odoratum	39	Lotus corniculatus subsp. corniculatus	15
Achillea millefolium agg.	38	Sedum acre	15
Hieracium pilosella	36	Avenula pubescens	14
Potentilla erecta	34	Artemisia campestris	14
Galium verum	32	Lotus corniculatus	14
Poa pratensis	29	Cerastium arvense	14
Rumex acetosella	28	Ceratodon purpureus	14
Hypochaeris radicata	28	Viola canina	14
Nardus stricta	26	Cladonia furcata	13
Carex arenaria	25	Cerastium fontanum subsp. vulgare	13
Danthonia decumbens	24	Trifolium arvense	13
Festuca ovina	24	Veronica chamaedrys	12
Veronica officinalis	21	Armeria maritima subsp. elongata	12
Holcus lanatus	21	Ranunculus acris	12
Dicranum scoparium	21	Pleurozium schreberi	12
Calamagrostis epigejos	19	Briza media	11
Festuca filiformis	19	Taraxacum laevigatum agg.	11
Calluna vulgaris	19	Senecio jacobaea	11
Pseudoscleropodium purum	19	Brachythecium albicans	11
Rhytidadelphus squarrosus	19	Festuca brevipila	11
Cerastium semidecandrum	18	Hypericum perforatum	11
Thymus pulegioides	18	Vaccinium myrtillus	11
Hypnum cupressiforme	18	Galium mollugo	10
Trifolium repens	18	Salix repens	10

Deschampsia flexuosa	17	Prunella vulgaris	10
Rumex acetosa	17	Campanula rotundifolia	10
Galium saxatile	17	Hypnum cupressiforme var. lacunosum	10
Koeleria macrantha	16		

## **E1.8 - Mediterranean dry acid and neutral closed grassland**

**Origin of data (countries):** ES, FR, PT

**List of alliances:** SAC-01A - Agrostion castellanae Rivas Goday ex Rivas-Mart. et al. 1980, SAC-01B - Festucion merinoi Rivas-Mart. et Sánchez-Mata in Rivas-Mart. et al. 1986 corr. Rivas-Mart. et Sánchez-Mata in Rivas-Mart. et al. 2002, SAC-01C - Agrostio castellanae-Stipion giganteae Rivas Goday ex Rivas-Mart. et Fernández González 1991, TRI-06A - Campanulo herminii-Nardion strictae Rivas-Mart. 1964, TRI-07A - Sesamoido pygmaeae-Poion violaceae Gamisans 1975

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed change of content and consequently change of name to: Open Iberian supramediterranean dry acid and neutral grassland

### **Floristic composition:**

Nardus stricta	92	Agrostis capillaris	16
Juncus squarrosus	39	Trifolium pratense	16
Potentilla erecta	37	Carex caryophyllea	16
Luzula campestris	28	Narcissus bulbocodium	15
Campanula herminii	27	Briza media	15
Festuca iberica	27	Calluna vulgaris	14
Anthoxanthum odoratum	26	Galium verum	14
Ranunculus bulbosus	26	Cynosurus cristatus	14
Festuca rothmaleri	24	Hypochaeris radicata	14
Hieracium pilosella	22	Carex ovalis	13
Agrostis castellana	21	Plantago alpina	12
Danthonia decumbens	21	Carex nigra	11
Lotus corniculatus	21	Genista anglica	11
Galium saxatile	21	Deschampsia flexuosa	11
Jasione laevis	20	Festuca nigrescens	11
Holcus lanatus	20	Luzula multiflora	10
Trifolium repens	18	Polygala vulgaris	10
Pedicularis sylvatica	18	Deschampsia cespitosa	10
Carum verticillatum	17		

## **E1.9 - Non-Mediterranean dry acid and neutral open grassland, including inland dune grassland**

**Origin of data (countries):** AD, AT, BE, BG, CH, CZ, DE, DK, EE, ES, FI, FR, GR, HR, HU, IE, IT, LT, LV, MK, NL, NO, PL, PT, RO, RS, SE, SI, SK, UA, UK, XK

**List of alliances:** COR-01A - *Corynephorion canescens* Klika 1931, COR-02A - *Hyperico perforati-Scleranthion perennis* Moravec 1967, COR-02B - *Armerion elongatae* Pötsch 1962, COR-02C - *Sedo-Cerastion arvensis* Sissingh et Tideman 1960, COR-02E - *Armerion junceae* Br.-Bl. ex Br.-Bl. et al. 1952, COR-02F - *Armerio-Potentillion Micevski* 1978, COR-03A - *Koelerion glaucae* Volk 1931, COR-03B - *Sileno conicae-Cerastion semidecandri* Korneck 1974, COR-04A - *Thero-Airion* Tx. ex Oberd. 1957, COR-05A - *Sedo-Scleranthion* Br.-Bl. 1950, COR-05B - *Sedion anglici* Br.-Bl. in Br.-Bl. et Tx. 1952, COR-05C - *Sedion pyrenaici* Tx. in Rivas-Mart. et al. 2011, COR-05D - *Sedo albi-Veronicion dillenii* Korneck 1974, COR-05E - *Scabioso-Trifolion dalmatici* Horvatic et N. Randelovic in N. Randelovic 1977, COR-05F - *Diantho pinifolii-Jasionion heldreichii* Bergmeier et al. 2009

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed division: E1.9a - Oceanic to subcontinental inland sand grassland on dry acid and neutral soils, E1.9b - Inland mobile sand and dune with siliceous grassland

### **Floristic composition:**

Rumex acetosella	43	<i>Sedum acre</i>	17
Agrostis capillaris	37	<i>Artemisia campestris</i>	17
Hieracium pilosella	37	<i>Calamagrostis epigejos</i>	16
Plantago lanceolata	36	<i>Cerastium arvense</i>	15
Carex arenaria	35	<i>Brachythecium albicans</i>	14
Festuca rubra agg.	34	<i>Thymus pulegioides</i>	14
Hypochaeris radicata	34	<i>Holcus lanatus</i>	14
Luzula campestris	33	<i>Hypericum perforatum</i>	14
Achillea millefolium agg.	32	<i>Festuca filiformis</i>	14
Galium verum	32	<i>Bromus hordeaceus</i>	13
Corynephorus canescens	30	<i>Pseudoscleropodium purum</i>	13
Hypnum cupressiforme	29	<i>Cladonia foliacea</i>	12
Poa pratensis	25	<i>Rubus caesius</i>	12
Festuca ovina	25	<i>Pimpinella saxifraga</i>	12
Cerastium semidecandrum	23	<i>Veronica arvensis</i>	12
Ceratodon purpureus	22	<i>Lotus corniculatus</i> subsp. <i>corniculatus</i>	11
Anthoxanthum odoratum	22	<i>Senecio jacobaea</i>	11
Dicranum scoparium	21	<i>Trifolium campestre</i>	11
Jasione montana	21	<i>Avenula pubescens</i>	11
Polytrichum piliferum	20	<i>Hieracium umbellatum</i>	10
Trifolium arvense	19	<i>Veronica officinalis</i>	10
Cladonia furcata	18	<i>Polytrichum juniperinum</i>	10

Aira praecox	18	Trifolium repens	10
Koeleria macrantha	18		

## **E1.A - Mediterranean dry acid and neutral open grassland**

**Origin of data (countries):** BG, ES, FR, GR, IT, MK, PT

**List of alliances:** BUL-01A - *Trifolio subterranei*-*Periballion minutae* Rivas Goday 1964, IND-02A - *Hieracio castellani*-*Plantaginion radicatae* Rivas-Mart. et Cantó 1987, TUB-01A - *Helianthemion guttati* Br.-Bl. in Br.-Bl. et al. 1940, TUB-01B - *Crassulo tillaeae*-*Sedion caespitosi* de Foucault 1999, TUB-01C - *Molinierion laevis* Br.-Bl. et al. 1952, TUB-01D - *Sedion pedicellato-andegavensis* Rivas-Mart. et al. 1986, TUB-01E - *Trifolion cherleri* Micevski 1972, TUB-03A - *Anthyllido hamosae*-*Malcolmion lacerae* Rivas Goday 1958, TUB-03B - *Corynephoro articulati*-*Malcolmion patulae* Rivas Goday 1958, TUB-03C - *Corynephorion maritimi* Costa, Pinto-Gomes, Neto et Rivas-Mart. in Costa et al. 2012

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed new name: Mediterranean to Atlantic open, dry, acid and neutral grassland

### **Floristic composition:**

Poa bulbosa	48	<i>Anthemis ruthenica</i>	15
<i>Trifolium campestre</i>	39	<i>Trifolium glomeratum</i>	15
<i>Trifolium arvense</i>	37	<i>Chrysopogon gryllus</i>	14
<i>Hypochaeris glabra</i>	34	<i>Taeniatherum caput-medusae</i>	14
<i>Tuberaria guttata</i>	33	<i>Cynodon dactylon</i>	14
<i>Filago minima</i>	31	<i>Trifolium smyrnaeum</i>	13
<i>Erodium cicutarium</i>	29	<i>Medicago rigidula</i>	12
<i>Eryngium campestre</i>	28	<i>Micropyrum tenellum</i>	12
<i>Vulpia ciliata</i>	25	<i>Dasypyrum villosum</i>	12
<i>Psilurus incurvus</i>	25	<i>Potentilla laciniosa</i>	12
<i>Ornithopus compressus</i>	23	<i>Teesdalia coronopifolia</i>	12
<i>Sherardia arvensis</i>	23	<i>Carthamus lanatus</i>	12
<i>Trifolium cherleri</i>	21	<i>Neatostema apulum</i>	12
<i>Galium divaricatum</i>	20	<i>Rumex acetosella</i>	11
<i>Scleranthus annuus</i>	19	<i>Vulpia bromoides</i>	11
<i>Vulpia myuros</i>	19	<i>Chondrilla juncea</i>	11
<i>Plantago lanceolata</i>	19	<i>Filago pyramidata</i>	11
<i>Trifolium scabrum</i>	18	<i>Achillea coarctata</i>	11
<i>Bromus squarrosus</i>	18	<i>Briza maxima</i>	11
<i>Veronica arvensis</i>	18	<i>Ornithogalum comosum</i>	11
<i>Filago gallica</i>	17	<i>Sedum caespitosum</i>	11
<i>Helianthemum salicifolium</i>	17	<i>Crassula tillaea</i>	11
<i>Sanguisorba minor</i>	17	<i>Aphanes arvensis</i>	10
<i>Plantago bellardii</i>	16	<i>Tolpis barbata</i>	10
<i>Petrorhagia prolifera</i>	16	<i>Medicago minima</i>	10
<i>Cerastium pumilum</i>	16	<i>Astragalus onobrychis</i>	10
<i>Trifolium angustifolium</i>	16	<i>Brachypodium distachyon</i>	10

<i>Trifolium subterraneum</i>	16	<i>Rumex bucephalophorus</i>	10
<i>Leontodon taraxacoides</i> subsp. <i>longirostris</i>	15	<i>Xeranthemum annuum</i>	
<i>Aegilops neglecta</i>	15		

## E1.B - Heavy-metal grassland

**Origin of data (countries):** BE, DE, GR, IT, PL, SI, UK

**List of alliances:** COR-07E - *Aethionemion saxatilis* Bergmeier et al. 2009, DRY-03C - *Ptilostemo casabonae-Euphorbion cupanii* Angiolini et al. 2005, THL-09A - *Thlaspium calaminarii* Ernst 1965, THL-09B - *Armerion halleri* Ernst 1965

**Additional selection rules:** n/a

**Implications for EUNIS classification:** n/a

### **Floristic composition:**

Helichrysum italicum subsp. microphyllum	56	Urospermum dalechampii	20
Euphorbia pithyusa subsp. cupanii	48	Rumex acetosa	17
Dittrichia viscosa	42	Piptatherum miliaceum	17
Ptilostemon casabonae	41	Campanula rotundifolia	16
Scrophularia canina subsp. bicolor	36	Cistus monspeliensis	16
Reseda luteola	34	Avena fatua	15
Carlina corymbosa	34	Agrostis capillaris	14
Reichardia picroides	32	Hypochaeris achyrophorus	13
Dactylis glomerata subsp. hispanica	31	Sanguisorba minor subsp. muricata	13
Jasione montana	31	Cladonia pyxidata	12
Daucus carota subsp. carota	30	Santolina chamaecyparissus	12
Rumex bucephalophorus	28	Cistus incanus	12
Cistus salvifolius	28	Limonium merxmueelleri	12
Sixalix atropurpurea subsp. maritima	26	Pimpinella saxifraga	12
Silene vulgaris	25	Carex macrolepis	11
Festuca ovina	24	Plantago lanceolata	11
Bellium bellidioides	21	Teucrium massiliense	11
Centaurium erythraea	20	Lavandula stoechas	10

## **E1.C - Dry mediterranean lands with unpalatable non-vernal herbaceous vegetation**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** exclude from grasslands (anthropogenic)

**Floristic composition:**

No data

## **E1.D - Unmanaged xeric grassland**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** exclude from grasslands (anthropogenic)

**Floristic composition:**

No data

## **E1.E - Trampled xeric grasslands with annuals**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** exclude from grasslands (anthropogenic)

**Floristic composition:**

No data

## **E1.F - Azorean open, dry, acid to neutral grassland**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed as new EUNIS type

**Floristic composition:**

No data

## **E2.1 - Permanent mesotrophic pastures and aftermath-grazed meadows**

**Origin of data (countries):** AT, BE, BG, CH, CZ, DE, EE, ES, FR, HR, HU, IE, IT, LU, NL, NO, PL, PT, RO, RS, RU, SE, SI, SK, UA, UK

**List of alliances:** MOL-01C - *Cynosurion cristati* Tx. 1947, MOL-01G - *Lino biennis-Gaudinion fragilis* (Br.-Bl. 1967) de Foucault 1989, MOL-02D - *Poion alpinae* Gams ex Oberd. 1950, MOL-02E - *Poion supinae* Rivas-Mart. et Géhu 1978, MOL-04A - *Molinion caeruleae* Koch 1926, MOL-04D - *Deschampsion cespitosae* Horvatic 1930, MOL-05A - *Potentillion anserinae* Tx. 1947

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed change of content and consequently change of name: Mesic permanent pasture of lowlands and mountains

### **Floristic composition:**

Trifolium repens	53	Potentilla anserina	17
Holcus lanatus	50	Phleum pratense	17
Ranunculus repens	49	Juncus articulatus	16
Poa trivialis	44	Cirsium arvense	16
Agrostis stolonifera	39	Leontodon autumnalis	15
Ranunculus acris	36	Carex hirta	15
Lolium perenne	35	Juncus effusus	14
Cerastium fontanum subsp. vulgare	34	Lathyrus pratensis	14
Plantago lanceolata	33	Lotus corniculatus	14
Rumex acetosa	32	Taraxacum sect. Ruderalia	14
Anthoxanthum odoratum	31	Carex panicea	14
Festuca rubra agg.	31	Lotus pedunculatus	14
Trifolium pratense	30	Phalaris arundinacea	14
Poa pratensis	28	Briza media	14
Cardamine pratensis	26	Rumex crispus	13
Achillea millefolium agg.	24	Myosotis scorpioides	13
Alopecurus geniculatus	23	Centaurea jacea	12
Cynosurus cristatus	21	Succisa pratensis	12
Alopecurus pratensis	21	Plantago major	12
Agrostis capillaris	20	Vicia cracca	12
Dactylis glomerata	20	Sanguisorba officinalis	12
Prunella vulgaris	20	Leucanthemum vulgare agg.	12
Deschampsia cespitosa	19	Glechoma hederacea	12
Festuca pratensis	19	Molinia caerulea	12
Bellis perennis	18	Poa annua	12
Elymus repens	18	Bromus hordeaceus	11
Potentilla erecta	18	Veronica chamaedrys	11
Taraxacum sect. Ruderalia	18	Cirsium palustre	11

Glyceria fluitans	18	Lysimachia nummularia	10
Galium palustre	17	Potentilla reptans	10
Lychnis flos-cuculi	17	Carex nigra	10

## E2.2 - Low and medium altitude hay meadows

**Origin of data (countries):** AD, AT, BE, BG, CH, CZ, DE, EE, ES, FR, HR, HU, IE, IT, LT, LU, MK, NL, NO, PL, PT, RO, RS, RU, SE, SI, SK, UA, UK, XK

**List of alliances:** FEP-06B - *Glycyrrhizion korshinskyi* Lysenko 2010, FEP-06C - *Glycyrrhizion glabrae* Golub et Mirkin in Golub 1995, MOL-01A - *Arrhenatherion elatioris* Luquet 1926, MOL-01C - *Cynosurion cristati* Tx. 1947, MOL-01F - *Ranunculo neapolitani-Arrhenatherion elatioris* Allegrezza et Biondi 2011, MOL-01H - *Rumicion thrysiflori* Micevski ex Carni et Mucina 2013, MOL-04A - *Molinion caeruleae* Koch 1926, MOL-04B - *Calthion palustris* Tx. 1937, MOL-04D - *Deschampion cespitosae* Horvatic 1930

**Additional selection rules:** n/a

**Implications for EUNIS classification:** n/a

### Floristic composition:

Plantago lanceolata	57	Cirsium arvense	17
Holcus lanatus	51	Cardamine pratensis	16
Ranunculus acris	50	Daucus carota	16
Trifolium pratense	49	Potentilla reptans	16
Achillea millefolium agg.	48	Leontodon hispidus	16
Trifolium repens	46	Luzula campestris	16
Dactylis glomerata	45	Stellaria graminea	16
Rumex acetosa	45	Galium verum	16
Festuca rubra agg.	44	Leontodon autumnalis	16
Anthoxanthum odoratum	43	Heracleum sphondylium	16
Cerastium fontanum subsp. vulgare	38	Agrostis stolonifera	15
Poa pratensis	38	Bromus hordeaceus	15
Festuca pratensis	36	Sanguisorba officinalis	15
Ranunculus repens	34	Medicago lupulina	15
Poa trivialis	34	Trifolium dubium	14
Arrhenatherum elatius	32	Taraxacum sect. Ruderalia	14
Lolium perenne	28	Glechoma hederacea	14
Alopecurus pratensis	27	Knautia arvensis	13
Lathyrus pratensis	27	Crepis biennis	13
Cynosurus cristatus	27	Carex panicea	13
Agrostis capillaris	27	Carex hirta	13
Veronica chamaedrys	26	Lysimachia nummularia	13
Leucanthemum vulgare agg.	26	Equisetum arvense	12
Lotus corniculatus	26	Plantago media	12
Centaurea jacea	26	Rhinanthus minor	12
Prunella vulgaris	25	Succisa pratensis	12
Vicia cracca	23	Taraxacum sect. Ruderalia	12
Trisetum flavescens	23	Avenula pubescens	12
Bellis perennis	21	Pimpinella saxifraga	12

<i>Lychnis flos-cuculi</i>	21	<i>Rumex crispus</i>	12
<i>Taraxacum sect. Ruderalia</i>	21	<i>Hypochaeris radicata</i>	11
<i>Briza media</i>	20	<i>Lotus pedunculatus</i>	11
<i>Deschampsia cespitosa</i>	19	<i>Ajuga reptans</i>	11
<i>Phleum pratense</i>	19	<i>Campanula patula</i>	11
<i>Potentilla erecta</i>	18	<i>Filipendula ulmaria</i>	11
<i>Elymus repens</i>	18	<i>Anthriscus sylvestris</i>	10
<i>Galium mollugo agg.</i>	17	<i>Molinia caerulea</i>	10

## E2.3 - Mountain hay meadows

**Origin of data (countries):** AT, CH, CZ, DE, ES, FR, IT, PL, RU, SK, UA, UK

**List of alliances:** MOL-01B - Phyteumato-Trisetion flavescentis Hundt ex Passarge 1969, MOL-02A - Triseteto flavescentis-Polygonion bistortae Br.-Bl. et Tx. ex Marschall 1947, MOL-03A - Polygonion krascheninnikovii Kashapov 1985, MOL-04B - Calthion palustris Tx. 1937

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed new name: Submediterranean moist meadow

### Floristic composition:

Ranunculus acris	58	Vicia sepium	18
Trifolium pratense	57	Heracleum sphondylium	18
Anthoxanthum odoratum	54	Centaurea jacea	18
Rumex acetosa	51	Prunella vulgaris	18
Trifolium repens	49	Luzula campestris	16
Dactylis glomerata	48	Arrhenatherum elatius	16
Plantago lanceolata	48	Ajuga reptans	15
Achillea millefolium agg.	46	Briza media	15
Poa trivialis	45	Sanguisorba officinalis	15
Veronica chamaedrys	42	Campanula patula	15
Agrostis capillaris	41	Bellis perennis	15
Festuca rubra agg.	40	Elymus repens	15
Festuca pratensis	38	Filipendula ulmaria	15
Vicia cracca	37	Knautia arvensis	15
Alopecurus pratensis	37	Potentilla erecta	14
Lathyrus pratensis	36	Rumex crispus	14
Ranunculus repens	35	Alchemilla monticola	14
Holcus lanatus	34	Alchemilla vulgaris agg.	14
Leucanthemum vulgare agg.	33	Leontodon autumnalis	14
Trisetum flavescens	31	Pimpinella major	14
Cerastium fontanum subsp. vulgare	28	Campanula rotundifolia	14
Cynosurus cristatus	27	Carum carvi	13
Taraxacum sect. Ruderalia	26	Galium verum	13
Poa pratensis	26	Phyteuma spicatum	13
Hypericum maculatum	26	Senecio aquaticus subsp. aquaticus	13
Leontodon hispidus	24	Galium mollugo agg.	13
Geranium sylvaticum	24	Rhytidadelphus squarrosus	12
Lotus corniculatus	23	Plantago media	12
Bistorta officinalis	23	Pimpinella saxifraga	12
Lychnis flos-cuculi	23	Rhinanthus minor	12
Lolium perenne	23	Cardaminopsis halleri	12
Stellaria graminea	22	Myosotis scorpioides	11

Deschampsia cespitosa	21	Bromus racemosus	11
Taraxacum sect. Ruderalia	20	Agrostis stolonifera var. stolonifera	11
Cardamine pratensis	20	Hordeum secalinum	10
Phleum pratense	19	Silene dioica	10

## E2.4 - Iberian summer pastures (vallicares)

**Origin of data (countries):** ES, PT

**List of alliances:** SAC-01A - Agrostion castellanae Rivas Goday ex Rivas-Mart. et al. 1980,  
SAC-01B - Festucion merinoi Rivas-Mart. et Sánchez-Mata in Rivas-Mart. et al. 1986 corr.  
Rivas-Mart. et Sánchez-Mata in Rivas-Mart. et al. 2002

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed new name: Iberian summer pasture  
(vallicar)

### **Floristic composition:**

Agrostis castellana	82	Vulpia bromoides	18
Hypochaeris radicata	82	Vulpia myuros	18
Plantago lanceolata	57	Anthoxanthum odoratum	14
Jasione montana	50	Bromus hordeaceus	14
Holcus lanatus	43	Campanula lusitanica	14
Aira caryophyllea	39	Ceratodon purpureus	14
Daucus carota	39	Cytisus multiflorus	14
Festuca elegans subsp. merinoi	39	Dicranum scoparium	14
Galium verum	39	Digitalis purpurea subsp. carpetana	14
Rumex acetosella	39	Erica australis	14
Trifolium striatum	39	Filago minima	14
Trifolium strictum	39	Linum bienne	14
Trifolium dubium	36	Polytrichum piliferum	14
Lotus corniculatus	32	Quercus pyrenaica	14
Arrhenatherum elatius subsp. bulbosum	32	Ranunculus bulbosus	14
Sanguisorba minor	32	Rhinanthus minor	14
Hieracium pilosella	29	Sanguisorba verrucosa	14
Crepis capillaris	25	Sedum amplexicaule subsp. tenuifolium	14
Erica arborea	25	Sesamoides purpurascens	14
Eryngium campestre	25	Anthyllis vulneraria	11
Petrorhagia prolifera	25	Bartramia pomiformis	11
Pteridium aquilinum	25	Carduus carpetanus	11
Trifolium arvense	25	Carex muricata	11
Trifolium pratense	25	Castanea sativa	11
Tuberaria guttata	25	Centaurea jacea	11
Arenaria montana	21	Centaurea paniculata subsp. castellana	11
Dactylis glomerata	21	Cynosurus echinatus	11
Festuca ampla	21	Cytisus grandiflorus	11
Halimium lasianthum subsp. alyssoides	21	Genista florida	11
Senecio sylvaticus	21	Hieracium castellanum	11
Achillea tomentosa	18	Hypericum perforatum	11
Anarrhinum bellidifolium	18	Koeleria caudata	11

<i>Andryala integrifolia</i>	18	<i>Lepidium heterophyllum</i>	11
<i>Campanula rapunculus</i>	18	<i>Micropyrum tenellum</i>	11
<i>Convolvulus arvensis</i>	18	<i>Phalacrocarpum oppositifolium</i>	11
<i>Cynosurus cristatus</i>	18	<i>Rubus</i>	11
<i>Cytisus striatus</i>	18	<i>Senecio erucifolius</i>	11
<i>Hypnum cypresiforme</i>	18	<i>Silene nutans</i>	11
<i>Prunella laciniata</i>	18	<i>Teucrium scorodonia</i>	11
<i>Trifolium angustifolium</i>	18	<i>Trifolium repens</i>	11
<i>Trifolium campestre</i>	18	<i>Vicia sativa subsp. nigra</i>	11

## E2.5 - Meadows of the steppe zone

**Origin of data (countries):** RU, UA

**List of alliances:** FES-02A - Agrostion vinealis Sipailova et al. 1985, FES-02E - Trifolion montani Naumova 1986

**Additional selection rules:** n/a

**Implications for EUNIS classification:** now included within E1.2a

### Floristic composition:

Achillea millefolium agg.	71	Equisetum arvense	14
Poa angustifolia	56	Hieracium umbellatum	14
Potentilla argentea	47	Sanguisorba officinalis	14
Galium verum	42	Vicia tetrasperma	14
Plantago lanceolata	39	Seseli libanotis	14
Carex praecox	34	Leucanthemum vulgare	14
Elymus repens	34	Linaria vulgaris	14
Agrostis vinealis	32	Phleum pratense	14
Festuca pratensis	28	Bistorta officinalis	14
Stellaria graminea	28	Carex hirta	13
Koeleria delavignei	27	Hypericum perforatum	13
Trifolium pratense	26	Lathyrus pratensis	13
Calamagrostis epigejos	26	Agrostis capillaris	13
Galium boreale	24	Centaurea scabiosa	13
Dactylis glomerata	22	Euphorbia esula subsp. tommasiniana	13
Rumex acetosella	21	Stachys officinalis	13
Ranunculus acris	21	Berteroa incana	13
Rumex thrysiflorus	21	Aegopodium podagraria	13
Ranunculus polyanthemos	21	Prunella vulgaris	13
Festuca valesiaca	20	Centaurea jacea	12
Cichorium intybus	20	Dracocephalum ruyschiana	12
Poa pratensis	19	Rumex confertus	12
Taraxacum sect. Ruderalia	19	Trifolium medium	12
Bromus inermis	19	Dianthus barbasi	12
Filipendula vulgaris	18	Heracleum sibiricum	12
Vicia cracca	18	Cerastium fontanum subsp. vulgare	11
Alopecurus pratensis	18	Veronica spicata	11
Festuca rubra agg.	18	Alchemilla	11
Lotus corniculatus	17	Phlomis tuberosa	11
Fragaria viridis	17	Primula macrocalyx	11
Veronica chamaedrys	17	Thalictrum simplex	11
Trifolium montanum	16	Artemisia austriaca	11
Plantago media	16	Veronica austriaca subsp. teucrium	11
Origanum vulgare	15	Sedum acre	10

Medicago lupulina	15	Eryngium planum	10
Rumex acetosa	15	Geranium pratense	10
Convolvulus arvensis	15	Glechoma hederacea	10

## **E2.6 – Agriculturally-improved, re-seeded and heavily fertilised grassland, including sport fields and grass lawns**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** exclude from grasslands  
(anthropogenic/agricultural)

**Floristic composition:**

No data

## **E2.7 – Unmanaged mesic grassland**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** exclude from grasslands (no clear definition)

**Floristic composition:**

No data

## **E2.8 – Trampled mesophyloous grasslands with annuals**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** exclude from grasslands (no clear definition)

**Floristic composition:**

No data

## **E3.1 - Mediterranean tall humid grassland**

**Origin of data (countries):** ES, FR, GR, IT, PT

**List of alliances:** MOL-09A - Molinio-Holoschoenion Br.-Bl. ex Tchou 1948

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed change of content and consequently change of name: Mediterranean tall humid inland grassland

### **Floristic composition:**

Scirpoides holoschoenus	67	Tetragonolobus maritimus	16
Agrostis stolonifera	33	Juncus acutus	15
Schoenus nigricans	32	Equisetum ramosissimum	15
Pulicaria dysenterica	29	Trifolium pratense	14
Molinia caerulea	29	Brachypodium phoenicoides	14
Holcus lanatus	27	Plantago lanceolata	14
Lythrum salicaria	24	Juncus maritimus	13
Daucus carota	23	Juncus articulatus	13
Mentha aquatica	22	Juncus subnodulosus	13
Phragmites australis	21	Lotus tenuis	13
Dittrichia viscosa	19	Succisa pratensis	13
Potentilla reptans	19	Carex distans	12
Carex flacca	19	Ranunculus repens	12
Rubus ulmifolius	18	Calystegia sepium	12
Saccharum ravennae	18	Eupatorium cannabinum	11
Festuca arundinacea	17	Prunella vulgaris	11
Juncus inflexus	16	Cynodon dactylon	11

## **E3.2 - Mediterranean short humid grassland**

**Origin of data (countries):** BG, ES, FR, IT

**List of alliances:** MOL-05D - *Trifolion maritimi* Br.-Bl. ex Br.-Bl. et al. 1952, MOL-09C - *Deschampsion mediae* Br.-Bl. et al. 1952 nom. conserv. propos.

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed division: E3.2a - Mediterranean short moist grassland of lowlands, E3.2b - Mediterranean short moist grassland of mountains

### **Floristic composition:**

Cynodon dactylon	45	Trifolium pratense	17
Plantago lanceolata	30	Lotus tenuis	16
Trifolium fragiferum	30	Hordeum marinum	16
Potentilla reptans	23	Mentha pulegium	16
Plantago coronopus	22	Agrostis stolonifera	15
Lolium perenne	22	Plantago maritima subsp. serpentina	15
Ranunculus sardous	21	Gaudinia fragilis	14
Bromus hordeaceus	21	Deschampsia media	11
Trifolium repens	19	Poa annua	11
Lotus corniculatus	18	Poa trivialis	11
Trifolium resupinatum	17	Agrostis stolonifera var. stolonifera	10
Carex divisa	17	Prunella hyssopifolia	10

### E3.3 - Sub-mediterranean humid meadows

**Origin of data (countries):** BG, FR, HR, IT, MK, RS, XK

**List of alliances:** MOL-08A - Molinio-Hordeion secalini Horvatic 1934, MOL-08B - Trifolion resupinati Micevski 1957, MOL-08D - Trifolion pallidi Ilijanic 1969, MOL-08E - Ranunculion velutini Pedrotti 1978

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed new name: Submediterranean moist meadow

#### **Floristic composition:**

Poa trivialis	63	Lysimachia nummularia	19
Bromus racemosus	57	Cichorium intybus	19
Trifolium pratense	52	Carex divisa	19
Alopecurus pratensis	45	Lotus tenuis	18
Taraxacum sect. Ruderalia	45	Orchis laxiflora	18
Plantago lanceolata	44	Rumex acetosa	18
Lolium perenne	44	Rhinanthus minor	18
Anthoxanthum odoratum	43	Moenchia mantica	17
Trifolium fragiferum	42	Carex otrubae	17
Oenanthe silaifolia	41	Centaurea jacea	17
Cynosurus cristatus	40	Tragopogon pratensis subsp. orientalis	17
Potentilla reptans	39	Trifolium dubium	17
Ranunculus sardous	36	Achillea millefolium agg.	16
Hordeum secalinum	36	Galium verum	16
Festuca pratensis	35	Alopecurus bulbosus	16
Trifolium repens	33	Mentha pulegium	16
Lotus corniculatus	32	Leucanthemum vulgare agg.	15
Trifolium resupinatum	32	Gratiola officinalis	15
Lychnis flos-cuculi	31	Ranunculus polyanthemos	15
Ranunculus acris	30	Convolvulus arvensis	14
Rumex crispus	30	Trifolium squamosum	13
Trifolium patens	30	Crepis setosa	13
Carex hirta	29	Daucus carota	13
Agrostis stolonifera	28	Trifolium pallidum	12
Poa pratensis	27	Inula britannica	11
Galium debile	25	Gaudinia fragilis	11
Holcus lanatus	25	Rorippa sylvestris	11
Elymus repens	24	Cirsium canum	10
Ranunculus repens	23	Tragopogon pratensis	10
Carex distans	23	Bromus hordeaceus	10
Ranunculus velutinus	22	Cynodon dactylon	10
Bellis perennis	22	Oenanthe fistulosa	10

<i>Prunella vulgaris</i>	22	<i>Rhinanthus rumelicus</i>	10
<i>Alopecurus rendlei</i>	21	<i>Cerastium fontanum</i> subsp. <i>vulgare</i>	10
<i>Lathyrus pratensis</i>	20		

## E3.4 - Moist or wet mesotrophic to eutrophic grassland

**Origin of data (countries):** AT, BE, BG, CH, CZ, DE, EE, ES, FR, HR, HU, IE, IT, NL, NO, PL, PT, RO, RS, RU, SE, SI, SK, UA, UK

**List of alliances:** FEP-06B - Glycyrrhizion korshinskyi Lysenko 2010, FEP-06C - Glycyrrhizion glabrae Golub et Mirkin in Golub 1995, MOL-04A - Molinion caeruleae Koch 1926, MOL-04B - Calthion palustris Tx. 1937, MOL-04C - Filipendulo-Petasition Br.-Bl. ex Duvigneaud 1949, MOL-04D - Deschampsion cespitosae Horvatic 1930, MOL-05A - Potentillion anserinae Tx. 1947, MOL-05B - Juncion inflexi Knapp 1971, MOL-05C - Loto tenuis-Trifolion fragiferi Westhoff et Den Held ex de Foucault 2009, MOL-06A - Oenanthon fistulosae de Foucault 2009, MOL-08C - Trifolio-Ranunculion pedati Slavnic 1948

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed division: E3.4a - Moist or wet mesotrophic to eutrophic hay meadow, E3.4b - Moist or wet mesotrophic to eutrophic pasture

### Floristic composition:

Ranunculus repens	51	Glyceria fluitans	17
Holcus lanatus	49	Lolium perenne	17
Poa trivialis	47	Lysimachia vulgaris	17
Ranunculus acris	38	Vicia cracca	16
Rumex acetosa	37	Lysimachia nummularia	16
Agrostis stolonifera	35	Sanguisorba officinalis	16
Trifolium repens	33	Festuca pratensis	16
Cardamine pratensis	33	Carex hirta	15
Lychnis flos-cuculi	31	Prunella vulgaris	15
Festuca rubra agg.	30	Phragmites australis	14
Anthoxanthum odoratum	30	Potentilla anserina	14
Filipendula ulmaria	29	Scirpus sylvaticus	14
Galium palustre	28	Succisa pratensis	13
Deschampsia cespitosa	26	Taraxacum sect. Ruderalia	13
Alopecurus pratensis	26	Ranunculus flammula	13
Cerastium fontanum subsp. vulgare	25	Elymus repens	12
Juncus effusus	25	Rumex crispus	12
Cirsium palustre	22	Achillea millefolium agg.	12
Lathyrus pratensis	22	Briza media	12
Lotus pedunculatus	22	Calliergonella cuspidata	12
Plantago lanceolata	22	Glechoma hederacea	12
Poa pratensis	21	Dactylis glomerata	12
Equisetum palustre	20	Juncus conglomeratus	12
Carex panicea	20	Persicaria amphibia	12
Angelica sylvestris	19	Glyceria maxima	12
Trifolium pratense	19	Cirsium arvense	11
Potentilla erecta	18	Molinia caerulea	11

<i>Juncus articulatus</i>	18	<i>Carex acuta</i>	11
<i>Alopecurus geniculatus</i>	18	<i>Agrostis canina</i>	11
<i>Carex nigra</i>	18	<i>Mentha aquatica</i>	11
<i>Lythrum salicaria</i>	18	<i>Agrostis capillaris</i>	11
<i>Galium uliginosum</i>	17	<i>Centaurea jacea</i>	10
<i>Myosotis scorpioides</i>	17	<i>Bistorta officinalis</i>	10
<i>Caltha palustris</i>	17	<i>Cirsium oleraceum</i>	10
<i>Phalaris arundinacea</i>	17	<i>Urtica dioica</i>	10

## E3.5 - Moist or wet oligotrophic grassland

**Origin of data (countries):** AD, AT, BE, BG, CH, CZ, DE, EE, ES, FR, GL, HR, HU, IE, IS, IT, ME, MK, NL, NO, PL, PT, RO, RS, RU, SI, SK, UA, UK, XK

**List of alliances:** MOL-04A - Molinion caeruleae Koch 1926, NAR-01D - Nardo-Juncion squarrosi (Oberd. 1957) Passarge 1964, SCH-02A - Caricion fuscae Koch 1926

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed change of content and consequently change of name: Non-Mediterranean moist or wet oligotrophic grassland

### Floristic composition:

Potentilla erecta	46	Lathyrus pratensis	15
Molinia caerulea	45	Lythrum salicaria	15
Carex nigra	36	Nardus stricta	15
Carex panicea	36	Cardamine pratensis	15
Holcus lanatus	33	Ranunculus repens	15
Anthoxanthum odoratum	32	Valeriana dioica	14
Ranunculus acris	29	Caltha palustris	14
Agrostis canina	28	Centaurea jacea	14
Succisa pratensis	28	Juncus conglomeratus	14
Festuca rubra agg.	28	Ranunculus flammula	14
Cirsium palustre	25	Carex rostrata	13
Deschampsia cespitosa	24	Phragmites australis	13
Eriophorum angustifolium	24	Trifolium pratense	13
Lychnis flos-cuculi	22	Potentilla palustris	13
Juncus effusus	22	Aulacomnium palustre	13
Rumex acetosa	22	Poa pratensis	13
Briza media	21	Vicia cracca	12
Galium palustre	21	Achillea millefolium agg.	12
Lotus pedunculatus	21	Luzula multiflora	12
Galium uliginosum	20	Hydrocotyle vulgaris	12
Lysimachia vulgaris	20	Angelica sylvestris	12
Carex echinata	20	Agrostis capillaris	12
Sanguisorba officinalis	19	Juncus subnodulosus	11
Viola palustris	18	Juncus articulatus	11
Plantago lanceolata	17	Galium boreale	11
Filipendula ulmaria	17	Selinum carvifolia	11
Prunella vulgaris	17	Epilobium palustre	10
Equisetum palustre	16	Stachys officinalis	10
Calliergonella cuspidata	15		

## E4.1 - Vegetated snow-patch

**Origin of data (countries):** AD, AT, CH, CZ, ES, FR, IT, MK, PL, SI, SK, UK

**List of alliances:** HER-01A - Salicion herbaceae Br.-Bl. in Br.-Bl. et Jenny 1926, HER-01B - Salici herbaceae-Caricion lachenalii Béguin et Theurillat 1982, HER-01C - Festucion picturatae Krajina 1933 corr. Dúbravcová 2007, HER-01E - Sedion candellei Rivas-Mart., Fernández González et Loidi in Rivas-Mart. et al. 2011, HER-02A - Arabidion caeruleae Br.-Bl. in Br.-Bl. et Jenny 1926

**Additional selection rules:** n/a

**Implications for EUNIS classification:** n/a

### Floristic composition:

Luzula alpinopilosa	45	Cerastium cerastoides	16
Gnaphalium supinum	42	Deschampsia flexuosa	16
Poa alpina	39	Nardus stricta	15
Ligusticum mutellina	38	Gentiana punctata	15
Geum montanum	31	Salix retusa	14
Homogyne alpina	29	Deschampsia cespitosa	14
Veronica alpina	28	Polytrichastrum alpinum	13
Polygonum viviparum	27	Ranunculus pseudomontanus	12
Salix herbacea	25	Myosotis alpestris	12
Anthoxanthum odoratum	24	Soldanella pusilla	12
Leucanthemopsis alpina	23	Oreochloa disticha	12
Agrostis rupestris	22	Saxifraga androsacea	11
Sedum alpestre	21	Saxifraga stellaris	11
Potentilla aurea	20	Kiaeria starkei	11
Polytrichastrum sexangulare	19	Pritzelago alpina	11
Festuca picturata	19	Campanula scheuchzeri	11
Silene acaulis	18	Ranunculus alpestris subsp. alpestris	10
Sibbaldia procumbens	17	Cardamine bellidifolia subsp. alpina	10
Soldanella carpatica	17	Carex sempervirens	10

## **E4.2 - Moss and lichen dominated mountain summits, ridges and exposed slopes**

**Origin of data (countries):** AT, FI, NO, RU, SK, UK

**List of alliances:** n/a

**Additional selection rules:** Selection based on dominance by mosses and liverworts in relevés

**Implications for EUNIS classification:** proposed to move to EUNIS Group H (no grasslands)

### **Floristic composition:**

Racomitrium lanuginosum	73	Salix herbacea	18
Cetraria islandica	67	Huperzia selago	16
Cladonia uncialis	67	Kiaeria starkei	16
Carex bigelowii	57	Festuca airoides	15
Deschampsia flexuosa	45	Festuca ovina	15
Vaccinium myrtillus	43	Polytrichum juniperinum	15
Cladonia arbuscula	42	Cetraria nivalis	14
Ochrolechia frigida	39	Cladonia pyxidata	14
Cladonia gracilis	35	Flavocetraria nivalis	14
Empetrum nigrum subsp. hermaphroditum	33	Polytrichum piliferum	14
Juncus trifidus	31	Rhytidadelphus loreus	14
Cladonia coccifera	30	Alectoria ochroleuca	13
Cetraria aculeata	28	Betula nana	13
Polytrichastrum alpinum	28	Cladonia bellidiflora	13
Vaccinium vitis-idaea	28	Cladonia squamosa	13
Alectoria nigricans	23	Dicranum scoparium	13
Pleurozium schreberi	23	Polytrichum strictum	13
Sphaerophorus globosus	23	Alchemilla alpina	12
Thamnolia vermicularis	23	Oreochloa disticha	12
Galium saxatile	22	Agrostis capillaris	11
Ptilidium ciliare	22	Cetraria cucullata	11
Cladonia rangiferina	21	Hylocomium splendens	11
Dicranum fuscescens	21	Luzula spicata	11
Vaccinium uliginosum	19	Nardus stricta	11
Festuca vivipara	18		

## E4.3 - Acid alpine and subalpine grassland

**Origin of data (countries):** AD, AT, BG, BH, CH, CZ, DE, ES, FR, HR, IT, ME, MK, MN, PL, PT, RS, SK, SR, UA, UK, XK

**List of alliances:** KOB-01A - Kobresio-Dryadion Nordhagen 1943, KOB-02B - Festucion versicoloris Krajina 1934, KOB-02C - Agrostion alpinae Jeník et al. 1980, MUL-02A - Calamagrostion villosae Pawłowski et al. 1928, MUL-02B - Trisetion fusci Krajina 1933, MUL-02C - Calamagrostion arundinaceae (Luquet 1926) Oberd. 1957, NAR-01A - Potentillo-Polygonion vivipari Nordhagen ex Dierßen 1992, TRI-01B - Nardo-Caricion rigidae Nordhagen 1943, TRI-03A - Caricion curvulae Br.-Bl. 1925, TRI-03B - Juncion trifidi Krajina 1934, TRI-03C - Festucion supinae Br.-Bl. 1948, TRI-04B - Nardion strictae Br.-Bl. 1926, TRI-04C - Ranunculo pollinensis-Nardion strictae Bonin 1972, TRI-04E - Potentillo ternatae-Nardion Simon 1958, TRI-04F - Festucion variae Br.-Bl. ex Guinochet 1938, TRI-04G - Agrostion schraderanae Grabherr 1993, TRI-04H - Festucion eskiiae Br.-Bl. 1948, TRI-06A - Campanulo herminii-Nardion strictae Rivas-Mart. 1964, TRI-06B - Plantaginion thalackeri Quézel 1953, TRI-07A - Sesamoido pygmaeae-Poion violaceae Gamisans 1975, TRI-08A - Poion violaceae Horvat et al. 1937, TRI-08B - Seslerion comosae Horvat et al. 1937

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed division: E4.3a - Boreal and arctic acidophilous alpine grassland, E4.3b - Temperate acidophilous alpine grassland

### Floristic composition:

Nardus stricta	51	Trifolium alpinum	14
Anthoxanthum odoratum	37	Solidago virgaurea	14
Deschampsia flexuosa	33	Vaccinium vitis-idaea	14
Vaccinium myrtillus	33	Bistorta officinalis	14
Potentilla erecta	24	Achillea millefolium agg.	13
Homogyne alpina	24	Deschampsia cespitosa	13
Potentilla aurea	21	Hieracium alpinum	13
Carex sempervirens	20	Oreochloa disticha	12
Agrostis capillaris	20	Festuca airoides	12
Agrostis rupestris	19	Trifolium pratense	12
Geum montanum	19	Hieracium pilosella	12
Juncus trifidus	17	Polygonum viviparum	12
Ligusticum mutellina	17	Calamagrostis villosa	12
Festuca rubra agg.	16	Campanula scheuchzeri	11
Avenula versicolor	16	Luzula alpinopilosa	11
Calluna vulgaris	16	Campanula alpina	11
Cetraria islandica	16	Carex caryophyllea	10
Poa alpina	15	Hypericum maculatum	10
Lotus corniculatus	15	Luzula campestris	10

## E4.4 - Calcareous alpine and subalpine grassland

**Origin of data (countries):** AD, AT, BA, BG, CH, CZ, DE, ES, FR, HR, IT, MK, PL, RS, SI, SK, UK

**List of alliances:** KOB-01A - Kobresio-Dryadion Nordhagen 1943, KOB-02A - Oxytropido-Elynion myosuroidis Br.-Bl. 1950, KOB-02B - Festucion versicoloris Krajina 1934, KOB-02C - Agrostion alpinae Jeník et al. 1980, ONO-01A - Ononidion striatae Br.-Bl. et Susplugas 1937, ONO-01B - Ononidion cristatae Royer 1991, ONO-01C - Festucion scopariae Br.-Bl. 1948, ONO-01H - Avenion sempervirentis Barbero 1968, ONO-02A - Festucion burnatii Rivas Goday et Rivas-Mart. ex Mayor et al. 1973, ONO-02B - Minuartio-Poion ligulatae O. de Bolòs 1962, SES-01A - Seslerion coeruleae Br.-Bl. in Br.-Bl. et Jenny 1926, SES-01B - Caricion austroalpinae Sutter 1962, SES-01C - Caricion ferrugineae G. Br.-Bl. et Br.-Bl. in G. Br.-Bl. 1931, SES-01D - Caricion firmae Gams 1936, SES-01E - Seslerio-Asterion alpini Hadac ex Hadac et al. 1969, SES-01F - Seslerion tatrae Pawłowski 1935 corr. Klika 1955, SES-01H - Laserpitio nestleri-Ranunculion thora Vigo ex Molero 1981, SES-01I - Primulion intricatae Br.-Bl. ex Vigo 1972, SES-01J - Armerion cantabricae Rivas-Mart. et al. 1984, SES-02A - Seslerion tenuifoliae Horvat 1930, SES-02C - Festucion pungentis Horvat 1930, SES-02D - Festuco-Knaution longifoliae Jovanovic-Dunjic 1955, SES-02E - Seslerion apenninae Bruno et Furnari 1966, SES-03A - Oxytropidion dinaricae Lakušić 1966, SES-03B - Anthyllido-Seslerion klasterskyi Simon 1958, SES-03C - Seslerio-Festucion xanthinae Horvat in Horvat et al. 1974, SES-03E - Seslerion nitidae Horvat 1936

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed division: E4.4a - Arctic-alpine calcareous grassland, E4.4b - Alpine and subalpine calcareous grassland of the Balkan and Apennines

### Floristic composition:

Anthyllis vulneraria	38	Carlina acaulis	14
Carex sempervirens	31	Sesleria coeruleans	13
Polygonum viviparum	30	Selaginella selaginoides	13
Poa alpina	27	Helictotrichon sedenense	13
Helianthemum oelandicum	27	Leontodon hispidus	12
Phyteuma orbiculare	25	Acinos alpinus	12
Galium anisophyllum	24	Carex humilis	12
Helianthemum nummularium	24	Biscutella laevigata	12
Sesleria albicans	24	Anthoxanthum odoratum	12
Silene acaulis	24	Festuca quadriflora	12
Dryas octopetala	21	Hippocratea comosa	12
Lotus corniculatus	21	Myosotis alpestris	11
Euphrasia salisburgensis	18	Gentiana clusii	11
Thymus praecox	18	Trifolium pratense	11
Gentiana verna	18	Parnassia palustris	11
Carex firma	18	Linum catharticum	10
Aster bellidiastrum	17	Potentilla crantzii	10

<i>Scabiosa lucida</i>	17	<i>Aster alpinus</i>	10
<i>Bartsia alpina</i>	17	<i>Carduus defloratus</i>	10
<i>Campanula scheuchzeri</i>	16	<i>Thesium alpinum</i>	10
<i>Tortella tortuosa</i>	16	<i>Minuartia sedoides</i>	10
<i>Koeleria vallesiana</i>	16	<i>Festuca gautieri</i>	10
<i>Saxifraga paniculata</i>	15		

## E4.5 - Alpine and subalpine enriched grassland

**Origin of data (countries):** AT, CH, CZ, DE, ES, FR, PL, RU, SI, SK, UA, UK

**List of alliances:** MOL-01B - Phyteumato-Trisetion flavescentis Hundt ex Passarge 1969, MOL-02A - Triseteto flavescentis-Polygonion bistortae Br.-Bl. et Tx. ex Marschall 1947, MOL-02D - Poion alpinae Gams ex Oberd. 1950, MOL-02E - Poion supinæ Rivas-Mart. et Géhu 1978

**Additional selection rules:** n/a

**Implications for EUNIS classification:** n/a

### Floristic composition:

Trifolium pratense	56	Luzula campestris	20
Agrostis capillaris	55	Phleum pratense	20
Achillea millefolium agg.	55	Campanula patula	18
Dactylis glomerata	54	Ranunculus repens	18
Veronica chamaedrys	53	Prunella vulgaris	18
Ranunculus acris	51	Potentilla aurea	18
Anthoxanthum odoratum	50	Cynosurus cristatus	18
Rumex acetosa	48	Pimpinella major	18
Festuca rubra agg.	46	Campanula rotundifolia	17
Trifolium repens	46	Poa alpina	17
Plantago lanceolata	42	Arrhenatherum elatius	17
Alchemilla vulgaris agg.	39	Ajuga reptans	17
Trisetum flavescentis	38	Carum carvi	16
Hypericum maculatum	36	Phyteuma spicatum	16
Leontodon hispidus	36	Bellis perennis	16
Cerastium fontanum subsp. vulgare	33	Crepis mollis	16
Deschampsia cespitosa	32	Nardus stricta	15
Leucanthemum vulgare agg.	30	Rhytidadelphus squarrosus	15
Vicia cracca	30	Galium mollugo agg.	15
Geranium sylvaticum	30	Cardaminopsis halleri	15
Lathyrus pratensis	30	Sanguisorba officinalis	14
Taraxacum sect. Ruderalia	29	Knautia arvensis	14
Bistorta officinalis	28	Primula elatior subsp. elatior	14
Poa trivialis	28	Silene dioica	13
Poa pratensis	26	Trollius europaeus	13
Lotus corniculatus	24	Rhinanthus minor	13
Festuca pratensis	24	Festuca nigrescens	12
Alopecurus pratensis	23	Silene vulgaris	12
Stellaria graminea	22	Lychnis flos-cuculi	11
Vicia sepium	22	Anthriscus sylvestris	11
Heracleum sphondylium	21	Aegopodium podagraria	11
Holcus lanatus	21	Avenula pubescens	11

Alchemilla vulgaris agg.	21	Campanula scheuchzeri	11
Briza media	20	Rumex alpestris	10
Potentilla erecta	20	Plantago media	10

## **E5.1 – Anthropogenic herb stands**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** exclude from grasslands (no grasslands)

**Floristic composition:**

No data

## E5.2 - Thermophile woodland fringes

**Origin of data (countries):** AD, AT, BE, CH, CZ, DE, DK, EE, ES, FR, HU, IT, NL, NO, PL, PT, RU, SE, SI, SK, UA, UK

**List of alliances:** GER-01A - Trifolion medii T. Müller 1962, GER-01B - Knaution dipsacifoliae Julve ex Dengler et Boch 2008, GER-02A - Geranion sanguinei Tx. in T. Müller 1962, GER-02B - Galio litoralis-Geranion sanguinei Géhu et Géhu-Franck in de Foucault et al. 1983, GER-03A - Melampyrrion pratensis Passarge 1979, GER-03B - Violo rivinianae-Stellarion holostaeae Passarge 1994, GER-03C - Poion nemoralis Dengler et al. 2006, GER-03D - Teucrion scorodoniae de Foucault et al. 1983, GER-03E - Linarion triornithophorae Rivas-Mart. et al. 1984, GER-03F - Origanion virentis Rivas-Mart. et O. de Bolòs in Rivas-Mart. et al. 1984

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed division: E5.2a - Thermophilous woodland fringe of base-rich soils, E5.2b - Thermophilous woodland fringe of acidic soils, E5.2c - Macaronesian thermophilous woodland fringe

### Floristic composition:

Dactylis glomerata	46	Trifolium medium	13
Hypericum perforatum	36	Deschampsia flexuosa	13
Achillea millefolium agg.	35	Crataegus monogyna	12
Festuca rubra agg.	33	Brachythecium rutabulum	12
Agrostis capillaris	33	Prunus spinosa	12
Arrhenatherum elatius	29	Galium mollugo agg.	12
Brachypodium pinnatum	28	Hieracium umbellatum	12
Quercus robur	24	Sanguisorba minor	12
Plantago lanceolata	24	Vincetoxicum hirundinaria	12
Origanum vulgare	23	Medicago lupulina	11
Euphorbia cyparissias	23	Sorbus aucuparia	11
Fragaria vesca	22	Vicia cracca	11
Pimpinella saxifraga	21	Rubus caesius	11
Agrimonia eupatoria	21	Solidago virgaurea	11
Veronica chamaedrys	21	Teucrium chamaedrys	11
Knautia arvensis	20	Cornus sanguinea	11
Holcus mollis	19	Trifolium pratense	11
Clinopodium vulgare	19	Daucus carota	11
Lotus corniculatus	18	Pseudoscleropodium purum	11
Poa pratensis	18	Lathyrus pratensis	11
Coronilla varia	17	Polygonatum odoratum	11
Holcus lanatus	17	Rumex acetosella	11
Anthoxanthum odoratum	17	Festuca ovina	11
Poa angustifolia	16	Frangula alnus	10
Rumex acetosa	16	Melampyrum pratense	10

Galium verum	16	Fragaria viridis	10
Centaurea scabiosa	15	Medicago sativa subsp. falcata	10
Geranium sanguineum	14	Hieracium laevigatum	10
Galium mollugo agg.	13	Plagiomnium affine	10
Viola hirta	13	Ranunculus acris	10
Elymus repens	13		

### **E5.3 - *Pteridium aquilinum* fields**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** exclude from grasslands (no grasslands)

**Floristic composition:**

No data

## E5.4 - Moist or wet tall-herb and fern fringes and meadows

**Origin of data (countries):** AT, BE, BG, CH, CZ, DE, ES, FR, HR, HU, IT, LU, MK, NL, PL, RS, SI, SK, UA, UK

**List of alliances:** EPI-02B - *Impatienti noli-tangere-Stachyion sylvaticae* Görs ex Mucina 1993, EPI-02C - *Aegopodium podagrariae* Tx. 1967 nom. conserv. propos., EPI-04A - *Senecionion fluviatilis* Tx. ex Moor 1958, EPI-04B - *Archangelion litoralis* Scamoni et Passarge 1963, EPI-04D - *Cynancho-Convolvulion sepium* Rivas Goday et Rivas-Mart. ex Rivas-Mart. 1977, EPI-04E - *Dorycnio recti-Rumicion conglomerati* Gradstein et Schmitenberg 1977, MOL-04C - *Filipendulo-Petasition Br.-Bl.* ex Duvigneaud 1949, MOL-04D - *Deschampsion cespitosae* Horvatic 1930, MUL-03A - *Petasition officinalis* Sillinger 1933, MUL-03B - *Arunco-Petasition albae* Br.-Bl. et Sutter 1977, MUL-03C - *Senecionion samniti* Bonin 1978

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed change of content and consequently change of name: Moist or wet tall-herb and fern fringe of the lowlands

### Floristic composition:

<i>Urtica dioica</i>	46	<i>Festuca rubra</i> agg.	15
<i>Poa trivialis</i>	37	<i>Lysimachia nummularia</i>	15
<i>Ranunculus repens</i>	36	<i>Iris pseudacorus</i>	15

## E5.5 - Subalpine moist or wet tall-herb and fern stands

**Origin of data (countries):** AD, AT, CH, CZ, DE, ES, FR, IT, MK, PL, RS, SI, SK, UK

**List of alliances:** MUL-01A - Adenostylion alliariae Br.-Bl. 1926 nom. conserv. propos., MUL-01C - Delphinion elati Hadac ex Hadac et al. 1969, MUL-01D - Cirsion flavispinæ Quél. 1953, MUL-01E - Doronicion corsici Gamisans 1975, MUL-01F - Cirsion appendiculati Horvat et al. 1937, MUL-04A - Rumicion alpini Rübel ex Scharfetter 1938

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed new name: Subalpine moist or wet tall-herb and fern stand

### Floristic composition:

Rumex alpestris	42	Oxalis acetosella	14
Deschampsia cespitosa	38	Geum rivale	14
Adenostyles alliariae	35	Epilobium alpestre	13
Geranium sylvaticum	32	Saxifraga rotundifolia	13
Chaerophyllum hirsutum	30	Ranunculus acris	13
Urtica dioica	28	Calamagrostis villosa	13
Aconitum napellus	25	Ranunculus platanifolius	13
Hypericum maculatum	22	Luzula sylvatica	13
Viola biflora	22	Vaccinium myrtillus	12
Silene dioica	20	Milium effusum	12
Stellaria nemorum	20	Poa alpina	12
Rubus idaeus	19	Doronicum austriacum	12
Rumex alpinus	19	Homogyne alpina	11
Alchemilla vulgaris agg.	18	Crepis paludosa	11
Veratrum lobelianum	17	Thalictrum aquilegiifolium	11
Athyrium filix-femina	16	Veronica chamaedrys	11
Athyrium distentifolium	16	Trollius europaeus	11
Ligusticum mutellina	15	Dryopteris filix-mas	11
Bistorta officinalis	15	Epilobium montanum	11
Cicerbita alpina	15	Heracleum sphondylium	11
Dactylis glomerata	15	Senecio nemorensis subsp. fuchsii	11
Ranunculus repens	15	Myosotis sylvatica	10
Peucedanum ostruthium	14	Agrostis capillaris	10
Veratrum album	14	Geum montanum	10

## **E6.1 - Mediterranean inland salt steppes**

**Origin of data (countries):** ES, FR, IT, MK, RO, TR, UK

**List of alliances:** CRY-01B - Heleochloion schoenoidis Br.-Bl. ex Rivas Goday 1956, FEP-01D - Puccinellion convolutae Micevski 1965, FEP-02A - Halo-Artemision Pignatti 1953, SAG-02A - Frankenion pulverulentae Rivas-Mart. ex Castroviejo et Porta 1976, SAG-02B - Polypogonion subspathacei Gamisans 1990, SAG-02C - Gaudinio-Podospermion cani S. Brullo et Siracusa 2000, SAL-02A - Lygeo-Lepidion cardaminis Rivas Goday et Rivas-Mart. ex Rivas-Mart. et Costa 1984, SAL-02B - Lygeo sparti-Limonion furfuracei Rigual 1972, SAL-02C - Limonion catalaunico-viciosoi Rivas-Mart. et Costa 1984, SAL-02E - Limonion confusi (Br.-Bl. 1933) Rivas-Mart. et Costa 1984, SAL-02F - Triglochino barrelieri-Limonion glomerati Biondi et al. 2001

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed new name: Mediterranean inland salt steppe

### **Floristic composition:**

Plantago coronopus	22	Sarcocornia fruticosa	14
Lygeum spartum	21	Hordeum marinum	13
Halimione portulacoides	20	Parapholis incurva	13
Suaeda vera	18	Puccinellia maritima	10
Sarcocornia perennis	18		

## **E6.2 - Continental inland salt steppes**

**Origin of data (countries):** AT, BG, CZ, DE, HU, KZ, MK, RS, RU, SK, UA

**List of alliances:** CRY-01A - Cypero-Spergularion salinae Slavnic 1948, CRY-01C - Lepidion latifolii Golub et Mirkin 1986, FEP-01A - Festucion pseudovinae Soó 1933, FEP-01C - Puccinellion limosae Soó 1933, FEP-02B - Artemision maritimae Micevski 1970, FEP-03A - Plantagini salsa-Artemision santonici Lysenko et Mucina in Lysenko et al. 2011, FEP-03E - Festuco valesiacae-Limonion gmelinii Mirkin in Golub et Solomakha 1988, FEP-04A - Artemisio pauciflorae-Camphorosmion monspeliacae Karpov 2001, KAL-02A - Artemisio santonicae-Puccinellion fominii Shelyag-Sosonko et al. 1989

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed new name: Continental inland salt steppe

### **Floristic composition:**

Puccinellia distans	42	Plantago maritima	14
Festuca pseudovina	30	Cerastium dubium	12
Scorzoneroides cana	28	Poa bulbosa	12
Limonium gmelinii	23	Bromus hordeaceus	12
Aster tripolium subsp. pannonicus	19	Plantago lanceolata	12
Artemisia santonicum	18	Chamomilla recutita	11
Camphorosma annua	16	Elymus repens	11
Cynodon dactylon	15		

### **E6.3 - Temperate inland salt marsh**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** proposed as new EUNIS type within grasslands, change of position from Group D (D6.1) to Group E

**Floristic composition:**

No data

## **E7.1 - Atlantic parkland**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** exclude from grasslands (complex)

**Floristic composition:**

No data

## **E7.2 - Sub-continental parkland**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** exclude from grasslands (complex)

**Floristic composition:**

No data

## **E7.3 - Dehesa**

**Origin of data (countries):** n/a

**List of alliances:** n/a

**Additional selection rules:** n/a

**Implications for EUNIS classification:** exclude from grasslands (complex)

**Floristic composition:**

No data

## **Appendix D: Revised lists of indicator species of the revised EUNIS woodland habitat types**

### **B1.7a - Atlantic and Baltic broad-leaved coastal dune woodland**

### F3.1a - Lowland to montane temperate and submediterranean Juniperus scrub

#### Diagnostic species (phi coefficient \* 100)

<i>Juniperus communis</i> subsp. <i>communis</i>	48.2	<i>Barbilophozia barbata</i>	23.1
<i>Palmogloea protuberans</i>	22.1	<i>Berberis aetnensis</i>	15.4
<i>Campylopus pyriformis</i>	15.1		

#### Constant species (occurrence frequencies)

<i>Juniperus communis</i> subsp. <i>communis</i>	100.0	<i>Calluna vulgaris</i>	29.0
<i>Deschampsia flexuosa</i>	26.0	<i>Dicranum scoparium</i>	24.0
<i>Brachypodium pinnatum</i>	24.0	<i>Pleurozium schreberi</i>	21.0
<i>Vaccinium myrtillus</i>	19.0	<i>Rosa canina</i> agg.	18.0
<i>Teucrium chamaedrys</i>	17.0	<i>Potentilla erecta</i>	17.0
<i>Hypnum jutlandicum</i>	16.0	<i>Hieracium pilosella</i>	16.0
<i>Festuca ovina</i>	16.0	<i>Agrostis capillaris</i>	16.0
<i>Sanguisorba minor</i>	15.0	<i>Pseudoscleropodium purum</i>	15.0
<i>Pinus sylvestris</i>	15.0	<i>Lotus corniculatus</i>	15.0
<i>Galium saxatile</i>	15.0	<i>Festuca rubra</i>	15.0
<i>Leontodon hispidus</i>	14.0	<i>Hypnum cupressiforme</i>	14.0
<i>Frangula alnus</i>	14.0	<i>Carex flacca</i>	14.0
<i>Hippocratea comosa</i>	13.0	<i>Campanula rotundifolia</i>	13.0
<i>Lophocolea bidentata</i>	12.0	<i>Helianthemum nummularium</i>	12.0
<i>Euphorbia cyparissias</i>	12.0	<i>Carlina vulgaris</i>	12.0
<i>Briza media</i>	12.0	<i>Anthoxanthum odoratum</i>	12.0
<i>Sorbus aucuparia</i>	11.0	<i>Quercus robur</i>	11.0
<i>Prunus spinosa</i>	11.0	<i>Ligustrum vulgare</i>	11.0
<i>Hylocomium splendens</i>	11.0	<i>Achillea millefolium</i>	11.0
<i>Agrostis vinealis</i>	11.0	<i>Rumex acetosella</i>	10.0
<i>Ptilidium ciliare</i>	10.0	<i>Pohlia nutans</i>	10.0
<i>Plantago lanceolata</i>	10.0	<i>Linum catharticum</i>	10.0
<i>Asperula cynanchica</i>	10.0	<i>Anthyllis vulneraria</i>	10.0

#### Dominant species (percentage frequencies of occurrences with cover > 25%)

<i>Juniperus communis</i> subsp. <i>communis</i>	100.0	<i>Brachypodium pinnatum</i>	10.0
<i>Calluna vulgaris</i>	7.0	<i>Festuca rubra</i>	5.0

### F3.1b - Temperate Rubus scrub

#### Diagnostic species (phi coefficient \* 100)

<i>Rubus caesius</i>	19.4
----------------------	------

#### Constant species (occurrence frequencies)

<i>Rubus fruticosus</i> agg.	47.0	<i>Urtica dioica</i>	44.0
------------------------------	------	----------------------	------

Rubus caesius	38.0	Rubus idaeus	30.0
Galium aparine	24.0	Dactylis glomerata	23.0
Cirsium arvense	22.0	Elymus repens	20.0
Arrhenatherum elatius	20.0	Poa trivialis	15.0
Calamagrostis epigejos	15.0	Agrostis capillaris	15.0
Heracleum sphondylium	14.0	Calystegia sepium	14.0
Galium mollugo agg.	13.0	Festuca rubra	13.0
Epilobium angustifolium	13.0	Sorbus aucuparia	12.0
Holcus lanatus	12.0	Poa pratensis	11.0
Equisetum arvense	11.0	Athyrium filix-femina	11.0
Artemisia vulgaris	11.0	Anthriscus sylvestris	11.0
Achillea millefolium	11.0	Senecio nemorensis	10.0
Sambucus nigra	10.0	Crataegus monogyna	10.0

*Dominant species (percentage frequencies of occurrences with cover > 25%)*

Rubus fruticosus agg.	38.0	Rubus caesius	37.0
Rubus idaeus	22.0		

**F3.1c - Lowland to montane temperate and submediterranean genistoid scrub**

*Diagnostic species (phi coefficient \* 100)*

Ulex europaeus	43.2	Cytisus scoparius	40.3
Genista florida	24.1	Erica cinerea	15.8
Teucrium scorodonia	15.7	Genista cinerascens	15.4

*Constant species (occurrence frequencies)*

Cytisus scoparius	57.0	Ulex europaeus	42.0
Pteridium aquilinum	37.0	Agrostis capillaris	31.0
Teucrium scorodonia	27.0	Calluna vulgaris	27.0
Potentilla erecta	18.0	Erica cinerea	18.0
Rubus ulmifolius	17.0	Anthoxanthum odoratum	17.0
Rumex acetosella	16.0	Rubus fruticosus agg.	15.0
Holcus lanatus	14.0	Dactylis glomerata	14.0
Achillea millefolium	14.0	Hypochaeris radicata	13.0
Holcus mollis	13.0	Festuca ovina	13.0
Deschampsia flexuosa	12.0	Plantago lanceolata	11.0
Genista florida	11.0	Galium saxatile	11.0
Festuca rubra	11.0	Crataegus monogyna	11.0
Brachypodium pinnatum	11.0	Rosa canina agg.	10.0
Hypericum perforatum	10.0		

*Dominant species (percentage frequencies of occurrences with cover > 25%)*

Cytisus scoparius	47.0	Ulex europaeus	38.0
Pteridium aquilinum	7.0	Genista florida	5.0
Agrostis capillaris	5.0		

### F3.1d - Balkan-Anatolian submontane genistoid scrub

*Diagnostic species (phi coefficient \* 100)*

Genista lydia	98.5	Minuartia hirsuta	98.0
Allium guttatum	97.9	Centaurea grisebachii	97.7
Hypericum olympicum	96.5	Thymus sibthorpii	94.4
Koeleria lobata	93.3	Micropyrum tenellum	92.0
Asperula aristata	88.4	Rumex acetosella	43.3

*Constant species (occurrence frequencies)*

Thymus sibthorpii	100.0	Rumex acetosella	100.0
Minuartia hirsuta	100.0	Micropyrum tenellum	100.0
Koeleria lobata	100.0	Hypericum olympicum	100.0
Genista lydia	100.0	Centaurea grisebachii	100.0
Asperula aristata	100.0	Allium guttatum	100.0

*Dominant species (percentage frequencies of occurrences with cover > 25%)*

Genista lydia	100.0
---------------	-------

### F3.1e - Temperate and submediterranean thorn scrub

*Diagnostic species (phi coefficient \* 100)*

Prunus spinosa	27.8	Rosa canina agg.	21.3
Rubus ulmifolius	17.2	Crataegus monogyna	16.6

*Constant species (occurrence frequencies)*

Prunus spinosa	59.0	Crataegus monogyna	53.0
Rosa canina agg.	42.0	Urtica dioica	35.0
Cornus sanguinea	35.0	Ligustrum vulgare	30.0
Galium aparine	28.0	Sambucus nigra	27.0
Rubus ulmifolius	27.0	Euonymus europaeus	23.0
Hedera helix	22.0	Rubus fruticosus agg.	17.0
Dactylis glomerata	17.0	Corylus avellana	17.0
Clematis vitalba	17.0	Rubus caesius	16.0
Glechoma hederacea	15.0	Geum urbanum	15.0
Fraxinus excelsior	14.0	Brachypodium pinnatum	14.0
Rhamnus catharticus	13.0	Galium mollugo agg.	13.0
Viburnum lantana	12.0	Poa trivialis	12.0
Acer campestre	12.0	Rubia peregrina	11.0
Lonicera periclymenum	11.0	Tamus communis	10.0
Arrhenatherum elatius	10.0		

*Dominant species (percentage frequencies of occurrences with cover > 25%)*

Prunus spinosa	34.0	Crataegus monogyna	22.0
Rubus ulmifolius	13.0	Sambucus nigra	9.0
Cornus sanguinea	9.0	Ligustrum vulgare	7.0

### F3.1f - Low steppic scrub

*Diagnostic species (phi coefficient \* 100)*

<i>Prunus fruticosa</i>	64.7	<i>Prunus tenella</i>	43.2
<i>Spiraea media</i>	40.1	<i>Caragana frutex</i>	39.6
<i>Phlomis tuberosa</i>	25.3	<i>Spiraea crenata</i>	25.2
<i>Thalictrum minus</i>	25.0	<i>Melica transsilvanica</i>	23.7
<i>Aconitum anthora</i>	21.6	<i>Stachys recta</i>	21.2
<i>Fragaria viridis</i>	21.1	<i>Hylotelephium maximum</i>	19.4
<i>Geranium sanguineum</i>	19.4	<i>Rosa pimpinellifolia</i>	19.1
<i>Artemisia sericea</i>	18.8	<i>Poa transbaicalica</i>	17.3
<i>Salvia nemorosa</i>	17.2	<i>Valeriana rossica</i>	17.1
<i>Linaria angustissima</i>	17.0	<i>Vincetoxicum hirundinaria</i>	16.9
<i>Adonis vernalis</i>	16.7	<i>Stipa pennata</i>	16.3
<i>Scutellaria alpina</i>	16.3	<i>Origanum vulgare</i>	16.3
<i>Salvia stepposa</i>	16.2	<i>Hieracium echiooides</i>	16.2
<i>Galium glaucum</i>	16.2	<i>Cotoneaster melanocarpus</i>	16.0
<i>Coronilla varia</i>	16.0	<i>Elymus hispidus</i>	15.8
<i>Medicago romanica</i>	15.7	<i>Verbascum lychnitis</i>	15.5
<i>Fumaria schleicheri</i>	15.5	<i>Artemisia armeniaca</i>	15.4
<i>Medicago falcata</i>	15.3		

*Constant species (occurrence frequencies)*

<i>Prunus fruticosa</i>	53.0	<i>Galium verum</i>	37.0
<i>Teucrium chamaedrys</i>	33.0	<i>Vincetoxicum hirundinaria</i>	30.0

## **Appendix G: Descriptions of EUNIS heathland, scrub and tundra habitat types**

In the following text, the EUNIS F Heath, scrub and tundra habitats, and similar vegetation occurring on B1 & B2 coastal heaths and scrub, have been given their original text description (Davies et al. 2004), then the proposed revised description. Where there has been a name change, the proposed name is given first, then the original EUNIS name in brackets. Green text indicates those habitats where Schaminée et al. (2014) recommended some revision, either splitting of habitats or fusion of adjacent habitats and splitting, a note of which is then provided, together with descriptions for each new habitat. In almost all cases, the recommended changes were adopted for the DG(Env) Red List of European Habitats project but, where further splits or changes of name were proposed for the Red List project, these are highlighted in red and this project recommends to align with the Red List proposals.

### **B1.5 Coastal dune heaths**

Original description: Stable dunes with a leached surface and vegetation dominated by *Calluna vulgaris*, *Empetrum nigrum* or *Erica* spp.

Proposed split into two sub-types according to the dominant species:

#### **B1.5a Atlantic and Baltic coastal *Empetrum* heath**

Heath on stable, decalcified dune sands along the cooler north Atlantic and Baltic coasts of Europe, dominated by *Empetrum nigrum*, with or without *Calluna vulgaris*, or occurring in dune slacks when *Erica tetralix* may also be abundant or even replace *Empetrum* with the same suite of associates. Persistent where wind-exposure or light grazing prevent succession to scrub or woodland.

#### **B1.5b Atlantic coastal *Calluna* and *Ulex* heath**

Heath on stable, decalcified, sharply-draining dune sands along the warmer, more humid Atlantic coast of Europe, dominated by *Calluna vulgaris*, *Erica* spp. and/or *Ulex* spp and other low spiny legumes often with a strong contingent of grasses and sedges. Persistent where wind-exposure or light grazing prevent succession to scrub or woodland.

### **B1.6 Coastal dune scrub**

Original description: Stable dunes with scrub, e.g. *Hippophae rhamnoides*, *Salix repens* in the north, or *Juniperus* spp. or sclerophyllous shrubs in the south.

Proposed split into two types on the basis of geographical location:

### **B1.6a Atlantic and Baltic coastal dune scrub**

Scrub dominated by a wide diversity of low to tall shrubs on stabilised dry dune sands and in dune slacks along the Atlantic and Baltic coasts, the composition varying according to regional climate and ground conditions. Fen vegetation with low *Salix repens* or grassland with *Rosa spinosissima* are not included.

### **B1.6b Mediterranean and Black Sea coastal dune scrub**

Scrub dominated by a wide diversity of low to tall shrubs on stabilised dry dune sands along the Mediterranean and Black sea coasts, often grading to dune grassland or woodland, the associated herb flora showing elements from these neighbouring vegetation types or mosaics.

The Red List project added a further sub-type

### **B1.6c Macaronesian coastal dune scrub.**

Often sparse scrub on coastal dune sands in the arid Mediterranean climate in parts of the Canarian archipelago.

### **B2.5 Shingle and gravel beaches with scrub**

Original description: Coastal gravel banks with scrub. Included are dense thermo-mediterranean brushes on gravel banks beside the Mediterranean and heaths on shingle in the nemoral zone.

Proposed merger with other habitat types on shingle and gravel beaches.

### **F1.1 Shrub tundra**

Original description: Tundras of the southernmost tundra belt, characterized by an abundance of medium small and small shrubs, including 1-2 m tall *Alnus fruticosa*, 0.5-0.8 m tall *Salix lanata*, *Betula nana*, *Betula exilis*, *Salix reptans*, *Salix pulchra*, and of dwarf shrubs, in particular, *Vaccinium uliginosum*, *Vaccinium vitis-idaea*, *Ledum decumbens*, *Rubus chamaemorus*, *Empetrum hermaphroditum*, *Empetrum nigrum*, *Arctostaphylos alpina*. They extend south to the wooded taiga belt.

Tundra with a usually extensive cover of sub-shrubs or low shrubs over herbs, mosses and lichens on sporadically permafrost soils of the southern arctic and subarctic zones, often grazed into grassy mosaics.

### **F1.2 Moss and lichen tundra**

Original description: Tundras of the middle tundra belt, characterized by a thick cover of mosses, formed notably by *Hylocomium splendens*, *Aulacomnium turgidum*, *Tomentypnum nitens*, *Ptilidium ciliare*, with dwarf shrubs, particularly *Dryas octopetala*, *Cassiope tetragona*, *Salix reptans*, *Vaccinium vitis-idaea*, sedges, among which the often dominant *Carex ensifolia*. Drier stands alternate in mosaic fashion with wetter areas dominated by sedges, in particular, *Carex stans*, *Eriophorum angustifolium*, *Eriophorum scheuchzeri*, and grasses, notably *Arctophila fulva*, *Dupontia fischartii*.

Tundra of the middle and northern high arctic zone where permafrost soils, often occurring in patterned ground, support a frequently sparse cover of mosses, lichens and low herbs.

### **F2.1 Subarctic and alpine dwarf Salix scrub (Subarctic and alpine dwarf willow scrub)**

Original description: Salix scrub composed of species that rarely exceed 1.5 m in height. Dwarf willow scrub is well developed in boreal and arctic mountains and in subarctic lowlands. In mountains of the nemoral and warm-temperate zones, stands of dwarf willow scrub are of much smaller extent and are characteristic of late-lying snow patches. They occur in the Alps, Pyrenees, Carpathians and Caucasus, and very locally to the south in the Paeonian mountains, Sierra Nevada, Cordillera Central, Monti Sibillini and Abruzzi. They occur locally in the Scottish Highlands and in the Sudeten.

Salix-dominated dwarf scrub, often with abundant bryophytes and lichens, on skeletal calcareous or siliceous soils in late snow beds with a short growing-season, occurring in the subarctic north of the woodland zone and in the high mountains of nemoral Europe, increasingly local and fragmentary to the south.

### **F2.2 Evergreen alpine and subalpine heath and scrub**

Original description: Small, dwarf or prostrate shrub formations of the alpine and subalpine zones of mountains, dominated by ericaceous species, *Dryas octopetala*, dwarf junipers, brooms or greenweeds; *Dryas* heaths of the British Isles.

Proposed split into three types on the basis of dominant growth form:

#### **F2.2a Alpine and subalpine ericoid heath**

Dwarf-shrub vegetation dominated by ericoids and other woody species (not *Juniperus* or *genistoids*) occurring in high mountains throughout Europe, varying in dominants and associates according to regional climate, degree of exposure and snow lie, soil reaction, soil depth and moisture.

#### **F2.2b Alpine and subalpine *Juniperus* scrub**

Juniper-dominated vegetation of the montane to sub-alpine belts of European mountains, occurring as primary vegetation tolerant of both high exposure and snow-lie, but also a secondary derivative of deforested, long-grazed and eroded ground at high altitudes.

#### **F2.2c Balkan subalpine *genistoid* scrub**

Genistoid heath and scrub of high mountains in the Balkans, often in primary grassy mosaics at higher altitudes, but also extending below the timberline where wood-cutting and grazing open up the woodland cover and sustain the vegetation as an anthropogenic replacement.

### **F2.3 Subalpine deciduous scrub**

Original description: Subalpine scrubs of *Alnus*, *Betula*, *Salix* and Rosaceae (*Amelanchier*, *Potentilla*, *Rubus*, *Sorbus*), less than 5 m tall, often accompanied by tall herbs that in the absence of scrub would be classified as E5.5. Excludes dwarf *Salix*

scrub (F2.1), which is composed of species that rarely exceed 1.5 m in height, and scrub on waterlogged soils (F9.2).

Low scrub, including *krummholz*, dominated by various deciduous trees and shrubs, on moist but free-draining, sometimes quite fertile, soils on high mountain slopes throughout Europe, often with long snow-lie and prone to natural disturbance due to avalanche and scree slides, after which it is well able to recover and recolonise. The associated flora can be rich in tall mountain herbs. It can also be found as a secondary succession stage in abandoned subalpine pastures and meadows.

#### **F2.4 Subalpine *Pinus mugo* scrub (Conifer scrub close to the tree limit)**

Original description: Scrubland with dwarf conifers (*krummholz*), often with incomplete canopy cover, close to the tree limit. At the arctic tree limit, the trees are of species that can grow to large stature under favourable conditions. However *Pinus mugo* of central and southern Europe is often genetically fixed as a shrub. Excluded are stands of forest conifers with height > 3 m (G3).

*Pinus mugo krummholz* on mineral soils with long snow-lie above the tree line through the mountains of central and eastern Europe. Woody and herbaceous associates and the sometimes abundant bryophyte layer vary according to the base-richness of the soils and ground moisture.

#### **F3.1 Temperate thickets and scrub**

Original description: Successional and plagioclimax scrub, mostly deciduous, of Atlantic, sub-Atlantic or subcontinental affinities, characteristic of the nemoral zone, but also colonizing cool, moist or disturbed stations of the Mediterranean evergreen forest zone. Included are thickets of *Buxus sempervirens*, *Corylus avellana*, *Cytisus scoparius*, *Juniperus communis*, *Prunus spinosa*, *Rubus fruticosus* and *Ulex europaeus*.

#### **F3.2 Submediterranean deciduous thickets and brushes**

Original description: Successional and plagioclimax scrub, mostly deciduous, of the submediterranean and supramediterranean zones, but also colonizing cool, moist or disturbed stations of the mediterranean evergreen forest zone. Included are some non-leafy brushes, for example *Cytisus purgans* and *Genista aetnensis*.

Proposed merger of F3.1 and F3.2 with a split into six types of the basis of dominant growth form. To this were added two further habitats in the Red List habitat typology, with a shift of one code, giving a total of 8 new sub-types:

#### **F3.1a Lowland to montane temperate and submediterranean *Juniperus* scrub**

*Juniperus communis* scrub on nutrient-poor sandy and calcareous soils through the temperate and submediterranean lowlands and foothills of Europe. The juniper can be very patchy in occurrence, often related to past land-use, and with a striking variety of growth forms, the associated flora being very diverse according to soil base-status, sharing much in common, where the scrub is open, with local calcicolous grasslands or heath.

### **F3.1b Temperate Rubus scrub**

Low Rubus-dominated scrub, deciduous or sometimes evergreen, of successions and ecotones in a wide variety of semi-natural landscapes through the Atlantic zone and elsewhere in sub-montane Europe where a locally moist climate prevails. Rubus is an enormously diverse genus of often apomictic and endemic taxa with associated floras related to soil base-status and moisture.

### **F3.1c Lowland to montane temperate and submediterranean genistoid scrub**

Low scrub dominated by various woody legumes on mostly sharply-draining, nutrient-poor acidic soils through the temperate and submediterranean lowlands and mediterranean foothills of Europe. To the north the vegetation is usually found in successions or ecotones within pastoral landscapes and is often rather species-poor; further south, the scrub can occur as a more persistent or repeatedly renewed habitat among rocky or unstable hill-slopes with richer associated floras.

### **F3.1d Balkan-Anatolian submontane genistoid scrub**

Open scrub, dominated by *Genista rumelica/lydia* endemic to steep rocky slopes and screes, and also degraded woodland, in the lowlands and foothills of the south-eastern Balkans, on various soils but especially rich on limey substrates where calcicolous grassland species figure strongly among the associated flora.

### **F3.1e Temperate and submediterranean thorn scrub**

Scrub dominated by a diversity of mostly thorny shrubs, small trees and saplings, in successions and ecotones on mesic soils in a wide variety of semi-natural landscapes through the temperate and submediterranean lowlands of Europe but sometimes extending to higher altitudes, as with the Balkan *šibljak*. The dominants and associated floras vary widely with differences in regional climate and soils.

### **F3.1f Low steppic scrub**

Low scrub, dominated by various, often clonal, shrubs frequently forming patches in locally mesic and sheltered situations within the dry grasslands of the steppe zone of central and eastern Europe. It can form a persistent natural landscape element or develop after abandonment of pasturing.

### **F3.1g Corylus avellana scrub**

Low scrub dominated by *Corylus avellana*, permanently maintained by exposure to winds and on shallow soils along the north Atlantic coast and locally on rocky slopes and cliffs through the Continental region.

### **F3.1h Temperate woodland clearing scrub**

Often dense scrub of shrubs and small trees invading after natural or anthropogenic clearance in woodlands of the temperate zone.

#### **F4.1 Wet heath (Wet heaths)**

Original description: Wet or humid ericoid-shrub dominated heaths of the Atlantic and sub-Atlantic zones, developed on peaty or semipeaty soils, waterlogged for at least part of the year, sometimes temporarily inundated, and usually moist even in summer.

Heath with prominent *Erica tetralix* on shallow, acid, nutrient-poor peats and peaty mineral soils, kept moist for much of the year and often seasonally waterlogged, through the Atlantic and sub-Atlantic lowlands and foothills of Europe. Typically occurring in wet depressions and seepage areas within dry heaths or as a marginal zone around bogs where drainage of deeper peats can increase its extent. In milder oceanic climates, other *Erica* and *Ulex* spp. occur in richer humid heath. Frequently influenced by grazing and sod-cutting.

#### **F4.2 Dry heath (Dry heaths)**

Original description: Heaths on siliceous, podsolic, rarely- or never-waterlogged soils in moist Atlantic and sub-Atlantic climates of the plains and low mountains of Western and Central Europe.

Heath dominated by various ericaceous sub-shrubs on free-draining, nutrient-poor, acid sands and siliceous soils through the lowlands and foothills of western and central Europe, extending northwards in more oceanic situations and into continental regions at higher rainier altitudes. Very often influenced by grazing and burning and frequently a secondary vegetation type derived by clearance of acidophilous woodland and maintained anthropogenically.

#### **F4.3 Macaronesian heath (Macaronesian heaths)**

Original description: Heaths of the Canary Islands, Azores and Madeira.

Shrubby vegetation on thin soils in the Azores, Madeira and Canary Islands, colonising pyroclastic debris, lava, rock outcrops and landslips, sometimes cyclically renewed by further disturbance or seral to woodland. Floristically diverse between and within the archipelagoes.

#### **F5.1 Arborescent matorral**

Original description: Successional and plagioclimax evergreen sclerophyllous or lauriphylloous vegetation of mediterranean or warm-temperate humid affinities with a more or less dense, broken or low arborescent cover and with a usually thick, high evergreen shrub stratum. Arborescent matorral derives mostly from degradation or regrowth of broad-leaved evergreen forests (G2) or is intermediate between them and maquis (F5.2); some derives from thermophilous deciduous (G1.7) or conifer (G3.7) forests.

#### **F5.2 Maquis**

Original description: Evergreen sclerophyllous or lauriphylloous shrub vegetation, with a more or less closed canopy structure, and with few annuals, some geophytes and often scattered trees, some of which may be in shrub form. Unlike arborescent matorral, maquis is typically dominated by species that do not have the potential to grow into

tall trees. In high maquis these may be *Arbutus* spp., *Erica arborea*, *Erica scoparia*, *Juniperus oxycedrus*, *Phillyria* spp. In low maquis, *Cistus* spp., *Erica* spp., *Genista* spp., *Lavandula* spp. may predominate.

Proposed merger of these two habitats into a single type

#### **F5.1 Mediterranean maquis and arborescent matorral**

Evergreen sclerophyllous or lauriphylloous shrub vegetation forming a dense closed canopy, with or without low emergent trees, on a wide variety of substrates and soils through the thermo- to meso-Mediterranean belts. May be permanent primary vegetation on xeric sites but is usually derived by degradation of evergreen deciduous or coniferous woodland and much influenced in structure and composition by grazing and fire.

#### **F5.3 Submediterranean pseudomaquis (Pseudomaquis)**

Original description: Mixed sclerophyllous evergreen and deciduous shrub thickets of the periphery of the range of Mediterranean sclerophyllous scrublands. They include, in particular, shrub formations of the Balkan and Italian peninsulas intermediate between Mediterranean maquis and schibljak, resulting from the degradation of thermophilous deciduous woodland G1.7, with a mixture of evergreen and deciduous bushes including *Quercus coccifera*, *Juniperus oxycedrus*, *Quercus trojana*, *Carpinus orientalis*, *Ostrya carpinifolia*, *Pistacia terebinthus*, *Buxus sempervirens*, *Berberis cretica*, *Paliurus spinachristi*, *Pyrus spinosa*, *Rosa* spp., similar Iberian formations with *Amelanchier ovalis*, *Prunus lusitanica*, *Ilex aquifolium*, French and Italian formations with *Quercus pubescens* and *Quercus ilex*, formations of Mediterranean Asia Minor and the Levant dominated by mixed deciduous and evergreen shrubs or small trees, in particular, *Quercus coccifera* (*Quercus calliprinos*) and *Pistacia palaestina*.

Mixed deciduous and evergreen scrub of shallow, rocky, mostly calcareous soils in the lowlands and foothills of southern Europe, particularly the east. Usually derived by woodland degradation and much affected in structure and composition by grazing, fire and logging.

#### **F5.4 Spartium junceum scrub (Spartium junceum fields)**

Original description: Thickets and brushes of Spanish broom, *Spartium junceum*, widespread in mediterranean and submediterranean areas of western Europe.

Scrub dominated by *Spartium junceum*, typical of disturbed, open, sunny situations on a wide variety of soils through the Mediterranean and sub-Mediterranean, where its rapid establishment is favoured by post-fire seed germination, aggressive rooting, nitrogen-fixation and unpalatability.

#### **F5.5 Thermomediterranean scrub**

Original description: Shrub formations characteristic of the thermo-Mediterranean zone. Included here are those formations, for the most part indifferent to the siliceous or calcareous nature of the substrate, that reach their greatest extent or optimal development in the thermo-Mediterranean zone, typically with abundant *Pistacia lentiscus*, *Myrtus communis*, *Phillyrea* spp., *Erica manipuliflora*, *Styrax officinalis*, *Genista fasselata*, *Euphorbia dendroides*, *Calicotome villosa* and *Sarcopoterium spinosum*. Also included are the numerous, strongly characterized, thermophile formations endemic to the south of the Iberian peninsula, mostly thermo-Mediterranean but

sometimes meso-Mediterranean; in their great local diversity they are a western counterpart of, and sometimes approach in appearance, the mostly eastern Mediterranean phryganas F7.

Scrub with a usually low and rather open cover of shrubs with sub-shrubs, dwarf shrubs and herbs between, on dry soils of varied composition through the thermomediterranean zone, and of very diverse local composition. Primary and permanent in more arid and exposed situations, but can be successional to woodland and often much affected by grazing.

#### **F6.1 Western garrigues**

Original description: Shrubby formations, often low, on mostly calcareous soils of the meso-mediterranean zone of the Iberian peninsula, France, Italy and the large western Mediterranean islands, notably the Balearics, Corsica, Sardinia, Sicily and Malta. Included here are those formations that reach their optimal development within the mesomediterranean zone although they often enter the thermo- or supra-mediterranean levels.

Proposed split into two types on the basis of soil characteristics:

##### **F6.1a Western basiphilous garrigue**

Sub-shrub vegetation dominated by nanophanerophytes and chamaephytes on thin, base-rich soils through the western thermo- to mesomediterranean belts, very diverse in composition with differences in local climate and soils. In rockier situations, it can be a permanent coloniser but is often derived from woodland clearance and is much affected by grazing and fire.

##### **F6.1b Western acidophilous garrigue.**

Sub-shrub vegetation dominated by nanophanerophytes on thin acidic soils, both hard silicate and soft sands, through the western thermo- to lower supramediterranean belts, very diverse in composition with differences in local climate and soils. In rockier situations, it can be a permanent coloniser but is often derived from woodland clearance or abandonment of farm fields and is much affected by grazing and fire.

#### **F6.2 Eastern non-Illyrian garrigues**

Original description: Shrubby formations, often low, of the meso-, thermo- and occasionally supramediterranean zones of Greece, southern Albania, Cyprus and southern Anatolia. Included here are all sclerophyllous formations, regardless of substrate, except those with conspicuous spiny cushion structure (F7), those with abundant thermo-Mediterranean scrub species (F5.5) and high maquis with *Erica arborea* and *Arbutus* spp. (F5.2).

#### **F6.3 Illyrian garrigues**

Original description: Shrubby formations, often low, of the meso- and occasionally supra-Mediterranean zones of the Adriatic lowlands of the Balkan peninsula from Istria to southern Albania. Included here are all sclerophyllous formations, regardless of substrate, except high maquis (F5.2) with *Erica arborea* and *Arbutus* spp.

#### **F6.4 Black Sea garrigues**

Original description: Shrubby formations of the Mediterranean enclaves of the Black Sea coasts, in Crimea, southern Bulgaria, Turkey-in-Europe and northern Anatolia, as well as of the Meditaneo-steppic zone of southern Thrace. Included here are all sclerophyllous formations, regardless of substrate, except high maquis (F5.2) with *Erica arborea* and *Arbutus* spp. and Phryganas (F7).

Proposed merger of these three into a single type:

#### **F6.2 Eastern garrigue**

Low, mostly evergreen sclerophyllous scrub on diverse soils through the eastern meso-, thermo- and occasionally supramediterranean belts, including around the Black Sea, where deciduous species can prevail. Derived by woodland degradation and usually maintained by grazing and fire, their structure and composition vary greatly with local climate and human impacts.

#### **F6.5 Macaronesian garrigues**

Original description: Low shrub vegetation with an open canopy, of the Canary Islands, Azores and Madeira.

Proposed merger with other B Coastal habitats characteristic of shingle and gravel beaches.

#### **F6.6 Supramediterranean garrigue (Supra-Mediterranean garrigues)**

Original description: Low shrub formations with pronounced Mediterranean affinities formed as a degradation stage of thermophilous deciduous woodland (G1.7) or sometimes of evergreen *Quercus* woodland (G2.1) in the supra-Mediterranean belt of the Mediterranean region. Included here are only those formations that are characteristic of the supra-Mediterranean level; formations, particularly of the lower supra-Mediterranean, that are closely related to meso-Mediterranean communities have been included under F6.1, F6.2, F6.3 or F6.4.

Open low scrub of calcareous soils through the western and central supramediterranean belt. Derived originally by woodland clearance and long maintained by grazing, abandonment is now allowing widespread reversion.

#### **F6.7 Mediterranean gypsum scrub (Mediterranean gypsum scrubs)**

Original description: Garrigues occupying gypsum-rich soils of the Iberian peninsula, usually very open and floristically characterised by the presence of numerous gypsophilous species, among which *Gypsophila struthium*, *Gypsophila hispanica*, *Centaurea hyssopifolia*, *Teucrium libanitis*, *Ononis tridentata*, *Lepidium subulatum*, *Hernaria fruticosa*, *Reseda stricta*, *Helianthemum squatum*. They are often rich in thymes (*Thymus*), germanders (*Teucrium*), rockroses (*Helianthemum*), composites (*Centaurea*, *Jurinea*, *Santolina*), *Frankenia*.

Open chamaephyte scrub with a lichen crust and rainy-spring annual herb flora, on gypsum-rich substrates in areas with a dry to semi-arid mediterranean climate in the Iberian peninsula. The extreme climatic and edaphic conditions maintain the habitat as naturally stable but it can bear some light grazing.

## **F6.8 Xero-halophile scrub**

Original description: Salt-tolerant shrub formations of dry ground in low-precipitation areas of the mediterranean zone, in particular, the Iberian peninsula and Sicily, and of the Macaronesian Islands.

Proposed split into two types on the basis of geographical variation:

### **F6.8a Mediterranean halo-nitrophilous scrubs**

Perennial scrubby vegetation with nitrophilous and salt-tolerant associates in often artificially-disturbed places through the semi-arid thermo- and inframediterranean belts where the dry climate slows the decomposition of litter and aids precipitation of salt from the soil.

**F6.8b Caspian Sea halo-nitrophilous scrub.** This habitat was not included in the Red List project since it does not occur within the boundaries of the EU28+ countries.

Perennial scrubby vegetation with nitrophilous and salt-tolerant associates in often artificially-disturbed places around the Caspian Sea where the dry climate slows the decomposition of litter and aids precipitation of salt from the soil.

## **F7.1 West Mediterranean spiny heaths**

Original description: Spiny shrublands, mainly on coastal cliffs, of the western Mediterranean region.

## **F7.2 Central Mediterranean spiny heaths**

Original description: Spiny shrublands, mainly coastal, of the central Mediterranean region.

Proposed merger of these two habitats

## **F7.1 Western Mediterranean spiny heaths**

Low scrub of often spiny, cushion-forming plants on thin soils on wind-exposed and spray-splashed tops of rocky cliffs on Corsica, Sardinia, Pantelleria and in the Gulf of Taranto.

## **F7.3 Eastern Mediterranean spiny heath/phrygana (East Mediterranean phrygana)**

Original description: Spiny shrublands, widespread at low and middle altitudes in the eastern Mediterranean and Anatolian regions. *Sarcopoterium spinosum* is a common dominant in the Aegean region.

Low scrub dominated by thorny hemispherical chamaephytes on various base-rich and acidic substrates in the thermo-, meso- and supramediterranean belts of mainland Greece, Anatolia, the Aegean and Ionian islands, Crete, Cyprus and the north-east Mediterranean coast. Can be of primary origin or result from clearance of evergreen sclerophyll woodland.

#### **F7.4 Hedgehog-heaths**

Original description: Primary cushion heaths of the high, dry mountains of the Mediterranean region and Anatolia, with low, cushion-forming, often spiny shrubs, in particular of genera *Acantholimon*, *Astragalus*, *Erinacea*, *Vella*, *Bupleurum*, *Ptilotrichum*, *Genista*, *Echinospartum*, *Anthyllis*, and various composites and labiates; secondary, zoogenic cushion heaths of the same regions, either downslope extensions of the high-altitude formations, and dominated by the same species, or specifically montane or steppic, often *Genista*-dominated in the Mediterranean region. Excluded are cushion-heaths of thermo-Mediterranean lowlands (F7.1, F7.2 and F7.3).

Proposed split into four types on the basis of geographical variation:

##### **F7.4a Western Mediterranean mountain hedgehog-heath**

Heath of often spiny hedgehog sub-shrubs on base-rich and acidic soils in the cold and droughty upper supra- and oromediterranean belts of the Iberian Peninsula, historically sustaining transhumance pastoralism but often extending down from crests and steep slopes due to grazing and burning.

##### **F7.4b Central Mediterranean mountain hedgehog-heath**

Heath of often spiny hedgehog sub-shrubs on base-rich and acidic soils in windy and sunny situations in the supra- and oromediterranean belts of Corsica, Sardinia, Elba, Sicily and the southern mainland Mountains of Italy. Downslope expansion below the timberline can follow clearance and grazing.

##### **F7.4c Eastern Mediterranean mountain hedgehog-heath**

Heath of often spiny hedgehog sub-shrubs on mostly base-rich soils in dry mountains of the supra- and oromediterranean belts of the east Mediterranean. Downslope expansion below the timberline can follow clearance and grazing.

##### **F7.4d Canarian mountain hedgehog-heath**

Heath of hedgehog sub-shrubs on scree and volcanic soils in the subalpine semi-desert belt of Tenerife and la Palma.

#### **F8.1 Canarian xerophytic scrub (Canary Island xerophytic scrub)**

Original Description: Xerophytic scrub of the Canary Islands. Varied types include stem succulents, leaf succulents and woody sclerophyllous shrubs.

Open scrub of sclerophyllous shrubs and succulent herbs on rocky substrates with skeletal soils in the arid lowlands and on deeper soils in the moister foothills of the Canary Islands.

#### **F8.2 Madeiran xerophytic scrub**

Original description: Xerophytic scrub of Madeira.

Diverse scrub of sclerophyllous shrubs, small trees and succulent herbs on usually thin soils of rocky outcrops, cliffs and abandoned fields in the arid lowlands of Madeira.

### **F9.1 Riverine scrub**

Original description: Scrub of broad-leaved willows, e.g. *Salix aurita*, *Salix cinerea*, *Salix pentandra*, beside rivers. Scrub of *Alnus* spp. and narrow-leaved willows, e.g. *Salix eleagnos*, where these are less than 5 m tall. Riverside scrub of *Hippophae rhamnoides* and *Myricaria germanica*. Excludes riversides dominated by taller narrow-leaved willows *Salix alba*, *Salix purpurea*, *Salix viminalis* (G1.1).

Proposed split into two units based on climatic differences.

#### **F9.1a Arctic, boreal and alpine riparian scrub**

Scrub of *Salix* spp. and *Myricaria germanica* establishing on unsorted mineral sediments deposited in turbulent seasonal streams and flood-prone permanent rivers through the uplands of the arctic, boreal and alpine zones. More or less permanent where kept wet, re-establishing after seasonal flooding or succeeding to thorn scrub where the sediments stabilise.

#### **F9.1b Temperate riparian scrub**

Scrub of *Salix* spp developed on the mineral sediments of shoals and banks of lowland rivers through the temperate zone, re-establishing after seasonal flooding or succeeding to riparian and gallery woodland where the sediments stabilise.

### **F9.2 Salix fen scrub (Willow carr and fen scrub; Scientific name: Salix carr and fen scrub)**

Original description: Low woods and scrubs colonizing fens, marshy floodplains and fringes of lakes and ponds, dominated by large or medium sized shrubby willows, generally *Salix aurita*, *Salix cinerea*, *Salix atrocinerea*, *Salix pentandra*, alone or in association with *Frangula alnus*, *Rhamnus cathartica*, *Alnus glutinosa* or *Betula pubescens*, any of which may dominate the upper canopy. In boreal regions and on cold subboreal plateaux, small shrubs may dominate, e.g. dwarf *Salix* spp. associated with *Betula humilis* or *Betula nana*. Excludes boreal and subalpine lakeside scrub on well drained soils (F2).

Scrub dominated by various *Salix* spp. on peaty and mineral soils maintained in a permanently waterlogged state by high ground water in floodplain backwaters, around lakes and ponds, among mires and dunes, and in abandoned wet meadows and pastures, occurring through the lowlands of atlantic, boreal and continental Europe and extending into the mediterranean region at higher altitudes. Associated floras vary according to the base status of the ground waters and soils.

### **F9.3 Mediterranean riparian scrub (Southern riparian galleries and thickets)**

Original description: Tamarisk, oleander, chaste tree galleries and thickets and similar low woody vegetation of permanent or temporary streams and wetlands of the thermo-Mediterranean zone and southwestern Iberia.

Usually open scrub of *Tamarix* spp., *Nerium oleander*, *Vitex agnus-castus* and similar shrubs and small trees on seasonally droughted and irregularly flooded riverbeds, streamsides and depressions through the thermo- and mesomediterranean belts.

## **Appendix I: Preliminary distribution and suitability maps of the revised EUNIS heathland, scrub and tundra habitat types**

<b>EUNIS-3 code</b>	<b>EUNIS-3 habitat name</b>	<b>Background data pool</b>
F1.1	Shrub tundra	Study area
F1.2	Moss and lichen tundra	No data
F2.1	Subarctic and alpine dwarf Salix scrub	Heathland, scrub, tundra
F2.2a	Alpine and subalpine ericoid heath	Study area
F2.2b	Alpine and subalpine Juniperus scrub	Study area
F2.2c	Balkan subalpine genistoid scrub	Study area
F2.3	Subalpine deciduous scrub	Heathland, scrub, tundra
F2.4	Subalpine Pinus mugo scrub	Heathland, scrub, tundra
F3.1a	Lowland to montane temperate and submediterranean Juniperus scrub	Study area
F3.1b	Temperate Rubus scrub	Study area
F3.1c	Lowland to montane temperate and submediterranean genistoid scrub	Study area
F3.1d	Balkan-Anatolian montane genistoid scrub	Study area
F3.1e	Temperate and submediterranean thorn scrub	Study area
F3.1f	Low steppic scrub	Heathland, scrub, tundra
F3.1g	Corylus avellana scrub	Study area
F3.1h	Temperate woodland clearing scrub	Study area
F4.1	Wet heath	Study area
F4.2	Dry heath	Study area
F4.3	Macaronesian heath	No data
F5.1-2	Arborescent matorral and maquis	Heathland, scrub, tundra
F5.3	Submediterranean pseudomaquis	Study area
F5.4	Spartium junceum fields	Study area
F5.5	Thermo-Mediterranean scrub	Study area
F6.1a	Western basiphilous garrigue	Heathland, scrub, tundra
F6.1b	Western acidophilous garrigue	Heathland, scrub, tundra
F6.2	Eastern garrigue	Study area
F6.6	Supra-Mediterranean garrigue	Study area
F6.7	Mediterranean gypsum scrub	Heathland, scrub, tundra
F6.8a	Mediterranean halo-nitrophilous scrub	Heathland, scrub, tundra
F6.8b	Caspian halo-nitrophilous scrub	No data
F7.1	Western Mediterranean coastal garrigue	Heathland, scrub, tundra
F7.3	Eastern Mediterranean spiny heath (phrygana)	Study area

F7.4a	Western Mediterranean mountain hedgehog-heath	Study area
F7.4b	Central Mediterranean mountain hedgehog-heath	Study area
F7.4c	Eastern Mediterranean mountain hedgehog-heath	Study area
F7.4d	Canarian mountain hedgehog-heath	No data
F8.1	Canary Island xerophytic scrub	No data
F8.2	Madeiran xerophytic scrub	No data
F9.1a	Arctic, boreal and alpine riparian scrub	Heathland, scrub, tundra
F9.1b	Temperate riparian scrub	Study area
F9.2	Salix fen scrub	Heathland, scrub, tundra
F9.3	Mediterranean riparian scrub	Heathland, scrub, tundra
B1.5a	Atlantic and Baltic coastal Empetrum heaths	Study area
B1.5b	Atlantic coastal Calluna and Ulex heaths	Study area
B1.6a	Atlantic and Baltic coastal dune scrub	Study area
B1.6b	Mediterranean and Black Sea coastal dune scrub	Study area
B1.6c	Macaronesian coastal dune scrub	No data
B2.5	Shingle and gravel beaches with scrub	Study area

### B1.5a - Atlantic and Baltic coastal Empetrum heaths

*Distribution based on vegetation relevés*

*Model prediction. Background data randomly selected from study area*

**Geographic restriction**

Coastal sand dunes and sea shores according to Bohn map (P1)

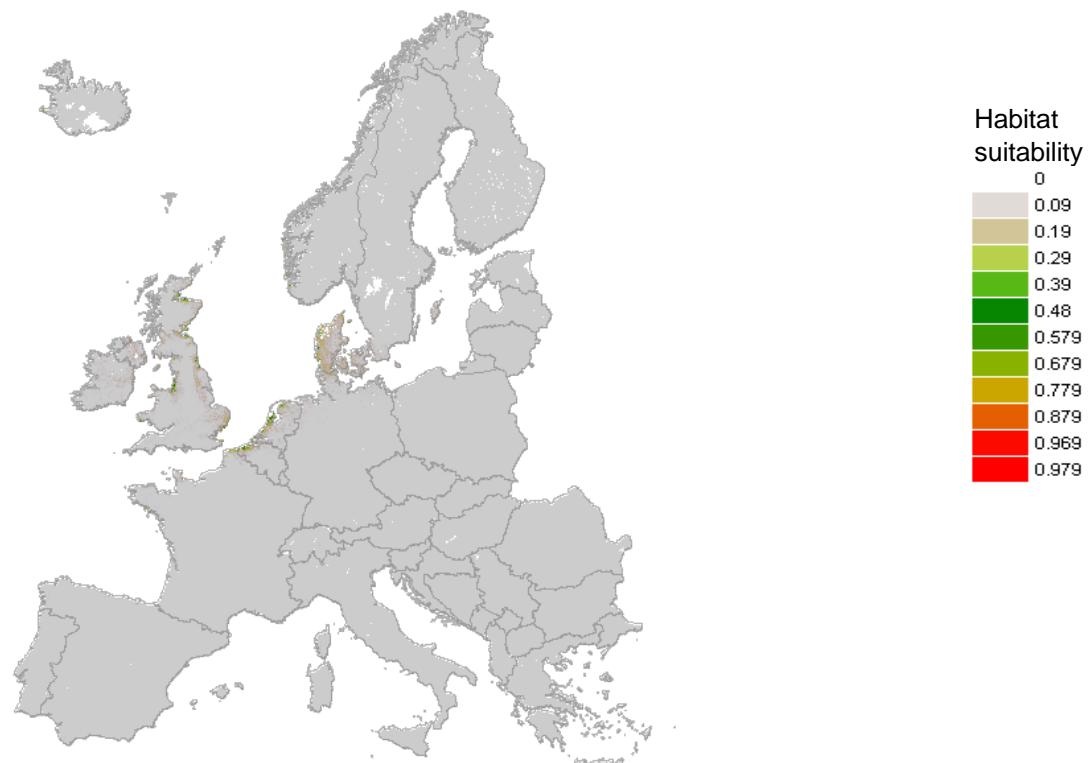

**Statistics from Maxent modelling**

<b>AUC training (0-1)</b>	0.9983
<b>AUC test (0-1)</b>	0.9974
<b>Contribution variables to the Maxent model (%)</b>	
Distance to water	72.6441
Potential evapotranspiration	6.7692
Weight in % of silt particles (0.0002-0.05 mm)	6.6846
Mean temperature of wettest quarter	4.6958
Precipitation of warmest quarter	3.0515
Weight in % of sand particles (0.05-2 mm)	2.929
Volume % of coarse fragments (> 2 mm)	1.2493
Temperature seasonality (stdev * 100)	1.1499
Soil organic carbon content (‰)	0.3173
Annual precipitation	0.1818
Weight in % of clay particles (<0.0002 mm)	0.1811
Cation Exchange Capacity	0.1299
Precipitation seasonality (coef. of var.)	0.0165
Bulk density (kg/m <sup>3</sup> )	0
Solar radiation	0
pH (water)	0

### B1.5b - Atlantic coastal Calluna and Ulex heaths

*Distribution based on vegetation relevés*

*Model prediction. Background data randomly selected from study area*

**Geographic restriction**

Coastal sand dunes and sea shores according to Bohn map (P1)

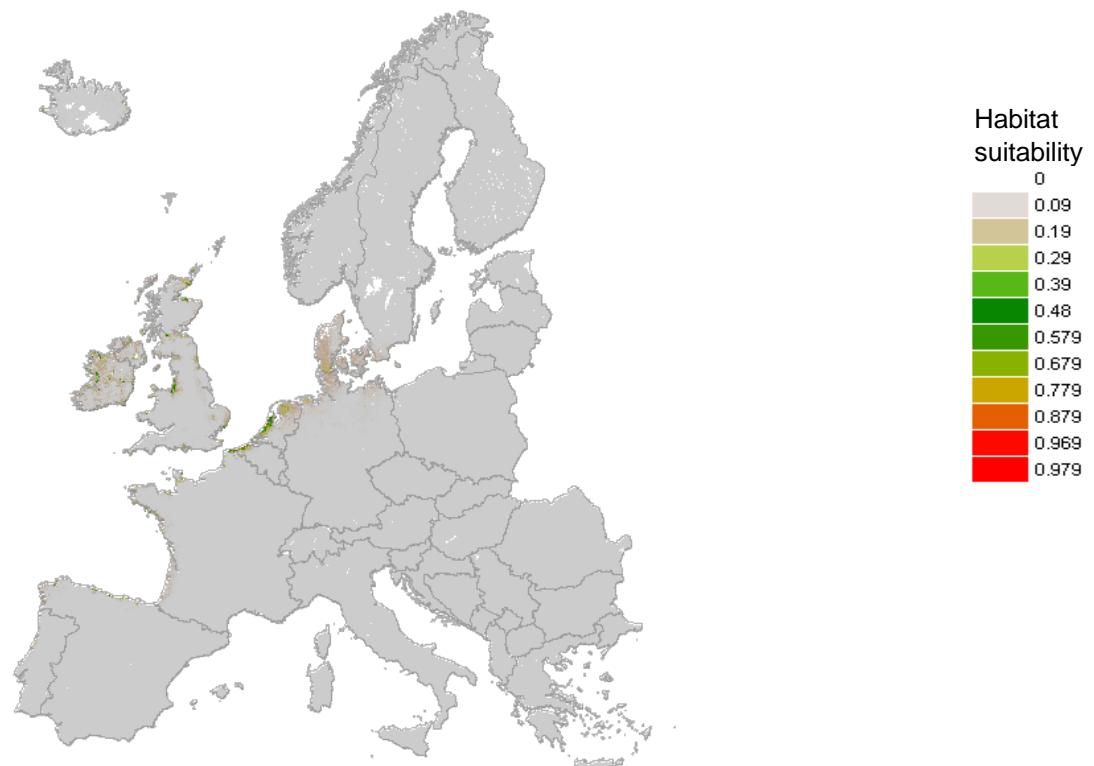

**Statistics from Maxent modelling**

<b>AUC training (0-1)</b>	0.9973
<b>AUC test (0-1)</b>	0.9965
<b>Contribution variables to the Maxent model (%)</b>	
Distance to water	71.6288
Potential evapotranspiration	6.6391
Temperature seasonality (stdev * 100)	5.6778
Mean temperature of wettest quarter	5.3908
Weight in % of silt particles (0.0002-0.05 mm)	4.676
Bulk density (kg/m <sup>3</sup> )	2.6155
Precipitation of warmest quarter	1.0111
Volume % of coarse fragments (> 2 mm)	0.7675
Weight in % of sand particles (0.05-2 mm)	0.7336
Solar radiation	0.353
pH (water)	0.2493
Precipitation seasonality (coef. of var.)	0.1328
Annual precipitation	0.0641
Soil organic carbon content (%)	0.058
Cation Exchange Capacity	0.0026
Weight in % of clay particles (<0.0002 mm)	0

### B1.6a - Atlantic and Baltic coastal dune scrub

*Distribution based on vegetation relevés*

*Model prediction. Background data randomly selected from study area*

**Geographic restriction**

Coastal sand dunes and sea shores according to Bohn map (P1)

**Statistics from Maxent modelling**

<b>AUC training (0-1)</b>	0.9941
<b>AUC test (0-1)</b>	0.994
<b>Contribution variables to the Maxent model (%)</b>	
Temperature seasonality (stdev * 100)	31.1807
Weight in % of silt particles (0.0002-0.05 mm)	20.4761
Potential evapotranspiration	11.6845
Volume % of coarse fragments (> 2 mm)	11.489
Distance to water	8.6953
Precipitation seasonality (coef. of var.)	5.2595
Mean temperature of wettest quarter	3.6934
Bulk density (kg/m <sup>3</sup> )	3.5278
pH (water)	2.7208
Weight in % of sand particles (0.05-2 mm)	0.4677
Precipitation of warmest quarter	0.3004
Cation Exchange Capacity	0.2433
Soil organic carbon content (%)	0.1383
Solar radiation	0.0543
Weight in % of clay particles (<0.0002 mm)	0.0381
Annual precipitation	0.0307

### B1.6b - Mediterranean and Black Sea coastal dune scrub

*Distribution based on vegetation relevés*

*Model prediction. Background data randomly selected from heathland-scrub-tundra data set*

**Geographic restriction**

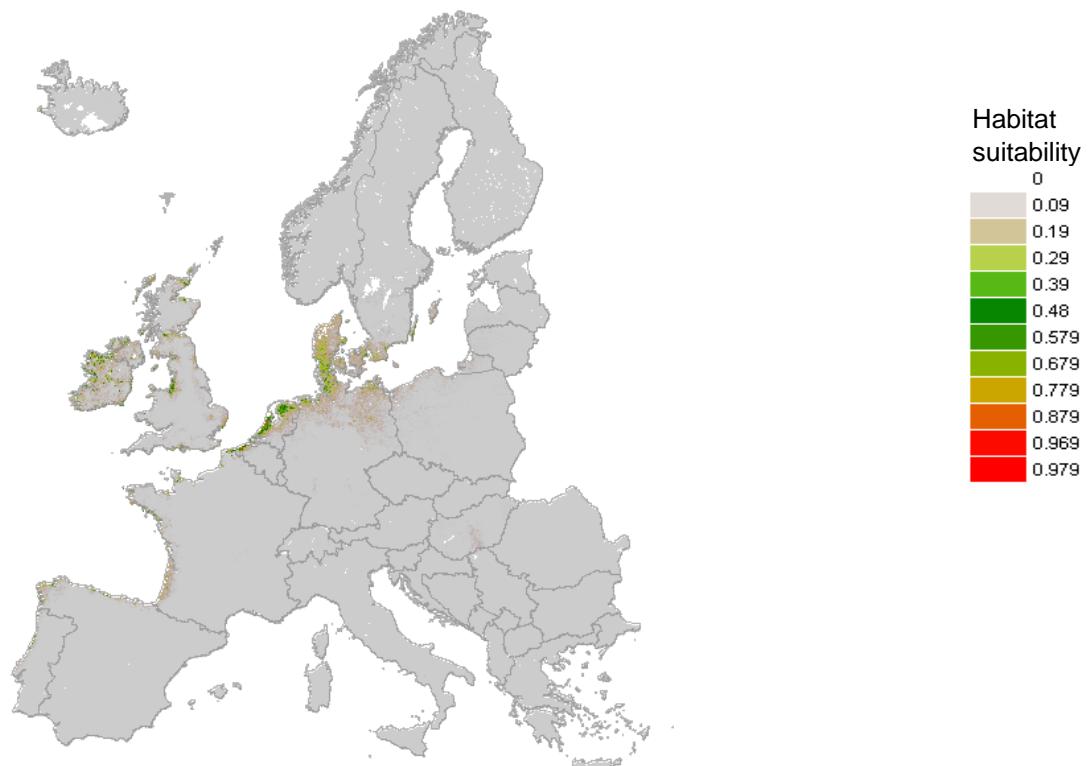

Coastal sand dunes and sea shores according to Bohn map (P1)

**Insufficient data to create a model**

## B2.5 - Shingle and gravel beaches with scrub

*Distribution based on vegetation relevés*

*Model prediction. Background data randomly selected from study area*

**Geographic restriction**

Coastal sand dunes and sea shores according to Bohn map (P1)

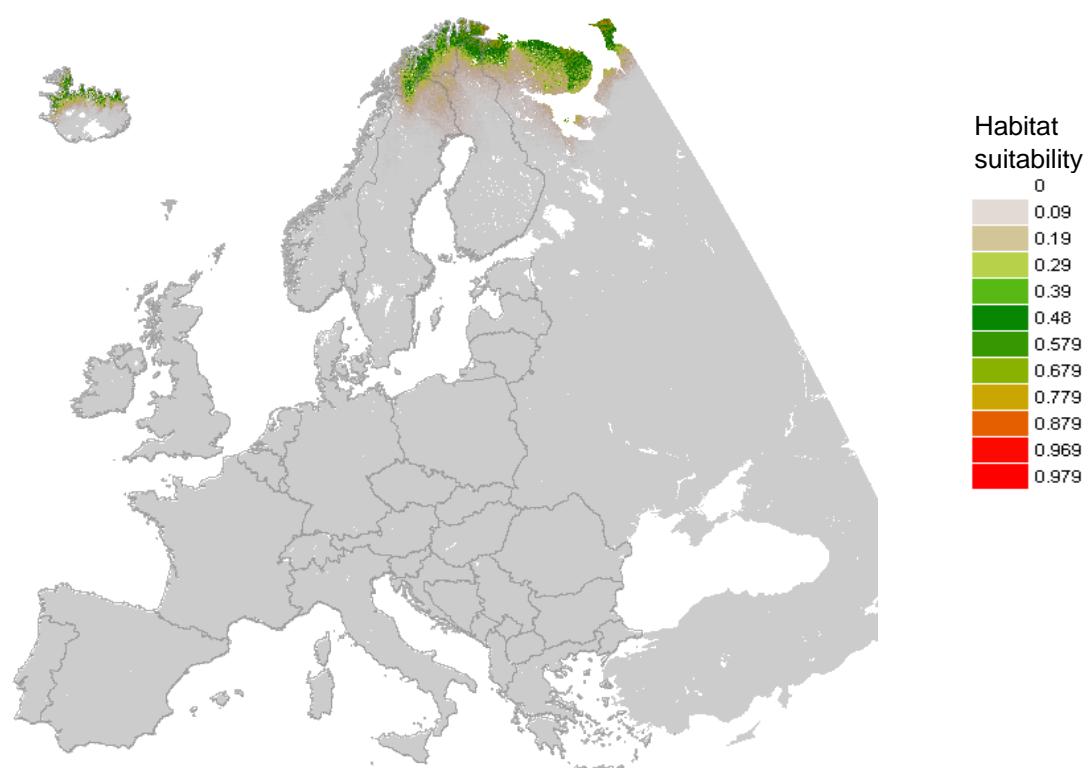

**Statistics from Maxent modelling**

<b>AUC training (0-1)</b>	0.9872
<b>AUC test (0-1)</b>	0.9946
<b>Contribution variables to the Maxent model (%)</b>	
Temperature seasonality (stdev * 100)	30.7466
Weight in % of silt particles (0.0002-0.05 mm)	23.8025
Potential evapotranspiration	14.4858
Volume % of coarse fragments (> 2 mm)	9.423
Distance to water	6.1451
Precipitation seasonality (coef. of var.)	5.3732
Bulk density (kg/m <sup>3</sup> )	5.1227
Cation Exchange Capacity	1.7517
Mean temperature of wettest quarter	0.8544
Weight in % of clay particles (<0.0002 mm)	0.7488
Weight in % of sand particles (0.05-2 mm)	0.6543
pH (water)	0.4926
Solar radiation	0.2011
Soil organic carbon content (%)	0.1725
Annual precipitation	0.0258
Precipitation of warmest quarter	0

### F1.1 - Shrub tundra

*Distribution based on vegetation relevés*

*Model prediction. Background data randomly selected from study area*

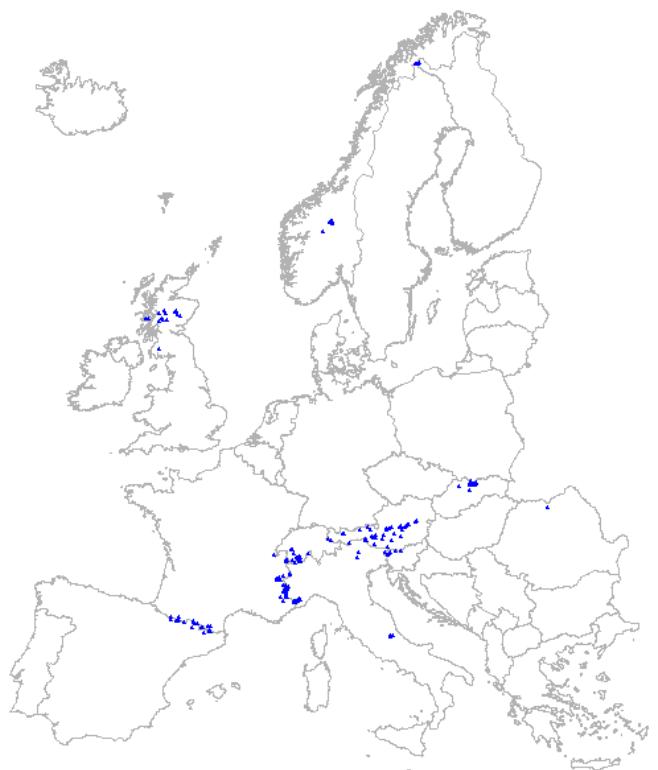

**Geographic restriction**

Arctic polar deserts and Arctic tundras according to the Bohn map (A1 & B1)

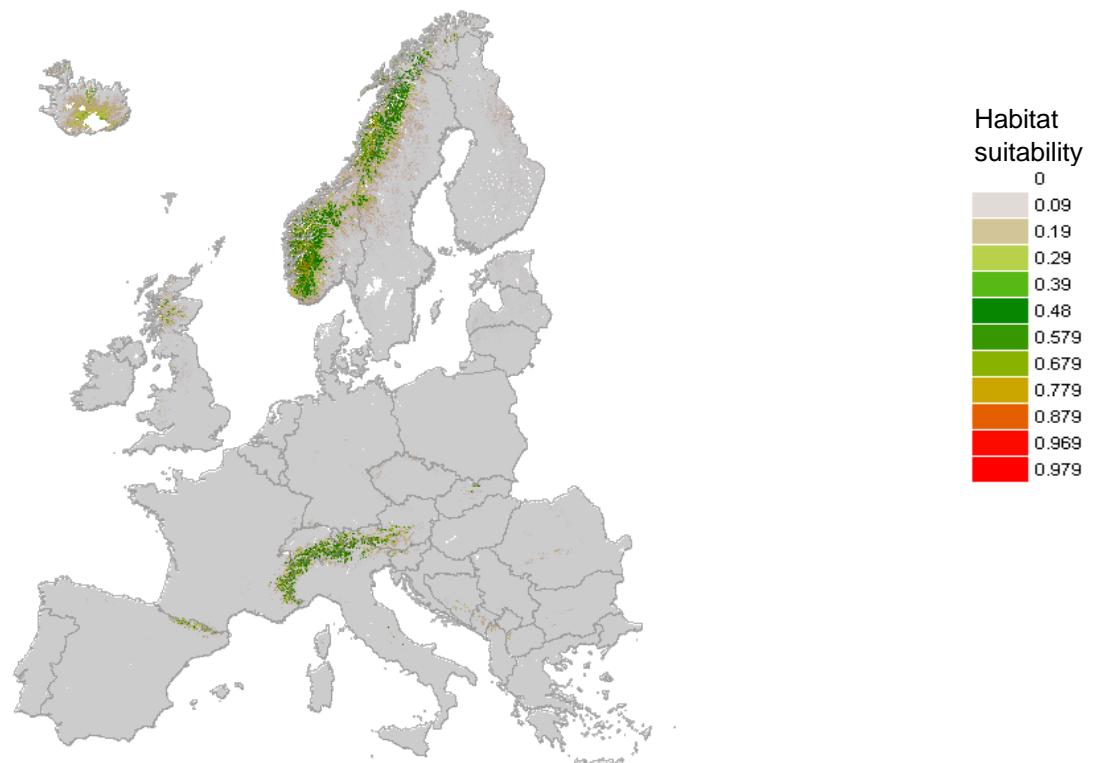

**Statistics from Maxent modelling**

<b>AUC training (0-1)</b>	0.9948
<b>AUC test (0-1)</b>	0.9976
<b>Contribution variables to the Maxent model (%)</b>	
Soil organic carbon content (‰)	63.0052
Mean temperature of wettest quarter	16.0319
Annual precipitation	15.7212
Precipitation of warmest quarter	2.9293
Solar radiation	1.1764
Distance to water	0.951
Weight in % of clay particles (<0.0002 mm)	0.5164
pH (water)	0.3903
Bulk density (kg/m³)	0.3385
Potential evapotranspiration	0.0721
Precipitation seasonality (coef. of var.)	0.0286
Cation Exchange Capacity	0.0116
Volume % of coarse fragments (> 2 mm)	0.0039
Weight in % of sand particles (0.05-2 mm)	0
Temperature seasonality (stdev * 100)	0
Weight in % of silt particles (0.0002-0.05 mm)	0

## F2.1 - Subarctic and alpine dwarf Salix scrub

*Distribution based on vegetation relevés*

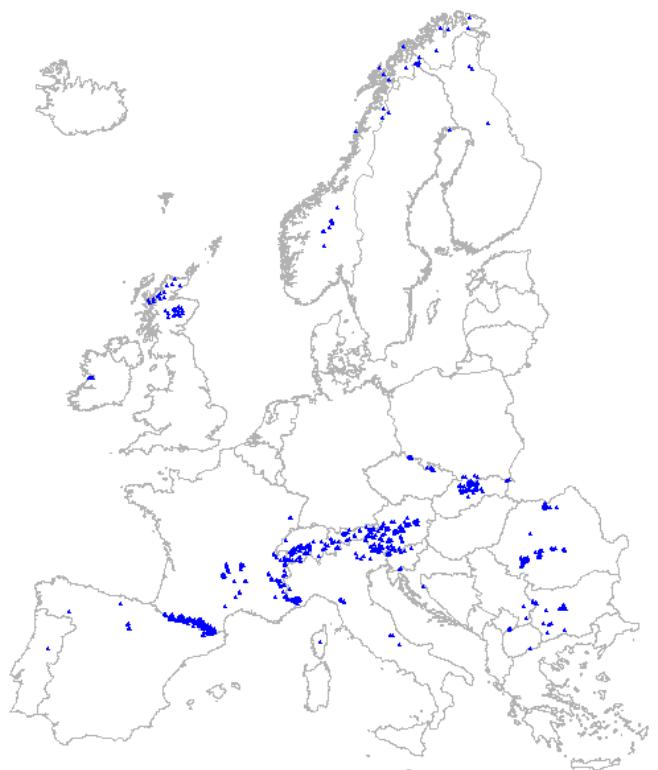

*Model prediction. Background data randomly selected from heathland-scrub-tundra data set*

## **Geographic restriction**

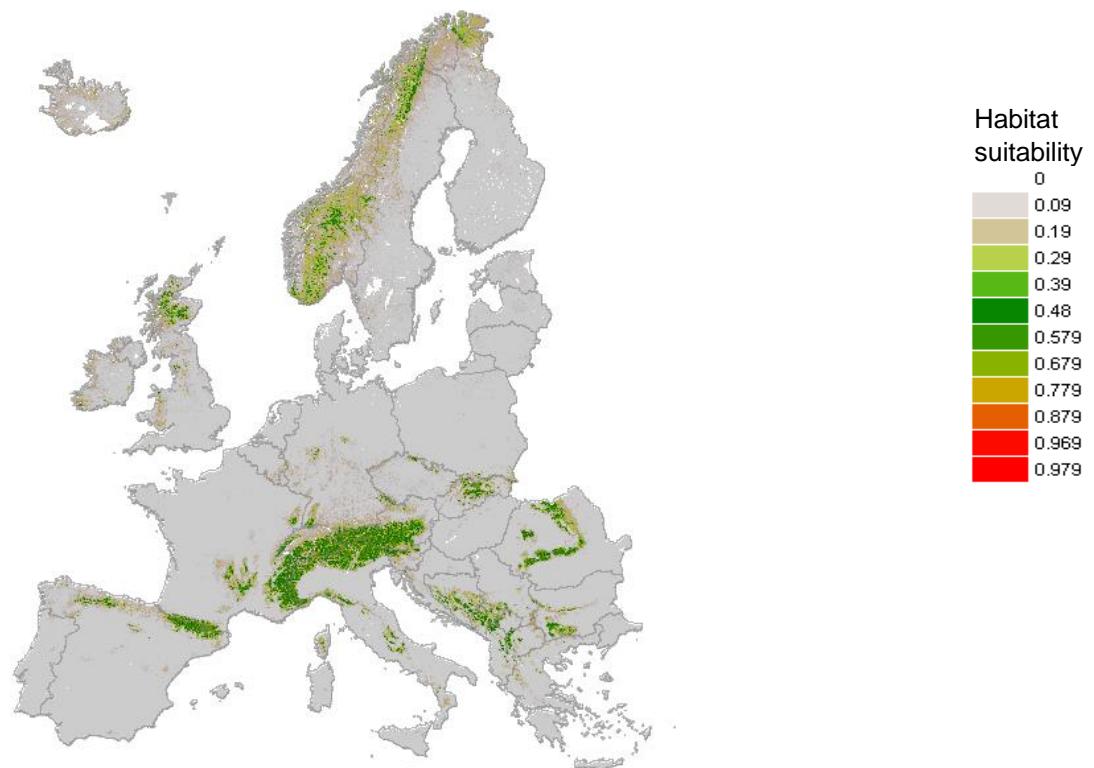

### **Statistics from Maxent modelling**

<b>AUC training (0-1)</b>	0.959
<b>AUC test (0-1)</b>	0.9495
<b>Contribution variables to the Maxent model (%)</b>	
Potential evapotranspiration	61.1313
Solar radiation	14.6043
Precipitation of warmest quarter	7.4932
pH (water)	2.9318
Annual precipitation	2.8906
Temperature seasonality (stdev * 100)	1.9971
Weight in % of sand particles (0.05-2 mm)	1.9254
Mean temperature of wettest quarter	1.4782
Volume % of coarse fragments (> 2 mm)	1.1563
Precipitation seasonality (coef. of var.)	1.1314
Cation Exchange Capacity	1.117
Soil organic carbon content (%)	0.8632
Weight in % of clay particles (<0.0002 mm)	0.6874
Bulk density (kg/m <sup>3</sup> )	0.4187
Weight in % of silt particles (0.0002-0.05 mm)	0.1248
Distance to water	0.0494

## F2.2a - Alpine and subalpine ericoid heath

*Distribution based on vegetation relevés*

*Model prediction. Background data randomly selected from study area*

## **Geographic restriction**

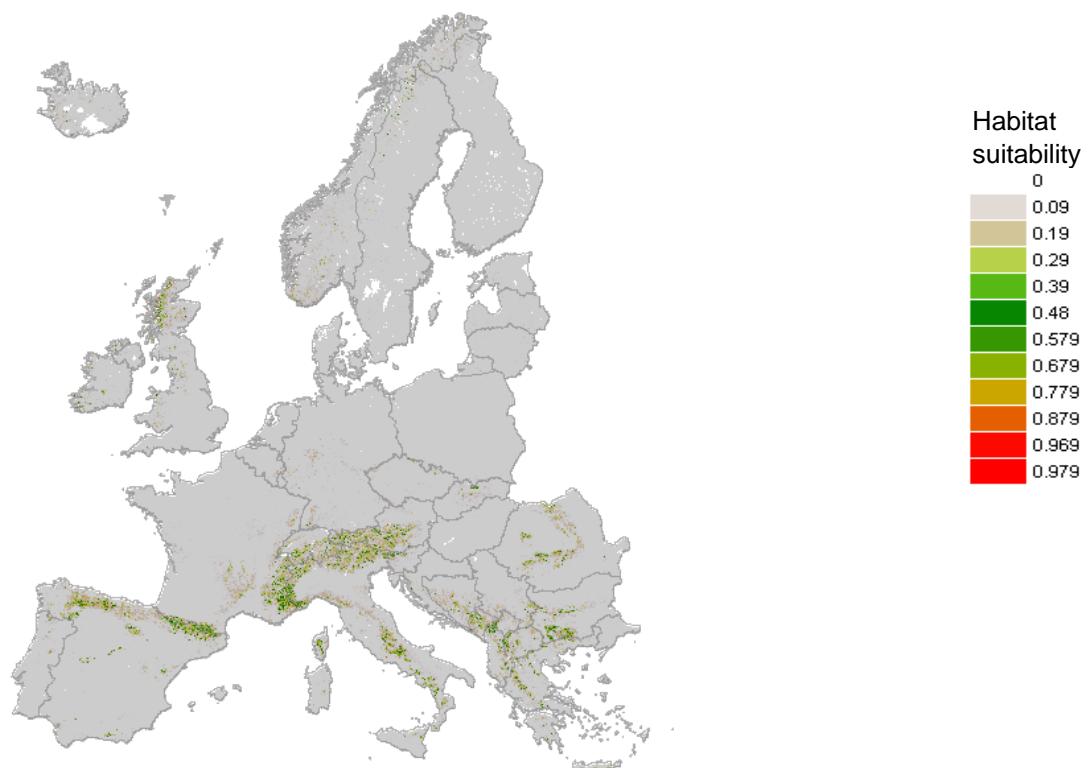

### **Statistics from Maxent modelling**

<b>AUC training (0-1)</b>	0.9024
<b>AUC test (0-1)</b>	0.901
<b>Contribution variables to the Maxent model (%)</b>	
Solar radiation	28.9848
Soil organic carbon content (‰)	14.898
Volume % of coarse fragments (> 2 mm)	11.2741
Annual precipitation	8.8449
Precipitation of warmest quarter	8.569
Bulk density (kg/m³)	5.7166
Weight in % of clay particles (<0.0002 mm)	1.3812
Temperature seasonality (stdev * 100)	1.002
Potential evapotranspiration	0.6311
Weight in % of sand particles (0.05-2 mm)	0.411
Mean temperature of wettest quarter	0.2967
Cation Exchange Capacity	0.1679
Weight in % of silt particles (0.0002-0.05 mm)	0.0379
Precipitation seasonality (coef. of var.)	0.0356
Distance to water	0.0125
pH (water)	0.0047

## F2.2b - Alpine and subalpine Juniperus scrub

*Distribution based on vegetation relevés*

*Model prediction. Background data randomly selected from study area*

## **Geographic restriction**

### **Statistics from Maxent modelling**

<b>AUC training (0-1)</b>	0.981
<b>AUC test (0-1)</b>	0.943
<b>Contribution variables to the Maxent model (%)</b>	
Solar radiation	44.7422

Soil organic carbon content (‰)	0
Weight in % of sand particles (0.05-2 mm)	0
Solar radiation	0
pH (water)	0
Weight in % of silt particles (0.0002-0.05 mm)	0
Temperature seasonality (stdev * 100)	0
Precipitation seasonality (coef. of var.)	0
Annual precipitation	0
Mean temperature of wettest quarter	0
Volume % of coarse fragments (> 2 mm)	0
Cation Exchange Capacity	0
Bulk density (kg/m³)	0

#### F7.4c - Eastern Mediterranean mountain hedgehog-heath

*Distribution based on vegetation relevés*

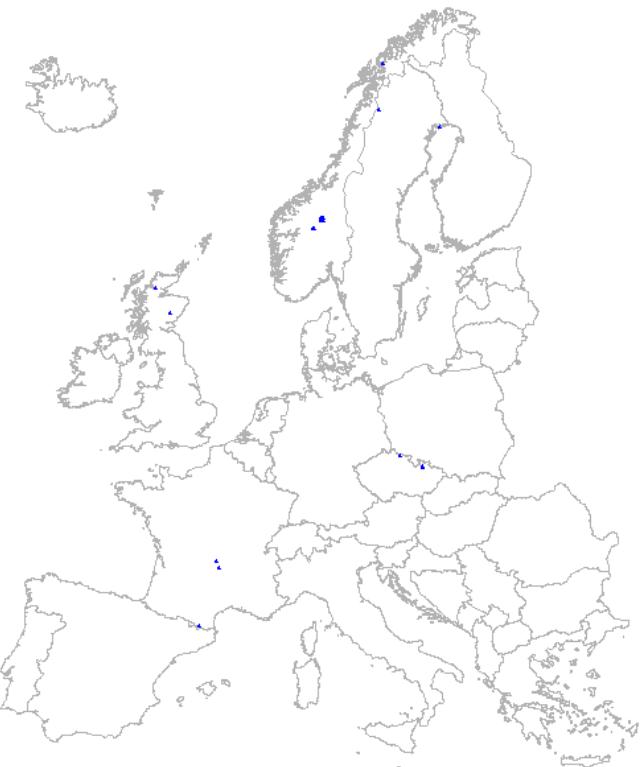

*Model prediction. Background data randomly selected from study area*

## **Geographic restriction**

### **Statistics from Maxent modelling**

<b>AUC training (0-1)</b>	0.9945
<b>AUC test (0-1)</b>	0.9937
<b>Contribution variables to the Maxent model (%)</b>	
Mean temperature of wettest quarter	13.7489
Cation Exchange Capacity	0.8623
Soil organic carbon content (‰)	0.6925
Potential evapotranspiration	0.6387
Precipitation of warmest quarter	0.534
Distance to water	0.2082
Precipitation seasonality (coef. of var.)	0.2079
Bulk density (kg/m <sup>3</sup> )	0.1531
Volume % of coarse fragments (> 2 mm)	0.1496
Weight in % of sand particles (0.05-2 mm)	0.1171
Solar radiation	0.0431
Weight in % of clay particles (<0.0002 mm)	0.0395
Annual precipitation	0.0017
Temperature seasonality (stdev * 100)	0
pH (water)	0
Weight in % of silt particles (0.0002-0.05 mm)	0

**F9.1a - Arctic, boreal and alpine riparian scrub**

*Distribution based on vegetation relevés*

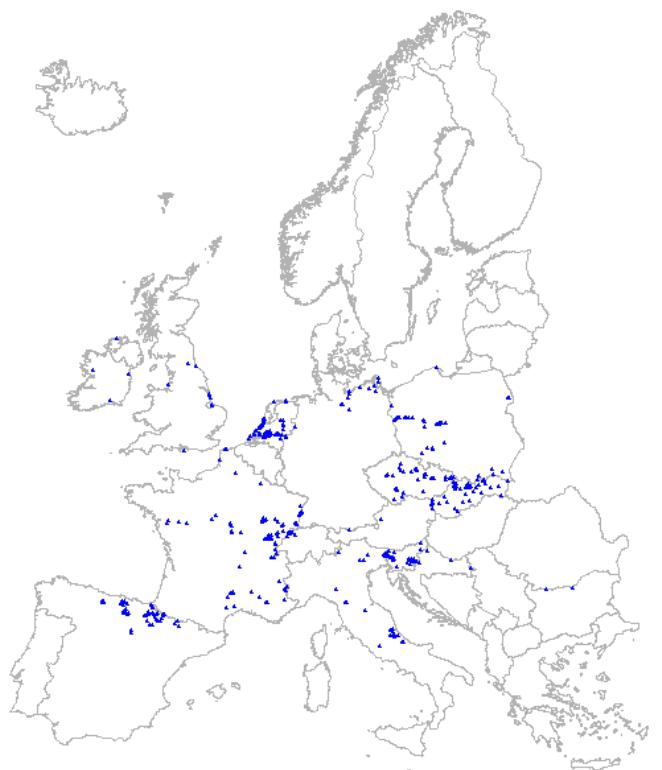

*Model prediction. Background data randomly selected from heathland-scrub-tundra data set*

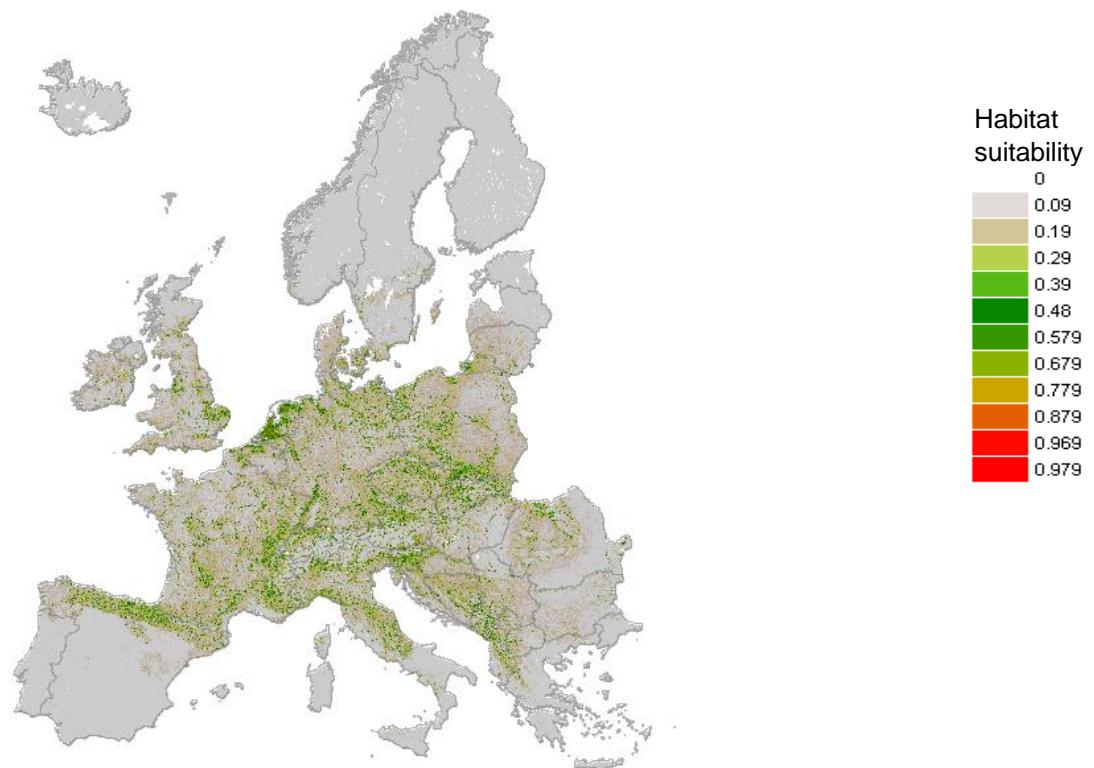

**Geographic restriction**

**Insufficient data to create a model**

**F9.1b - Temperate riparian scrub**

*Distribution based on vegetation relevés*

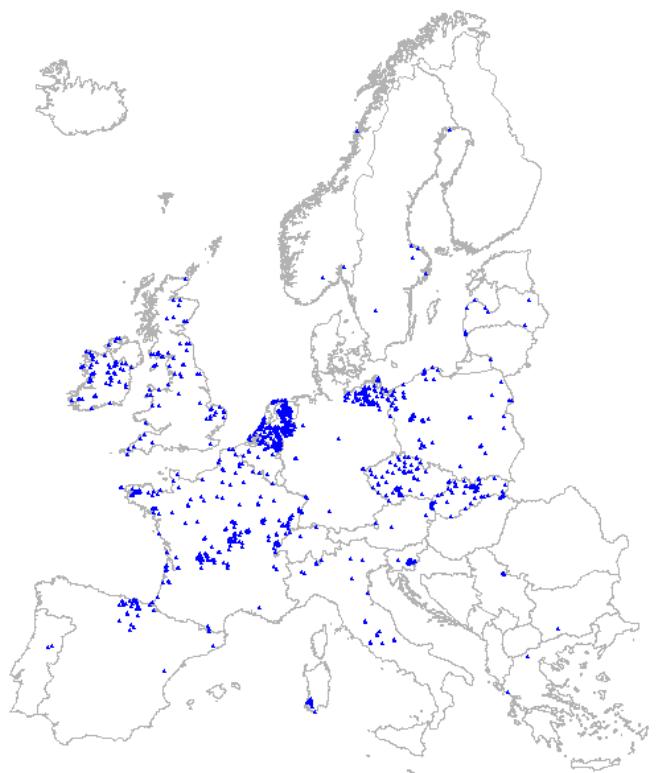

*Model prediction. Background data randomly selected from study area*

## **Geographic restriction**

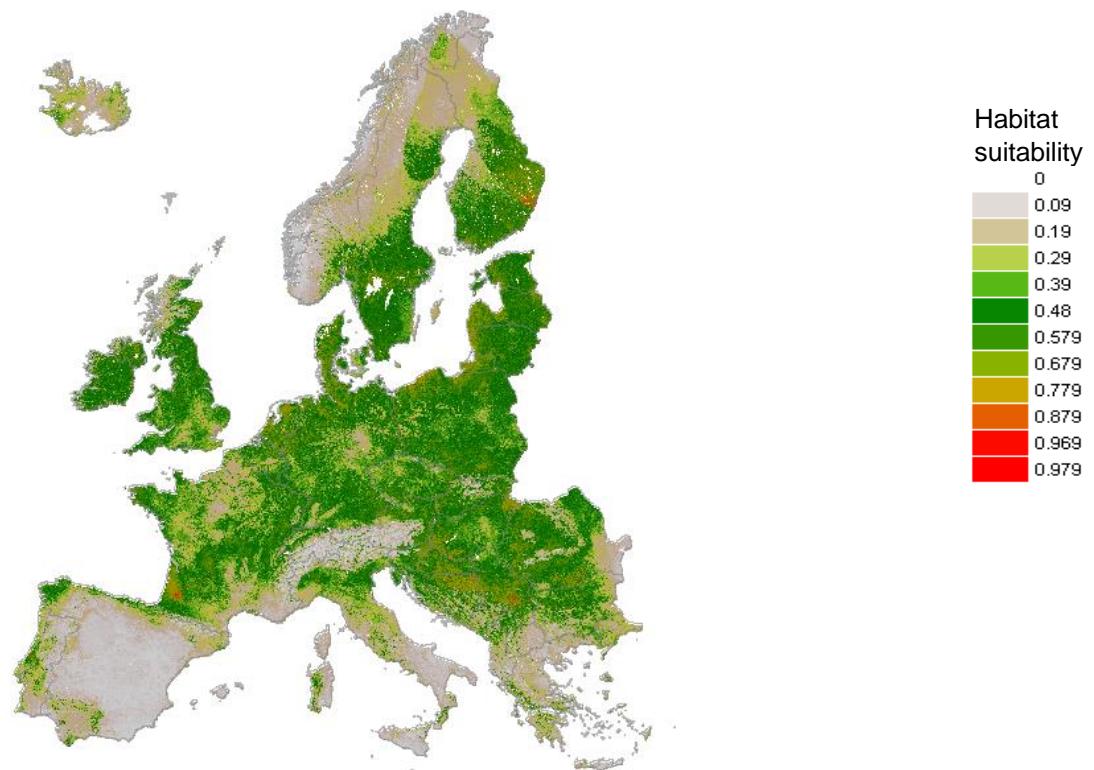

### **Statistics from Maxent modelling**

<b>AUC training (0-1)</b>	0.9399
<b>AUC test (0-1)</b>	0.9057
<b>Contribution variables to the Maxent model (%)</b>	
Distance to water	18.2433
Bulk density (kg/m <sup>3</sup> )	10.7106
Precipitation of warmest quarter	10.3829
pH (water)	7.9892
Solar radiation	4.4862
Temperature seasonality (stdev * 100)	2.0553
Potential evapotranspiration	1.9646
Mean temperature of wettest quarter	0.7656
Volume % of coarse fragments (> 2 mm)	0.5325
Weight in % of silt particles (0.0002-0.05 mm)	0.467
Annual precipitation	0.4519
Cation Exchange Capacity	0.398
Precipitation seasonality (coef. of var.)	0.3399
Weight in % of sand particles (0.05-2 mm)	0.1665
Weight in % of clay particles (<0.0002 mm)	0.0777
Soil organic carbon content (%)	0.0106

## F9.2 - Salix fen scrub

*Distribution based on vegetation relevés*

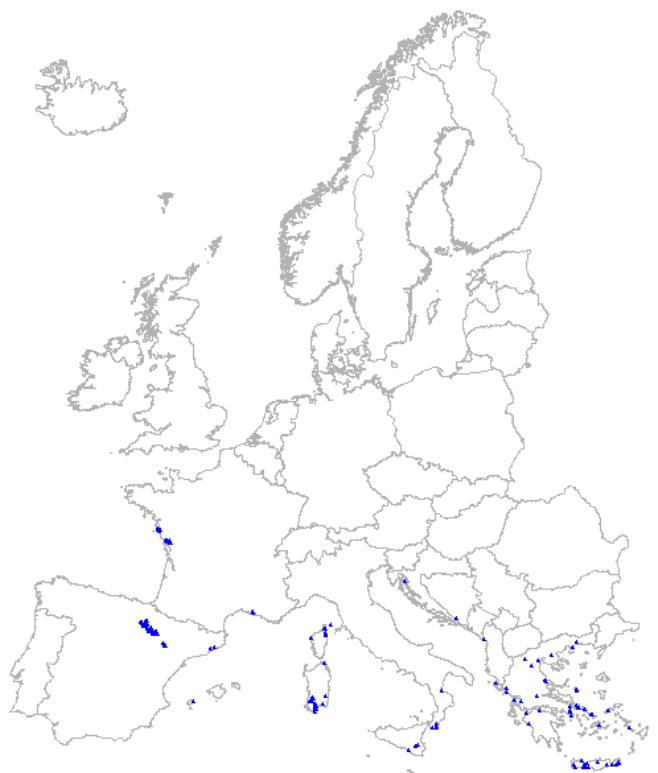

*Model prediction. Background data randomly selected from heathland-scrub-tundra data set*

## **Geographic restriction**

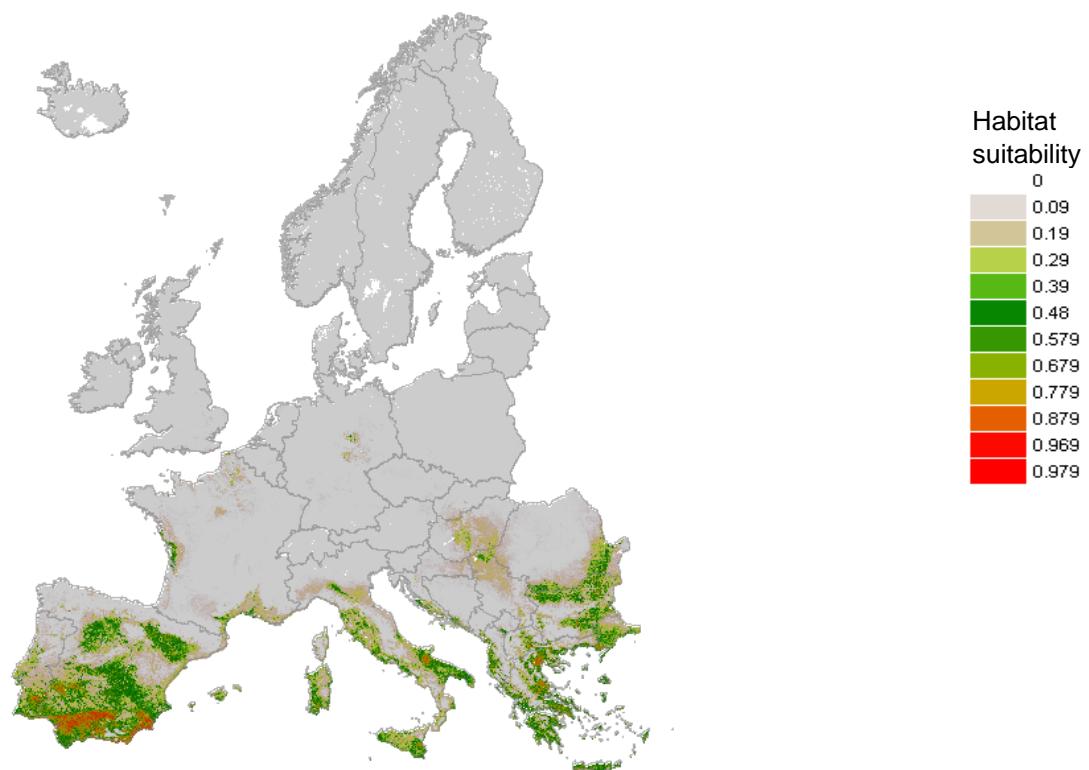

### **Statistics from Maxent modelling**

<b>AUC training (0-1)</b>	0.7915
<b>AUC test (0-1)</b>	0.7492
<b>Contribution variables to the Maxent model (%)</b>	
Volume % of coarse fragments (> 2 mm)	31.9898
Solar radiation	31.4305
Precipitation of warmest quarter	11.7358
Potential evapotranspiration	4.098
Weight in % of silt particles (0.0002-0.05 mm)	3.5562
Annual precipitation	2.4729
Weight in % of sand particles (0.05-2 mm)	2.3418
Precipitation seasonality (coef. of var.)	2.1749
pH (water)	2.1705
Temperature seasonality (stdev * 100)	1.6118
Distance to water	1.5405
Cation Exchange Capacity	1.4386
Soil organic carbon content (%)	1.0339
Bulk density (kg/m <sup>3</sup> )	1.0289
Mean temperature of wettest quarter	0.8632
Weight in % of clay particles (<0.0002 mm)	0.5128

### F9.3 - Mediterranean riparian scrub

*Distribution based on vegetation relevés*

*Model prediction. Background data randomly selected from heathland-scrub-tundra data set*

## **Geographic restriction**

### **Statistics from Maxent modelling**

<b>AUC training (0-1)</b>	0.9732
<b>AUC test (0-1)</b>	0.9783
<b>Contribution variables to the Maxent model (%)</b>	
Precipitation of warmest quarter	35.8734
Bulk density (kg/m <sup>3</sup> )	34.9487
Potential evapotranspiration	7.319
Weight in % of clay particles (<0.0002 mm)	6.0807
pH (water)	4.7564
Solar radiation	2.9503
Precipitation seasonality (coef. of var.)	2.5036
Mean temperature of wettest quarter	1.481
Weight in % of sand particles (0.05-2 mm)	0.8846
Annual precipitation	0.8603
Weight in % of silt particles (0.0002-0.05 mm)	0.7586
