Iconographia Meliolinearum

In February 1962 C. J. Hansford's Monograph of the *Meliolineae* will be published as the second Beiheft of *Sydowia*. In this monograph 1814 species will be described on about 806 pages; the genera *Amazonia*, *Meliola*, *Appendiculella* and *Asteridiella* are treated.

The author has prepared pictures of nearly all the species described, showing all the details necessary for identification as hyphopodia, tips of bristles of mycelium, spores, etc. The pictures are of special value as nearly all of them have been drawn after the type specimens, many of them being difficult to obtain.

The publisher of *Sydowia* now publishes the text of the monograph. Publication of figures will only be possible if a sufficient number of persons interested in them would be prepared to subscribe in advance for the illustrations. These would be published in three parts, each part of 100 plates, each plate with 6 figures. Providing 200 subscriptions could be obtained, each part will cost about 250 Austrian Shillings (about 10.— \$ = 3/10/- £). The proof print of fig. 1209 inserted below gives an idea of the high standard of the illustrations.

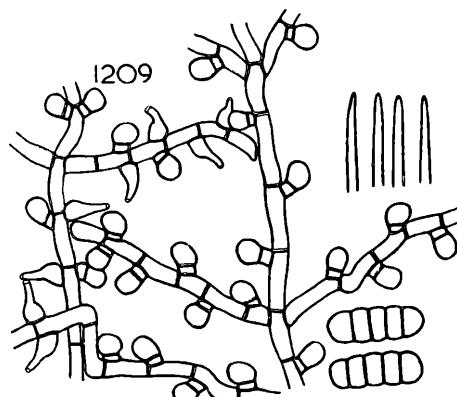

The publisher and the editor want to draw the attention of all mycologists to the fact that the author has spent nearly twenty years in carefully preparing the monograph and the illustrations and that the use of the work would be greatly facilitated by having the illustrations published simultaneously.

Iconographia Meliolinearum

Im Februar 1962 ist die von Dr. C. J. Hansford verfaßte Monographie der Meliolineen als 2. Beiheft der Sydowia erschienen. Sie umfaßt 806 Druckseiten, auf denen 1814 Arten beschrieben werden, die sich auf die Gattungen *Amazonia*, *Meliola*, *Irenopsis*, *Appendiculella* und *Asteridiella* verteilen. Zu dieser Monographie gehören fast ebenso viele Abbildungen, auf denen alle für die Bestimmung wichtigen Einzelheiten — Verzweigung der Myzelhyphen mit den Hyphopodien, Spitzen der Myzelborsten und Sporen — dargestellt werden. Da fast alle Figuren nach Präparaten von Originalexemplaren gezeichnet wurden, sind sie besonders wertvoll, zumal sehr viele Meliolineen-Typen für Vergleichszwecke nicht oder nur schwer zu erhalten sind.

Der Sydowia-Verlag bringt jetzt den Text der Monographie heraus, könnte aber den Druck der dazu gehörigen Abbildungen nur dann durchführen, wenn sich eine hinreichend große Zahl von Interessenten finden würde, die im Voraus auf das Abbildungswerk subskribieren. Die Iconographie würde in 3 Lieferungen zu je 100 Tafeln mit je 6 Figuren auf jeder Tafel erscheinen, die unter der Voraussetzung, daß sich ca. 200 Subskribenten melden, je ca. 250 ö. S = \$ 10 kosten würden. Auf dem umseitig stehenden Probedruck von Fig. 1209 ist die sorgfältige, naturgetreue Darstellung klar zu erkennen.

Verlag und Herausgeber richten an alle Interessenten die dringende Bitte, das Erscheinen der Meliolineen-Iconographie, an deren Herstellung der Verfasser ca. 20 Jahre lang gearbeitet hat, durch Subskription auf das Werk zu ermöglichen und diesbezüglich den Verlag ehestens verständigen zu wollen.

An die Abonnenten und Mitarbeiter der „Sydowia“

Die bis jetzt erschienenen Jahrgänge der unter dem Titel „Sydowia“ neu herausgegebenen, von H. Sydow begründeten „Annales mycologici“ dürften den Beweis dafür erbracht haben, dass sie ihre Bedeutung als internationale mykologische Zeitschrift behaupten konnten. Dem Wunsche einiger Mitarbeiter entgegenkommend, haben wir uns entschlossen, folgende Neuerung einzuführen: Damit die einlangenden Manuskripte so schnell als möglich veröffentlicht werden, wird die Zeitschrift vom 12. Jahrgang an alljährlich in 2—3 Heften herauskommen, die in ca. 6- oder 4-monatlichen Intervallen erscheinen werden.

Mit Rücksicht auf die hohen Druckkosten können Arbeiten in der „Sydowia“ nur unter folgenden Bedingungen aufgenommen werden:

1. Die Manuskripte müssen sorgfältig, möglichst mit der Maschine geschrieben und in fehlerfreier Sprache verfaßt sein. 2. Werden nachträglich kleine Korrekturen im Manuskript mit Handschrift vorgenommen, so sind vor allem die lateinischen Pflanzennamen, alle Fachausdrücke und Autornamen möglichst deutlich zu schreiben. Durch nachträgliche Einschaltungen, Streichungen und sonstige Korrekturen ganz unübersichtlich gewordene Manuskripte können nicht gedruckt werden. Es wird dringend gebeten, alle Manuskripte locker, d. h. mit zeilenbreiten Zwischenräumen zu schreiben. 3. Werden von den Autoren nachträglich in den Bürstenabzügen oder in den Umbruchkorrekturen Änderungen im Satze vorgenommen, so müssen sie die dadurch entstehenden Mehrkosten des Druckes tragen. 4. Die Herren Autoren werden gebeten, ihre Arbeiten möglichst kurz zu fassen. Weitschweifige Einleitungen, Erörterungen und Wiederholungen sind zu vermeiden. Bei Arbeiten rein systematischen Inhaltes sind Zusammenfassungen ganz überflüssig und können daher auch nicht gedruckt werden. Bei nicht systematischen Arbeiten können Zusammenfassungen gebracht werden, sollen aber sehr kurz und womöglich in einer anderen Sprache als der Originaltext verfaßt sein. 5. Arbeiten für die Sydowia können in lateinischer, englischer, französischer, italienischer oder spanischer Sprache verfaßt sein. 6. Im eigenen Interesse werden die Herrn Autoren gebeten, ihren Arbeiten nur unbedingt notwendige, naturgetreue Abbildungen beifügen zu wollen. Mit Rücksicht auf die hohen Herstellungskosten für Tafeln und Abbildungen müssen diese von den Autoren getragen werden. 7. Die Autoren werden gebeten, bei Anfertigung aller Abbildungen und Tafeln auf die Größe des Satzspiegels (11 x 18,5 cm) Rücksicht zu nehmen. 8. Für Form und Inhalt der Arbeiten sind nur ihre Autoren verantwortlich.

Zusendungen von Werken und Abhandlungen, deren Besprechung in der „Sydowia“ gewünscht wird, Manuskripte und alle die Redaktion betreffende Anfragen sind an den Herausgeber, Bestellungen und geschäftliche Mitteilungen an den Verlag zu richten.

Der Preis für den Jahrgang beträgt 40 Schw. Fr.

Separata werden den Herren Mitarbeitern auf Verlangen bis zu 30 Exemplaren kostenlos gewährt. Außer diesen Freixemplaren werden auf Wunsch noch weitere Separata hergestellt, wenn sie spätestens bei der Einsendung der letzten Korrektur beim Verlage bestellt werden.

Nachforderungen fehlender oder verloren gegangener Hefte können nur berücksichtigt werden, wenn sie spätestens beim Empfang des nächstfolgenden Heftes erfolgen.

Berger & Söhne Ges.m.

Introduction

The family *Chaetothyriaceae* was raised by Hansford, C. G., in 1946, in the light of the studies of Bitancourt, A. A., 1936, on type material of *Chaetothyrium guaraniticum* Speg.

Now the characteristics of this family are reduced to contain only fungi of hyaline mycelium, in accordance with its genus type; some genera are fragmented into other new genera to maintain the best definition on their taxonomic delimitation, while other genera are transferred to another family.

The first rough idea of taxonomic interest about the relative position of mycelium and perithecia is to be attributed to Theissen and Sydow, discriminating, among the Capnodiaceae family, the tribes Eu-Capnodieae Th. & Syd. and Chaetothyrieae Theiss. (See Ann. Mycol. vol. XV, p. 471—472, 1917).

A progressive step has been taken by Bitancourt (Arq. Inst. Biol. S. Paulo, vol. VII, pag. 7—12, 1936) who effected a thorough revision of the Spegazzinian type of the genus *Chaetothyrium*, *C. guaraniticum* Speg.

He observed that the perithecia are found beneath the mycelial pellicle, which is adherent to the outer wall of the upper part of these fruiting bodies. The mycelium pellicle is then lying on the leaf surface like a cloth covering a solid body.

A further step was the full validation of this characteristic made by Hansford (I. M. I. Myc. Pap. N. 15, pag. 139—159, 1946) instituting the *Chaetothyriaceae* family with five genera: *Chaetothyrium*, *Setella*, *Microcallis*, *Phaeosaccardinula* and *Actinocymbe*.

Bitancourt's revision of the Spegazzinian type of the genus *Chaetothyrium* stated that the mycelium is hyaline, not visible under small magnification. The ascocarp is perithecial, unilocular, ostiolate and paraphysate, but it is surrounded by mycelial reticular tissue, not well defined, made according to up of almost loose hyaline hyphae ("subicle" of some authors).

The same kind of hyphae, bound in strands, are connecting the perithecia and some scattered setae, while the remaining mycelium is made up of a thin net of hyphae.

This peculiar characteristic has been clearly expressed by Hansford, in the description of the family as a "thin pellicle on loose network over the host leaf"; but he included in this family fungi having subhyaline to olivaceous hyphae, evidently with the purpose of

putting together all the fungi with perithecia developed beneath the mycelial pellicle.

During many years, we had occasion to study abundant material pertaining to the *Chaetothyriaceae* family, and, in our opinion, the establishment of this family is fully justified.

But, by widening the family to include species with dematiaceous, as a rule fumagineous mycelium, the *Chaetothyriaceae* include heterogeneous elements, having in common the perithecial development under the mycelial pellicle.

One group of species presents hyaline to subhyaline, relatively thin mycelium, sparingly or confusedly septate, not or very slightly narrow at the septa, as a rule firmly adhering to the leaf surface (the leaf cuticle, in some portion of the vegetative hyphae, may be swollen).

The interperithecial infertile mycelium, may be composed of loose, interlaced hyphae, or of delicate, reticulate-vermiculate strands. It is not evident under small magnification. The same mycelial pseudotissue is found on and around the perithecia, obscuring its true structure, and forming a kind of "subicle" with a mucous-evanescent peripheral portion.

The perithecial wall is relatively thin, composed of an outer part build up by one to a few layers of parenchymatous cells and an inner part of more or less differentiated layers of hyphae.

Another group of species possesses full dematiaceous mycelium, brown to blackish in color, relatively thick, clearly and densely septate, as a rule narrowed at the septa up to a full dematioid or toruloid shape. This mycelium never adheres to the leaf surface, also in correspondence to the sterile hyphae. The leaf cuticle is not altered in any way. In addition, this kind of mycelium is not rarely mucous or slimy, and, in any case, is apt to absorb moisture. The interperithecial sterile mycelium may be loose or aggregate in strand or forming a pellicle, and, in any case, it is well evident also under small magnification. It is easy to separate this mycelium from the leaf. The same strands or pellicle cover the peritheciun, completely obscuring its structure when forming a continuous pellicle; the perithecia however, are developed beneath the mycelial pellicle.

In our opinion, this discrimination fully agrees with the distinction of three families; *Chaetothyriaceae*, with hyaline mycelium, *Phaeos accardinulaceae* and *Euceramiaceae* having dark mycelium with uni- or plurilocular perithecia.

So delimitated, the *Chaetothyriaceae* family includes the genus *Chaetothyrium* as typified by *C. guaraniticum* and the genera *Recifea* Bat. & Cif., *Ciferriusia* Bat., *Sphaerochaetia* Bat. & Cif., *Microcalliomyces* Bat. & Cif., *Ainsworthia* Bat. & Cif., *Trebiomyces* v. Hoehn. emended and *Batistaella* Ciferri.

The problem of the characterization of the family *Phaeosaccardinulaceae* with the genus *Phaeosaccardinula* P. Henn., is more delicate.

Hansford does not mention the nature of the mycelium, translating the diagnosis of Saccardo's Sylloge, with a few modifications. The type species (*P. diospyricola* P. Henn.) possesses "sub-fuscous, simple hyphae". The second species of the same genus, *P. ficicola* P. Henn., is described as having "hyphis radiantibus ramosis, septatis, hyalinis vel fuscis"

Theissen and Sydow (l. c. pag. 480) considered *Phaeosaccardinula* as having dematioid mycelium, but there is no indication of a personal revision of the type specimen.

The three species referred by the same mycologists (*P. malloti* (Rehm) Theiss.; *P. buttleri* (Syd.) Theiss. & Syd. and *P. indiae* (Syd.) Theiss. & Butl. possess black or dull-brown mycelium.

To sum up, it appears justified to take out from *Chaetothyriaceae* Hansf. all the fungi having dematioid mycelium and transferring them to the new families *Phaeosaccardinulaceae*, with the genus *Phaeosaccardinula* as the type, having perithecia unilocular, and *Euceramiaceae*, with the genus *Euceramia* as the type, having perithecia plurilocular.

A few words about the systematic position of the above quoted families are to be added.

The *Phaeosaccardinulaceae* as well as the *Euceramiaceae* families, so defined, fully pertains to the sooty molds group in relation to the complete epiphytic life, notwithstanding the morphology and quite distinct origin of their perithecia. These two families and the *Chaetothyriaceae* are ascribed, then, to the new order, *Chaetothyriales*.

In addition, *Phaeosaccardinulaceae* may possess a pycnidial stage, either with elongate or spherical pycnidia, in common with the member of the *Capnodiaceae* family. Also in common with *Capnodiaceae*, the *Phaeosaccardinulaceae* and *Euceramiaceae* may be associated with insects and their secretions or not.

The systematic position of the order *Chaetothyriales*, appears to be parallel to the order *Capnodiales* both orders deriving from *Pseudosphaerales* (incl. *Dothideales*). The evolution line in *Chaetothyriales* we suppose to come from the hyaline mycelium in *Chaetothyriaceae* to the subhyaline or dull mycelium in *Phaeosaccardinulaceae* and *Euceramiaceae*.

The asci, judging from Bitancourt's revision of *Chaetothyrium guaraniticum* and from the results of our study with several genera of the families *Phaeosaccardinulaceae* and *Euceramiaceae*, are normally unitunicate, in accordance with Luttrell's statement; however, as an exception, a few species have bitunicate asci; the discharge of the spores has not been observed.

In conclusion, according to our point of view, the *Chaetothyriaceae*

family, as defined by Hansford, sensu stricto, is fully justified to include all fungi with superficial hyaline mycelium, the perithecia of which develop beneath a mycelial network or pellicle.

The new family *Phaeosaccardinulaceae* will comprehend all sooty-molds fungi with dull, dematioid mycelium, having perithecia unicellular developed beneath the mycelial pellicle.

The new family *Euceramiaceae* should be distinguished from *Phaeosaccardinulaceae* for having in common the perithecia developed beneath a mycelial pellicle; they, however, are plurilocular.

These three families are ascribed to the new order *Chaetothyriales* having the family *Chaetothyriaceae* as the type.

The affinity of the order with *Pseudosphaeriales* results from the strands of pseudoparaphysoides (namely, the remaining of hyphae filling the perithecia, after the differentiation of ascogenous hyphae), having a tendency to grow from the top to the bottom of the ascocarp.

Chaetothyriaceae. Hansf.

Hyaline mycelium.

Scolecosporae Spores hyaline, transversally septate, thread- or worm-like, with ratio of dimensions at least 10 : 1.

Mycelium and perithecia not setose *Limaciniella* Stev.

Ainsworthia Bat. & Cif. n. gen.

Dedicated to Dr. G. C. Ainsworth, British mycologist.

Mycelium pelliculosum, hyalinum vel sub-hyalinum, non setosum,

non hyphopodiatum. Perithecia ob pellicula mycelica tecta, non setosa, pseudo ostiolata. Asci 1-tunicati, aparaphysati. Ascospores muriformes, hyalinae.

Typus: *A. xantoxyliae* Batista & Costa.

Ainsworthia morindae (Stev.) Bat. n. comb.

Syn: *Phaeosaccardinula morindae* Stevens in Bern. P. Bishop Mus. Bul. 19 : 59, 1925.

Mycelium thinly pelliculose, hyaline to subhyaline, the hyphae irregularly branched and composed of oblong and cylindrical cells, not setose, nor hyphopodiate. Perithecia developed beneath the mycelial pellicle, globose, membranous gelatinous, dark-brown,

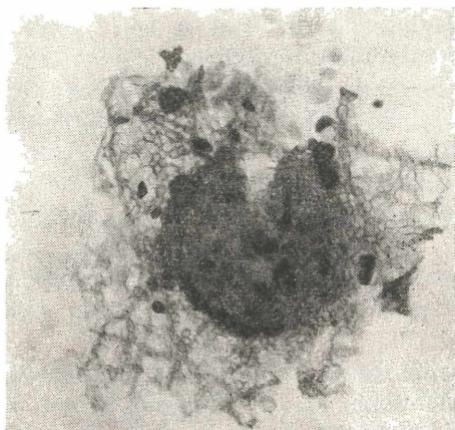

Fig. 1. *Ainsworthia smilacina* Bat. et Vit.

pseudo-ostiolate, about 220μ diam, without setae. Asci ovoid, 8-spored, numerous, $44 \times 30 \mu$, aparaphysate. Ascospores ellipsoid to oblong, muriform, 4-transversally septate, 1-longitudinal septum, not constricted, hyaline, $27 \times 10 \mu$.

On *Morinda citrifolia* — Ohau, Hakipuu, June 6, 1925.

Est *Ainsworthia* per mycelium et perithecia non setosa et per ascospores muriformes.

Ainsworthia negeriana (Sacc. & Syd.) Cif. & Bat. n. comb.

Syn.: *Tephrosticta negeriana* Sacc. & Syd. ap. Sydow. Ann. Mycol., II: 162 (1904).

Mycelium as a delicate subicle, without setae, ash grey; Perithecia globose-hemispheric, then collapsed, glabrous, $160-200 \mu$ diam., with a not papillate, apical pore, 20μ diam. Asci clavate, short stipitate, with rounded top, $65-75 \times 11-13 \mu$, 8-spores. Ascospores

distichous, ellipsoid-oblong, obtuse to acute, 3-septate, hyaline, with a broken longitudinal septum, $12-14 \times 5 \mu$.

On *Litsea* — Chile.

Ainsworthia seaveriana (Toro) Bat. & Cif. n., comb.

Ex.: *Phaeosaccardinula seaveriana* Toro in *Mycologia*, XVII: p. 145, 1925.

Mycelium amphigenous, effuse, ash-olivaceous, hyphae subhyaline, septate, constricted, cells $7-23 \times 6-8 \mu$. Perithecia globose-flattened, black, glabrous, $168-200 \mu$ in diam.; ascii clavate, 4-spores, sessile, $60-70 \times 22-30 \mu$; ascospores ellipsoid, muriform, 4-7 transverse septa, 2-4 longitudinal septa, $39-45 \times 16-18 \mu$, hyaline.

On *Erythrina* — Porto Rico.

Ainsworthia smilacina Bat. & Vital, n. sp.

Mycelium epiphyllous, superficial, pelliculose, thin, subhyaline to yellowish, hyphae reticulate, septate, not constricted, with cylindrical cells, $6-17.5 \times 5-7.5 \mu$, not setose, nor hyphopodiate. Perithecia developed beneath the mycelial pellicle globose-depressed, $152-186 \mu$ diam., rare, brownish, pseudo-ostiolate, membranous, the walls having subglobose to polygonal cells, $4-9 \mu$ wide, not setose. Fig. 1. Ascii subglobose, 8-spores, 1-tunicate, sessile, $22-27.5 \mu$, apophysate. Ascospores clavate to ellipsoid, polystichous, 3-4 transversally septate with 1-longitudinal septum, hyaline, $15-17.5 \times 5-7.5 \mu$, Fig. 1 & 2.

Associated with *Hormiscium* sp. and *Trichopeltinaceae*.

On leaves of *Smilax* sp. — Olympus, Ohau, Hawaii, June, 24, 1921. Leg. F. L. Stevens. Type no. 6667, Herbarium University of Illinois.

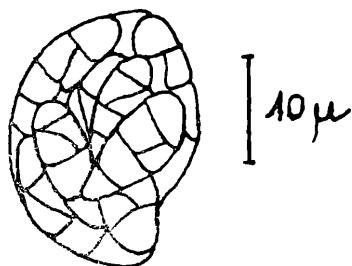

Fig. 2. *Ainsworthia smilacina* Bat. et Vit. — Ascus.

Obs.: This specimen was designated as the type of *Phragmocapnia smilacina* Mendoza, which we have not found.

Mycelium epiphyllum, superficiale, pelliculosum, tenuie, subhyalinum vel flavidum, ex hyphis reticulatis, septatis, non constrictis, ex cellulis $6-17.5 \times 5-7.5 \mu$, non setosis, non hyphopodiatis compositum. Perithecia ob pelliculam

mycelicam tecta, globose-depressa, $152-186 \mu$ diam., rara, brunnescensia, pseudo-ostiolata, membranosa, subparenchymatica, ex cellulis polygonalibus vel subglobosis, $4-9 \mu$ diam., non setosis, efformata. Asci sub-globosi, 8-spori, 1-tunicati, sessiles, $22-27.5 \mu$, aparaphysati. Ascospores clavatae, vel ellipsoideae, polystichae, 3-4 transversaliter septatae, 1-lengitudinaliter septae, hyalinae, $15-17.5 \times 5-7.5 \mu$.

Ainsworthia xanthoxyli Bat. & Costa, n. sp.

Colonies superficial, epiphyllous, brownish at the naked eye, single, scattered, small, rounded, about 0.5 mm diam. Mycelium superficial, thinly pelliculose, not setose nor hyphopodiate, composed of a few hyaline to subhyaline, septate hyphae, little constricted, with cylindrical cells from 4.5 to $13.5 \times 1.5-3.3 \mu$. Perithecia developed beneath the mycelial pellicle, globose-flattened, scattered, not setose brownish, $118-145 \mu$ in diam., $78.5-100 \mu$ in height, pseudo-ostiolate,

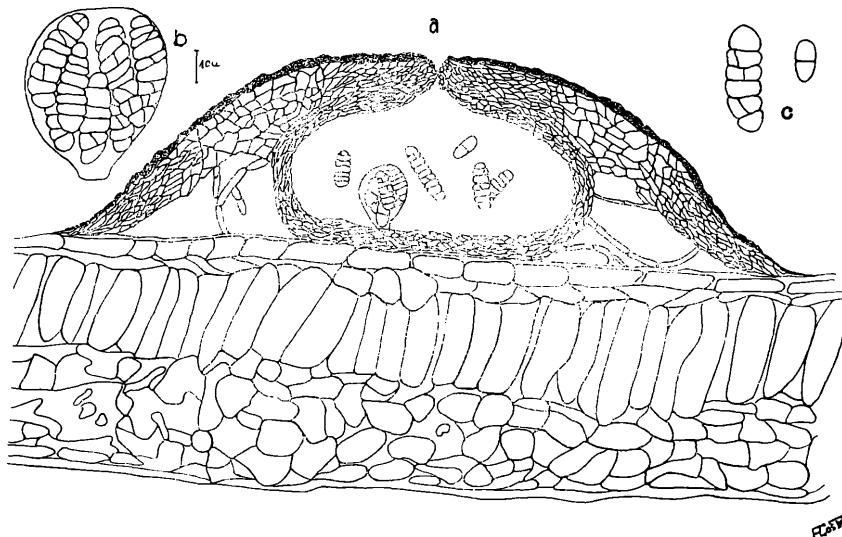

Fig. 3. *Ainsworthia xanthoxyli* Bat. et Costa. — a) Histological cut showing the peritheciun beneath the mycelial pellicle. — b) Ascus. — c) Spores.

semitranslucent; perithecial wall membranous, pseudoparenchymatic, of 5 to 7 layers, $14-20 \mu$ in thickness at the top, $8-12 \mu$ thick at the base, made up of cylindrical and polygonal cells, $3.5-11.5 \times 1-3.5 \mu$. Asci subglobose to clavate, 6-8-spores, one tunicate, sessile to short pedicellate, $30-48 \times 15-30 \mu$, aparaphysate. Ascospores cylindraceous, at first 1-transversally septate, then with 5 to 8 transversal septa and 1 to 4 longitudinal septa, constricted, hyaline, $25-35 \times 7.5-10 \mu$, polystichous, Fig. 3.

On live leaves of *Xanthoxylum rhoifolium* Lam. Victoria. Leg. S. J. Silva, 24. 6. 56. Typus 5663, Institute of Mycology, University of Recife. Dets. A. Chaves Batista and Carlos Amaral Costa.

This species appears to be distinct from *D. ficina* for having smaller perithecia, shorter ascii, and ascospores with larger number of septa both transversal and longitudinal, besides the hyaline condition of the mycelium.

Coloniae superficiales, epiphyllae, brunneolae, sparsae, minutae, 0.5 mm diam., rotundatae, Mycelium superficiale, pelliculosum, ex hyphis hyalinis vel subhyalinis, septatis, parvum constrictis, ex cellulis cylindraceis, 4.5–13.5 × 1.5–3.3 µ, non setosis, exhypopodiatis compositum. Perithecia sub pellicula mycelii oriunda, globosé-depressa, sparsa, non setosa, brunnea 118–145 µ diam., 78.5–100 µ alt., pseudostiolata, cum parietibus semitranslucidis, membranosis, pseudoparenchymaticis, 5–7 stratosis, 14–20 µ cr, ex cellulis cylindraceis vel polygonalibus, 3.5–11.5 × 1–3.5 µ compositis. Ascii subglobosi vel clavati, 6–8-spori, 1-tunicati, sessiles vel brevi-stipati, 30–48 × 15–30 µ aparaphysati. Sporae cylindraceae, ab initio 1-septatae, dein 5–8 transversaliter septatae et 1–4 longitudinaliter septatae constrictae, hyalinae, 25–35 × 7.5–10 µ, polystichae.

Also on *Artocarpus incisa* — associated with immature *Trichomerium*. Rosario, Puerto Rico. F. L. Stevens, 11–14–913. Spec. 13315, Inst. Mycol. Univ. Recife and in The Fungus National Collections, U.S.A.

Almeidaea Cif. & Bat. n. gen.

Typus: *A. vermispora* (Hansf.) Cif. & Bat., n. comb.

Mycelium pelliculosum. Hyphae hyalinae vel subhyalinae, cum seta simplici, fusca. Perithecia sub pellicula mycelica oriunda, globosa, pseudo-ostiolata non setosa; ascii 8-spori; sporae cylindraceae vel elongatae pluri-transversaliter septatae, hyalinae.

Dedicated to Brazilian mycologist for medical fungi Prof. Floriano de Almeida, of São Paulo, Brazil).

Almeidaea vermispora (Hansf.) Cif. & Bat. n. comb.

Syn. *Chaetothyrium vermisporum* Hansf. in Comm. Mycol. Inst. Mycol. Pap. n. 15, p. 151, 1946.

Mycelium amphigenous, pelliculose, brownish, hyphae hyaline to subhyaline, 2.5–3 µ thick, reticulate; mycelial setae erect, straight, simple, brown, septate, 180–200 × 5–7 µ. Perithecia blackish-

brown, globose-depressed, 120–160 μ diam., 80 μ high, pseudo-ostiolate, walls 7 μ thick, 2–3 layered. Ascii ovoid to ellipsoid, nodose-stipitate, 8-spores, 60 \times 30 μ , aparaphysate. Ascospores vermiform, 15–17 septate, not constricted, 35–50 \times 5–6 μ , hyaline, Fig. 4.

On leaves of *Canthus*, *Ventilago*, *Hugonia*-Uganda.

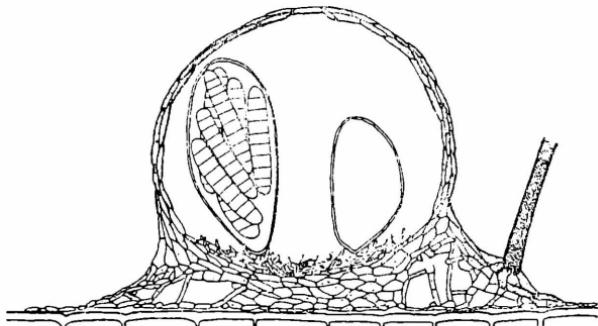

Fig. 4. *Almeidaea vermispora* (Hansf.) Cif. et Bat.

***Almeidaea mysorensis* (Hansf.) Bat. & Cif., n. comb.**

Syn.: *Chaetothyrium mysorensis* Hansf. Hansf. & Thirum. in Farlowia, 3: 301, 1948.

Mycelium epiphyllous, effuse, pelliculose, reticulate, almost invisible, hyphae hyaline, 2–3 μ wide. Perithecia globose, 150–210 μ

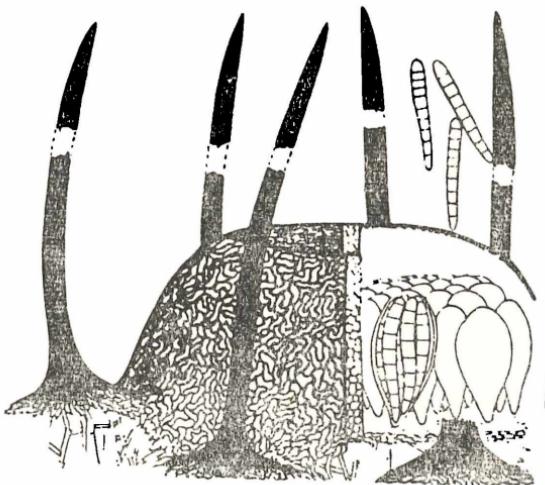

Fig. 5. *Almeidaea mysorensis* (Hansf.) Bat. et Cif.

diam., developed beneath the mycelial pellicle; setae around the perithecia, erect, black, straight, 200 \times 8–10 μ , acute; ascii clavate, 8-spores 55–60 \times 20–25 μ , aparaphysate; ascospores cylindric-

clavate, 7—9 transverse septate, not constricted, hyaline, $40—50 \times 5 \mu$, Fig. 5.

On *Salacia*, India.

Batistaella Ciferri, n. gen.

Mycelium tenuiter pelliculosum, subhyalinum, non setosum, nec hyphopodiatum. Perithecia pellicula mycelica obtecta, non setosa. Ascii paraphysati. Ascosporae coloratae, transversaliter et longitudinaliter pluriseptatae.

Typus: *B. coumae* (Bat. & Vital) Ciferri.

Eximio mycologo brasiliensi Dr. Augusto Chaves Batista dicatum.

Batistaella canthii (Hansf.) Cif., nov. comb.

Syn.: *Phaeosaccardinula canthii* (Hansf.) Hansf.

Saccardinula canthii Hansf. in Proc. Linn. Soc. Lond. CLIII, pag. 52, 1941 Comm. Mycol. Inst. Myc. Pap. no. 15, 154, 1946.

Mycelium almost invisible, thinly pelliculose, hyphae subhyaline, reticulate, septate, 3μ thick. Perithecia / globoid, brown, $180—240 \mu$ in diam., 150μ high, pseudo-ostiolate, not setose. Ascii ellipsoid to ovoid, 8-spores, sessile, $100 \times 50 \mu$. Ascospores cylindric to fusoid, $10—15$ transverse septate, 1-longitudinal septum in many cells, yellowish, pink in mass, $50—80 \times 12—15 \mu$.

On *Plectronia*, *Ventilago*, *Alchornea*, *Casearia*-Uganda.

Batistaella coumae (Batista & Vital) Cif. n. comb.

Syn.: *Phaeosaccardinula coumae* Bat. & Vital in Ann. Soc. Biol. Pern. t. XIII, p. 110, 1955.

Mycelium epiphyllous or amphigenous, thin pelliculose, hyphae subhyaline, reticulate. Perithecia scattered, globose, brown, $170—235 \mu$ in diam., pseudo-ostiolate. Ascii 8-spores, ellipsoid to ovoid, pedicellate, $62.5—97.5 \times 30—42.5 \mu$, paraphysate. Ascospores ellipsoid, muriform, $7—13$ -transversally septate with many longitudinal septa, fuscous, $42.5—75 \times 17.5—22.5 \mu$.

On *Couma* — Brazil.

Chaetothyrium Speg. emend. Bitancourt.

Mycelium very thin, in colonies almost invisible to thinly pelliculose, hyaline to subhyaline, hyphae parallel to reticulate, composed of elongate cells. Mycelial setae erect, dark, scattered, and present also over the perithecia. Perithecia scattered, subglobose, dark, formed below the mycelial pellicle, pseudo-ostiolate, with setae on the covered membrane. Ascii cylindric to ovate, basal, 8-spores, a paraphysate. Ascospores phragmoseptate, hyaline.

Type: *C. guaraniticum* Speg. in Fung. Guaran. II: no. 123,

1888 — A. A. Bitancourt, in Arch. Inst. Biol. São Paulo, vol. 7,
p. 5—22, 1936.

Chaetothyrium concinnum Syd. in Ann. Myc. XXIV: 343—346,
1926.

Mycelium superficial, epiphyllous, slightly pelliculose, spread, hyaline, hyphae reticulate-branched, 2—3 μ thick, septate; mycelial setae scattered, 100—500 μ in height, 7—12 μ wide, brown-blackish, erect, curved, acuminate. Perithecia developed beneath the mycelial

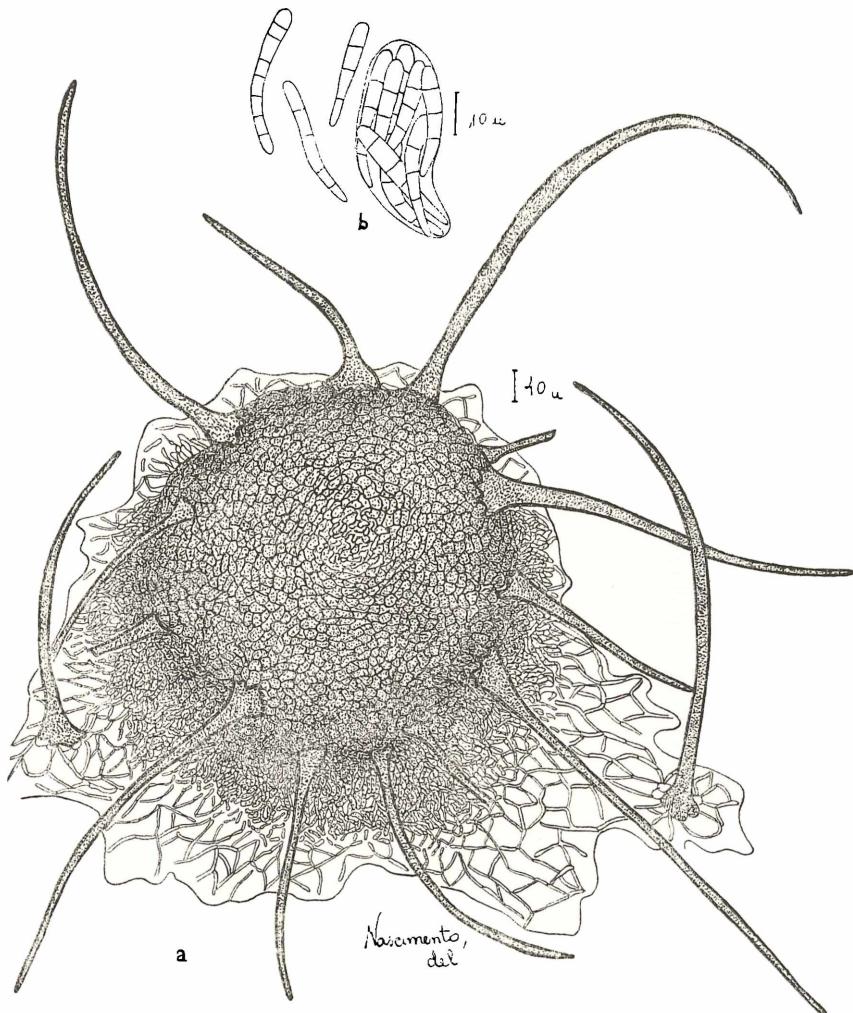

Fig. 6. *Chaetothyrium concinnum* Syd. — a) Perithecium and mycelium, both setae. — b) Ascus and ascospores.

pellicle, globose-depressed $180-248 \mu$ diam., $150-210 \mu$ in height, brown-blackish, gregarious, pseudo-ostiolate, membranous, subparenchymatic, the walls made up of subglobose cells, $3.5-10 \times 3-8 \mu$, in several layers. The perithecial setae are $10-12$ scattered at the margins of the perithecia, erect, straight or curved, blackish-brown, opaque, $150-500 \mu$ in height, $18-24.5 \mu$ diam. at the base, $2.5-15 \mu$ wide at the top, rigid. Fig. 6. Ascii clavate, sessile or short stipitate, 8-spores, 1-tunicate, $46-63 \times 18-25 \mu$, aparaphysate. Ascospores clavate-fusoidal, 3-8-septate, little constricted or not, parallel or polystichous hyaline, $15-38 \times 4.5-6 \mu$. Fig. 6.

On leaves of *Casearia silvestris* — Grecia, Costa Rica. Leg. H. Sydow, 12. 1. 925.

This redescription is derived from the examination of Sydow's type generously lent to us by Instituti Botanico e Crittogrammi, Università de Pavia, Italy. No. 635, Sydow, Fungi exsiccati. The characteristics of this fungus agrees well with those of the family Chaetothyriaceae.

It is associated with *Merismella concinna* Syd. and *Stigmopeltella costaricana* Syd.

Chaetothyrium guaraniticum Speg. (sensu Bitancourt) in Fungi Guaranit. II no. 123 — Syll. Fung. IX. pag. 1061, 1891 — A. A. Bitancourt, in Arch. Inst. Biolog. São Paulo, 7: p. 7, 1936.

Mycelium almost invisible to the naked eye, hyphae parallel, hyaline to subhyaline, reticulate, pelliculose around the perithecia; mycelial setae scattered, straight, rigid, erect, black, $380 \times 5-10 \mu$. Perithecia developed beneath the mycelial pellicle, subglobose, dark-olivaceous, $100-150 \mu$ diam., setose, pseudo-ostiolate, unilocular; ascii cylindric to clavate, shortly stipitate, 8-spores, $40-50 \times 10-15 \mu$, aparaphysate, Ascospores oblong-fusoid, 3-septate, hyaline, $15-19 \times 5-5.5 \mu$. Fig. 7.

On unknown host — Guarapí — Paraguay.

Chaetothyrium mangiferae Mendoza ap. Stevens F. L. in Bernice P. Bishop. Mus. Nr. 19, p. 56, 1925.

Mycelium superficial, epiphyllous, spread, pelliculose, hyphae reticulate, subhyaline, composed of cylindrical cells, $7.7-17.5 \times 2.5-6 \mu$; mycelial setae scattered, continuous, black-brown, acuminate, $22.5-50 \times 6-8.5 \mu$. Perithecia developed beneath the mycelial pellicle, globose-depressed, $67-125 \mu$ diam., numerous, disperse, brown, pseudo-ostiolate, membranous, subparenchymatic, the walls made up of subglobose cells, $3.5-5.5 \mu$ diam.; perithecial setae identic with the mycelial setae. Ascii ellipsoid, 4-8-spores, 2-tunicate, sessile, $32.5-47 \times 15-17.5 \mu$ aparaphysate. Ascospores cylindro-clavate, 3-8-septate, polystichous, hyaline, $14.5-20 \times 4-6 \mu$. Fig. 8.

On leaves of *Mangifera indica* L. — Ohau, Honolulu, June, 6, 1921, Leg. F. L. Stevens.

This specimen, no. 6652, Herbarium of University of Illinois, is the type of the species, and from their study we now re-describe this fungus. It is associated with *Deslandesia honoluluense* Bat. & Vital, *Microxyphium columnatum* Bat., Cif. & Nasc., and *Tripospermum* sp.

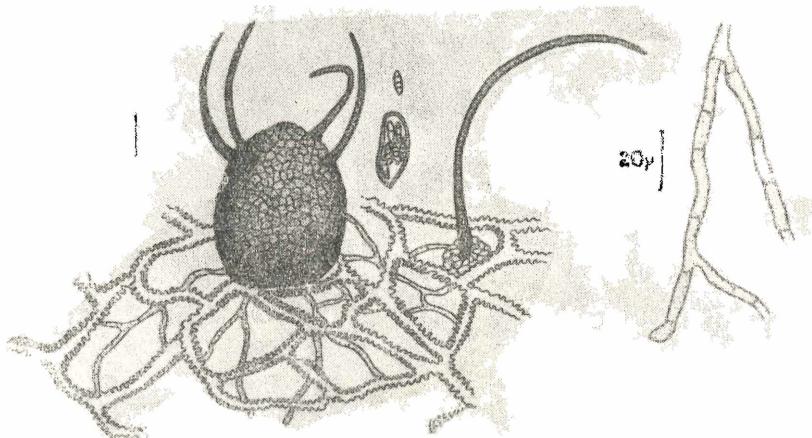

Fig. 7. *Chaetothyrium guaraniticum* Spieg.

Chaetothyrium pongamiae Harris ap. Stevens & Pierce — Indian Jour. Agric. Sci. III, part 5, p. 912, 1933.

Mycelium epiphyllous, pelliculose, thin, subhyaline, reticulate, hyphae with cylindrical cells, $6.5-17 \times 2.5-4 \mu$; mycelial setae scattered, blackish, curved, acuminate, $100-150 \times 5-10 \mu$. Perithecia developed beneath the mycelial pellicle, globose-depressed, $272-340 \mu$ diam., brownish, setose, with identical mycelial setae, translucent membranous, the walls having polygonal cells, $2.5-8 \mu$ wide, pseudo-ostiolate, $10-12.5 \mu$ diam. Ascii ellipsoid, 8-spores, sessile, $40-50 \times 20-22.5 \mu$, aparaphysate. Ascospores cylindro-clavate, 3-5-septate, hyaline, polystichous, $21-25 \times 6.5-7.5 \mu$, Fig. 9.

On leaves of *Pongamia glabra*. Leg. Hubert Harris, Bombay, Poona, India, 1932. Spec. no. 6656, Herbarium University of Illinois.

This re-description we made in collaboration with Dr. A. Fernandes Vital from the study of the type lent to us through the courtesy of The University of Illinois.

Chaetothyrium straussiae Mendoza. ap. Stevens, in Bernice P. Bishop. Mus. 19, p. 56, 1925.

Colonies epiphyllous, effuse, grayish; mycelium superficial

thinly pelliculose, reticulate, hyphae hyaline to subhyaline, septate, not constricted, with cells $8-15 \times 2.5-5 \mu$; mycelial setae scattered, erect, continuous, blackish-brown, curved, acuminate, $112-195 \times$

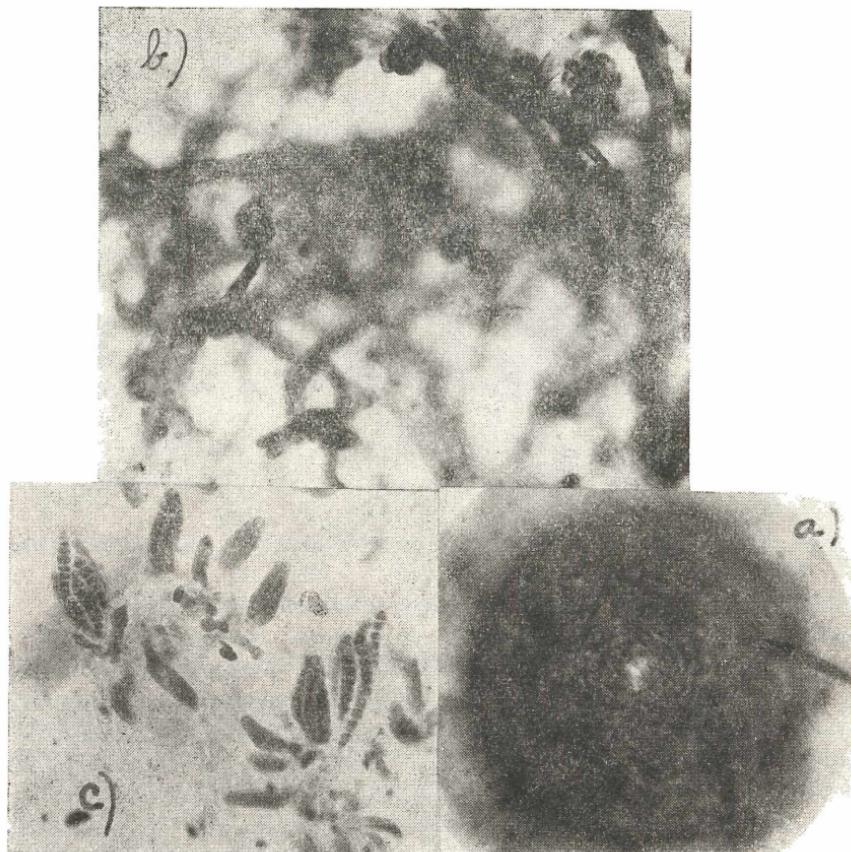

Fig. 8. *Chaetothyrium mangiferae* Mendoza. — a) Perithecium setose. — b) Mycelium setose. — c) Ascus.

$5-7.5 \mu$. Perithecia subglobose, developed beneath the mycelial pellicle, $123-195 \mu$ diam., brown, unilocular, pseudo-ostiolate, membranous, the walls composed of subglobose cells $3.5-10 \mu$ diam., with setae on the covered membrane equal to the mycelial setae. Asci cylindric-clavate, 1-tunicate, sessile, 8-spores, $47.5-62.5 \times 13-15 \mu$, aparaphysate. Ascospores elliptic-fusoid, 3-transverse septate, not constrict irregularly distichous, hyaline, $12.5-17.5 \times 5-6.5 \mu$, Fig. 10.

On leaves of *Straussia mariniana*, Wahiawa, Ohau, Hawaii, Coll. by F. L. Stevens, May 31, 1921, Type 5668, and on leaves of

Vismia sp. Iumatum ari — Hawaii, coll. by G. L. Stevens, July 7, 1922, British Guyana, no. 6657, Herbarium University of Illinois.

This is a re-description of the species through examination of the type by A. Chaves Batista & A. Fernandes Vital, for which we are indebted to The University of Illinois.

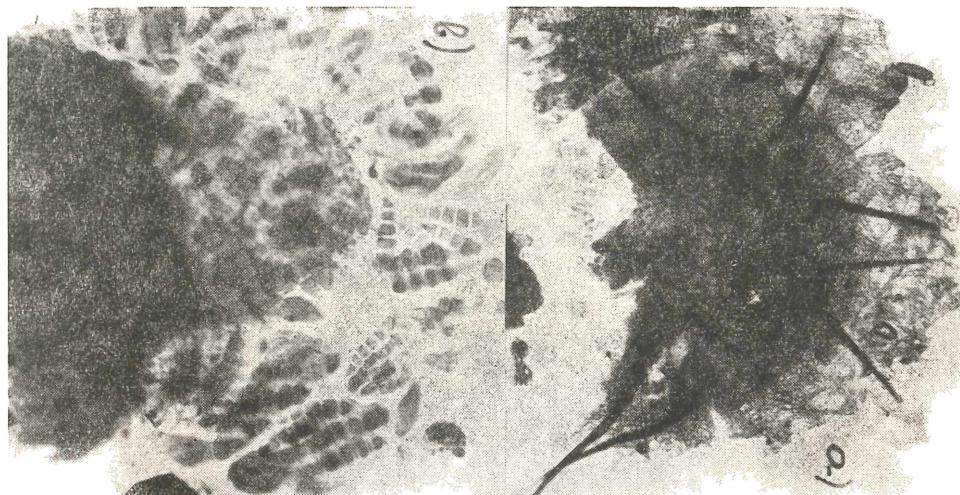

Fig. 9. *Chaetothyrium pongamiae* Harris. — a) Perithecioid setose. — b) Ascospores.

Excluded species.

Chaetothyrium ugandensis Hansf. in Comm. Myc. Inst. Mycol. Pap. no. 15, p. 146, 1946.

Mycelium hypophylloous, superficial, very thin, effuse, brownish, hyphae subhyaline to olivaceous, septate, much branched, $1-3 \mu$ wide, with erect setae like conidiophores, scattered, septate, blackish-brown, up to 300μ long, 6μ wide at the base, simple, apex much branched, each branch producing one apical conidia, continuous, $4-7 \times 2.5-3 \mu$ possibly, also, catenulate conidia, subhyaline. Perithecia subglobose, $130-150 \mu$ diam., $90-110 \mu$ in high, pseudo-ostiolate, glabrous or setose, brown, with walls $10-15 \mu$ in thickness, 2-4 layered. Ascii clavate, sessile or nodose-pedicellate, 8-spored, $50 \times 15 \mu$. Ascospores clavate, 3-septate, $20 \times 5 \mu$, hyaline.

On *Canthus* — Uganda.

Conidiferous "setae"

This species must be considered as doubtful until a revision of the specimen type is made, because of the presence of conidiferous setae.

In any case it is not *Chaetothyrium* in our sense.

Chaetothyrium dictyosporum Petr. in Medd. Göteborgs Bot. XVII:
p. 133. 1947. On *Ficus*-China.

Chaetothyrium punctiforme Rick in Broteria, V: p. 40, 1906.
It is probably an *Aphanostigme*.

Other *Chaetothyrium*, not identified.

Ciferriusia Bat. n. gen.*)

Mycelium pelliculosum, superficiale, non hyphopodiatum, ex hyphis rectis, parallele-reticulatis, hyalinis vel sub-hyalinis compositum. Setae myceliae nullae. Perithecia pellicula mycelica ob tecta, epiphylla, pluriasca, unilocularia, sine setis. Ascii paraphysati, 2-tunicati. Ascosporeae transversaliter pluriseptatae, hyalinae.

Typus. *C. psychotriæ* Bat.

Ciferriusia orientalis Bat. & Costa, n. sp.

Colonies amphigenous, scattered, punctiform; mycelium pellucide, scanty, hyaline to subhyaline, composed of reticulate hyphae, little branched, not constricted, indistinctly septate, 1—2.5 μ thick,

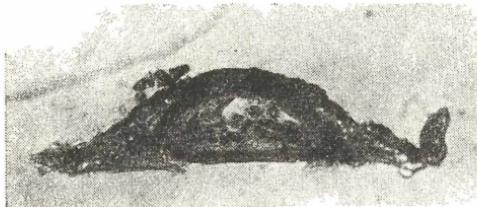

Fig. 11. *Ciferriusia orientalis* Bat. et Costa.

not setose, nor hyphopodiate. Perithecia subglobose to globose-depressed, developed beneath the mycelial pellicle, 90—180 μ diam., 50—65 μ high, glabrous, Fig. 11 membranous, pseudo-ostiolate, 7—10 μ diam., brownish; the perithecial walls are 5—11 μ in thickness in the upper part and 8—14 μ thick in the lower part, composed of 5 to 10 layers of cylindrical cells, brownish to hyaline from the outer side to the inner side, Fig. 12, the cells being 4—8.5 \times 1—2.5 μ . Ascii clavate to subcylindric, 4—8 spores, sessile, 2-tuncate, 40—58 \times 10—13 μ ; paraphyses filiform, septate, simple to branched, longer than the ascii, 1—1.5 μ thick. Ascospores cylindrical to clavate, 3-transversally septate, not constricted, hyaline, monostichous to polystichous, 15—21 \times 4—5 μ . Fig. 11 & 12.

On leaves of unknown host, associated with *Porinia epiphylla* (Lichen.) Leg. A. D. E. Elmer, July, 1916. Irosim, Island of Luzon — Philippines. Type 16599, in Herbarium Bogoriense — Bogor, through the courtesy of Miss S. M. Tjitrasoma. Present also *Phragmoscutella pulcherrima* var. *octospora* Bat. & Costa.

*) Dedicated to Prof. R. Ciferri, Italian mycologist, collaborator in the study of Brazilian fungi in the Institute of Mycology, University of Recife.

Coloniae rarae, sparsae, punctiformes. Mycelium pelliculosum, hyalinum vel subhyalinum, ex hyphis reticulatis, superficialibus, parvum ramosis, non constrictis, 1–2.5 μ cr, non setosis, hypopodiatum compositum, Perithecia sub pellicula mycelica, subglobosa vel globose-depressa, 90–180 μ diam., 50–65 μ alt., glabra, membranosa, pseudo-ostiolata, 7–10 μ diam., brunnescentia, cum parietibus 5–11 μ cr. in superiore parte, 8–14 μ cr. in basali parte, 5–10 stratosis, ex cellulis cylindraceis, 4–8.5 \times 1–2.5 μ efformatis. Asci clavati vel subcylindracei, 4–8 spori, sessiles, 2-tunicati, 40–58 \times 10–13 μ , cum paraphysisibus filiformibus, septatis, simplicibus, vel ramosis, 1–1.5 μ cr. Sporae cylindricae vel clavatae, 3-transversaliter septatae, non constrictae, hyalinae, monostichiae vel polystichiae, 15–21 \times 4–5 μ .

Ciferriusia psychotriae Bat. n. sp.

Plagulae not distinct. Free mycelium rare, peliculose, reticulate, composed of straight hyphae, branched, indistinctly septate and sub-hyaline 2–3 μ diam. Mycelial setae absent. Perithecia epiphyllously

Mycelium pelliculosum, hyalinum, perithecia circumdantibus, cum rarissimis hyphis liberis, hyalinis vel subhyalinis, rectis, septatis, non constrictis, ex cellulis cylindraceis, $11-13 \times 4-6 \mu$, non setosis, haud hypopodiatis, compositum. Perithecia pellicula mycelica obtecta, sparsa, subglobosa, $122.5-200 \mu$ diam., $120-180 \mu$ alt., atrobrunnea, glabra, pseudo ostiolata; cum parietibus membranosis, pseudoparenchymaticis, 5-10 — stratosis, $35-43 \mu$ cr. in area superiore, $20-25 \mu$ cr. in area basali, ex cellulis subglobosis $5.5-12 \times 4-9 \mu$ efformatis. Asci clavati, curto-pedicellati, 4-8-spori, 1-tunicati, $36-56 \times 11-16 \mu$, paraphysati. Ascosporae falciformes, 8-10-transversaliter septatae, multiguttulatae, hyalinae, $42-54 \times 4-6 \mu$ parallele dispositae.

***Ciferriusia womersleyi* (Hansf.) Bat. n. comb.**

Syn.: *Chaetothyrium womersleyi* Hansf. in Proc. Linn. Soc. New South Wales, LXXXI, part I: 23, 1956.

Epiphyllous. Mycelium pelliculose spread, of hyaline hyphae,

irregularly branched, having cells of $8-20 \times 2-4 \mu$, not setose, nor hyphopodiate. Perithecia developed beneath the mycelial pellicle, brown-black, smooth, globose-flattened, 250μ diam., $80-100 \mu$ in

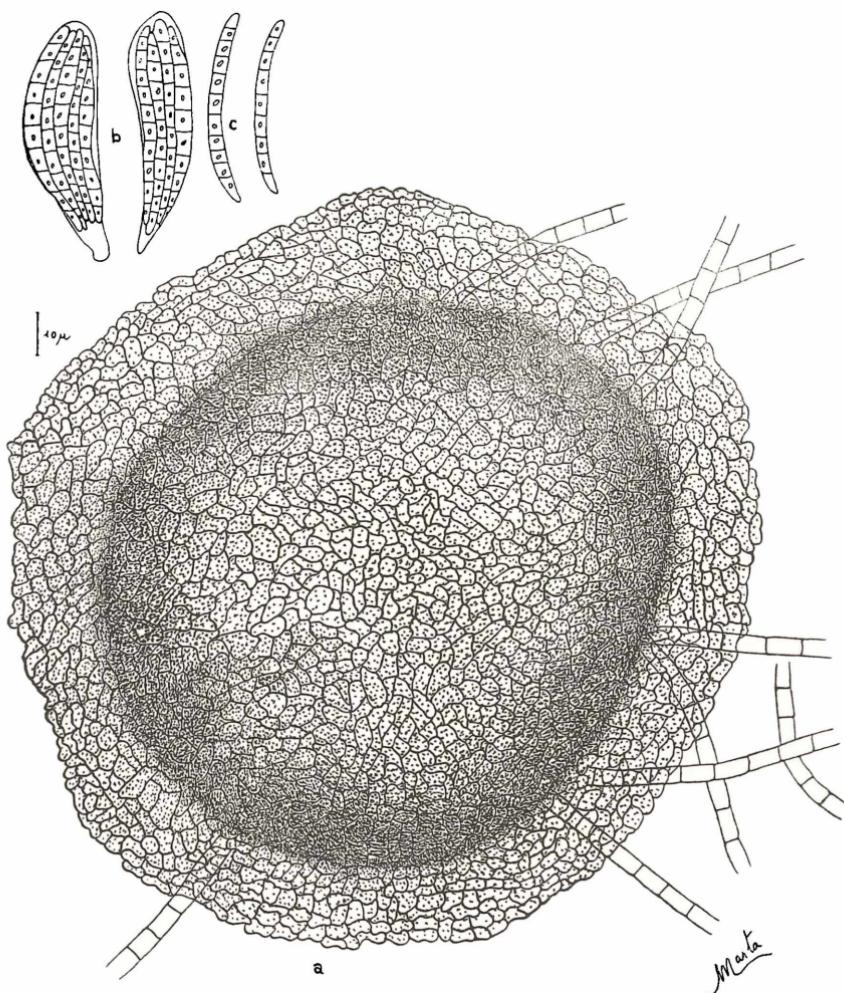

Fig. 15. *Ciferriusia spathodeae* Bat. et Matta. — a) Perithecia under a frontal view. — b) Asci. — c) Spores.

height, the walls pseudo-parenchymatic in 1-2 layers. Asci clavate, 2-tunicate, short stipitate or subsessile, 8-spored, $80-40 \mu$, paraphysate. Ascospores cylindric, having attenuate ends, transversally, 9-14 septate, not constricted, hyaline, $50-65 \times 6-7 \mu$.

On leaves of *Syzygium* sp. Lal. New Guinea, Womersley.

Setis absentibus, est *Ciferriusia*.

***Limaciella* Mendoza emend. Bat.**

Mycelium scanty, superficial, hyaline, pelliculose, hyphae lengthened not constricted, not hyphopodiate, not setose, hyaline, Perithecia developed beneath the mycelial pellicle, subglobose to globose-depressed, membranous, pseudo-ostiolate, brownish, glabrous. Asci 4—8 spored, 2-tunicate, paraphysate. Ascospores scolecoidal, transversally pluri-septate, hyaline.

Type: *L. psidii* Mendoza in Bernice P. Bishop Mus. Bul. 19: 58, 1925.

***Limaciella luzonensis* Bat & Costa n- sq.**

Colonies epiphyllous, minute, brown with whitish margin. Mycelium superficial hyaline to subhyaline, pelliculose, composed of reticulate hyphae, branched with lengthened cells, $17-123 \times 1-1.5 \mu$,

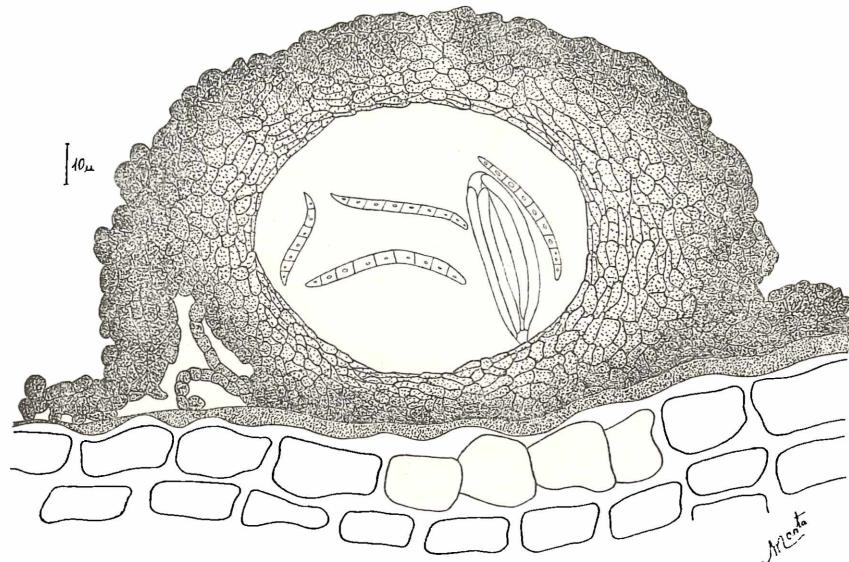

Fig. 16. *Ciferriusia spathodeae* Bat. et Matta. — Perithecium seen under a longitudinal cut, being evident its mycelial origin.

not setose, nor hyphopodiate, hyaline. Perithecia developed beneath the mycelial pellicle, Fig. 17, superficial, subglobose to globose-depressed, $225-360 \mu$ wide, $100-160 \mu$ in height, pseudo-ostiolate, membranous, semitransparent, brownish, glabrous; the perithecial walls are pseudoparenchymatic to prosenchymatic, $11-22.5 \mu$ in thickness, composed of 6—10 layers of cylindrical cells, each one of $1-2.5 \mu$ wide. Asci ellipsoid-lengthened, 4—6 spored, sessile to short stipitate, 2-tunicate, $117-150 \times 15-22.5 \mu$; paraphyses filiform, numerous, branched, septate, longer than the asci, hyaline, $1-2 \mu$

thich. Ascospores scolecoidal, (ratio 10:1) acute at both ends, 6—11 transversally septate, not constricted, hyaline, $62.5-83 \times 5-7.5 \mu$, polystichous Fig. 17 and 18.

On leaves of *Costus* sp. collected on the Island of Luzon, Philippine, April 1916. Type. Specimen no. 15855, Herbarium Bogoriense, Bogor. — For the study of this specimen we are indebted to Miss S. M. Tjitrasoma, of the Herbarium Bogoriense.

Plagulae epiphyllae, punctiformes, brunneae in area centrali, hyalinae in marginibus. Mycelium superficiale, hyalinum vel subhyalinum, pelliculosum, ex hyphis reticulatis, hyalinis, ramosis, ex cellulis elongatis, $17-123 \times 1-25 \mu$, non setosis, non hyphopodiatis compositum. Perithecia sub pellicula myceliana evoluta, subglobosa vel globose-depressa, $225-360 \mu$ diam., $100-160 \mu$ alt., pseudo-ostiolata, membranosa, semitranslucida, brunnescentia, glabrata, cum parietibus pseudo-parenchymaticis vel subprosenchymaticis, $11-25 \mu$ cr., 6—10, stratosis, ex cellulis cylindraceis, $1-2.5 \mu$ diam., efformata. Asci ellipsoide-elongati, 4—6-spore, sessiles vel non, 2—6 unicati, $117-150 \times 15-22 \mu$. Paraphyses filiformes, numerosae, ramosae, septatae, hyalinae, $1-2 \mu$ cr. Sporae scoleco ideae, ad polos acutatae, 6—11 transversaliter septatae, non constrictae, hyalinae, $62.5-83 \times 5-7.5 \mu$, polystichiae.

Limaciella psidii Mendoza in Stevens, Bernice P. Bishop Mus. Bul. 19: 58, 1925.

Mycelium superficial, thinly pelliculose, hyaline to straw-colored, hyphae irregularly branched, having cylindrical cells, not setose, nor hyphopodiate. Perithecia developed beneath the mycelial pellicle, globose-depressed, membranous, pseudo-ostiolate, brownish to reddish-brown, glabrous, about 200μ diam. Asci ellipsoid, 8-spores, $68 \times 14 \mu$; paraphyses. filiform, hyaline. Ascospores scolecoid, acute at both ends, 6—8 transversally septate, about 50×4 , hyaline.

On *Psidium guayava* L., Kanai, Hawaii, June, 1925.

Marceloa Bat. & Peres n. gen.*)

Mycelium thinly pelliculose, hyaline, not hyphopodiate nor setose.

Perithecia globosa, developed beneath the mycelial pellicle, brown, membranous, astomous, setose.

Asci 1-tunicate, not paraphysate.

Ascospores cylindraceo-vermiform, many transversally septate and 1 or more longitudinally septate, dark.

Type: *M. africana* nobis.

Mycelium pelliculatum, tenuer, hyalinum, non hyphopodiatum, haud setosum, Perithecia globosa, pelliculam mycelicam ob tecta, brunnea, emm-branosa, astoma, setosa. Asci 1-tunicati, apara-physati. Ascospores cylindraceo-vermiformes, transverso-longitudinaliter pluriseptatae, olivaceae vel brunneae.

Marceloa africana Bat. & Peres n. sp.

Mycelium epiphyllous, superficial, thinly pelliculose, hyaline, composed of very branched and indistincte septate, hyphae, $1-2 \mu$

*) In hommage to Dr. Marcelo Gonçalves Peres, Brazilian microbiologist.

diam., not setose nor hyphopodiate. Perithecia globosa, developed beneath the mycelial pellicle, scattered, rare, 190—270 μ diam., brown, astomous, membranous, pseudoparenchymatic, the walls

Fig. 17. *Limaciniella luzonensis* Bat. et Costa. — a) Frontal view of a perithecium. — b) Longitudinal cut of a perithecium.

made of polygonal cells $5—9 \times 3—8 \mu$, setose. The setae are numerous, straight, flexuous, not branched, septate, brownish, acute, 190—290 μ in height, 4—9 μ wide at the base and 3—4 μ wide on the apex, Fig. 19. Ascii ellipsoid to ovoidal, 1-tunicate, sessile, 8-spored, $70—105 \times 32—68 \mu$, not paraphysate. Ascospores cylindraceo-vermiform,

olivaceous, 18—21 transversally septate and 1 or more longitudinally septate, polystichous, $70-95 \times 9-14 \mu$. Fig. 19.

Mycelium epiphyllum, superficiale, tenuiter pelliculosum, hyalinum, ex hyphis irregulariter ramosis et indistincte septatis, $1-2 \mu$ diam., non setosis, haud hyphopodiatis, compositum. Perithecia globosa, pelliculam mycelicam ob tecta, sparsa, rara, $190-270 \mu$ diam., brunnea, astoma, setosa, membranosa, cum parietibus pseudoparenchymaticis, ex cellulis polygonalibus, $5-9 \times 3-8 \mu$ efformatis. Setae myceliales numerosae, rectae, flexuosa, non ramosae, brunnescentes, septatae, acutae, $190-290 \mu$ alt., $5-9 \mu$ basaliter diam., et $3-4 \mu$ apicaliter diam. Ascii ellipsoidei vel ovoidei, 1-tunicati, sessiles, 8-spori, $70-105 \times 32-68 \mu$, aphysas. Ascosporeae cylindraceo-vermiformes, olivaceae, $18-21$ transversaliter septatae, 1—pro more longitudinaliter septatae, polystichae, $70-95 \times 9-14 \mu$.

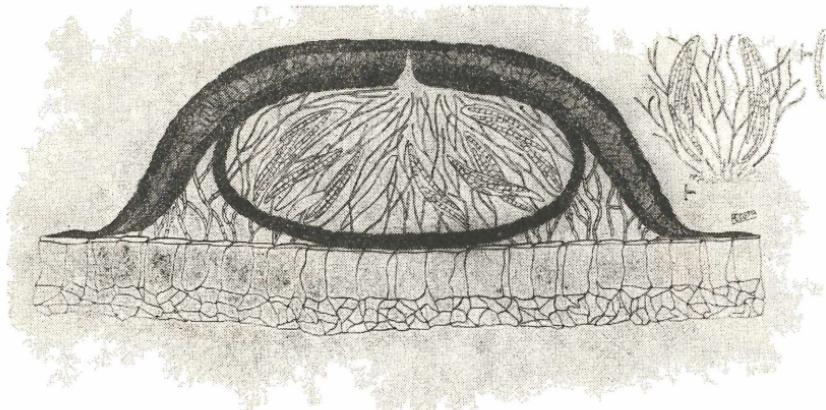

Fig. 18. *Limaciniella luzonensis* Bat. et Costa. — Perithecium developed beneath the mycelial pellicle; ascospores and Spores.

Microcalliomycetes Bat. & Cif. n. gen.

Mycelium tenué, pelliculosum, hyalinum vel subhyalinum, setosum, non hyphopodiatum. Perithecia pellicula mycelica ob tecta, setosa; ascii pseudo-paraphysati; ascosporae 1-septatae, hyalinae.

Typus: *M. amadelpha* (Syd.) Batista & Ciferri in Ann. Myc. XXIV, pl 342, 1926.

This genus appears quite distinct in the *Chaetothyriaceae* family for the presence of setae both in mycelium and perithecia, the ascospores being 1-septate and hyaline.

Microcalliomycetes amadelpha (Syd.) Bat. & Cif. n. comb.

Syn. *Microcallis amadelpha* Syd. in Ann. Mycol. XXIV: p. 342, 1926.

Hyphophyllous; mycelium pelliculose, hyaline, hyphae, reticulate,

2–3 μ thick; perithecia developed beneath the mycelial pellicle, 250–400 μ diam., 25–30 μ in height, brown-olivaceous, pseudo-ostiolate; setae on the mycelium and on the perithecia, erect, blackish-brown, septate, obtuse, 130–170 μ in height, 5–7 μ at the base,

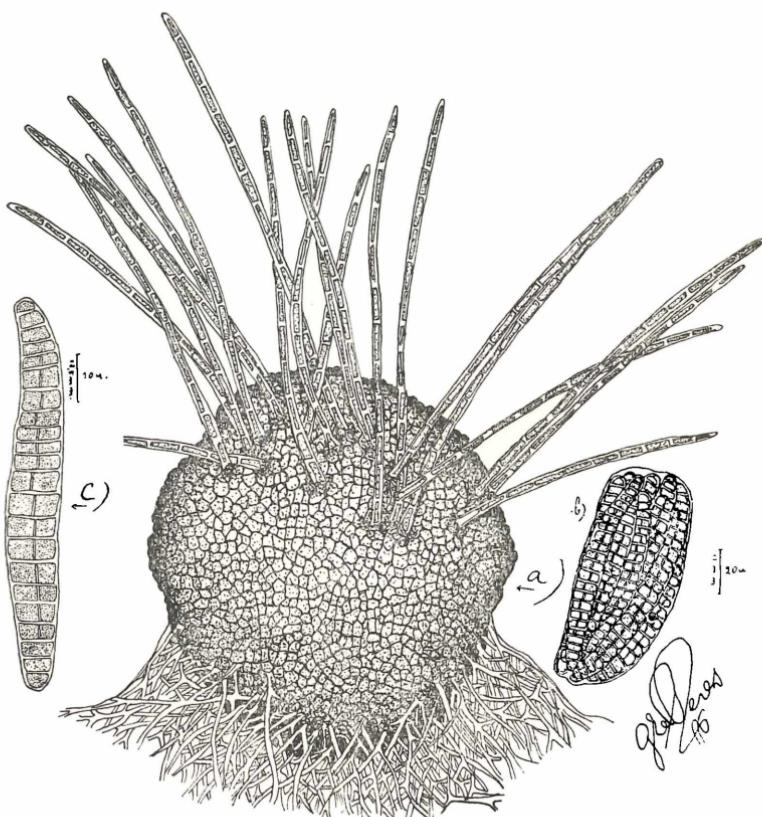

Fig. 19. *Marceloa africana* Bat. et Peres. — a) Setose perithecium and mycelial pellicle. — b) Ascus. — c) Spore.

2 μ at the apex; asci oblong-ellipsoid, 25–33 \times 11–16 μ ; paraphysoides numerous; ascospores oblong-clavate, 1-septate, 9–12 \times 3.5–4 μ hyaline.

On *Phoebe, Roupala* — Costa Rica.

Recifea Bat. & Cif.*)

Mycelium tenué, pelliculosum, hyalinum, non setosum, non hyphopodiatum. Perithecia pellicula mycelica obtecta, setosa; asci a paraphysati; ascosporae 1-septatae, hyalinae.

* Ob Recife, Pernambuco, Brasiliae urbs.

Typus: *R. scutiae* (Hansf.) Batista & Ciferri n. comb.

We have not studied the single species ascribed to this genus, so that the interpretation of the short and stout appendice like warts, on the peritheciun, indicated by Hansford are of doubtful judgment. They are described as continuous or uniseptate, so that we suppose these warts are, really, young, or abortive, perithecial setae.

Recifea scutiae (Hansf.) Bat. & Cif. n. comb.

Syn.: *Microcallis scutiae* Hansf. in Proc. Linn. Soc. London, 157 sess. p. 191, 1944—1945.

Hyphophyllous. Mycelium thin pelliculose, scarcely visible, hyphae hyaline, 2—3 μ thick. Perithecia globose-depressed, blackish-brown, developed beneath the mycelial pellicle, 100 \times 80 μ , pseudo-ostiolate, superior walls 6—10 μ in thickness, with some conoid warts, continuous to 1-septate, erect, 20 \times 5—10 μ . Ascii clavate ellipsoid, 8-spores, sessile, 30—40 \times 12—15 μ . Ascospores clavate, 1-septate, 15—17 \times 2—3 μ , hyaline, Fig. 20.

On *Scutia* Uganda.

Sphaerochaetia Bat. & Cif. n. gen.

Syn.: *Zukalia* Sacc. (our sense).

Mycelium tenuissimum, ex hyphis hyalinis, non setosis, non hyphopodiatis, compositum. Perithecia globosa, sub pellicula mycelica oriunda, fusca, setosa. Ascii 2-tunicati aparaphysati; ascosporae pluri-transverse-septatae, hyalinae.

Typus.: *S. loganiensis* (Sacc. & Berl.) Bat. & Cif. n. comb.

Sphaerochaetia dominicanum (Cif.) Bat. & Cif. n. comb.

Syn. *Chaetothyrium dominicanum* Cif. in Sydowia, Ann. Myc. X p. 133, 1956.

Mycelium epiphyllous, little developed, hyaline to subhyaline, composed of septate hyphae, 2—3 μ diam. Perithecia formed beneath a mycelial pellicle, globose-depressed, 100—180 μ diam., scattered, pseudoostiolate, 10—18 μ diam. setae on the perithecia, irregularly radiate, yellowish to brownish, simple, rigide, 20—60 \times 3—4 μ . Ascii oblong-clavate, sessile to substipitate, 2-tuncate, 8-spores, 40—55 \times 15—30; paraphysoids not distinct. Ascospores ellipsoid to clavate, straight or curved, 3—5 transversally septate, hyaline, 10—17 \times 5—8 μ .

On leaves of *Eupatorium odoratum* L. Valle del Cibao, prov. Santiago, Palmarejo, Dominicana. Leg. R. Ciferri & E. L. Ekman, 21—11—930.

Sphaerochaetia erysiphoides (Speg.) Bat. & Cif. nov. comb.

Syn.: *Zukalia erysiphoides* Speg. in Fung. Guarani. II, pag. 49 Syll. Fung. IX, p. 432, 1891.

Mycelium hyphophyllous, subarachnoideous, olivaceous, not dense, hyphae rameose-intricate, sub-hyaline, 2—5 μ wide, setose; perithecia globose, 100—120 μ diam., subaggregate, membranous; setae on the perithecia, base subfasciculate, divaricate, 150—220 \times 4—6 μ , fuscous; ascii cylindraceous, wide tunicate, 8-spored, short pedicellate, 80—90 \times 18—20 μ , a paraphysate; ascospores cylindric fusoid, 7-septate, constricted, hyaline, 40—45 \times 5 μ .

On *Cupania* — Brazil.

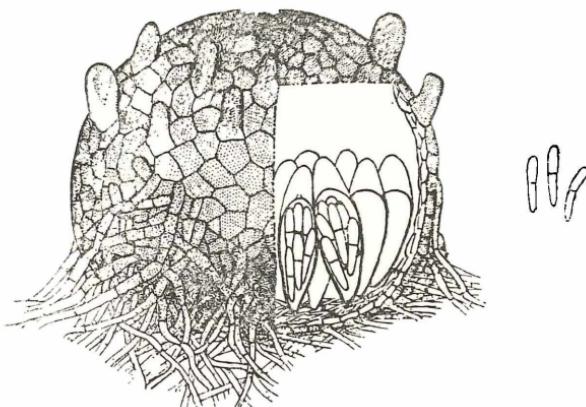

Fig. 20. *Recifea scutiae* (Hansf.) Bat. et Cif.

Syn.: *Chaetothyrium loganiensis* (Sacc. & Berl.) Theiss. & Syd.

Zukalia loganiensis Sacc. & Berl. Syll. Fung. IX: 431.

Epiphyllous. Mycelium thin, effuse, hyphae septate, thin branched, subhyaline; perithecia globose, astomous, 130—140 μ diam., blackish,

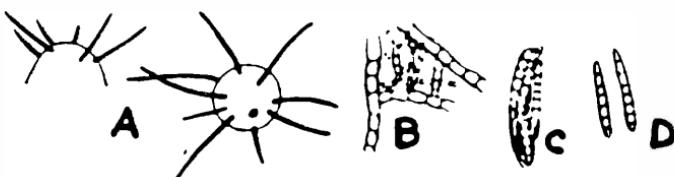

Fig. 21. *Sphaerochaetia loganiensis* (Sacc. et Berl.) Bat. et Cif.

with divergent septate, fuligineous setae; ascii fusoid clavate, 40—50 \times 18 μ ; ascospores fusoid-clavate, not constricted, 7—8-septate, hyaline, 28—32 \times 7—8 μ , Fig. 21.

On *Smilax* sp. — Australia.

Treubiomycetes v. Höhn. emend. Bat. & Cif.

Syn.: *Chaetomeris* Clem.

Mycelium superficial, thinly membranous, setose, hyphae hyaline, reticulate; perithecia globose-flattened, dark, pseudo-ostiolate, developed beneath the mycelial pellicle, setose; asci 8-spored, aparaphysate; ascospores muriform, hyaline.

Type: *T. pulcherrimus* v. Höhn. in *Fragm. Mycol.* VIII, 1909; *Syll. Fung.* XXII: 495, 1913, Clements & Shear, *The Genera of Fungi*, p. 254, 1931.

***Treubiomycetes pulcherrimus* v. Höhn. rev. Bat. & Cif.**

Syn.: *Chaetomeris pulcherrima* (Höhn) Clem.

Mycelium epiphyllous, pelliculose, hyaline, hyphae 3—6 μ thick, reticulate, setose. Perithecia globose-flattened, 300 μ in diam., pseudo-

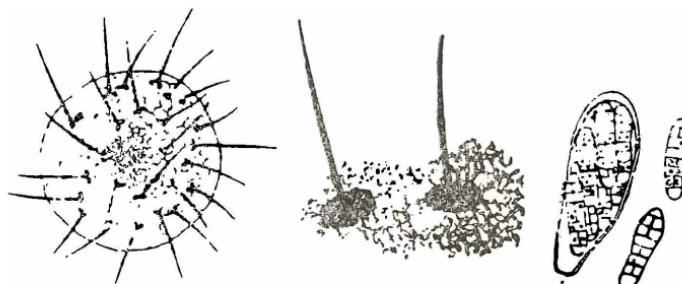

Fig. 22. *Treubiomycetes pulcherrimus* v. H. — From v. Höhn *Sitz b. Ak. Wiss. Wien, Math. Nat. Kl.* 118. Abt. I: 1181 (1909).

ostiolate, yellowish-brown, with setae analogous to the mycelial setae, rigid, acute, $120—200 \times 8—9 \mu$. Asci clavate, 8-spores, $60—70 \times 25—28 \mu$, aparaphysate; ascospores cylindric-oblong, hyaline, 7-transverse septate, many longitudinal septa, $34—38 \times 8—9 \mu$, Fig. 22.

On *Ficus* — Java.

Wiltshirea Bat. & Peres n. gen.*)

Mycelium pelliculous, hyaline, without setae and hyphopodia. Perithecia developed beneath the mycelial pellicle, subglobose, pseudo-ostiolate, membranous, brown, glabrous. Asci 8-spores, not paraphysate. Ascospores muriform, brown.

Type: *W. quercifoliae* Bat., Peres & Nasc. n. sp.

Mycelium pelliculosum, hyalinum, non setosum nec hyphopodiatum. Perithecia pellicula mycelica obtecta, sub-globosa, pseudo-ostiolata, membranosa, brunnea, glabrata. Asci 8-spores habentes, aparaphysati. Ascosporae muriformes, brunneae.

*) In homage to Dr. S. P. Wiltshire, formerly Director Commonwealth Mycological Institute, England.

Wiltshirea quercifoliae Bat., Peres & Nasc. n. sp.

Mycelium superficial, epiphyllous, pelliculous, hyaline, devoid of hyphopodia and setae and composed of subrectis, septate and constricted hyphae, irregularly branched, ($45-90^\circ$), having cells of $9.5-22 \times 2.5-5 \mu$. Perithecia superficial, developed beneath the

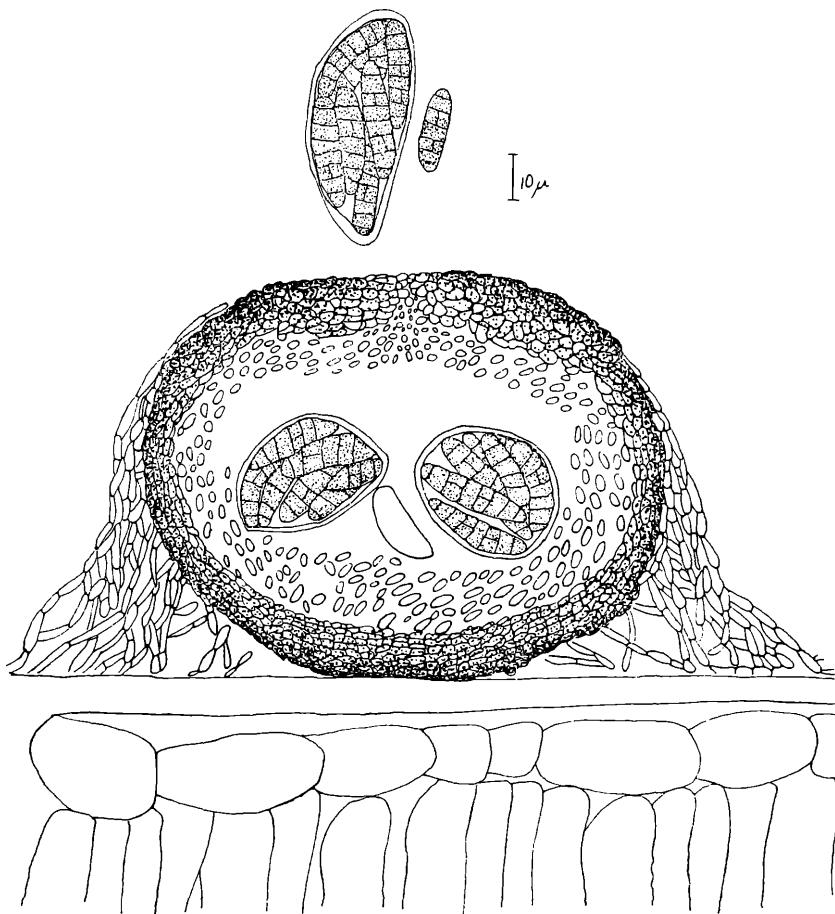

Fig. 23. *Wiltshirea quercifoliae* Bat., Peres. et Nasc. — Perithecium, ascus and spores.

mycelial pellicle, glabrous, sub-globose, depressed, scattered, membranous, brownish $133-180 \mu$ diam., pseudo-ostilate, $56-81 \mu$ in height; the walls are $17-41 \mu$ diam., sub-parenchymatic, made of polygonal cells, $4.5-8 \times 3-5.5 \mu$, Fig. 23. Ascii ovoidal or subglobose, 8-spores, 2-tunicate, sessile, aparaphysate, $30-50 \times 17-28 \mu$. Ascospores cylindrical, obtuse, transversally, 7-septate, with 1-longitudinal septum, polistichous, brownish, $22-28 \times 6-7 \mu$. Fig. 23.

On leaves of *Quercus laurifolia*. Crescent City, Fla. Geo. Martin, 3-1880. Type, no. 205 in Herb. Acad. Nat. Sci. Philadelphia, U.S.A., under the name of *Saccardia martinii* S. & E.

Mycelium superficiale, epiphyllum, pelliculosum ex hyphis hyalinis, irregulariter ramosis, septatis, constrictis, ex cellulis $9.5-22 \times 2.5-5 \mu$, non hyphopodiatis nec setosis, compositum. Perithecia pellicula mycelica tecta, superficialia, glabrata, subglobosa, dein colapso-depressa, $133-180 \mu$ diam., pseudo-ostiolata, $56-81 \mu$ alt., membranosa, brunnescens; cum parietibus $17-41 \mu$ cr., plurimum stratosis, ex cellulis polygonalibus, $4.5-8 \times 3-5.5 \mu$, efformatis. Asci ovoidei vel subglobosi, 8-sporos continentis, 2-tunicati, sessiles, $30-50 \times 17-28 \mu$, paraphysati. Ascospores cylindraceae, obtusae, 7 transversaliter septatae, 1-longitudinaliter septae, polystichae, brunnescentes, $22-28 \times 6-7 \mu$.

Phaeosaccardinulaceae Bat. & Cif. n. fam.

Type.: *Phaeosaccardinula* P. Henn.

Fungi epiphytic, associated with insects or not. Superficial mycelium olivaceous or blackish-brown, pelliculose or in a loose network, formed by septate hyphae with cells lengthened or not, of cruciform or irregular branching generally reticulate, little constricted at the septa, with or without erect setae, not hyphopodiate. Perithecia superficial, although developed beneath the mycelial pellicle, which is adherent to the outer walls of the perithecia; perithecia flattened-globose, subglobose, or conoid, brown to blackish, not shield-shaped or dimidiate, not radiate, unilocular, pseudo-ostiolate with an apical pore visible or not; the enveloping mycelial pellicle may produce setae on the apex of the perithecia, scattered, or localized around the base of the perithecia; thus the setae may be considered of remote mycelial origin. Asci developed basally, generally clavate or ellipsoid, sessile or subsessile, few in number, successively ripening, 2-8 spores, with or without paraphysoids. Ascospores hyaline or dark, septate or continuous.

Pycnidia of the family *Asbolisiaceae*, of different shapes and with various types of pycnidiospores, may be associated with the mycelium of the *Phaeosaccardinulaceae*, but there is not any proof that they are related to the ascigerous development of the perfect fungus. The same is true of some *Dematiaceae*, as *Triposporium*, *Tripospermum* *Helminthosporium*, and others.

Ceramothyrium Bat. & Maia

Type: *C. paiveae* Bat. & Maia.

This genus and most of its species has been fully described in Atti, Inst. Bot. Crittig. Univ. Pavia, Italy, ser. 5, XIV: 23—52, 1957. We now add a few other species not previously studied.

Ceramothyrium biseptatum (Sacc.) Bat. & Maia

Syn.: *Limacinia biseptata* Sacc. in Att. Inst. Bot. Lab. Crittig. Univ. Pavia ser. 5, XVI: 32, 1957.

The type species, on *Macaranga tanarins*, Mt. Maquiling, Los Banos, Prov. Laguna, Philippines, Jan. 1914, Fungi Malayana, C. F. Baker, no. 150 we have examined through the courtesy of the Universitá de Pavia. — Also on *Macaranga*, Los Banos, Philippines, Leg. C. F. Baker, 10: 1. 1914, Det. A. Chaves Batista, 28. 2. 1957, sp. no. 10928, I.M.U.R., associated with *Microxyphium* sp.

Ceramothyrium boedijnii Bat., Nasc. & Cif. n. sp.

Mycelium epiphyllous, black, thin pelliculose, glabrous, not

hyphopodiate, hyphae brown, reticulate, branched, with cylindrical cells, $15-20 \times 6-7 \mu$. Perithecia developed beneath the mycelial pellicle, globose-depressed, black, until 140μ diam., $60-70$ in height, pseudo-ostiolate, smooth, Fig. 24. Ascii clavate, sessile, 8-spores, $40-60 \times 18-25 \mu$, aparaphysate. Ascospores clavate to subfusoid, 3 transversally septate, hyaline, $15-20 \times 5-7 \mu$. Fig. 24.

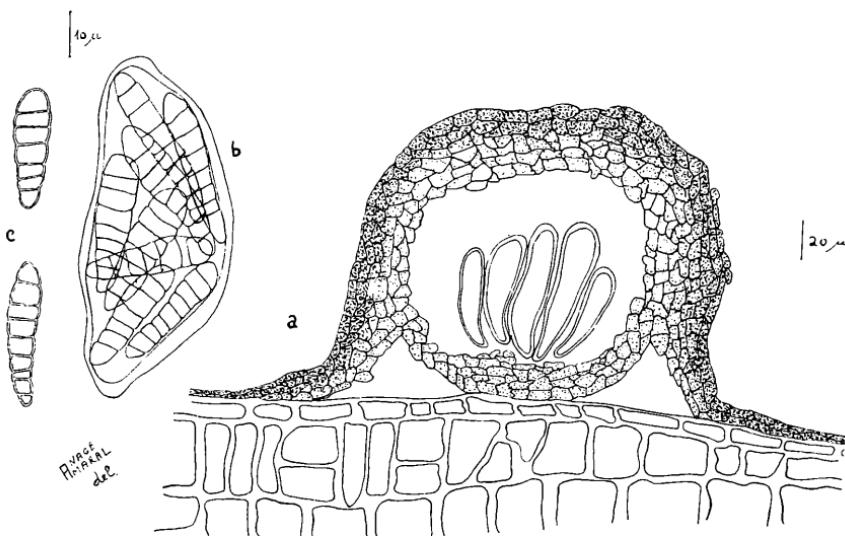

Fig. 25. *Ceramothyrium calycanthi* Bat. — a) Perithecium. — b) Ascus. — c) Spores.

On leaves of indet. *Rubiaceae* Bantam. G. Karang, Indonesia, Boedijn, 1330. Also on *Theobroma cacao* Keravat, New Britain, Leg. D. Shaw, 12. 956. Spec. Wari, 7767 and 13021, Inst. Micol. Univ. Recife.

Est *Ceramothyrium* per ascostromata glabrata, pellicula mycelica tecta et ascosporos hyalinos, 3-transversaliter septatos et mycelium haud setosum.

Hansford, in Sydowia, Ann. Mycol. X: 99, 1956 described *Chaetothyrium boedijnii* Hansf. which really is now understood as one species of *Phaeochaetia*. The specimen which he kindly sent to us possess so *Ceramothyrium* and *Phaeochaetia* being the original description of Hansford correspondent to our *Ceramothyrium*, less the setae.

Ceramothyrium calycanthi Bat. n. sp.

Epiphyllous. Free pelliculose mycelium, irregularly reticulate, having straight hyphae, branched, light-brown, septate, constricted, the cells being $6.5-12.5 \times 4-5.5 \mu$, not setose nor hyphopodiate. Perithecia developed beneath the mycelial pellicle, Fig. 25, isolate

globose-depressed, 165–205 μ wide, 110–155 μ in height, olive-brown, glabrous, pseudo-ostiolate, membranous, the walls in 4 to 6 layers, 35–40 μ in thickness, composed of subglobose and polygonal cells, 7.5–14.5 \times 6.5–11 μ . Ascii ellipsoid to sub-globose, 2-tunicate, sessile, 8-spores, 44–66 \times 29.5–37 μ , aparaphysate. Ascospores clavate, 6–10 transversally septate, little constricted, polystichous, hyaline, 24.5–37 \times 6.5–9.5 μ . Fig. 25.

On leaves of *Calycanthus* sp. associated with *Trichomerium didymopanax* Bat., Nasc. & Cif. and *Dictyarthrinopsis costaricensis* Bat. — Georgia, U.S.A. Leg. C. L. Shear. Type, 11084, Institute of Mycology, University of Recife and isotype in The National Fungus Collections, U.S.A.

This material has been sent to us by our friend Dr. John A. Stevenson, Apr. 1, 1957.

Epiphyllum. Mycelium pelliculosum, irregulariter reticulatum, ex hyphis ramosis, brunnescentibus, septatis, constrictis, ex cellulis 6.5–12.5 \times 4–5.5 μ , non setosis, haud hyphopodiatis compositum. Perithecia sub pellicula myceliana oriunda, isolata, globoso-depressa, 165–205 μ diam., 110–155 μ alt., olivaceo-brunnea, glabrata, pseudo-ostiolata, cum parietibus 4–6 stratosis, 35–40 μ cr, membranosis, ex cellulis subglobosis vel polygonalibus, 7.5–14.5 \times 6.5–11 μ , efformatis. Ascii ellipsoidei vel subglobosi, 2-tunicati, sessiles, 8-spori, 44–66 \times 29.5–37 μ , aparaphysati. Ascosporae clavatae, 6–10 transversaliter septatae, parum constrictae, polystichae, hyalinae, 24.5–37 \times 6.5–9.5 μ .

Ceramothyrium coffeaeum Bat. & Nasc. n. sp.

Colonies brownish-black, epiphyllous, spread to effuse, superficial. Mycelium pelliculose, brownish-composed of dense branched, septate and constricted hyphae having cylindrical cells, 7.5–18 \times 3–7 μ . Hyphopodia and setae null. Ascostromata brownish, developed beneath the mycelial pellicle superficial, subglobose, depressed, glabrous, membranous, pseudo-ostiolate, 110–112 μ in height, 110–140 μ diam., gregarious, single to confluenti, loculum subglobose, 68–100 \times 61–85 μ . The walls are subparenchymatic, 12–19.5 in thickness and made of polygonal cells, 3.5–11 \times 2.5 μ . Ascii elliptical to clavate, 2-tunicate, sessile to short pedicelate, 8-spored, aparaphysate, 41–50 \times 13–17 μ . Ascospores ellipsoidal, hyaline, transversally, 3-septate, not constricted, distichous, 12–16 \times 4–6 μ .

On leaves of *Coffea robusta* — Goroka — New Guinea. Leg. D. Shaw. Spec. Wari, 7769, cotype South Australia. Type, 12798, Institute of Mycology, University of Recife.

Plagulae atro-brunneae, epiphyllae, effusae, superficiales, efformatae. Mycelium pelliculosum, ex hyphis septatis, denseque ramosis, brunnescentibus et ex cellulis cylindraceis, constrictis, 7.5–18 \times 3.7 μ , non setosis, haud hyphopodiatis, compositum. Ascostromata brunnescentia, pellicula mycelica tecta, superficialia, subglobosa sed colapso-depressa, glabrata, embranosa, 110–140 μ diam., 100–112 μ alt., pseudo-ostiolata; loculum subglobosum, 68–100 \times 61–85 μ ; parietes subparenchymatici, 12–19.5 μ cr ex cellulis polygonalibus, 3.5–11 \times 2.5–3 μ , efformati. Ascii ellipsoidei vel ellipsoideo-clavati, 2-tunicati,

sessiles vel curto-stipitati, 8-spori, $41-50 \times 13-17 \mu$, apophysati. Ascospores ellipsoideae, 3-septatae, haud constrictae, distichae, hyalinae, $12-16 \times 4-6 \mu$.

Esse especimen fôra identificado por C. G. Hansford como *Chaetothyrium boedijnii* Hansf.

ascospores transversally 3—9-
septate, $25-30 \times 7-9 \mu$. *D. paulensis*

Deslandesia ficina (Syd.) Bat. n. comb.

Syn.: *Tephrosticta ficina* Syd. in Philipp. Jour. Sci. VIII: 271, 1913.

Syn.: *Phaeosaccardinula ficina* (Syd.) Hansf. in Comm. Myc. Inst. Mycol. Pap. no. 15, p. 156, 1946.

Mycelium epiphyllous, thinly pelliculose, hyphae subhyaline to fuscous, 4—7 μ thick. Perithecia globose-flattened, 140—190 μ in

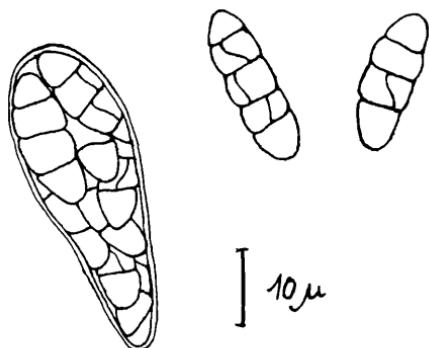

Fig. 29. *Deslandesia ficina* (Syd.) Bat. var. *microsporae* Bat. et Vit. — Ascus and spores.

diam., black, glabrous, pseudo-ostiolate. Asci clavate, 8-spores, $50-65 \times 17-22 \mu$, aparaphysate. Ascospores ellipsoid-oblong, muri-form, with 5—7 transversal septa, hyaline, $28-35 \times 10-13 \mu$. We have studied what appears to be the type through the courtesy of Prof. Lee Bonar, The University of California, U.S.A.

The specimen, no. 528.221, was labeled as *Tephrosticta ficina* Syd. n. sp., Los Banos, Philippines, Coll. C. F. Baker, Jan. 1913. On *Ficus* sp. — Also found on leaves of *Coffea liberica*. Buitenzorg, Indonesia. Spec. no. 11.110, Institute of Mycology, University of Recife, and in The National Fungus Collections, U.S.A.

Deslandesia ficina (Syd.) Bat. var. **microspora** Bat. & Vital n. var.

Mycelium epiphyllum superficial, pelliculose, thin, brownish,

not setose, nor hyphopodiate, composed of reticulate and constricted hyphae, with cells $10-15 \times 4-5 \mu$. Perithecia globose-depressed, developed beneath the mycelial pellicle, $150-190 \mu$ diam. Fig. 30., pseudo-ostiolate, single, scattered, brown, not setose; the perithecial walls are pseudoparenchymatic, made up of subglobose to polygonal cells, $2.5-8 \mu$ diam. Ascii ellipsoid to clavate, 8-spores, sessile to short pedicellate, 2-tunicate, $47.5-52.5 \mu$, aparaphysate, Fig. 29. Ascospores cylindraceous, muriform, 3-5 transversally septate, constricted, hyaline, polistichous, $17.5-25 \times 6-7.5 \mu$.

Chaetothyrium hawaiiense Mendoza in Bernice P. Bishop Mus. No. 19, p. 56, 1926.

Mycelium epiphyllous, membranous, hyphae fuscous, 6–7 μ thick, not setose. Perithecia globose, Fig. 40, gregarious or not, 200 μ

in diam., glabrous, black, pseudo-ostiolate; ascospores 8-spores, ovoid, $50 \times 20-25 \mu$, aplanospore; ascospores oblong, muriform 3-5 transverse septate, $20-24 \times 10-12 \mu$, hyaline, Fig. 37-38

On *Mallotus* — Philippines.

On *Morinda* — Hawaii.

We have examined what appears to be the type, under Rehms: Ascomycetes 2075, *Limacinula malloti* Rehm. Ad folia *Mallotus philippinensis*. Los Banos. Philipp. Ins. 3. 1913 — C. F. Baker, through the courtesy of The New York Botanical Garden.

This specimen has pellicle and brown mycelium composed of constricted hyphae with cells from $6.5-12.5 \times 6.5-9 \mu$. The perithecia develop beneath the mycelial pellicle, being globose-depressed, $150-220 \mu$ diam., brown, pseudo-ostiolate, the walls having polygonal to subglobose cells, $6.5-13.5 \times 5.5-10 \mu$. Ascospores 8-spores, sessile, ovoid to ellipsoid, $44-53 \times 21-31 \mu$, aplanospore. Ascospores oblong to cylindraceous, muriform, 3-5 transversally septate, hyaline, polystichous, $20-24.5 \times 6.5-10 \mu$.

The specimen of Mendoza, labeled as *Chaetothyrium hawaiiense* entirely agrees with this variety. It has the no. 6651, in the Herbarium University of Illinois. For the examination of the fungus we are indebted to that University.

Parallelly we found what appears to be this fungus in one specimen from the Herbarium of The University of California, no. 528216, also on *Mallotus philippinensis*, coll. in Philippines, March 25, 1913, C. F. Baker and determined as *Limacinula malloti* Rehm.

In another specimen, Rehm Ascomycetes, also no. 2075 and labeled as *Limacinula malloti* Rehm, on leaves of *Mallotus philippinensis*, Los Banos, Philipp., 3/1913, C. F. Baker we found ascospores $50-73 \times 22-26.5 \mu$ and ascospores $19-31 \times 7-11 \mu$, with 7 transverse septa.

Deslandesia roseospora (v. Höhn) Bat. & Cif., n. comb.

Syn.: *Limacinula roseospora* v. Höhnel, Sitzungsber. Akad. Wiss. Wien, CXVIII, p. 39 (1909) — See Hansford, I.M.I, Pap. N. 15, p. 154 (1946) — Fraser, Proc. Sinn. Soc. N.S.W., LXI, p. 283 (1936).

Mycelium scant, effuse, hyphae septate, reticulate, with cylindrical cells from $7-10 \times 3-4 \mu$, not setose brown-black. Perithecia globose-flattened, $160-300 \mu$ diam., $120-150 \mu$ in height, dark brown, pseudo-ostiolate, and developed beneath the mycelial pellicle, Fig. 39. Ascospores oblong-cylindric, to clavate, 8-spores, sessile $60-100 \times 12-28 \mu$, aplanospore. Ascospores $50-98 \times 7-13 \mu$, cylindraceous to subfusoid, 13-22 transversally septate and with several longitudinal septa, hyaline to pink. Fig. 39.

On unknown host plant, Brazil, and on *Sideroxylon* and *Eudianandra*, Australia.

Fraseria Bat. nov. gen.*)

Mycelium superficiale, effusum, non setosum, haud hyphopodiatum, ex hyphis subhyalinis vel brunnescensibus compositum.

Hypocapnodium strigosum Sawada nom. seminud. in Stud. Citrol. III: 225, 1929; Descr. Cat. Form. Fung. V: 22, 1931.

Epiphyllous. Mycelium spread, thinly crustaceous, brown, the hyphae irregularly branched, anastomosing, septate, constricted, with oblong or subcylindrical cells, $6-18.5 \times 2.5-4.5 \mu$, without hyphopodia. Mycelial setae abundant, straight or curved, opaque, $84-238 \times 3-7 \mu$. Perithecia scattered or subgregarious, globose-depressed, subcoriaceous, brown, pseudo-ostiolate, $120-182 \mu$ diam., developed beneath the mycelial pellicle. Perithecial setae numerous, $25-53$, simple, straight or curved, blackish-brown, $84-210 \times 5-7 \mu$. Ascii clavate to cylindric-clavate, (2-tunicate?) short pedicellate, 8-spores, $41-60 \times 11.5-16 \mu$, aparaphysate. Ascospores clavate, 3-5-transversally septate, not constricted, at first hyaline, then slightly colored, $21-30 \times 5-7 \mu$.

On *Citrus maxima*, Formosa, Prov. Taihoku, Seisiryo, Leg. W. Yamamoto, 15/3/942. Type.

Also on *Euphorbia sp.* loc. cit.

Gilmania xylopiiæ Bat., Nasc. & Cif. n. sp.

Mycelium superficial, epiphyllous, pelliculose, brown, not hyphopodiate, hyphae brownish, lengthened, opposite branched in an angles of $45-90^\circ$, septate, little constricted, composed of cylindrical cells from $11-17 \times 3.5-5.5 \mu$; mycelial seate much scattered when far from the perithecia, erect, simple, septate, spiny, obtuse, $50-55 \mu$ in height and $7-7.5 \mu$ wide, brown to blackish. Perithecia developed beneath the submycelial pellicle, superficial, subglobose to obpyriform, $82-165 \times 110-154 \mu$, Fig. 44, gregarious, blackish-brown, unilocular, pseudo-ostiolate, membranous, with subparenchymatic walls composed of polygonal cells, $6.5-15.5 \times 5.5-11 \mu$; the outer layer is covered with many setae of mycelial origin; the setae are brown, erect, straight or curved, simple, septate, spiny, obtuse, $50-80 \times 5-7.5 \mu$. Ascii ellipsoid, sessile, 8-spores, bitunicate, $41-68 \times 15-20 \mu$, aparaphysate. Ascospores fusoid with rounded ends, 3 septate, constricted, at first hyaline then brownish, distichous to polystichous, guttulate, $25.5-36.5 \times 8-11.5 \mu$. Fig. 41.

On living leaves of *Xylopia brasiliense* Spregn. Jaboatão. Leg. Severino José da Silva, 19. 5. 56. Type 5590, Institute of Mycology, University of Recife.

Mycelium epiphyllum, superficiale, effusum, pelliculosum, brunneum, ex hyphis elongatis, brunnescensibus, opposite ramosis, $45-90^\circ$, sptatis, parum constrictis, ex cellulis cylindraceis, $11-17 \times 3.5-5.5 \mu$, non hyphopodiatis, compositum. Setae myceliales erectae, simplices, septatae, spinescentes, rarae, atro-brunneae, $50-55 \times 7-7.5 \mu$. Perithecia sub pellicula mycelica evoluta, superficiale, subglobosa vel obpyriformia, $82-165 \mu$ diam., $110-154 \mu$ alt., gregaria, atro-brunnea, uniloculata, pseudo-ostiolata; ex parietibus membranaceis, subparenchymaticis, ex cellulis polygonalibus, $6.5-15.5 \times 5.5-11 \mu$, setis mycelialibus vestitis; setae erectae, rectae vel curvatae, septatae, brunneae, spinescentes, obtusae, $50-80 \times 5-7.5 \mu$. Ascii ellipsoidei, sessiles, 8-spori, bitunicati, $41-68 \times 15-20 \mu$, aparaphysati. Ascosporae fusoideae, ad polos

rotundatae, 3-septatae, constrictae, primo hyalinae dein brunneae, distichae vel polystichae, guttulatae, $25-36.5 \times 8-11.5 \mu$.

Gilmania xiphopaga (Viegas) Bat. n. comb.

Syd.: *Setella xiphopaga* Viegas in Bragantia, IV pag. 40, 1944.

Hypophylloous. Mycelium composed of brown hyphae, cylindric, septate, straight, $6-7 \mu$ diam., with black seta, 1—1.5 mm in high, acute, radiate. Ascostroma globoid, black, unilocular, $280-300 \mu$ in

height, $180-200 \mu$ wide, setose, carbonaceous. Ascii fusoid, 8-spores, $90-100 \times 16-18 \mu$ Ascospores fusoid, pluriseptate, $70-80 \times 5-6 \mu$, colored.

On undet. plant — Brazil.

Globoa Bat. & Maia n. gen.

Mycelium superficial, membranous, brownish — black, with branched septate and constricted hyphae, not setose nor hyphopodiate. Perithecia developed beneath the mycelial pellicle, globose to globoid, pseudo-ostiolate, membranous, glabrous, brown to brownish-black. Ascii 2-tunicate, 8-spores, aparaphysate. Ascospores cylindrical, many transversally septate, brown.

Type: *G. toddaliae* nobis n. sp.

Mycelium superficiale, membranous, brunneum vel atro-brunneum, ex hyphis irregulariter ramosis, septatis, constrictis, non setosis, haud hyphopodiatis, compositum. Perithecia pellicula mycelica ob tecta, globosa, pseudo-ostiolata, membranosa, glabrata, atrobrunnea. Ascii 2-tunicati, 8-spori, aparaphysati. Ascosporeae cylindricae, pluritransversaliter septatae, brunneae.

Globoea toddaliae Bat. & Maia n. sp.

Mycelium superficial, membranous, blackish-brown, hyphae irregularly branched, septate, constricted, having oblong cells, $16-21.5 \times 2.5-3 \mu$; hyphopodia and setae absent. Perithecia developed beneath the mycelial pellicle, globose to sub-globose, membranous,

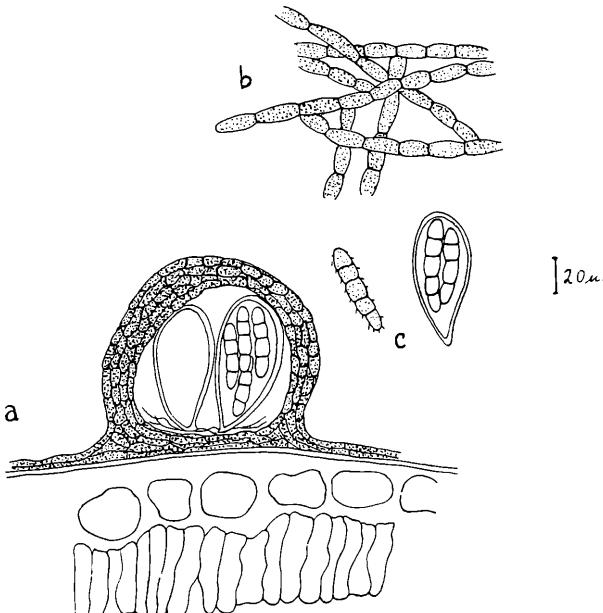

Fig. 42. *Globoea toddaliae* Bat. et Maia. — a) Perithecium developed beneath the mycelial pellicle. — b) Mycelial hyphae. — c) Ascus and spore.

sessile, brown, glabrous, $120-145 \mu$ diam., $100-110 \mu$ in height, pseudo-parenchymatic, the walls being $19-21.5 \mu$ diam., and composed of cells of $8-9.5 \times 5.5-7 \mu$ diam., Fig. 42. Ascii clavate, sessile to short pedicellate, 2-tunicate, 8-spores, aparaphysate, $57-67.5 \times 24-27 \mu$. Ascospores brownish, 3-4 septate, slightly constricted, polystichous, $32.5-43 \times 5.5-6.5 \mu$, slightly spiny. Fig. 42.

On leaves of *Toddalia asiatica* associated with *Asterina* sp. Entebbe Road — Uganda — Leg. C. G. Hansford, 2/1931. Type, 1456, Herb. Mycologist. Dep. Agric. Uganda.

Note: Under question mark, C. G. Hansford had admitted this fungus as *Limacinia*.

Mycelium superficiale, membranous, atro-brunneum, ex hyphis irregu-

lariter ramosis, septatis, constrictis, ex cellulis $16-21.5 \times 2.5-3 \mu$, non hyphopodiatis, non setosis, compositum. Perithecia pellicula mycelica ob tecta, sparsa, globosa vel subglobosa, brunnea, glabrata, $120-145 \mu$ diam., $100-110 \mu$ alt., pseudo-ostiolata, $13.5-16 \mu$ diam., pseudo-parenchymatica, cum parietibus 2-3 stratosis, $19-21.5 \mu$ cr. ex cellulis sub globosis $8-9.5 \times 5.5-7 \mu$, efformata. Asci clavati, sessiles vel curtopedicellati, 2-tunicati, 8-spori, aparaphysati, $57-67.5 \times 24-27 \mu$. Ascospores cylindraceae 3-4-transversaliter septatae, parum constrictae, parumque spinescentes, brunnescentes, $32.5-43 \times 5.5-6.5 \mu$.

Hansfordina Bat. n. gen.*)

Mycelium pelliculosum, superficiale, ex hyphis reticulatis, olivaceis, non setosis, non hyphopodiatis, compositum. Perithecia oriunda subpellicula mycelica, globoidea, pseudo-ostiolata, non setosa; asci octospori, aparaphysati; sporae 1-septatae, hyalinæ.

Typus: *H. nuxiae* (Hansf.) Batista comb. nov.

Key to the Species of the Genus *Hansfordina*.

A — Ascospores $17-20 \mu$ long	<i>H. nuxiae</i>
AA — Ascospores $10-11 \mu$ long	<i>H. tonduzi</i>

***Hansfordina nuxiae* (Doidge) Bat. n. comb.**

Syn.: *Limacinia nuxiae* Doidge in Bothalia II. p. 240, 1929.

Microcallis nuxiae (Doidge) Hansf. Comm. Myc. Inst. Mycol. Pap. 15, p. 142, 1946.

Hypophylloous. Mycelium superficial, pelliculous, olivaceous, hyphae, $2.5-3.5 \mu$ thick, reticulate, not setose, nor hyphopodiate. Perithecia developed beneath the mycelial pellicle, globose, $50-60 \mu$ diam., aggregate up to 20, pseudo-ostiolate, glabrous, olivaceous. Asci ovoid to subglobose, 8-spores, nodose-pedicellate, $30-37 \times 16-17 \mu$. Ascospores clavate, 1-septate, conglobate, $12-20 \times 3.5-5 \mu$, hyaline, (according to Hansford, l. c.).

In Doidge's description the ascospores are 3-septate and $17-20 \times 3.5-5 \mu$.

On *Nuxia* — South Africa.

***Hansfordina tonduzi* (Speg.) Bat. n. comb.**

Syn.: *Capnodinula tonduzi* Speg. in Bol. Ac. Nac. Cienc. Corboda, 23, p. 189, 1919.

Mycelium subpelliculous, blackish, neither setose, nor hyphopodiate; perithecia globoid, 75μ diam., pseudo-ostiolate, olivaceous-black, not setose; asci cylindric-clavate, 8-spores, $25-30 \times 10 \mu$, aparaphysate; ascospores subclavate, 1-septate, hyaline, $10-11 \times 2.5-3 \mu$.

On *Vitis* — Costa Rica.

*) In honor of the British Mycologist Dr. C. G. Hansford who established the family Chaetothyriaceae.

Kanousea Bat. & Cif. n. gen.*)

Mycelium pelliculosum, tenue, superficiale, hyalinum vel flavobrunneum, non hyphopodiumatum, ex hyphis rectis, reticulatis et setis mycelialibus, erectis, atrobrunneis, compositum. Perithecia globosa oriunda in pellicula mycelica, brunnea, pseudo-ostiolata, membranacea; setae peritheciales nullae. Asci octospori, paraphysati. Ascosporae 1-septatae, hyalinae.

Typus: *K. consociata* (Syd.) Bat. & Cif. n. comb.

Key to Species of *Kanousea*

A — Ascospores $10-13 \times 3.5-4.5 \mu$	<i>K. consociata</i>
AA — Ascospores $20-22 \times 7-8 \mu$	<i>K. macarangae</i>
AAA — Ascospores $37-45 \times 8-10 \mu$	<i>K. megalospora</i>

Kanousea consociata (Syd.) Bat. & Cif. n. comb.

Syn.: *Microcallis consociata* Syd. in Ann. Mycol. XXIV: p. 341, 1926.

Hypophylloous; mycelium pelliculose, scarcely visible, hyphae reticulate, yellowish to hyaline, $2-2.7 \mu$ thick. Perithecia developed beneath the mycelial pellicle, $180-220 \mu$ diam., $25-30 \mu$ in high, pseudo-ostiolate, surrounded by erect hyphae, $22 \times 3-4 \mu$; asci ellipsoid, ovoid to clavate, 8-spores, subsessile, $25-32 \times 13-17 \mu$ (rarely up to 40μ high); paraphysoids numerous. Ascospores oblong-clavate, conglobate, 1-septate, $10-13 \times 3.5-4.5 \mu$, hyaline.

On *Phoebe*, *Roupala* — Costa Rica.

Est *Kanousea* per mycelium setosum et perithecia glabra, cum ascosporis 1-septatis, hyalinis.

Kanousea Macarangae (Hansf.) Bar. & Cif. n. comb.

Syn.: *Microcallis macarangae* Hansf. in Proc. Linn. Soc. London, 156 sess. part. 2, p. 111, 1943—1944.

Hypophylloous. Mycelium ashy-brown, superficial, pelliculose, hyphae subhyaline to olivaceous, $2-3.5 \mu$ thick, reticulate, with scattered setae, erect, simple, blackish-brown, $150 \times 3-4 \mu$, septate, obtuse. Perithecia developed beneath the mycelial pellicle, globose-depressed, $100-160 \mu$ wide, 70μ in height; walls 8μ in thickness, pseudo-ostiolate. Asci ellipsoid, 8-spores sessile, $55-60 \times 25 \mu$; paraphyses filiform, simple, hyaline. Ascospores clavate, 1-septate, hyaline, $20-22 \times 7-8 \mu$.

On leaves of *Macaranga monandra* — Entebbe Road, Uganda.
Leg. Hansford, no. 3167.

Peritheciis non setosis est *Kanousea*.

*) Dedicated to mycologist Dr. Bessie Kanouse, of the University of Michigan, U.S.A.

Kanousea megalospora (Petr. & Cif.) Bat. & Cif. n. comb.

Syn.: *Microcallis megalospora* Petr. & Cif. in Ann. Myc. XXX, p. 203, 1932.

On *Anacardium* sp. — Rep. Dominicana.

Mycelium hypophyllous, effuse, hyphae reticulate, yellowish to olivaceous brown, $2.5-4 \mu$ thick, with numerous setae, straight or curved, septate, olivaceous black, $200-350 \times 7-9 \mu$. Perithecia globose-flattened, $110-180 \mu$ in diam., pseudo-ostiolate, olivaceous-brown, not setose. Asci clavate to ellipsoid subsessile, $60-90 \times 30-44 \mu$, with paraphysoides. Ascospores oblong-cylindric to fusoid, 1-septate, $37-45 \times 8-10$.

Peritheciis non setosis est *Kanousea* sp.

Microcalliopsis Bat. & Cif. n. gen.

Mycelium superficial, pelliculose, brownish, hyphae reticulate-branched, not setose, not hyphopodiate. Perithecia developed beneath the mycelial pellicle, brownish-black, pseudo-ostiolate, setose. Asci paraphysate. Ascospores ellipsoid, 1-septate, hyaline.

Typus: *M. schizostachyl* (Hansf.) Bat. & Cif. n. comb.

Est *Hansfordina* cum peritheciis setosis.

Key to Species of *Microcalliopsis*.

A — setae 90μ long, ascospores $15-18 \times 5-6 \mu$.	<i>M. schizostachyi</i>
AA — setae $10-25 \mu$ long, ascospores $19-23 \times 3.5-5 \mu$.	<i>M. rutideae</i>

Microcalliopsis rutideae (Hansf.) Bat. & Cif. n. comb.

Syn.: *Microcallis rutideae* Hansf. in Proc. Linn. Soc. London, 158: p. 40, 1945—1946.

Mycelium pelliculose, hyphae hyaline to brownish, $1.5-3 \mu$ thick. Perithecia developed beneath the mycelial pellicle, globose-depressed, blackish-brown, $50-100 \mu$ in high, $50-80 \mu$ wide, with clavate setae, brown, 1—2-septate, $10-25 \times 7-10 \mu$. Asci ellipsoid, 8-spores, sessile, $43-15 \mu$; paraphyses filiform, continuous, hyaline, 1μ thick. Ascospores clavate-cylindric, 1-septate, $19-23 \times 3.5-5 \mu$, hyaline.

On *Rutidea* — Uganda.

Microcalliopsis schizostachyi (Hansf.) Bat. & Cif. n. comb.

Syn.: *Microcallis schizostachyi* Hansf. Sydowia, Ann. Mycol. X: 97, 1956.

Mycelium epiphyllous, pelliculose, spread, brownish, hyphae septate, having cylindrical cells, $10-15 \times 7-9 \mu$, branched, not setose, nor hyphopodiate. Perithecia developed beneath the mycelial

pellicle, brownish-black, globose-depressed, about $90\ \mu$ in height and $60\ \mu$ wide membranous, pseudo-ostiolate; the walls are in several layers, $12\ \mu$ thick. Perithecial setae 5—15 disposed in circle, erect, straight, simple, septate, brownish-black, $90—7\times 9\ \mu$. Ascii sessile or not, ellipsoid, 8-spores, $50\times 15\ \mu$, paraphysate. Ascospores ellipsoid, 1-septate, hyaline, $15—18\times 5—6\ \mu$.

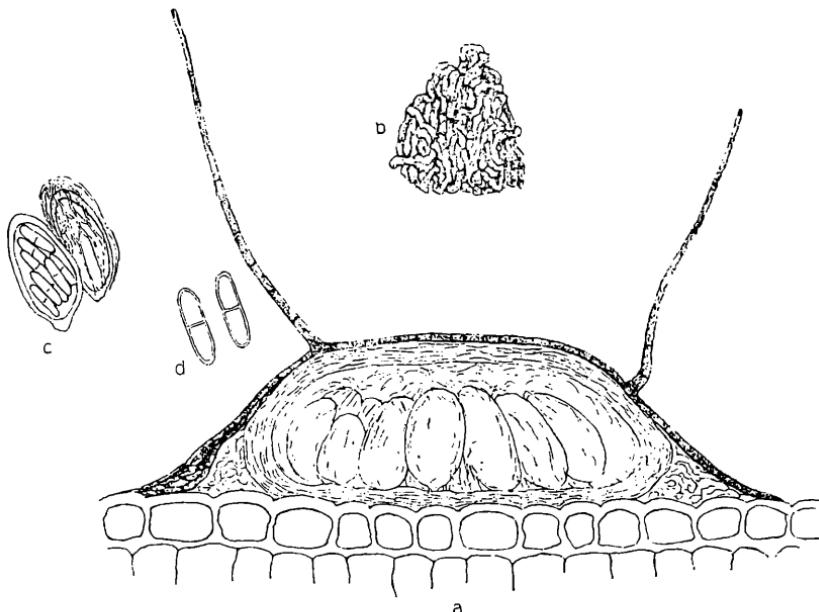

Fig. 44. *Microcallis phoebe* Syd. — From Sydow. Annal. Mycol. XXIV. 339, 1926.

On leaves of *Schizostachium sp.* G. Boender, Indonesia, Boedijn, 1170. Typus.

Microcallis Syd.

Superficial mycelium olivaceous-brown, scarcely visibly, hyphae reticulate-branched with long setae erect, septate, brown. Perithecia flattened-globose, covered with thin mycelial pellicle, olivaceous-brown, setose. Ascii clavate, subsessile, 8-spored; paraphysoids present; ascospores oblong-clavate, 1-septate, hyaline.

Type *M. phoebe* Syd. in Ann. Mycol. XXIV, p. 337, 1926.

Key of the Species of the Genus *Microcallis*

- A — Ascospores $13.5—16\times 3.5—5\ \mu$; setae $200—500\ \mu$
 - long . *M. ceibae*
- AA — Ascospores $15—20\times 5—6.5\ \mu$; setae $150—230\ \mu$
 - long . *M. phoebe*

Microcallis ceibae Bat. & H. Lima in Ann. Soc. Biol. Pern. XIII, p. 191, 1955.

Mycelium hypophylloous, thinly pelliculose, almost invisible, hyaline to yellowish-brown; hyphae 1.5–2.2 μ thick, straight, reticulate; many mycelial setae, scattered, erect, simple, straight, obtuse, septate, blackish-brown, $200–500 \times 4–5 \mu$. Perithecia globose, $75.5–92 \mu$ in diam., membranous, blackish-brown, pseudo-ostiolate, ornate with numerous setae, Fig. 43, curved, septate, brown, $45.5–85 \times 3.5–5.5 \mu$. Ascii ovoid, 8-spores, short pedicellate, $38–40 \times 20–23 \mu$, paraphysate. Ascospores clavate-cylindric, 1-septate, hyaline, $13.5–16 \times 3.5–5 \mu$ Fig. 43, 45.

On leaves of *Ceiba pentandra* (L.) Gaertn, Benot Velho, Vitoria, Pernambuco, Brazil. Leg.: Severino José da Silva. Det. A. Chaves Batista and I. H. Lima, 24. 3. 1955, sp. no. 1091 IMUR, associated with *Eremotheca ceibae* Bat. & H. Lima n. sp.

Also on *Inga marginata* Willd. Dois Irmãos, Recife, Pernambuco. Leg. Osvaldo Soares da Silva. Det. A. Chaves Batista & I. H. Lima, 29. 5. 1955, no. 2351, I.M.U.R.

Microcallis phoebe Syd. in Ann. Mycol. XXIV: pag. 338, 1926.

On *Phoebe* — Costa Rica.

Hypophylloous, pelliculose; hyphae branched-reticulate, septate, olivaceous to blackish-brown, $2.5–3.5 \mu$ thick; mycelium setae scattered, rigid, septate, curved, dark-brown, obtuse, $150–230 \mu$ high, 5μ wide at the base and 2.5μ at the apex. Perithecia developed beneath the mycelial pellicle, globose-depressed, $70–150 \mu$ diam., $35–50 \mu$ in high, pseudo-ostiolate ("gleboseque dissoluta" in the original diagnosis), olivaceous-brown; the superior walls $5–7 \mu$ in thickness, with setae analogous to the mycelial setae; ascii clavate to ellipsoid, 8-spores, subsessile, $35–50 \times 12–18 \mu$; paraphysoids filiform, 1μ diam. branched; ascospores oblong-clavate, 1-septate, $15–20 \times 5–6.5 \mu$, hyaline, Fig. 44.

Hansford, (The Foliicolous Ascomycetes etc. pag. 141, 1946), suggests that the perithecia are too flat, and there may be some mistakes in the description. Certainly the fungus is a member of the Chaetothyriaceae family, as the original illustration shows, and not a Micropeltaceae. The type has not been available. After the research of Bitancourt (Arch. Inst. Biol. São Paulo, pags. 5–22) 1936 the genus *Chaetothryina* Speg. has been emended, and then confirmed the validity of the species *Microcallis phoebe* Syd., *M. consociata* Syd., *M. amadelpha* Syd. and *M. megalospora* Petrak & Cif., considered as "nomina nuda" by Petrak & Sydow (1934. Annotation).

Mycostevensonia Bat. & Cif. n. gen.

Typus: *M. funtumiae* (Hansf.) Bat. & Cif. n. comb.

Mycelium pelliculosum, non setosum, non hypopodiatum,

superficiale, ex hyphis hyalinis vel brunneis, septatis, compositum. Perithecia evoluta sub pellicula mycelica, globose-depressa, pseudo ostiolata, atrobrunnea, setosa. Ascii 8 spori, aparaphysati. Ascosporae muriformes, hyalinae.

Phaeochaetia acalyphae (Hansf.) Bat. & Cif. n. comb.

Syn.: *Chaetothyrium acalyphae* Hansf. in: Comm. Mycol. Inst. Myc.

Pap. no. 15, p. 147, 1946.

On *Acalypha* — Uganda.

Mycelium epiphyllous, superficial, thinly pelliculose, not setose; hyphae subhyaline to yellow-olivaceous, flexuose, 3μ thick. Perithecia scattered, globose, olivaceous — black, $120-150 \mu$ diam., pseudo-ostiolate, walls $13-20 \mu$ thick, setose, with setae simple, erect, $120 \times 6 \mu$. Asci clavate, short stipitate, 8-spores, $60-30 \mu$. Ascospores clavate-fusoid, 3-septate, $25-30 \times 7-9 \mu$, hyaline.

Phaeochaetia anonicola (Hansf.) Bat. & Cif. n. comb.

Syn.: *Chaetothyrium anonicola* Hansf. in Comm. Mycol. Inst. Myc.

Pap. no. 15, p. 149, 1946.

On *Anona* — Uganda.

Mycelium epiphyllous, brown, pelliculose; hyphae olivaceous, nearly straight, reticulate, septate, $2.5-4 \mu$ thick. Perithecia sub-globose, blackish-brown, pseudo-ostiolate, sessile, $100-230 \mu$ diam., ornate with numerous setae, blackish-brown, simple, septate, straight, $50-90 \times 6-7 \mu$; perithecial walls $8-15 \mu$ thick. Asci ovoid to ellipsoid, 8-spores, nodose-stipitate, $55-80 \times 20-28 \mu$, apophysate. Ascospores fusoid, 3-septate, $30-37 \times 5-6.5 \mu$, hyaline to yellowish.

Phaeochaetia arbutifoliae Bat., Cif. & Nasc. n. sp.

Mycelium epiphyllous, superficial, spread, blackish-brown, hyphae made up to cylindric and constricted cells, $5.5-14.5 \times 3-6 \mu$, branched, not setose, nor hyphopodiate. Perithecia subglobose, $90-110 \mu$

diam., developed beneath the mycelial pellicle, gregarious, blackish-brown, pseudo-ostiolate, membranous, the walls subparenchymatic, 2-layers, the outer dark, the inner hyaline, $17-24.5 \mu$ thick, composed of polygonal cells, $5.5-12.5 \times 4-8 \mu$; the basal wall is in one layer,

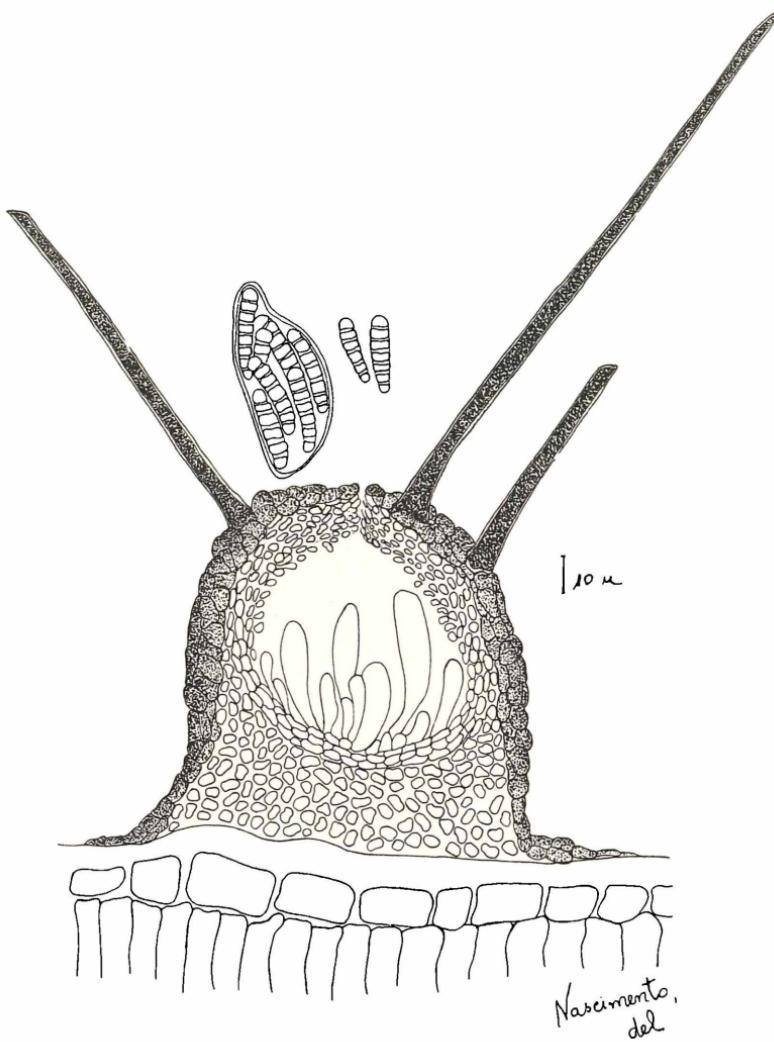

Fig. 48. *Phacochaetia arbutifoliae* Bat. Cif. et Nasc. — Perithecium setose, ascus and spore.

$24-31 \mu$ thick. Setae scattered on the perithecia, continuous, erect, acuminate, blackish-brown, opaque, $165-270 \times 6-7.5 \mu$. Ascii ellipsoid, 8-spores, 2-tunicate, sessile, $50-54 \times 14-20 \mu$, aparaphysate. Ascospores clavate-cylindric, 4-7 transversally septate, constricted, polystichous, hyaline, $13-16.5 \times 4-4.5 \mu$. Fig. 48.

On leaves of *Photinia arbutifoliae* Lindl. Sonoma County — Calif. H. E. Parks, April, 20, 1931. Type no. 756704, Herbarium of The University of California. Associated with *Fumagospora gaultheriae* Bat. & Vital, *Chaetasbolisia californiana* Bat., Cif. & Nasc. and *Trichomedium atronitidum* (Miller & Bonar) Cif. & Bat.

The specimen was labeled as:

Capnodium heteromeles Cke. & Hk.

Vertixore atronitidum Miller & Bonar

Phaeosaccardinula anomala (Cke. & Hk.) Miller & Bonar.

Mycelium epiphyllum, superficiale, effusum, atrobrunneum, ex hyphis cylindraceis, constrictis, $5.5-14.5 \times 3-6 \mu$ ramosis, non setosis, non hyphopodiatis, compositum. Perithecia subglobosa, $90-110 \mu$ diam., pellicula mycelica oriunda, gregaria, atro-brunnea, pseudo-ostiolata, cum parietibus membranosis, subparenchymaticis $17-24.5 \mu$ cr., 2-stratosis, ex cellulis polygonalibus $5.5-12.5 \times 4-8 \mu$ efformatis et cum pariete basali 1-stratosa, $24-31 \mu$ cr. Setae peritheciales effusae, erectae, continuae, acuminatae, atro-brunneae, opacae, $165-270 \times 6-7.5 \mu$. Ascii ellipsoidei, 8-spori, 2-tunicati, sessiles, $50-54 \times 14-20 \mu$, aparaphysati. Ascosporae clavate-cylindraceae, 4-7 transversaliter septatae, constrictae, polystichae, hyalinæ, $13-16.5 \times 4-4.5 \mu$. — In follis *Photinia arbutifoliae* Lindl. Sonoma County, Calif. H. E. Parks, April 20, 1931. Typus no. 756704, ex Herbario Univ. Californiae.

We have also found this fungus on leaves of *Hakea salignea* Botanical Garden of Coimbra-Portugal, coll. by Moller. This specimen, C. Róumeugré, Fungi selecti exsiccati, was labeled as no 4843, *Capnodium mesnerianum* Thum. For the study of this fungus we are indebted to The University of Pavia, Italy.

Also on leaves of *Mangifera indica* L., Maricao, Puerto Rico, Leg. F. L. Stevens, 1913, Det. A. C. Batista & M. L. Nascimento, 15. 5. 1958, spec. no. 13333, I.M.U.R., associated with *Chaetasbolisia falcata* Miller & Bonar.

Phaeochaetia capensis (Doidge) Bat. n. comb.

Syn.: *Aithaloderma capense* Doidge in Bothalia, 2: part IV, p. 239, 1927.

Chaetothyrium capense (Doidge) Hansf. in Bothalia, V p. 192, 1950.

On *Schotia* — London.

Mycelium superficial, epiphyllous, pelliculose, black or olivaceous, hyphae fuscous-olivaceous, reticulate, composed of cells about 30μ long, and $3-12 \mu$ thick. Perithecia scattered, conoid, $100-120 \mu$ diam., black, pseudo-ostiolate, setose, with parenchymatous structure and cells $4-5 \mu$ diam.; the setae are $24-30 \times 6-6.5 \mu$, continuous, curved, acuminate. Ascii ovoid to subclavate, 8-spores, $30-37 \times$

10—12 μ , a paraphysate. Ascospores 3-septate, slightly constricted, hyaline, $20—24 \times 3.5—5 \mu$. Fig. 49.

We have also found this fungus on *Magnolia glauca*, associated with *Trichomerium pelliculosum* and *Asbolisiaceae*; the specimen has been from Ellis & Everhart's collection, coll. in Florida, 1883, Dr. Geo Martin and lent to us by The New York Botanical Garden, under the label "1545. *Capnodium pelliculosum* Berk & Rav."

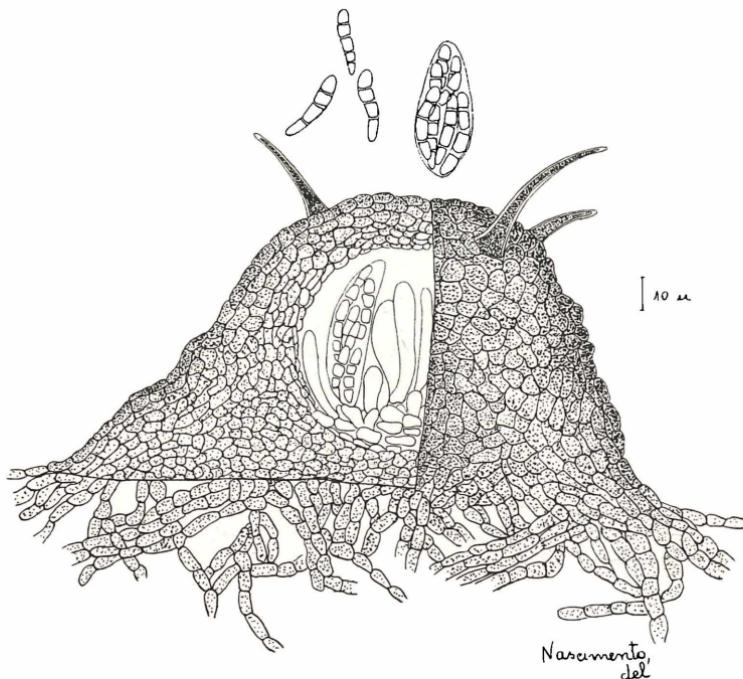

Fig. 49. *Phaeochaetia capensis* (Dodge) Bat. — Perithecioid, ascus and spores.

Also found in one specimen of unknown host, associated with *Chaetasbolisia falcata* Miller & Bonar. Isl. of Madeira. Leg. Prof. C. Torrend, S. J. 1910. Ex Herb. P. A. Saccardo, sub *Capnodium salicinum*.

***Phaeochaetia clavatispora* (Syd.) Bat. & Cif. n. comb.**

Syn.: *Chaetothyrium clavatisporum* (Syd.) Hansf. Comm. Mycol. Inst. Mycol. Pap. no. 15, 150, 1946.

Aithaloderma clavatisporum Syd. Ann. Mycol. XI: p. 257, 1913.

Ixora, *Psidium*, *Acrostichum* — Philippine Islands.

Mycelium epiphyllous, superficial, effuse, thinly pelliculose, olivaceous to black, hyphae $4—6 \mu$ wide. Perithecia conoid, $60—90 \mu$ diam., brown to blackish, pseudo-ostiolate, Fig. 53, with erect setae

10—20 \times 3.5—5 μ , olivaceous, brownish, continuous, walls 6—8 μ diam. Ascii 8-spores, subclavate, shortly stipitate, 30—36 \times 14—20 μ , aparaphysate. Ascospores clavate, conglobate, 3—5-septate, hyaline, 24—26 \times 5—6 μ ; associated with *Microxyphium*. Fig. 50.

Obs.: The specimen on *Psidium guajava* collected in the Philippine Islands and deposited in the Herbarium of University of California, under number 203383, entirely agrees with the original description of Sydow. We have examined this specimen through the courtesy of Prof. Lee Bonar, Univ. of California.

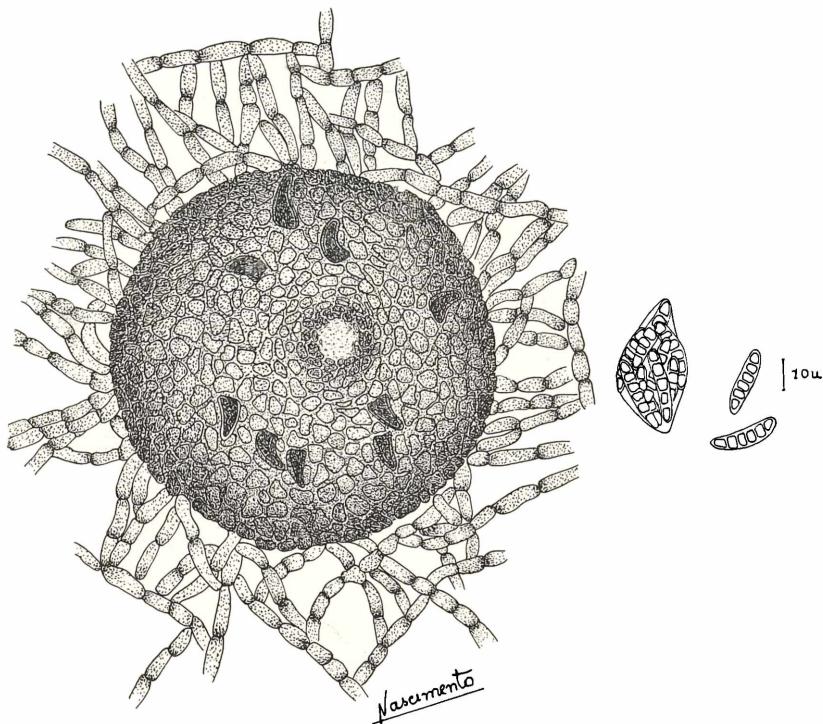

Fig. 50. *Phaeochaetia clavatispora* (Syd.) Bat. et lif. — Perithecioid, ascus and spores.

We have seen the same fungus in one specimen of The Herbarium of The University of Illinois, no. 6625, det. by Sydow, Sept. 1913, as *Aithaloderma clavatisporum*, and collected in Los Banos, Philippines (*Fungi Malayana*, C. F. Baker).

We have also examined the two following Sydow's specimens: "Fungi Malayana, C. F. Baker, no. 2 suppl. *Aithaloderma clavatisporum* Syd. on *Ixora coccinea*, Mount Maquiling, Los Banos, Laguna, Philippines, Apr. 1914, and "Fungi Malayana, C. F. Baker, no. 2 suppl. 2, *Aithaloderma clavatisporum* Syd. on *Psidium guajava*, Mount

Maquiling, Los Banos, Laguna, Philippines, Sept. 1913" Both are *Phaeochaetia* being the last one associated with *Microxyphium*.

Also on leaves of *Cestrum laurifolium*, Mayaguez, Puerto Rico, Leg. F. L. Stevens, 15. 6. 915, spec. no. 13373, I.M.U.R.

Also found on *Psychotria chlorotica* Müll, Arg., Paulista, Pernambuco, Leg. A. F. Vital, Det. A. C. Batista, 26. 8. 1957, spec. no. 11466, I.M.U.R., associated with *Phragmoxyphium psychotriae* Bat. n. sp., *Phaeosaccardinula caucasica* (Woronich) Hansford, v. *artocarpi*, Bat., Cif. & Nasc., *Phaeochaetia clavispora* (Speg.) Bat. & Cif. var. *gardeniae* Bat. & Nasc.

Likewise found on *Cupania* sp., Paulista, Pernambuco, A. C. Batista, 2. 9. 1957, spec. no. 11677, I.M.U.R.

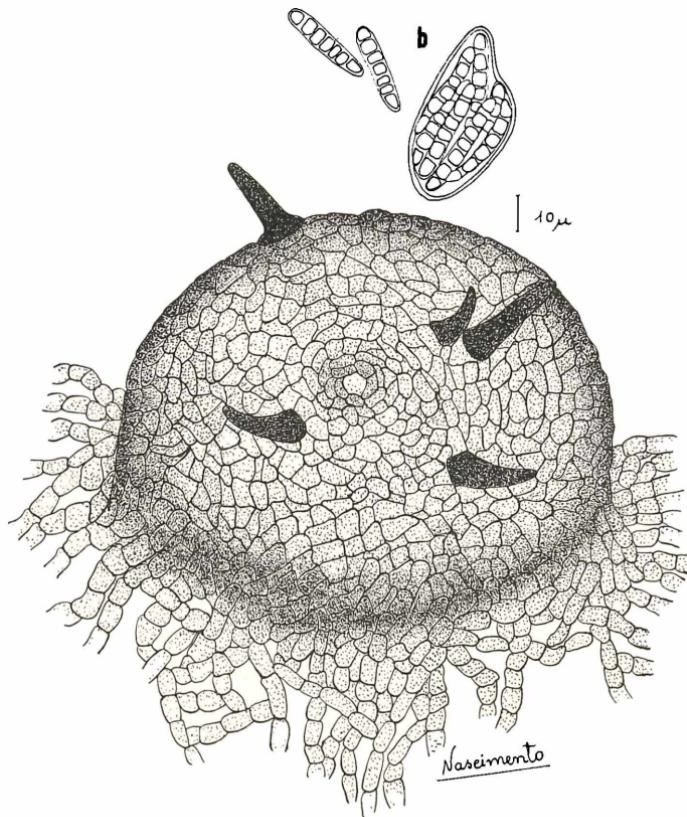

Fig. 51. *Phaeochaetia clavatispora* var. *globosa* Bat., Nasc. et Cif. — a) Perithecioid and pellicula mycelium. — b) Ascus and Ascospores.

Phaeochaetia clavatispora (Syd.) Bat. & Cif. var. *globosa* Bat., Nasc. & Cif. n. var.

Mycelium epiphyllous, blackish-brown, spread, not setose, nor hyphopodiate, composed of constricted and branched hyphae with

cylindrical cells $4.5 \times 4.5 - 5.5 \mu$. Perithecia globose $125 - 150 \mu$ diam., developed beneath the mycelial pellicle, gregarious, blackish-brown, pseudo-ostiolate, setose, the setae being continuous, blackish, straight or incurvate, acuminate, $17 - 30 \times 6 - 7.5 \mu$, Fig. 54. Ascii ellipsoid to pyriform, 2-tuncate, sessile, 6—8-spores, $30 - 50 \times 17 - 23 \mu$, aparaphysate. Ascospores cylindric-fusoid, 2—6-septate, constricted, polytichous, hyaline, $17.5 - 29 \times 5.5 - 7.5 \mu$. Fig. 51.

On leaves of *Mallotus philippinensis* — Los Banos, Philippines Ins., 3, 1913, C. F. Baker, associated with *Deslandesia paulensis* (Rehm.) Bat. var. *malloti* Bat. & Cif. In the Herbarium of The New York Botanical Garden.

A typo recedit peritheciis majoribus et sporis 2—6-septatis.

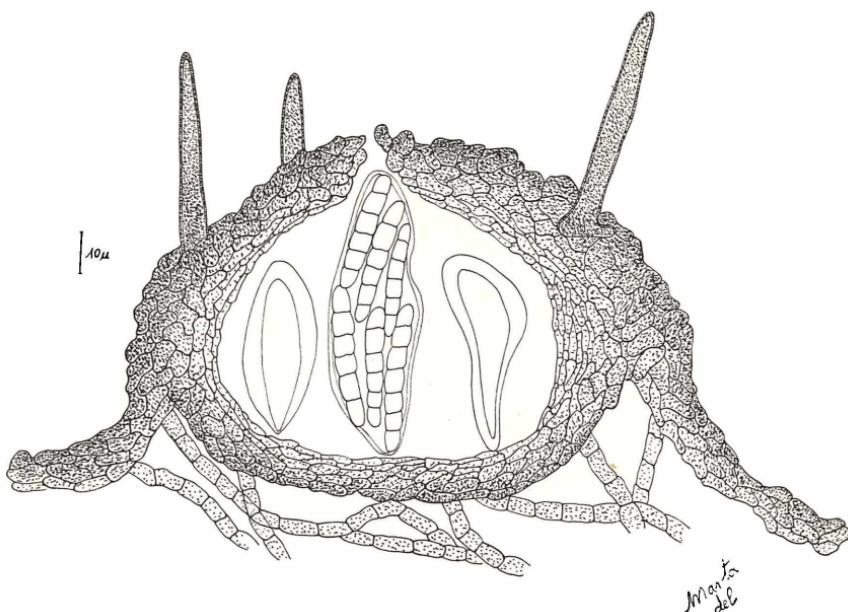

Fig. 52. *Phaeochaetia clavispora* var. *gardeniae* Bat. et Nasc.

***Phaeochaetia clavispora* (Speg.) Bat. & Cif. n. comb.**

Syn.: *Zukalia clavispora* Fung. Puigg. no. 224.

On unknown host. — Brazil.

Mycelium amphigenous, effuse, pelliculous, hyphae opposite, branched, $5 - 6 \mu$ wide, olivaceous; perithecia ovoid, setose, astomous, gregarious, $150 - 180 \mu$ diam.; ascii clavate, $80 \times 20 \mu$, aparaphysate; ascospores cylindric-clavate, 3—5-septate, $30 - 45 \times 5 - 6 \mu$, constricted subhyaline.

Identified also on *Miconia laevigata* (L) P. in association with *Ciferrioxypodium giganteum* Bat. & Nasc. and *Naetrocybe diospyri*

Bat. & Maia. Arecibo Road — Puerto Rico. Leg. F. L. Stevens, 6/1/1915. Espec. no. 7217, Herb. Univ. Illinois and 13077, Inst. Micologia, Univ. do Recife.

Phaeochaetia clavispora (Speg.) Bat. & Cif. var. *gardeniae* Bat. & Nasc. n. var.

Mycelium superficial, blackish-brown, epiphyllous, pelliculose, not setose, nor hyphopodiate, hyphae septate, composed of subglobose to cylindrical cells, $5.5-15.5 \times 5-6.5 \mu$.

Perithecia developed beneath the mycelial pellicle, subglobose, 150—182 μ wide, 110—150 μ height, blackish-brown, setose, pseudo-ostiolate, Fig. 55 & 56. membranous, subparenchymatic, the walls having subglobose to polygonal cells, $5-15 \times 3-8 \mu$. The setae are blackish-brown, continuous, 11 to 15 in number, erect, rigid, rotund at the end, $80-170 \times 6-7.5 \mu$. Ascii ellipsoid, 1-tunicate, 8 spores, $44-61 \times 15-22 \mu$, aparaphysate. Ascospores clavato-fusoid, 5—7 transversally septate, constricted, polystichous, hyaline, $22-44 \times 5.5-6.5 \mu$. Fig. 52—53.

On *Gardenia jasminoides* — Nugenb. Miss, March, 3, 1909, Coll. by P. H. Hulbard. Specimen from The National Fungus Collection, Beltsville, Md., det. as *Capnodium* sp. Type.

Also identified on *Mallotus philippinensis*, Los Banos, Philippines. Coll. C. F. Baker, March 25/1913, associated with *Deslandesia paulensis* var. *malloti* (Rehm) Bat. & Cif.

Likewise found on leaves of *Psychotria marckgravii* Spreng. associated with other fungi, including some of the family Capnodiaeae and Asbolisiaceae. Paulista, J. S. Pires, 19/8/57. Inst. Micol. Univ. Recife.

Also on *Psychotria chlorotica* associated with *Phragmoxyphium psychotriae* Bat., *Phaeochaetia clavatispora* var. *setoseptata* Bat. and *Phaeosaccardinula caucasica* var. *artocarpi* Bat. Paulista, Pern. Leg. Dr. A. F. Vital, 26/8/57. Spec. no. 11465, Inst. Micol. Univ. Recife.

A typo recedit ascis minoribus et ascosporis 5—7 septatis. In foliis *Gardeniae jasminoidis*.

***Phaeochaetia echinulata* (Yam.) Bat. & Cif. n. comb.**

Syn.: *Chaetothyrium echinulatum* Yam. in Ann. Phytopath. Soc. of Japan, XXI: 4, 167 1956.

Epiphyllous. Mycelium superficial, thinly crustaceous, brown, spread, composed of irregularly branched hyphae, anastomosing, little spiny, the cells being oblong or cylindrical, $7-15 \times 3-4.5 \mu$, without hyphopodia. Mycelial setae abundant, simple, black, continuous, straight or curved, $168-322 \times 7-8 \mu$. Perithecia subgregarious, globose-depressed, pseudo-ostiolate, subcoriaceous, glabrous, black, $170-238 \mu$ diam., developed beneath the mycelial pellicle. Ascii subcylindric to elliptic-cylindric, short pedicellate, (2 tunicate ?)

8-spores, $46-65 \times 11-14 \mu$, a paraphysate. Ascospores oblong to ellipsoid-oblong, (3-septate?) not constricted, hyaline, $13-21 \times 4.5-5 \mu$.

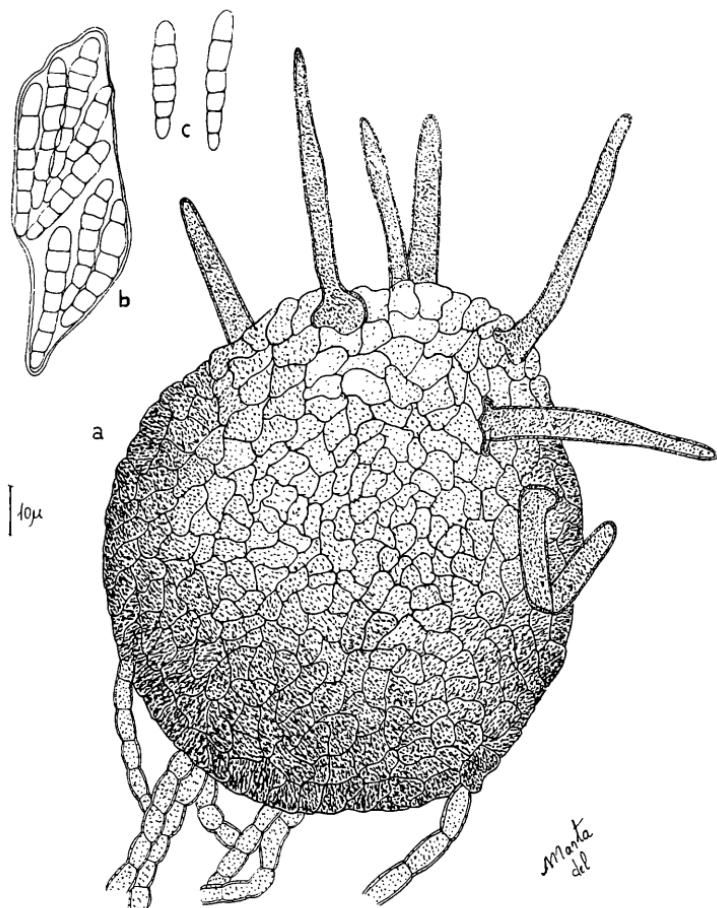

Fig. 53. *Phaeochaetia clavispora* var. *gardeniae* Bat. et Nasc. — a) Perithecioid setose. — b) Ascus. — c) Spores.

On *Citrus maxima* — Formosa, Prov. Taihoku, Sniten, Leg W. Yam. 16/3/941, Type.

Also on *Ardisia*, *Euphorbia*, *Itea*, *Lasianthus*, *Phyllostachyum*, *Styrax* (loc. cit.).

***Phaeochaetia ilicifolia* Bat. & Nasc. n. sp.**

Mycelium epiphyllous, superficial, blackish-brown, pelliculose, effuse, dense, hyphae brown, septate, constricted, composed of cylindrical cells, $5.5-11 \times 2-4.5 \mu$, not setose, nor hyphopodiate.

Perithecia gregarious, superficial, developed beneath the mycelial pellicle, subglobose, $90-135 \mu$ diam., blackish-brown, setose, the setae being 8 to 25 in number, continuous, acuminate, blackish, $35-100 \times 7-10 \mu$; the perithecial walls are subparenchymatic, made up of polygonal to subglobose cells, $5.5-9 \times 4-5.5 \mu$, Fig. 57. Asci

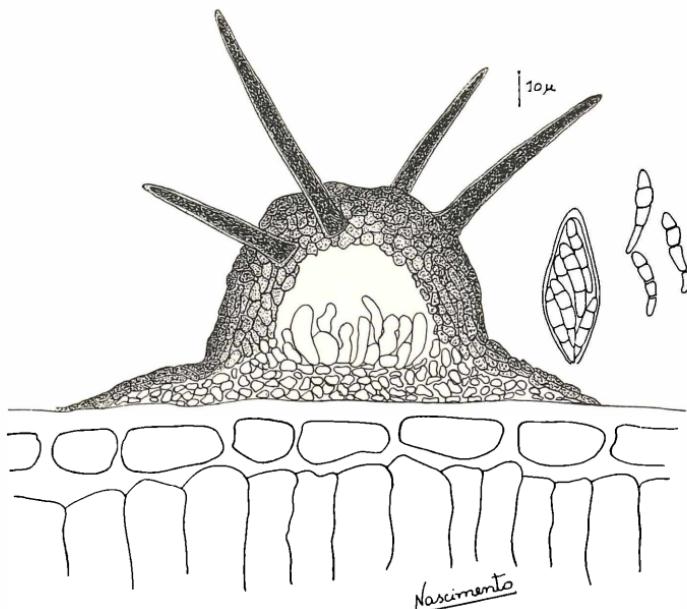

Fig. 54. *Phaeochaetia ilicifolii* Bat. et Nasc. — Perithecium, ascus and ascospores.

ellipsoid, 8-spores, 2-tunicate, sessile, $30-40 \times 12-16 \mu$, apophysate. Ascospores clavate-fusoid, transversally 3-septate, constricted, hyaline, distichous to polystichous, $17.5-19 \times 3.5-4.5 \mu$.

Type, on dahon — *Ilex cassine* L.-Coll. by Arthur S. Rhoads, Febr. 5, 1944, in Deep Creek, between de Leon Springs and Barberville, Volusia Co. Florida. Fig. 54.

This specimen was lent to us through the courtesy of Dr. J. A. Stevenson, of the National Fungus Collection, Beltsville, Md. U.S.A.

Mycelium epiphyllum, superficiale, atro-brunneum, pelliculosum, effusum, ex hyphis densis, brunneis, septatis, constrictis, ex cellulis cylindraceis, $5.5-11 \times 2-4.5 \mu$, non setosis, non hyphopodiatris, compositum. Perithecia superficiales, gregariae, sub pellicula mycelica evoluta, sub-globosa, $90-135 \mu$ diam., atrobrunnea; setae peritheciales 8-25, continuae, acuminate, atrae, $35-100 \times 7-10 \mu$; paries peritheciales subparenchymatici, ex cellulis polygonalibus vel subglobosis, $5.5-9 \times 4.5-5.5 \mu$, efformati. Asci ellipsoidei, 8-spori, 2-tunicati, sessiles, $30-40 \times 12-16 \mu$, apophysati. Ascospores clavate-fusoideae, 3-transversaliter septatae, constrictae, hyalinae, distichae vel polystichae, $17.5-19 \times 3.5-4.5 \mu$.

We have identified this same fungus in one specimen lent to us by The University of Pavia, Italy, on *Hakea saligna*. Coimbra, Portugal, Leg. P. G. Mesnier, 1877, det. as *Capnodium mesnieriianum* (Thüm.) Associated with *Chaetasbolisia californiana* Bat., Cif. & Nasc.

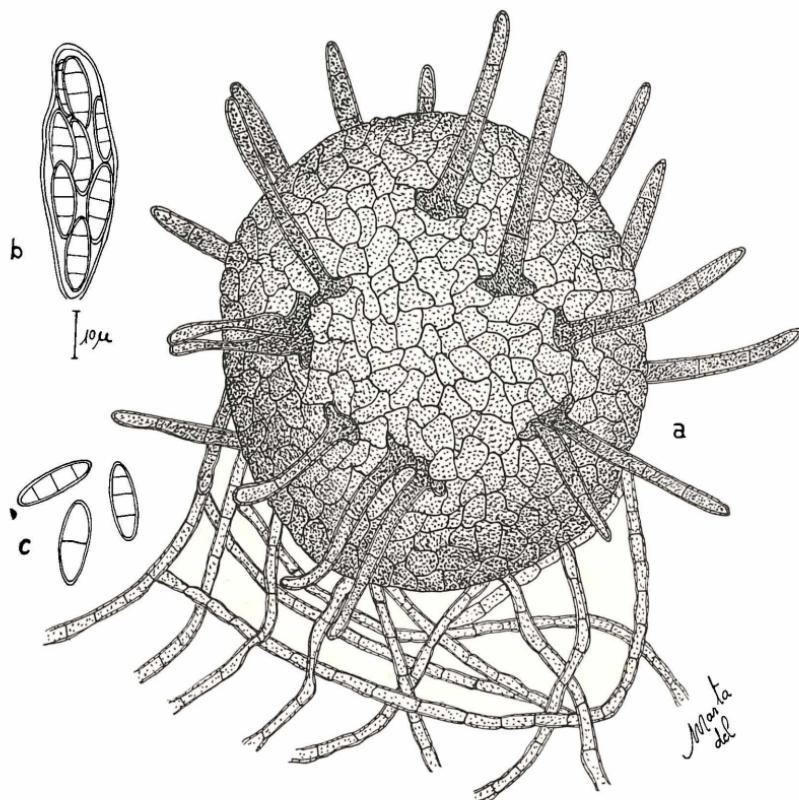

Fig. 55. *Phaeochaetia spinigera* (v. H.) Bat. et Cif. — a) Perithecium and mycelium. — b) Ascus. — c) Spores.

***Phaeochaetia petchii* (Hansf.) Bat. & Cif. n. comb.**

Syn.: *Chaetothyrium petchii* Hansf. in Proc. Linn. Soc. London, vol. 158: p. 40, 1945—1946.

On *Citrus* — Ceylon.

Amphigenous. Mycelium pelliculose, thin, hyphae brownish, 5—10 μ thick, cross-branched, reticulate. Perithecia developed beneath the mycelial pellicle, globose-depressed, 180—250 μ wide, 100—150 μ in high, walls 9—12 μ in thickness, pseudo-ostiolate, ornate with radiant setae, erect, black, septate, subacute, 100 \times 6—10 μ . Asci ellipsoid, sessile, 8-spores, 100 \times 25 μ , aparaphysate. Ascospores fusoid, 3-septate, hyaline, to chlorino-hyaline, 27—35 \times 6—9 μ .

Phaeochaetia psidii (Bern) Bat. & Cif., n. comb.

Syn.: *Trichomerium psidii* Bat. in Mycop. & Mycol. Appl. V.: 2—3, 149, 1951.

Trichomerium guajavae (Bern.) Bat. & Cif. (Wrong by a lapse). in Ann. Soc. Biol. Pern. tom. XIII: 2, p. 117, 1954.

On *Murraya Psidium*.

Mycelium epiphyllous, superficial, pelliculose, black, not setose, hyphae lengthened, brown, reticulate, made up of cells from $12.5 - 17.5 \times 3.5 - 10 \mu$. Perithecia developed beneath the mycelial pellicle, globose, black, pseudo-ostiolate, membranous, $125 - 235 \mu$ diam., walls sub-parenchymatic, 1—2 layers, composed of subglobose cells, $8 - 15.5 \mu$ wide; setae completely surrounding the perithecia, erect, straight or curved, septate, blackish, obtuse, $70 - 125 \times 5 - 7.5 \mu$. Ascii ellipsoid, 8-spores, sessile, $40 - 57.5 \times 15 - 20 \mu$, a paraphysate. Ascospores fusoid, 3-septate, hyaline, $17.5 - 22.5 \times 5 - 6.5 \mu$.

This species is distinct from *Phaeochaetia setosa* (Zimm.) Bat. & Cif. in its morphological proportions, the perithecia and the larger setae; the ascospores are slightly different.

Phaeochaetia rosea (Hansf.) Bat. & Cif. n. comb.

Syn.: *Chaetothyrium roseum* Hansf. in Proc. Linn. Soc. London, 156 sess. part. 2, p. 111, 1943—1944.

On *Jasmium* — Uganda.

Superficial mycelium hypophyllous, pelliculous, hyphae sub-hyaline to olivaceous $3 - 4 \mu$ thick, reticulate, not setose. Perithecia developed beneath the mycelial pellicle, globose-depressed, blackish-brown, $140 - 180 \mu$ wide, $70 - 100 \mu$ in height, ornate with numerous erect, olivaceous, continuous setae, $50 \times 4 - 5 \mu$, walls $5 - 8 \mu$ thick. Ascii cylindric to ellipsoid, 8-spores, $70 \times 12 - 15 \mu$, a paraphysate. Ascospores clavate-fusoid, 3-septate, $22 - 25 \times 4 - 5 \mu$, hyaline.

Phaeochaetia setosa (Zimm.) Bat. & Cif. n. comb.

Syn.: *Chaetothyrium setosum* (Zimm.) Hansf. in Reinwardtia, 3: (1). 1945.

Antennaria setosa Zimm. in Cbl. Bakt. II, Abt. 8, 151, 1902.

Limacinia setosa (Zimm.) Sacc. & Trott. in Syll. Fung. XVII: 577, 1905.

Hypocapnodium setosum (Zimm.) Speg. in Physis, 4: 287, 1918.

Chaetothyrium spinigerum (v. Höhn.) Yam. in jour. Soc. Trop. Agric. Formosa, XIII: 221, 1941.

Triposporiopsis spinigera (v. Höhn.) Yam. Ann. Phytopath. Soc. Japan, 19: p. 55, 1954; idem, XXI: 168, 1956.

Mycelium superficial, epiphyllous, spread, thin membranous, having hyphae $4-6 \mu$ wide, septate, irregularly branched, brownish; some hyphae are subhyaline. Perithecia scattered, globose-depressed, $80-140 \mu$ diam, Fig. 58, dark-brown, walls composed of angular cells, $10-15 \mu$ diam., one-layered, $6-8 \mu$ thick, setose with up to 3 straight, erect septate, brown setae, arising from the base and sides, obtuse, 2—4-septate $70 \times 6-8 \mu$. Ascii clavate-ellipsoid, 8-spores, subsessile, $60 \times 15 \mu$, aparaphysate. Ascospores fusoid, 2—3-seriate, 2—3-septate, constricted at the middle septum, hyaline, $20-24 \times 6-7 \mu$. Fig. 55.

On *Ficus* — Sunda. On *Citrus*, *Coffea*, *Cyclobalanopsis*, *Dendrocalamus*, *Euphorbia*, *Gardenia*, *Glochidion*, *Holarhena*, *Leleba*, *Murraya*, *Photinia*, *Phyllostachys*, *Psidium*, *Quercus*, *Sapindus*, *Thea* — Formosa, Yamamoto, 1956, loc. cit.

Also on leaves of *Cupania* sp. Paulista, Pernambuco, Leg.

A. Chaves Batista, 2. 9. 1957. Spec. 11677, Institute of Mycology University of Recife.

Phaeochaetia strigosa (Fraser) Bat. & Cif. n. comb.

Syn.: *Chaetothyrium strigosum* Fraser in Proc. Linn. Soc. N. S. Wale., vol. LXI, p. 288, 1936.

On *Wilkiea*, *Eugenia*, *Pleiococcus* — Australia.

Mycelium superficial, effuse, thin, hyphae smoky-brown, cylindrical, constricted at the septa, Perithecia globose-flattened, 200—400 × 150—200 μ , pseudo-ostiolate, dark-brown, developed beneath the mycelial pellicle with the walls ornate with numerous setae of mycelial origin; the setae are smoky-brown, 1—2-septate, obtuse, up to 300 μ high and reflected over the basal portions of the perithecia. Ascii clavate, 8-spores, bitunicate, 90—95 × 20—30 μ , aparaphysate. Ascospores cylindrical, 7—9 transversally septate, hyaline, 32—46 × 5—7 μ .

Phaeochaetia syzigii (Hansf.) Bat. & Cif. n. comb.

Syn.: *Chaetothyrium syzigii* Hansf. in Comm. Mycol. Inst. Mycol. Pap. p. 148. 1946.

On *Syzygium* — South Africa.

Mycelium superficial, epiphyllous, pelliculose, not setose, hyphae straight or sinuous, blackish-brown, 5—10 μ thick, little constricted, reticulate. Perithecia globose, blackish, 260 μ diam., 200 μ in height pseudo-ostiolate, setose, setae erect, septate, simple, straight, rigid, 200 × 7—9 μ ; perithecial walls 200 μ thick, 3—4 layered. Ascii ellipsoid or subcylindric, 8-spores, nodose-stipitate, 70 × 20 μ . Ascospores fusoid, 3-septate, 20 × 6—7 μ , hyaline or subhyaline.

Phaeochaetia variabilis (Toro) Bat. n. comb.

Syn.: *Chaetothyrium variabile* Toro in Mycologia, XIX, 2: 79, 1927.

Mycelium epiphyllous, spread, light-brown, membranous, hyphae septate, 5—7 μ wide, not setose. Peritheciun developed beneath the mycelial membrane, globose, 90—130 μ diam., brownish-black, pseudo ostiolate; perithecial setae 1—7 for each perithecium, straight, continuous, acute, black, 75—112 × 5—7 μ . Ascii clavate to ellipsoid, sessile, 2-tunicate, 8-spores, 40—45 × 22—24 μ , aparaphysate. Ascospores clavate, 4—5 transversally septate, not constricted, hyaline, 16—18 × 5—6 μ .

On leaves of *Wedelia reticulata* D. C. Santiago, no. 260. Dominica, 1926.

Phaeochaetia woronichinii Cif. & Bat., nov. nom.

Syn.: *Aithaloderma hederae* (Pat.) Woron. var. *caucasicum* Woron.

Ann. Mycol. vol. XXIV, p. 247, 1926. (*Chaetothyrium caucasicum* Woron. preoccupied).

On *Hedera* — Transcaucasia.

Mycelium pelliculose, with lengthened, septate cells, olive-brown, irregular, a network covering the ascocarps. Perithecia round to

ovate, 65—100 μ diam., with 1-septate setae, 3—15 in number, 30—130 \times 4—7 μ . Fig. 56. Ascii ellipsoidal, without paraphyses, 33—40 \times 13—16 μ . Ascospores hyaline, ovoid-lengthened, with rounded ends, 5—7 transversally septate, 16—21 \times 3.5—4.5 μ . Fig. 56.

According to Woronichin it is possible that this species is the same described by Patouillard as *Acanthostigma (?) hederae*.

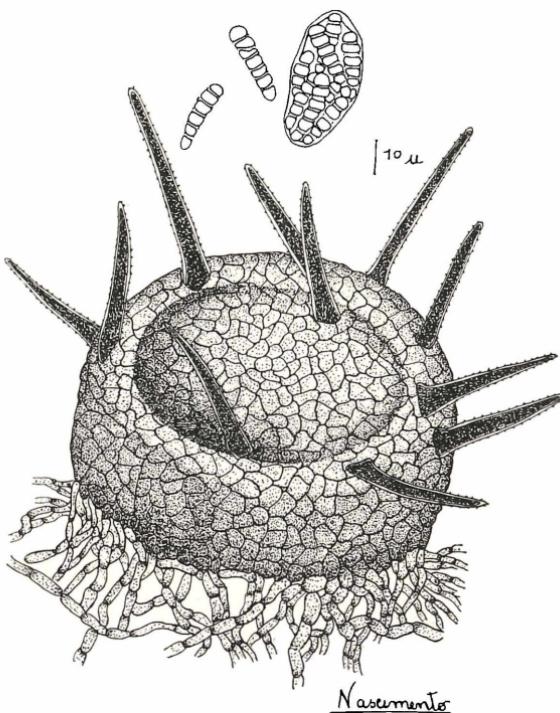

Fig. 56. *Phaeochaetia woronichinii* Cif. et Bat. — Perithecioid, ascus and spores.

What appears to be the same fungus, we found in one specimen of The National Fungus Collection, Beltsville, Md, labeled as *Capnodium* sp. on *Miconia* sp. Monserrate, Colombia, coll. H. Garcia B., March 12, 1937, det. A. J. Watson.

The characteristics of the material are the following: Mycelium epiphyllous, superficial, spread, brown, pelliculose, thin, composed of hyphae dense branched, septate, constricted, with cylindrical cells, 7—12.5 \times 3—6.5 μ . Perithecia developed beneath the mycelial pellicle, globose-depressed, pseudo-ostiolate, 120—143 μ wide, 93—121 μ in height, blackish-brown, setose, the setae continuous, blackish, 49—90 \times 5—6 μ , rough, acuminate, 10 to 15 each perithecioid; the perithecial walls are membranous, subparenchymatic, made up of polygonal cells, from 5.5—9 \times 3—5.5 μ . Ascii ellipsoid, 8-spored, 3-tunicate,

sessile, $34-44 \times 14-22 \mu$, aparaphysate, Ascospores clavate-cylindric, 5-7 transversally septate, constricted, hyaline, $17-23 \times 4.5-5.5 \mu$, polystichous.

Another specimen akin to this fungus we found on *Eugenia jambos* coll. in the Republic of Haiti by George V. Nash, 1903 and labeled as *Apiosporium*. This specimen which we examined — through the courtesy of The New York Botanical Garden, has the following characteristics.

Mycelium pellicular, not setose, nor hyphopodiate, blackish-brown, spread, composed of septate and constricted hyphae with cylindric cells, $5.5-11 \times 2.5-5.5 \mu$. Perithecia developed beneath the mycelial pellicle, subglobose, $110-127 \mu$ diam., blackish-brown, pseudo-ostiolate, membranous, subparenchymatic, the walls with subglobose to polygonal cells, $4-8 \times 2.5-5.5 \mu$, setose, the setae far from the pseudo-ostiole, 1-2, acuminate, blackish brown, continuous, $22-25 \mu$ in length. Asci ellipsoid to pyriform, 2-tunicate, sessile, 4-7 spores, $36.5-44 \times 17-19.5 \mu$, aparaphysate. Ascospores cylindric-fusoid, 2-8-septate, constricted, polystichous, hyaline, $16.5-25 \times 3.5-6.5 \mu$.

It is associated with *Naetrocymbae scoriae*.

Phaeochaetia sp.

Syn.: *Chaetothyrium boedijnii* Hansf. in Sydowia, Ann. Myc. X (1-6): 99, 1956.

This species is poor represented in our specimen; so that we cannot study it satisfactorily. The description of Hansford corresponds to our *Ceramothyrium boedijnii* devoid setae.

Phaeochaetia sp.

On *Phillyrea latifolia*, A. C. Bat., M. L. Nascimento & R. Ciferri, 22. I. 57, sp. no. 6001, I.M.U.R., associated with *Scolecoxyphium formosum* Bat., Nasc. & Cif., n. sp. and *Chaetasbolisia microglobulosa* Bat. & Nasc.

Also on *Coccus nucifera* L., Palawan, Phillipines, A. C. Batista, M. L. Nascimento & R. Ciferri, spec. no. 5991, I.M.U.R., associated with *Scolecoxyphium formosum* and *Chaetasbolisia*.

Phaeosaccardinula P. Henn. (1905).

Syn.: *Phaeopeltis* Clem. 1909.

Tephrosticta (Sacc. & Syd.) Syd. as sub genus — 1904.

Capnites Theiss. 1916.

Type *P. diospyricola* P. Henn. in Syll. Fung. XVII: pag. 873, 1905.

Mycelium superficial, pelliculose, fuscous to blackish, not setose; setose; perithecia globose-depressed, dark, pseudo-ostiolate, paren-

chymatous, not setose; asci various, 8-spores; ascospores oblong-cylindric, muriform, fuscous.

Key to the subgenera of the Genus *Phaeosaccardinula*

- A) Asci with true paraphyses Subg. .*Eu-Phaeosaccardinula*
AA) Asci devoid of true paraphyses Subg. .*Aparaphysella*

Key to the Species of the subgenus *Eu-Phaeosaccardinula*.

- A — Asci not evanescent, up to 8-spores
B — Asci with 2—3 ascospores; ascospores 13—23 μ wide, with 12—18 transverse septa. *P. musicola*
BB — Asci with 4—8 ascospores
C — Ascospores 18—43 μ in length, with 7—8 transversal epta. *P. samoensis*
CC — Ascospores 35—60 μ in length, with 7—13 transversal septa *P. diospyricola*
AA — Asci evanescent, 4-spored *P. pipericola*

Key to Species of subgenus *Aparaphysella*.

- A — Asci with up to 6 spores
B — Asci one-spores; ascospores transversally 9—13-septate, 56—78 \times 15—20 μ *P. monosporica*
BB — Asci usually containing more than one spore
C — Ascospores more than 60 μ long. *P. gigantospora*
CC — Ascospores less than 60 μ long
D — Ascospores with 4—7 transversally septa *P. epicarpa*
DD — Ascospores with more than 10 transversally septa
E — Ascospores brown, transversally 7—12-septate, 40—50 \times 15—20 *P. guajavae*
EE — Ascospores subhyaline, transversally 12—30-septate, 27—56 \times 10.5—21.5 μ *P. guajavae* var. *citrina*
EEE — Ascospores yellowish, transversally 7—14-septate, 41.5—66 \times 12—17 μ . *P. vera*
AA — Asci 8-spores (exceptionally 6—8-spores)
F — Ascospores 30—60 μ long

- G — Asci 8-spores, deliquescent,
80—120 μ long; ascospores
5—8-septate transversally *P. ceibae*
GG — Asci 6—8-spores, less than 80 μ long
H — Ascospores 42—60 μ long, transversally
8—15-septate. *P. cupularis*
HH — Ascospores 30—45 \times 5—9 μ , transver-
sally 8—11-septate *P. caucasica*
HHH — Ascospores 30—45 \times 11—16.5 μ , trans-
versally 5—11-septate *P. caucasica*
var. *artocarpi*
FF — Ascospores 25—33 μ long
I — Asci more than 60 μ long and less
than 25 μ wide; perithecia
smooth, 27—150 μ diam. *P. dematiae*
II — Asci less than 60 μ long and more
than 25 μ wide; perithecia some-
what tuberculate, 135—205 μ
diam. *P. butleri*
FFF — Ascospores 10—20 μ long
FFF — Ascospores 10—20 μ long
F — Asci 25—36 \times 17—23 μ ; peri-
thecia 80—120 μ diam. *P. hyphaenes*
JJ — Asci 30—68 \times 11—17 μ ; peri-
thecia 112—184 μ diam. *P anomala*

Phaeosaccardinula anomala (Cke. & Hk.) Miller & Bonar in
Univ. Calif. Publ. Botan. 19 p. 410, 1941.

Syn.: *Asterina anomala* Cke. & Hk. in part. Grevilles 9: 87, 1881.

On *Photinia*, *Umbellularia*, *Lithocarpus* — U.S.A.

Mycelium epiphyllous, superficial, hyphae lightbrown; perithecia
globose-flattened, 112—184 μ in diam., pseudo-ostiolate, brown;

asci 8-spores, $30-68 \times 11-17 \mu$, a paraphysate; ascospores fusoid, muriform, subhyaline, $10-18 \times 3-6 \mu$.

Also on *Lithocarpus densiflora*, Herb. Univ. of California, H. E. Parks, 2. 7. 56, sp. no. 5672, I.M.U.R., in association with *Chaetabolisia falcata* Miller & Bonar.

Likewise found on *Photinia arbutifolia* Lind, Herb. Univ. of California, H. E. Parks, 2. 7. 56, spec. no. 5675, I.M.U.R., associated with *Trichomerium atronitidum* (Miller & Bonar) Ciferri & Bat. and *Vertixore atronitidum* Miller & Bonar.

Phaeosaccardinula butleri (Syd.) Theiss. & Syd.

Syn.: *Limacinula butleri* Syd. in Ann. Mycol. IX: pag. 383, 1911. — Syll. Fung. XXIV 386, 1926. — Ann. Soc. Biol. Pern. t. XIII, no. 2, 108, 1955.

On *Artocarpus* — India and Brazil.

Mycelium epiphyllous, effuse, crustaceo-membranous, brownish, hyphae $5-7.5 \mu$ thick. Perithecia globose-flattened, $135-205 \mu$

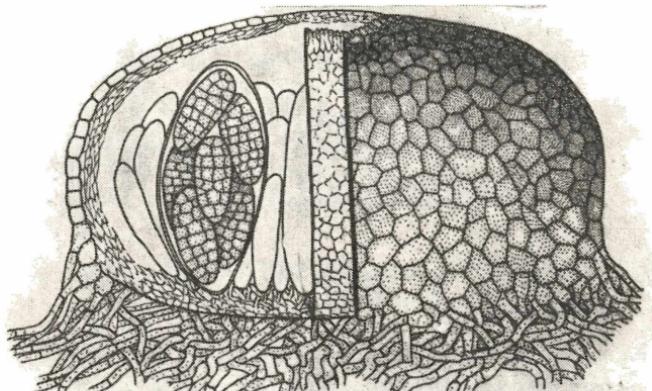

Fig. 58. *Phaeosaccardinula butleri* Syd. — Perithecium, mycelium and asci.

in diam., membranous, pseudo-ostiolate, blackish-brown; asci ellipsoid to clavate, 8-spores, $47.5-60 \times 27.5-35 \mu$, a paraphysate. Ascospores ellipsoid, muriform, 5-7 transversally septa, subhyaline, $25-32.5 \times 7.5-10 \mu$. Associated with *Microxyphium* with pycnidia cylindric or bottle-shaped, $205-382.5 \times 28-39 \mu$. Pyrenidiospores continuous, hyaline, $2.5-4 \times 2 \mu$, Fig. 58.

Also on *Artocarpus integrifolia* L., Páu Ferro, São Lourenço, Pernambuco, A. C. Batista & A. F. Vital, 9. 5. 1955, spec. no. 2147, I.M.U.R., associated with *Tripospermum fructigenum* (Rabenh. ex Sacc. & Trotter) Hughes.

Phaeosaccardinula caucasica (Woronich.) Hansf.

Syn.: *Limacinula caucasica* Woronichin in Bull. of Appl. Bot. vol. VIII, p. 793. — Syll. Fung. XXIV, p. 387, 1926. — Comm. Mycol. Inst. Myc. Pap. no. 15, p. 154, 1946.

On *Taxus* — Russia.

Mycelium capnodiaceous, hyphae 3—4 μ thick, not setose, not

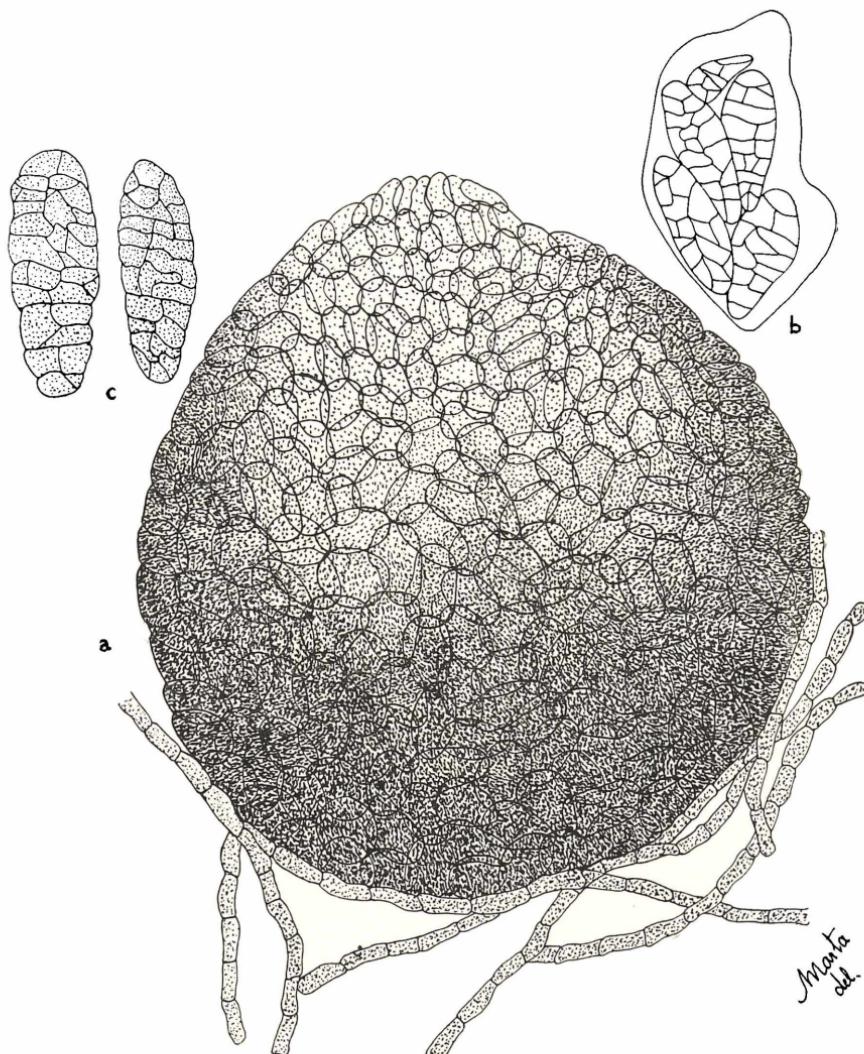

Fig. 58. *Phaeosaccardinula caucasica* var. *artocarpi* Bat. Nasc. et Cif. —
a) Perithecium and mycelial hyphae. — b) Ascus. — c) Spores.

hyphopodiate; perithecia globose, ostiolate, 220—230 μ in diam., not setose; asci oblong-ovoid, 45—75 \times 18—30 μ apophysate;

ascospores fusoid, $30-45 \times 5-9 \mu$, muriform with 8-11 transverse or obliquely septa dull. Associated with pyenia of *Microxyphium* $540-650 \mu$ high, $25-35 \mu$ in diam.

Also on *Byrsonima sericea* D. C. Dois Irmãos, Recife, Leg. Osvaldo S. da Silva, spec. no. 11821, I.M.U.R., Det., A. C. abhorrentis Bat. and *Ainsworthia xanthoxyliae* Bat. & Costa. Rincon — Cuba, Charles & Ballon, March 7, 1927. Spec. no. 13345, Ins. Myc. Univ. Recife, and in The Fungus National Collections, U.S.A.

***Phaeosaccardinula ceibae* (Petr. & Cif.) Bat. & Cif. n. comb.**

Syn.: *Chaetothyrium ceibae* Petr. & Cif. in Sydowia, Ann. Myc. X: 132, 1956.

Mycelium brownish-black, little dense, composed of cylindrical and septate brown hyphae, 2—5 μ thick and oblong and catenulate brown cells, 5—25 \times 3—10 μ . Perithecia developed beneath the mycelial pellicle, brownish-black, 150—300 μ diam., ovoid to pyriform, the walls being in several layers. Ascii clavate to subcylindrical, 8-spored, deliquescent, 80—120 \times 25—35 μ , aparaphysate. Ascospores ellipsoid to subcylindrical, at first hyaline then brownish, 5—8 transversally septate, 1—2 longitudinal septum, 35—55 \times 10—18 μ .

On leaves of *Ceiba pentandra* (L.) Gaertn. Valle del Cibao, prov. Santiago, Hato del Hyaque, Dominicana. Leg. R. Ciferri, 28-1-1931.

Phaeosaccardinula cupularis (Patouillard) Hansf. Comm. Mycol. Inst. Mycol. Pap. no. 15, p. 157, 1946.

Syn.: *Limacinula cupularis* Pat. in Bull. Soc. Mycol. France, XXXIV: 89, 1918.

On unknown host — Madagascar.

Mycelium blackish-brown, membranous, hyphae brown, cylindrical, 5—8 μ thick; perithecia globose-flattened, 250—300 μ in diam., black, pseudo-ostiolate; ascii ovoid-clavate, 6—8-spored, 75 \times 33 μ , aparaphysate; ascospores oblong, muriform, 8—15 transverse-septate, red-olivaceous, when ripe, 42—60 \times 16—20 μ .

Phaeosaccardinula dematia Miller & Bonar in Univ. Calif. Publ. Botan. 19, no. 12, pag. 411, 1941.

On *Baccaris*, *Sequoia*, *Umbellularia*, *Abies* — U.S.A.

Mycelium superficial, epiphyllous, membranous, black, hyphae brown, branched, straight-walled; perithecia developed beneath the mycelial pellicle, globose-flattened, 27—150 μ in diam., not setose, somewhat tuberculate, pseudo-ostiolate, blackish; ascii 8-spored, ventricose, long-stipitate, 62—98 \times 10—23 μ , aparaphysate; ascospores biserrate ellipsoid-fusoidal, 5—6-cells, muriform, 26—33 \times 7—12.5 μ brown. Associated with Asbolisiaceae.

Also found on *Baccharis pilularis* D. C., Contra Costa County, Wildcat Canyon, Herb. Univ. of California, 9. 3. 55, Spec. no. 1609, I.M.U.R.

and spores.

diis. Perithecia gregaria, pellicula mycelica obtecta, sub-globosa, $220-260 \mu$
diam., $175-187 \mu$ alta, pseudo-ostiolata, glabra, membranaceae, brunneo-
nigra; parietes pseudoparenchymatici 3-5 stratosi e cellulis polygonalibus

$8-15 \times 6-12 \mu$ compositi. Asci ellipsoidei $4-6$ spori, 1-tunicati, sessiles, $58-74 \times 29-34 \mu$, aparaphysati. Ascospores ellipsoideae $4-7$ muriformes, transversaliter septatae, ad septa non constrictae, primo hyalinae, dein flavo-brunneae, $35-40 \times 15-16 \mu$.

Phaeosaccardinula gigantospora Bat. & Matta n. sp.

Mycelium epiphyllous superficial, membranous, blackish-brown, spread, composed cf brown, branched and septate, little constricted,

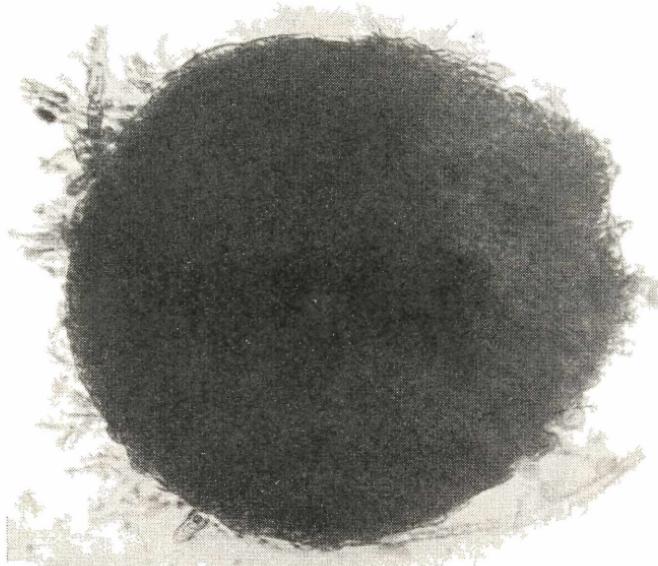

Fig. 63. *Phaeosaccardinula gigantospora* Bat. et Matta. — Full ripe perithecioid detached of the mycelial pellicle.

hyphae, which have subcylindrical cells, $27-46.5 \times 7-20 \mu$, not setose nor hyphopodiate. Perithecia scattered, globose Fig. 66, or globose depressed, $120-325 \mu$ in height, $125-350 \mu$ wide, developed beneath the mycelial membrane, Fig. 67, blackish, membranous, pseudo-ostiolate, glabrous, pseudo-parenchymatic, the walls made up of 6-10 layers of oblong cells, $15-19 \times 5-13 \mu$; in the young perithecia the walls are $66-87 \mu$ diam., but in full ripe perithecia these walls may have only $25-30 \mu$ in thickness. Asci ellipsoid, sessile or short pedicellate, 1-4-spored, 2-tunicate, $110-155 \times 25-38 \mu$, aparaphysate. Ascospores cylindric to ellipsoid, subhyaline at first, then brownish, $12-22$ transversally septate with many vertical septae, $68-118 \times 27-39 \mu$, little constricted or not, Fig. 62-64.

On leaves of *Manilkara sapodilla* (L.) Gilly, associated with several fungi. Rodov. Salvador-Feira, km. 16, Leg. Eurico A. F. da Matta, 28/1/957. Type, 11378, Institute of Micology, University of Recife.

Mycelium epiphyllum, superficiale, membranosum, atro-brunneum, effusum, ex hyphis brunneis, ramosis, septatis, constrictis, ex cellulis subcylindraceis, $27-46.5 \times 7-20 \mu$, non setosis, haud hypopodiatis, compositum. Peri-

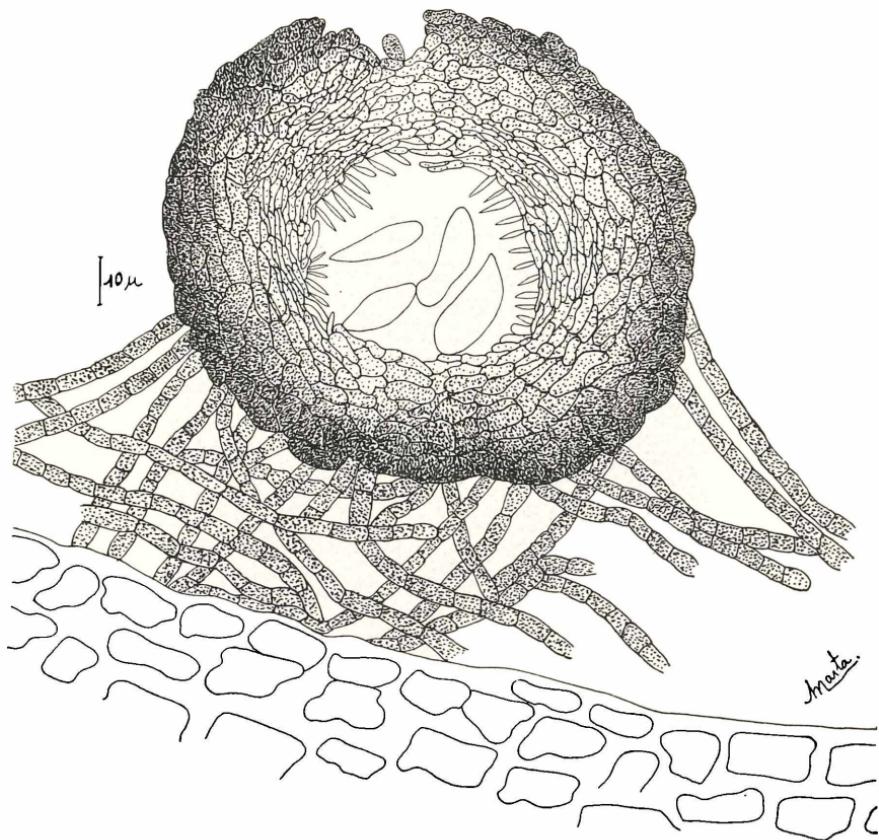

Fig. 64. *Phaeosaccardinula gigantospora* Batt. et Matta. — Perithecioid seen under a longitudinal cut.

thecia sparsa, globosa, vel globose-depressa, $120-325 \mu$ alt., $125-350 \mu$ diam., membrana mycelica tecta, atra, pseudo-ostiolata, glabrata, membranosa, pseudoparenchymatica, cum parietibus 6-10 stratosis, $25-30 \mu$ cr. ad maturitatem, ex cellulis oblongis, $15-19 \times 5-13 \mu$, efformatis. Asci ellipsoidei, sessiles vel curto stipitati, 1-4-spori, 2-tunicati, 1-4 spori, $110-155 \times 25-38 \mu$, aparaphysati. Ascosporeae cylindriceae vel ellipsoideae, primo subhylinae dein brunnescentes, $12-22$ transversaliter septatae, pluri-verticaliter septae, $68-118 \times 27-39 \mu$, parum constrictae vel non.

Phaeosaccardinula guajavae Batista & Vital in Ann. Soc. Biol. Perm. t. XIII, no. 2, p. 111, 1955.

On *Psidium* — Brazil.

Mycelium epiphyllous, effuse, grayish to blackish, pelliculose, hyphae brown, $3.5-10 \mu$ thick. Perithecia globose-flattened, $125-$

240 μ in diam., unilocular, pseudo-ostiolate, walls in 2–3 layers. Ascii ellipsoid, 2–7-spores, 75–97.5 \times 40–45 μ , aparaphysate. Ascospores ellipsoid-cylindric, muriform, 7–12 transversally septate, brown, 40–50 \times 15–20 μ .

Associated with pycnidia *Microxyphium*, 100–225 \times 12.5–17.5 μ ; pycnidiospores ellipsoid, continuous, hyaline, 3–4 \times 1.5–2 μ .

Phaeosaccardinula guajavae var. *citrina* Batista, n. var.

A specie differt ascosporae 12–30 transversaliter septatae, longitudinaliter multo septatae. — In foliis vivis *Citri aurantii* cult., Recife, Pernambuco, Brazil.

Mycelium epiphyllous, blackish, crustaceous to pelliculose, not setose, effuse, composed of brown hyphae septate, constricted, with cells from 10–24.5 \times 3–5.5 μ ; irregularly branched, dense reticulate.

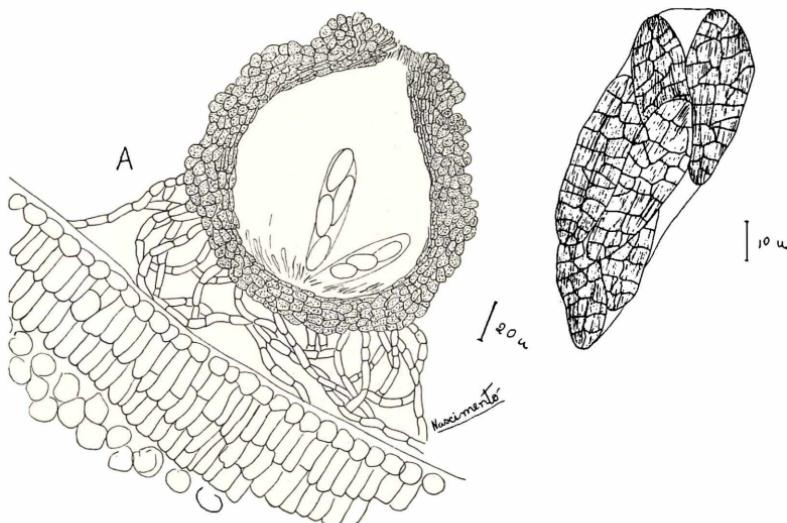

Fig. 65. *Phaeosaccardinula guajavae* var. *citrina* Bat., Nasc. et Cif. — A) Peritheciun and mycelium. — B) Ascus.

Perithecia developed beneath the mycelial pellicle, Fig. 69, subglobose to globose depressed, glabrous, 165–240 μ diam., 130–200 μ in height when ripe, blackish-brown, pseudo-ostiolate, membranous, subparenchymatic; walls 21.5–35 μ in thickness, outer layer with polygonal cells, 5–15 \times 3.5–13 μ . Ascii ellipsoid, 2–6-spores, 1-tunicate, sessile, aparaphysate, 73–90 \times 21.5–38 μ . Ascospores ellipsoid, muriform, 12–30 transversally septate, little constricted, polistichous, subhyaline, 27–56 \times 10.5–21.5 μ . Fig. 65.

On leaves of *Citrus aurantium* associated with *Ceramothyrium* and *Capnodium* with *Orthezia insignis* Douglas. Leg. Severino nosé

da Silva, Vitoria, 9. 1. 56. Spec. no. 5188, Institute of Mycology, University of Recife, Brazil. Also on *Cocos nucifera* no. 5567.

Phaeosaccardinula hyphaenes (P. Henn.) Hansf.

Syn.: *Pleomeliola hyphaenes* P. Henn. in Engl. Bot. Jahrb. p. 46, 1903. Syll. Fung. XVII: p. 554, 1905. Comm. Myc. Inst. Myc. Pap. no. 15, p. 154, 1946.

On *Hyphae* — Zanzibar, Afrika.

Mycelium pelliculose, hyphae branched, brown, $3-4 \mu$ thick; perithecia subglobose, $80-120 \mu$ in diam., brown, membranous, pseudo-ostiolate; asci ovoid, 8-spored, $25-36 \times 17-23 \mu$, aparaphysate; ascospores oblong-cylindric, $4-5$ transversally septate, with interrupted longitudinal septum, $10-15 \times 3.5-4.5 \mu$, fuscous.

***Phaeosaccardinula monosporica* Bat. & Cif. n. sp.**

Mycelium epiphyllous, superficial, thinly membranous, blackish,

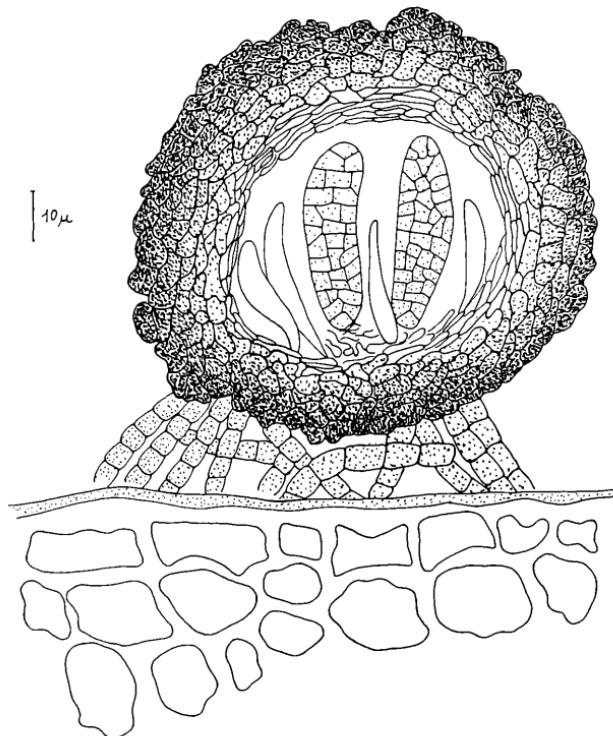

Fig. 66. *Phaeosaccardinula monosporica* Bat. et Cif. — Perithecium under a longitudinal cut.

oblong or subcylindrical cells, $10-11 \times 3-4 \mu$, not setose, nor hypho-spread, composed of dark-brown branched and septate hyphae, with

podiate. Perithecia at first developed beneath the mycelial pellicle, scattered, globose, 145—210 μ diam., Fig. 71, blackish-brown, membranous to coriaceous, glabrous, pseudo-ostiolate; their walls are pseudo-parenchymatic, in 4—6-layers, 17—23 μ thick, having oblong or subcylindrical cells, 6—11 \times 5—8 μ , Fig. 72. Ascii ellipsoid, 1-tunicate, 1 spores, 61—96 \times 15—17 μ , aparaphysate. Ascospores ellipsoid, muriform, 9—13 transversally septate, brownish, 56—78 \times 15—20 μ . Fig. 66—67.

On leaves of *Manilkara sapodilla* (L.) Gilly associated with *Capnocrinum capsuliferum* (Rehm) Bat. & Cif., *Leptoxyphium bahiensis* Bat., *Septonema toruloideum* C. & E., *Antennariella bahiensis* Bat.

and *Podoxyphium azevedoi* Bat., Nasc. & Cif. Leg. Dr. Eurico A. F. da Matta. Ondina, Salvador, Bahia, 25. 5. 956. Type, 11405, Institute of Mycology, University of Recife.

Mycelium epiphyllum, superficiale, tenuiter membranosum, effusum, atrum, ex hyphis brunneis, ramosis, septatis, ex cellulis oblongis vel subcylindraceis, 10—11 \times 3—4 μ , non setosis, haud hyphopodiatis, compositum. Perithecia ab initio pellicula mycelica tecta, sparsa, globosa, 145—210 μ diam., atro-brunnea, membranosa vel coriacea, glabrata, pseudo-ostiolata cum parietibus pseudoparenchymaticis, 4—6-stratosis, 17—23 μ cr., ex cellulis oblongis vel subcylindraceis, 6—11 \times 5—8 μ , efformatis. Ascii ellipsoidei, 1-tunicati,

1-spori, $61-96 \times 15-17 \mu$, aparaphysati. Ascosporae ellipsoideae, muriformes, 9-13-transversaliter septatae, brunnescentes, $56-78 \times 15-20 \mu$.

Phaeosaccardinula musicola Bat. in An. IV Cong. Nac. Soc. Bot. Brasil, p. 81, 1953.

On *Musa* — Brazil.

Mycelium epiphyllous, not setose, black, pelliculose, effuse, hyphae brownish-black constricta with cells of $5.5-19 \mu$ irregularly branched, sub-reticulate, $4-7.5 \mu$ thick. Perithecia globose-depressed, black abundant, scattered, membranous, $170-230 \mu$ in diam., not setose,

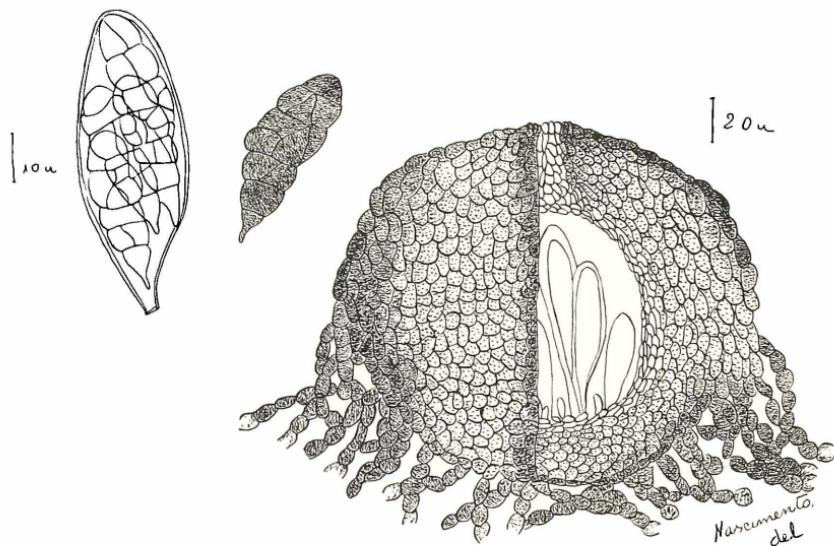

Fig. 68. *Phaeosaccardinula samoensis* v. Höhn. — a) Perithecium. — b) Ascus and spore.

parietal cell round, $3.5-7.5 \mu$. Ascii basal ellipsoid, 2-3 spores, sessile, $57-95 \times 30-42 \mu$, paraphysate, paraphyses to 50μ long. Ascospores ellipsoid, rotund, little constricted, muriform, $38-53 \times 13-23 \mu$, dull.

Also on leaves of *Musa sapientum* L. Casa Amarely, Recife, Leg. Albino F. Vital, sp. no. 149, I.M.U.R., Det. A. Chaves Batista, 29. 11. 52.

Also found on *Artocarpus integrifolia* L. Jaboatão, Pernambuco, Leg. Eugenio Wanderley, spec. no. 1214, I.M.U.R. Det. Albino F. Vital, 19. 1. 1955.

Phaeosaccardinula pipericola Bat. & Vital in Ann. Soc. Biol. Pern. t. XIII: no. 2, pag. 115, 1955.

On *Piper* — Brazil.

Mycelium epiphyllous, rarely hyphophyllous, grayish-brown, pelliculose, hyphae septate, brownish, $3-10 \mu$ thick. Perithecia

globose-flattened, 170—210 μ in diam., dark-brown, pseudo-ostiolate. Ascii evanescent, 4 spores, cylindric, then ellipsoidal, sessile about 58—65 \times 30—38 μ , with paraphyses. Ascospores ellipsoid, muriform, 7—12 transversally septate, fuscous, 35—58 \times 12.5—15 μ . Associated with pycnidia of *Microxyphium*, 230—260 \times 15—32.5 μ ; pycnidiospores ellipsoid, continuous, hyaline, 1—2.5 \times 1 μ .

Also found on leaves of *Piper nigrum* Instituto Agronômico do Norte, Belém, Pará Leg. A. Fernandes Vital, spec. no. 2280, I.M.U.R. Det. A. C. Batista & A. Fernandes Vital, 25. 5. 55, in association with *Phaeophragmeriella constricta* Bat. & Vital n. sp. and *Triposporium* sp.

Equally found on *Jambosa malaccensis* D. C., Recife, Pernambuco, Leg. Severino José da Silva, spec. no. 5312, I.M.U.R. Det. A. C. Batista & M. L. Nascimento 24. 2. 56, associated with *Septonema trichomericola* Bat. & Nasc. and *Trichomerium jambosae* Bat. & Nascimento.

Phaeosaccardinula samoensis v. Höhn.

Syn.: *Limacinula samoensis* v. Höhn. in Fragm. Z. Mycol. III in Sitzb. K. Ak. d. Wissensch. Wien. Bd. CXVI, Abt. I, p. 101, 1907.

Phaeosaccardinula permixta (Syd.) Hansf. in Comm. Mycol. Inst. Myc. Pap. no. 15, pag. 154, 1946.

Chaetothyrium permixtum Syd. in Ann. Mycol. XXIV 348, 1926.

On *Phoebe*, *Casearia*, *Ocotea*, *Philodendron*, *Roupala* — Costa Rica, Dominica., Samoa.

Mycelium epiphyllous, capnodiaceous; thinly pelliculose, yellowish to brown, branched, 2.5—5 μ thick; perithecia dull-brown pseudo-ostiolate, sessile spheroidal or globose-flattened, underpellicular, black, glabrous, 170—300 μ in diam.; 90—120 μ high; ascospores with 7—8 transversally septa, 1 longitudinally at first light, then dull, oblong or ellipsoid, 18—43 \times 7—14 μ , Fig. 68.

Chaetothyrium permixtum Syd. is a highly variable species, and, in our opinion, it is no other but the older *Phaeosaccardinula samoensis* v. Höhn. It is clearer from the figure of von Höhnel (see Theissen and Sydow in Ann. Mycol., vol. XV, pag. 479, 1917) rather than from the description of von Höhnel.

From fig. 4 of the same paper it appears that the pycnidia are produced at the top of some erect hyphae. Unfortunately, there is no description of the pycnidia stage.

This same fungus we have found on *Eupatorium* sp. from Puerto Rico, associated with *Hormiscium* sp. Leg. F. L. Stevens, 15—12—913. Spec. no. 6019 from the Private Herb. of F. L. Stevens, and 13073, Instituto de Micología, Univ. do Recife. The spores of this specimen are 1 to 2 longitudinal septate.

Phaeosaccardinula vera Bat. & Cif. n. sp.

Superficial mycelium epiphyllous, thinly pelliculose, effuse, brown, not setose or hyphopodiate, with hyaline to brownish hyphae, densely branched, formed by cylindrical cells, $7-19 \times 4-8 \mu$, septate little constricted. Perithecia scattered or gregarious, superficial,

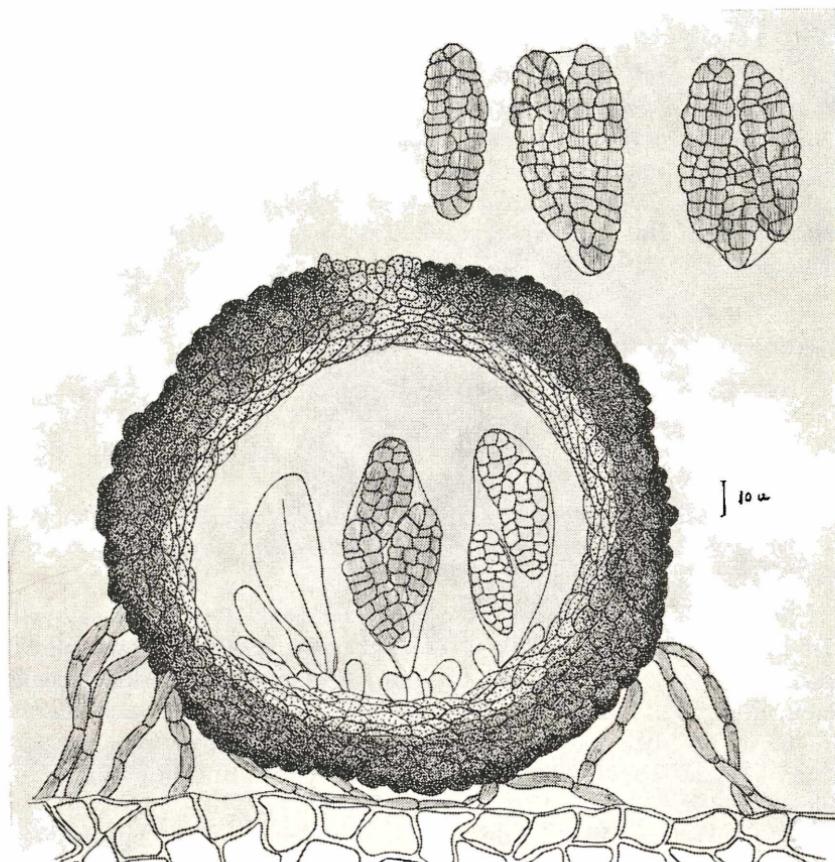

Fig. 69. *Phaeosaccardinula vera* Bat. et Cif. — Perithecium under a longitudinal cut, ascospores.

developed beneath the mycelial pellicle, depressed globose, $137.5-195 \mu$ in diam., $110-154 \mu$ high, pseudo-ostiolate, glabrous, blackish-brown, membranous, with walls from $32-42 \mu$ in diam., made up of four distinct layers of polygonal to subglobose cells, $6.5-14.5 \times 3.5-10 \mu$. Fig. 74; the inner layers are distinct subhyaline. Ascii ellipsoid, 2-3-spored, one-layered, sessile, $61-73.5 \times 24.5-36 \mu$, aparaphysate. Ascospores cylindric to ellipsoid, muriform, 7-14

transversally septate, slightly constricted, subhyaline at first, then yellowish, $41.5-66 \times 12-17 \mu$. Fig. 69.

On leaves of *Psidium guajavae* L. — Casa Amarela, Recife. Leg. Severino José da Silva, 4. 4. 56. Type 5398, Institute of Mycology, University of Recife. Associated with other Capnodiaceous fungi.

Also found on *Clidemia* sp., associated with *Microxyphium cylindricum* (ex Yamamoto) Bat. & Cif. — Rio Piedras, Porto Rico. Bruce Fink, 11—24—1915. Spec. no. 11225, Institute of Mycology, University of Recife.

Mycelium epiphyllum, pelliculosum, effusum, brunneum, non setosum, non hyphopodiatum, ex hyphis hyalinis vel brunnescensibus, denseque ramosis, septatis, constrictis, ex dellulis cylindraceis, $7-19 \times 4-8 \mu$, compositum. Perithecia sparsa vel gregaria, superficia in mycelia pellicula evoluta, globose-depressa, $137.5-195 \mu$ diam., $110-154 \mu$ alt., pseudo-ostiolata, glabrata, atro-brunnea, membranosa cum parietibus $32-42 \mu$ cr., ex cellulis polygonalis vel subglobosis, $6.5-14.5 \times 3.5-10 \mu$ efformatis. Ascii ellipsoidei, 2—3-spori, sessiles, $61-73.5 \times 24.5-36 \mu$, aparaphysati. Sporae cylindraceae vel ellipsoideae, 7—14 transversaliter septatae, muriformes, parvum constrictae, subhyalinae dein flavidae, $41.5-66 \times 12-17 \mu$.

Also on *Psidium guajava* Raddi, Pina, Recife, Pernambuco, Leg. E. Maciel, sp. no. 2521, I.M.U.R. Det., A. Ch. Batista & A. F. Vital, 7. 7. 1955, in association with *Trichomerium guajavae* (Bern.) Bat. & Cif., *Aschersonia turbinata* Berk. *Tripospermum* sp. and *Helminthosporium* sp.

Scolecobonaria Bat. n. gen.

Typus: *S. lithocarpi* (Miller & Bonar) Bat. n. comb.

Mycelium pelliculosum, ex hyphis olivaceis vel brunneis, non setosum, non hyphopodiatis, compositum. Perithecia globosa vel globoso-depressa, a pellicula mycelica oriunda, non ostiolata. atro-brunnea, membranosa, non setosa. Ascii 6—8-spori, aparaphysati. Ascospores cylandro-elongatae, multitransversaliter septatae, hyalinae.

Scolecobonaria filiformis (Yam.) Bat., n. comb.

Syn.: *Limacinia filiformis* Yam. in Ann. Phytopath. Soc. of Japan. XXI: 170, 1956.

Epiphyllous. Mycelium spread, thin crustaceous, mucilaginous. fuscous, having irregularly branched hyphae, brown, septate, constricted with oblong or subcylindrical cells, $14-23 \times 3-7 \mu$, not setose. Perithecia scattered or subgregarious. developed beneath the mycelium, globose-depressed, $187-272 \mu$ diam., $115-168 \mu$ in height. subcoriaceous, dark-brown, not setose. Ascii clavate, 2-tunicate. short pedicellate, 8-spores, $58-85 \times 18-23 \mu$, aparaphysate. Ascospores cylindric-lenghened, parallel, straight or curved, 5—13 transversally septate, not constricted, hyaline, $46-76 \times 4-6 \mu$.

On *Citrus maxima* — Formosa. Taihoku Leg. W Yamamoto, 11. 9. 938 — type.

Scolecobonaria lithocarpi (Miller & Bonar) Bat., n. comb.

Syn.: *Limacinia lithocarpi* Miller & Bonar in A Study of Perisporiaceae etc. Univ. Calif. Publ. Bot. vol. 19: no. 12, p. 409, 1941.

Mycelium epiphyllous, superficial, pelliculous, hyphae at first olivaceous then brownish, made up of cylindric or oblong cells $7.5 \times 12 \times 2 - 4.5 \mu$, constricted, not setose nor hyphopodiate. Perithecia

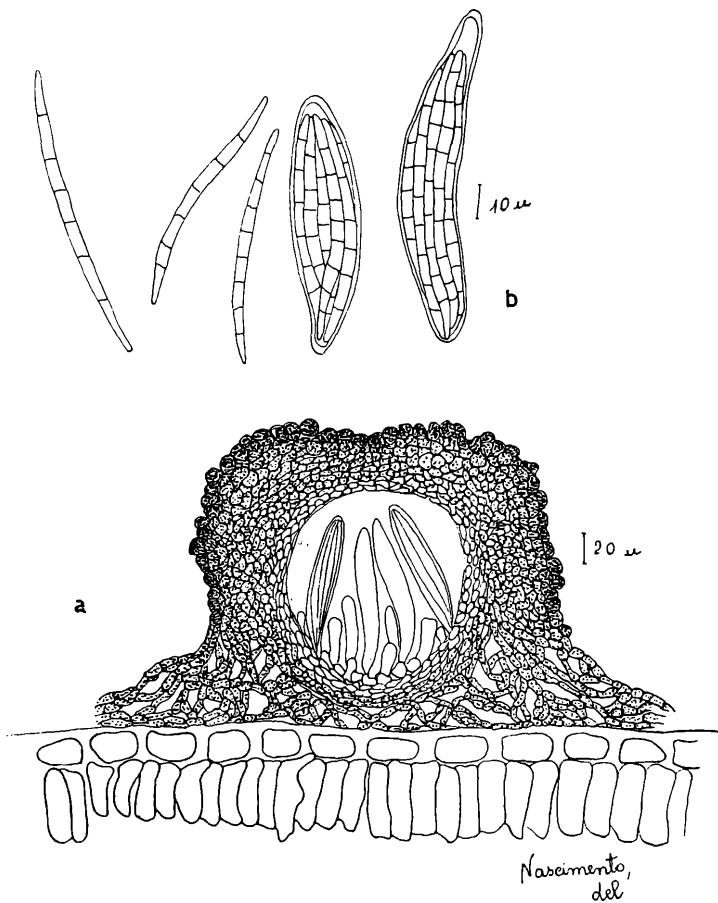

Fig. 70. *Scolecobonaria lithocarpi* (Miller et Bonar) Bat. — a) Perithecium developed beneath the mycelial pellicle. — b) Ascii and ascospores.

gregarious, subglobose or globose depressed, $175 - 220 \mu$ diam., $115 - 180 \mu$ in height, glabrous, blackish-brown, developed beneath the mycelial pellicle, membranous subparenchymatic, the walls composed of 2–3 layers $37 - 62 \mu$ thick, having polygonal cells of $3.5 - 10 \times 2.5 - 8 \mu$. Ascii subcylindric to ellipsoid, 2-tunicate, sessile, 6–8-spored, $55 - 87 \times 12 - 20 \mu$, aparaphysate. Ascospores cylindric-

lengthened, 6–12 transversally septate, often curved, 40–66×3–6 μ , hyaline, parallel. Fig. 70.

On living leaves of *Lithocarpus densiflorus* (H. & A.) Rehd —

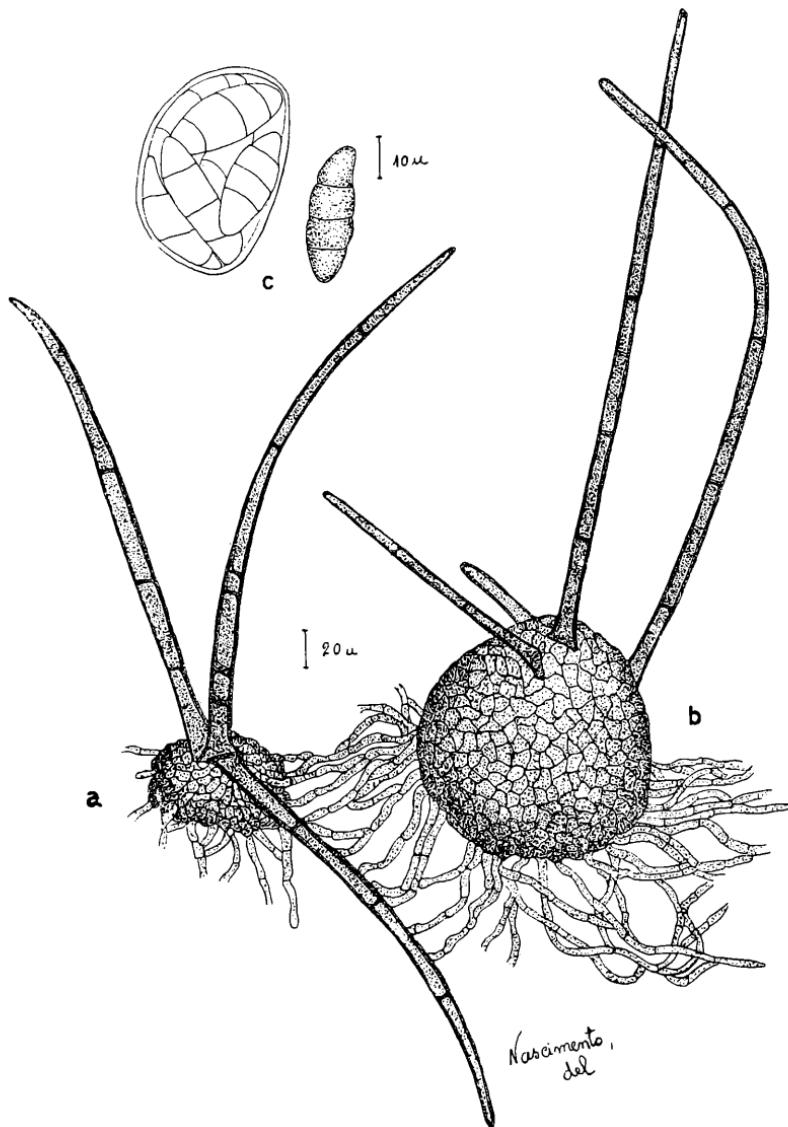

Fig. 71. *Setella disseminata* Syd. — a) Perithecial primordium. — b) Ripe perithecium and scanty mycelium. — c) Ascus and spore.

Von Duzen River, near Alton, Humboldt Co., Calif. March 1931,
H. E. Parks 3575 type.

This is a redescription of the fungus based on the examination

of Miller & Bonar's cotype. This study was made possible through the courtesy of Prof. Lee Bonar, who kindly lent us his material.

Est *S. lithocarpi* characteribus diversis a *Limacinia* et typus ut n. genus.

Setella Syd.

Type: *S. disseminata* Sydow.

Mycelium scant to almost invisible. Perithecia superficial, globose to conoid, submembranous, dark, with one or more long seta on the apex, astomous; ascii 4—8-spored, aparaphysate; ascospores oblong-ellipsoid, many transversally septate.

Setella disseminata Syd. in Ann. Mycol. XIV pag. 359, 1916;
Ann. Mycol. XV p. 477, 1917.

Colonies epiphyllous, scattered, rarely hypophyllous, superficial, blackish-brown. Mycelium superficial, slightly brown, scanty, radially disposed, hypha reticulate-branched, septate, with lengthened cylindrical cells. $18.5 - 25 \times 3.5 - 5 \mu$, not constricted, without setae and hyphopodia. Perithecia subglobose or conoid, $45 - 110 \mu$ diam., Fig. 76. olivaceous or blackish-brown, astomous, submembranous, subparenchymatic, the walls made up of polygonal cells, $7.5 - 15 \times 4.5 - 14 \mu$. setose; the setae are 1 to 10, restricted to the top of the perithecia. $220 - 440 \mu$ in length, $- 12 \mu$ wide at the base, erect, straight, rarely curved, attenuate, septate, blackish. Ascii ovoid or oblong, 2-tuncate. sessile, 4—8-spores, $40 - 65 \times 20 - 30 \mu$, aparaphysate. Ascospores ellipsoid to oblong, 3-septate, not constricted, at first hyaline then brown, $20 - 31 \times 9 - 13 \mu$, distichous or tristichous. Fig. 71.

On leaves of *Schizostachyum acutiflorum* — Los Banos, Philippines, Leg. S. A. Reyes, 25—10—913; on leaves of *Gigantochloa scribneriana* — Los Banos, Philippines, Leg. C. F. Baker, 1—12—913; on *Bambusa*, Laguna, Luzon, Philippines, Leg. M. Ramos, Nov. 1915, and on *Bilbergia*, Paraguay.

This redescription was possible through the loan of the specimen n. 208241, from The Herbarium of The University of California sent to us through the courtesy of Prof. Lee Bonar.

The specimen collected by M. Ramos, Nov. 1915, Province of Laguna, Luzon, Philipp. and det. by Sydow, on *Bambusa* agrees well with the characteristics of the previously described species with the exception of the setae which are more abundant, from 1 to 10. So, the character setae must be amplified in the genus diagnosis, as we did.

Setella halophila Fisher in Proc. Roy. Soc. Vict. New South Wales, 62: p. 129—131, 1950.

On leaves of *Aegiceras* — Australia.

Mycelium membranous, blackish, hyphae of two types: with isodiametric cells $5 - 7 \mu$ wide, constricted, and with lengthened cells.

3—5 μ wide, not constricted. Perithecia globoid, 60—100 μ diam., blackish, with 2—7 bristle-like appendages, 17.5—37.5 μ long. Ascii ellipsoid, 30 \times 10 μ , evanescent, aparaphysate. Ascospores ellipsoid, 3-transversally septate, 10—12.5 \times 3—7.5 μ . Fig. 72.

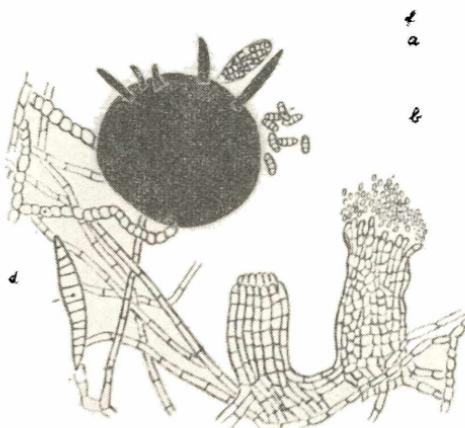

Fig. 72. *Setella halophila* Fish. — a) Ascospores. — b) Pyenidiospores of *Microxyphium columnatum*. — c) Coudium of Dernatiaceous fungus. — d, e) Mycelial hyphae. — f) Bristle-like appendage. — From E. E. Fisher in Proc. Roy. Soc. Victoria LXII: 130, 1950.

This fungus is described in association with Dematiaceae and Asbolisiaceae, probably *Microxyphium columnatum* Batista, Cif. & Nasc.

Shanoriella Bat. & Cif. n. gen.*)

Type: *S. theae* (Syd. & Butl.) Batista & Ciferri, n. comb.

Mycelium crustaceo-membranosum, effusum, atro-brunneum, superficiale, ex hyphis septatis, fuscis, haud hyphopodiatis, setosis, compositum. Perithecia globose-depressa, oriunda in pellicula mycelica, glabra, pseudo-ostiolata, atro-brunnea. Ascii 8-spori, aparaphysati. Ascosporae muriformes, hyalinae.

Shanoriella celastri (Doidge) Bat. & Cif. n. comb.

Syn.: *Treibiomycetes celastri* Doidge in Bothalia, 2: p. 239, 1927.

On *Celastrus* sp. — South Afrika.

Epiphyllous, producing round to irregular fuscous spots, 3—5 mms. diam. Mycelium superficial, as network of pale greyish torulose hyphae, 3—5 μ diam., mycelial setae scattered, black, erect, straight or curved,

*) Dedicated to the North American mycologist Dr. Leland Shanor from Urbana, Ill.

170—240 × 5—8 μ. Perithecia globose-flattened, developed beneath the mycelial pellicle, smooth, 160—240 μ diam., pseudo-ostiolate, about 18 μ diam., the walls being formed by several layers of cells, 8—10 μ diam. Asci clavate, fasciculate, 2-tunicate, 8 spores, 50—70 × 20—27 μ, aparaphysate. Ascospores oblong to subclavate, muriform, 5—7 transversally septate, slightly constricted, hyaline, 27—30 × 7—8.5 μ.

Shanoriella theae (Syd. & Butl.) Bat. & Cif. n. comb.

Syn.: *Limacinula theae* Syd. & Butl.

Phaeosaccardinula theae (Syd. & Butl.) Theiss.

Capnites theae (Syd. & Butl.) v. Höhn. in Ann. Mycol. IX: pag. 386, 1911. Syll Fung. XXIV: p. 386, 1926.

On *Camelia*.

Mycelium epiphyllous, crustaceo-membranous, effuse, black, hyphae septate, fuscous, 5 μ thick; mycelial setae simple, acute, black, 130 × 8 μ. Perithecia globose-flattened, 150—225 μ in diam., pseudo-ostiolate, glabrous, blackish-brown. Asci ovoid, 8-spores. Ascospores muriform, 5-transversally septa, 1-longitudinal septum, hyaline, 25—33 × 9—11 μ.

This species, under the name *Limacinula theae* has been assigned as synonymous with *Phaeosaccardinula javanica* (Zimm.) Yamamoto, in Ann. Phytopath. Soc. Japan, X, p. 262, 1940.

Skoteinospora Bat. n. gen.

Type — *S. coccolobae* Bat. n. sp.

Mycelium superficial, membranous, brownish-black, hyphae irregularly branched, septate, constricted, not setose, nor hypopodiate. Perithecia developed beneath the mycelial membrane, globose to pyriform, glabrous, pseudo-ostiolate, brownish-black. Asci 2—8-spori, bitunicate, aparaphysate. Ascospores cylindraceous, lengthened, 10 : 1 the relation between the length and the width, olivaceous to brown, many transversally septate.

Mycelium superficiale, membranosum, atro-brunneum, ex hyphis irregulariter ramosis, septatis, constrictis, non setosis, haud hypopodiatis, compositum. Perithecia sub pellicula mycelica oriunda, globosa vel pyriformia, glabrata, pseudo-ostiolata, atro-brunnea. Asci 2—8-spori, bitunicati, aparaphysati. Ascosporae cylindraceae, elongatae, pluri transversaliter septatae, olivaceae vel brunneae.

Skoteinospora coccolobae Bat. n. sp.

Colonies black, epiphyllous, spread, loose-membranous, covering entirely the leaves surface. Mycelium superficial, brownish-black, membranous, composed of dense and irregularly branched hyphae, septate, constricted, having oblong cells, 8—16 × 3—7 μ, not setose,

or hyphopodiate. Perithecia developed beneath the mycelial membrane, globose to pyriform, scattered, 130—270 μ diam., 100—170 μ height, pseudo-ostiolate, brownish-black, membranous, with sub-

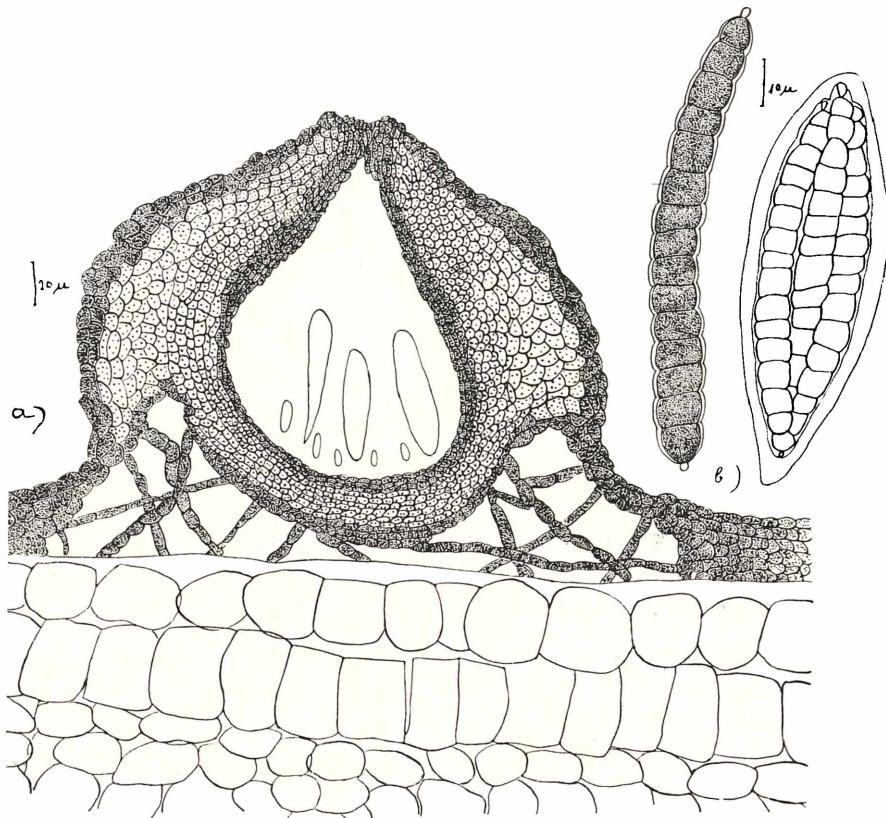

fig. 73. *Skoteinospora coccobae* Bat. — a) Perithecium under a longitudinal cut. — b) Ascus and spore.

arenchymatic walls, 13.5—40 μ in thickness, and in several layers of polygonal cells, 11—21.5 \times 10.5—11.5 μ ; the fertile area of the erithecia is about 80—165 μ in diam. and 45—150 μ in height. Asci ellipsoid, short pedicellate, 2-tunicate, 2—8 spores, 65—110 \times 19—3 μ , aparaphysati. Ascospores cylindric-lengthened, 13—15 septate, livaceous, 62—105 \times 5—8 μ , with apiculate ends 2—3 \times 1—2 μ , fig. 73.

On leaves of *Coccoboa peltigera* Meissn. Caruaru. Pe. Leg. Dr. Ipaminondas de Barros Correia, 25. 3. 1958. Tipo, 13020, Institute of Mycology, University of Recife.

Plagulæ atrae, epiphyllæ, effusæ, membranosæ, Mycelium superficiale, atro-brunneum, membranosum, ex hyphis denseque et irregulariter

ramosis, septatis, constrictis, ex cellulis oblongis, $8-16 \times 3-7 \mu$, non setosis, haud hyphopodiatis, compositum. Perithecia pellicula mycelica tecta, globosa vel pyriformia, sparsa, $130-270 \mu$ diam., $100-170 \mu$ alt., pseudo-ostiolata, atro-brunnea, membranosa; loculum $80-165 \mu$ diam. et $45-150 \mu$ alt., cum parietibus subparenchymaticis, $13.5-40 \mu$ cr. pluri stratosis, ex cellulis polygonalibus, $11-21.5 \times 10.5-11.5 \mu$, efformatis. Ascii ellipsoidei, curto-stipitati, 2-tunicati, 2-8-spori, $65-110 \times 19-33 \mu$, aparaphysati. Ascospores cylindraceo-elongatae, $13-15$ transversaliter septatae, olivaceae, $62-105 \times 5-8 \mu$, ad polos apiculatae, $2-3 \times 1-2 \mu$.

Teichosporina (Arnaud) Cif. & Bat. n. comb. in Ann. Sc. Nat. Agric.

Montpellier, ser. 2, vol. X, p. 324. 1911 (as subgenus).

Type: *T. salicis* Arn. under the subgenus.

Mycelium fumagoid, pelliculose, not setose; perithecia developed beneath the mycelic pellicle, spheric, sessile, glabrous; ascospores phaeodictyous, with a shortly mucronate; apical thorn hyaline.

Teichosporina has been described by Arnaud as subgenus of *Teichospora*. In our system it possesses a generic rank in the family Phaeosacardinulaceae.

Teichosporina hemisphaerica (Bat.) Bar. n. comb.

Syn.: *Chaetomeris hemisphaerica* Bat. in Mycop. et Mycol. Appl. vol. V, fasc. 2-3, p. 153, 1951.

Mycelium epiphyllous, superficial, blackish-brown, membranous, composed of irregularly branched, brown, septate and constricted hyphae, having oblong to cylindrical cells, $14-17 \times 5.5-8 \mu$, not setose, nor hyphopodiata. Perithecia hemisphaerica, developed beneath the mycelial pellicle, $228-285 \mu$ diam., blackish-brown, pseudo-ostiolate, glabrous, pseudo-parenchymatic, the walls being formed by subglobose cells, $5.5-11.5 \mu$ diam. Ascii clavate, 2-tuncate, $56-64.5 \times 28-36.5 \mu$ pedicellate, until 28μ long. umbellate disposed, 8-spores, aparaphysate. Ascospores cylindro-fusoid, slightly dark, muriform, with 6-transversally septa, and 1 longitudinal septum, $30-35 \times 8-11 \mu$, and mucronate at both ends.

On leaves of *Polyscias gneiffoylei* Bailey associated with other fungi — Sois Irmãos — Recife — Type, 1169, Inst. Pesq. Agron., 1950.

Teichosporina salicis (Arnaud) Cif. & Bat. n. comb.

Syn.: *Teichospora salicis* Arn. in Ann. Sc. Nat. Agric. Montp. ser. 2, vol. X, p. 324, 1911 as subgenus.

Limacinula salicis (Arn.) Sacc. & Trotter in Sylloge Fung. XXIV pag. 387, 1926.

On *Salix* — France.

Mycelium fumagoid, not setose; perithecia 200μ diam., globose sparse, black, found on a fumagoid subicle. Ascii clavato-cylindric, aparaphysate, 8-spores. Ascospores ellipsoid-fusoid, brown. with a

hort hyaline, acute appendix, with 3 transversal septa and 1 longitudinal, narrowed at the septa, $25-30 \times 8-10 \mu$ with the typical, valine, acute, thorny.

This species has been named by Arnaud as: *Teichospora (Teichosporina) salicis*. It is unrelated to *Morfea salicis* (Roll. & Fautr.) f. & Bat.

italia Cif. & Bat. n. gen.*)

ypus: *V. ekmanii* (Ciferri) Cif. & Batista, n. comb.

Mycelium effusum, ex hyphis brunneis, septatis, setosis, non rhopodiatris, compositum. Perithecia atro-brunnea, sub pellicula yeelica oriunda, globose-depressa, setosa; asci bitunicati, 8-spori, paraphysati; ascospores, 3 pro more transversaliter septatae, valinae.

Key to Species fo *Vitalia*.

A — Ascospores always with more than 3 transverse septa

B — Perithecial setae fasciculate; ascospores with 7—9 transverse septa, $32-47.5 \times 5-6.5 \mu$ *V. setofasciculata*

BB — Perithecial setae septate, but not fasciculate; ascospores with 3—6 transverse septa, $23-37 \times 3-8 \mu$ *V. mangiferae*

A — Ascospores with 1—3 (rarely 4) transverse septa

C — Setae either continuous or septate; ascospores $15-20 \times 5-7.5 \mu$ *V. cercopiae*

CC — Setae continuous (rarely septate in *V. plumierae*)

D — Perithecia more than 200μ diam.; ascospores $34-49 \times 14.5-19.5 \mu$ *V. plumierae*

DD — Perithecia less than 200μ diam.

E — Perithecia less than 100μ diam.; ascospores $19-25.5 \times 4-4.5 \mu$ *V. diospyricola*

EE — Perithecia reaching more than 100μ diam.

F — Perithecial setae not reaching 100μ in length

G — Ascospores 1—2-septate, $9-12 \times 3-4.5 \mu$ *V. phormicola*

GG — Ascospores 2—3-septate, $15.5-23 \times 4.5-7.5 \mu$ *V. averrhoae*

FF — Perithecial setae reaching more than 100μ in length

Vitalia ekmanii (Petr. & Cif.) Bat. & Cif., n. comb.

Syn.: *Chaetothyrium ekmanii* Petrak & Ciferri in Ann. Mycol. XXX, no. 3/4, pag. 170, 1932.

Chaetothyrium tapiriae Batista in An. IV Congr. Nac. Soc. Bot. Brasil, p. 76, 1953.

On *Faramea*, R. Dominicæ — On *Tapiria* — Brazil.

Mycelium hypophyllous, hyphae reticulate, 2—3.5 μ thick, yellowish-brown or subhyaline, with numerous rigid setae, blackish-brown, $160—230 \times 6.5—8 \mu$. Perithecia globose-flattened, $80—200 \mu$

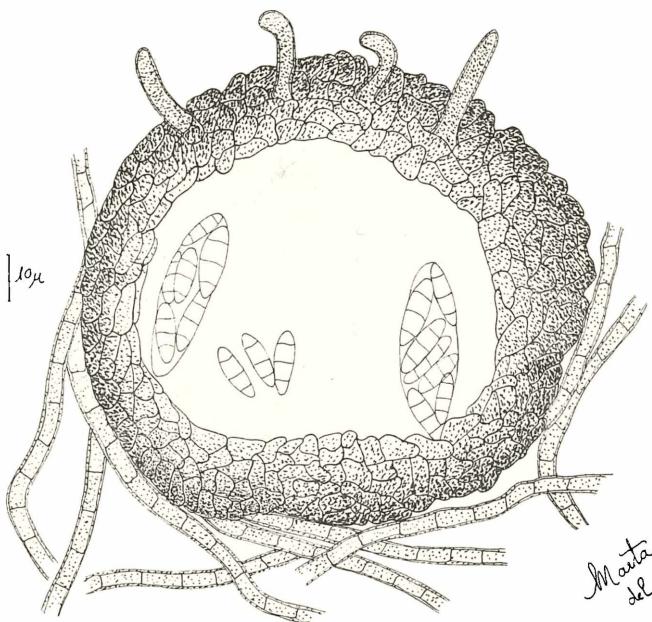

Fig. 79. *Vitalia cecropiae* Bat. Vital et Cif. — Perithecium under longitudinal cut.

in diam., pseudo-ostiolate, ornate with similar mycelial setae, $90—130 \times 6—7.5 \mu$; ascii clavate, subsessile, 4—8 spores, $38—50 \times 12—15 \mu$, with paraphysoids; ascospores oblong-ellipsoid to fusoid, hyaline, 3-septate, $10—16 \times 4.5—6.5 \mu$. Fig. 81.

We have studied the specimen no. 227 of R. Ciferri Mycoflora Domingensis exsiccata, determined by F. Petrak as *Chaetothyrium permixtum* Syd. and collected at Puerto Plata, Rep. Dominicana by R. Ciferri, 19. 3. 930, on *Cordia sulcata* D. C.

The characteristics of this specimen as described below, agree entirely with *V. ekmanii*.

The mycelium is pelliculose, olivaceous to brownish, superficial, hypophyllous, composed of cylindrical hyphae, constricted, irregularly branched, with cells from $6.5—16.5 \times 2—4.5 \mu$. The mycelial setae are erect, continuous, blackish-brown, curved, acuminate, $110—165 \times 4.5—6.5 \mu$. Perithecia subglobose, developed beneath the mycelial pellicle, blackish-brown, gregarious, $160—190 \mu$ wide, $110—145 \mu$ in

height, pseudo-ostiolate, membranous, subparenchymatic, with walls $22-27 \mu$ thick, made up of polygonal cells, $4.5-14.5 \times 4-10 \mu$. Perithecial setae in number of 16-21 for each perithecium and equal to the mycelial setae, Fig. 89 (87). Asci ellipsoid, 2-tunicate, sessile,

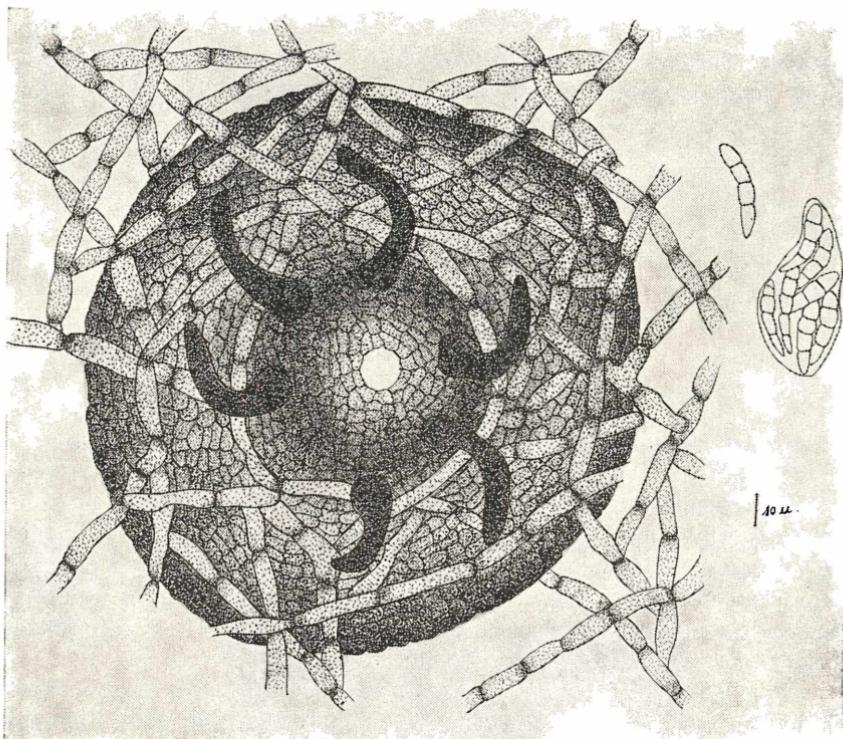

Fig. 80. *Vitalia diospyricola* Bat. Maia et Cif. — Perithecium setose, asci and spore.

8 spores, $49-54 \times 10-15 \mu$, a paraphysate, Fig. 88. Ascospores ellipsoid, 3-septate, not constricted, distichous, hyaline, $12-14 \times 4-5 \mu$.

We have also found this fungus on fern leaves, coll. by Heller, in Porto Rico; spec. from New York Botanical Garden, formerly Ellis Collection no. 6351, labeled as *Apiosporium*.

Also identified on leaves of *Dryopteris* sp. La Palma, San José, coll. by P. C. Standley, March 17, 1924. This specimen has the number 3893, in the National Fungus Collection, U.S.A. as Plants of Costa Rica, associated with *Hormiscium* sp. 1. 3. 957, spec. no. 10948, I.M.U.R.

***Vitalia jaboatonensis* Bat., Nasc. & Cif. n. sp.**

Mycelium epiphyllous, superficial, effuse, thin pelliculose, oli-

vaceous, hyphae lengthened, flexuose, reticulate, made up of cylindrical cells, $5.5-13.5 \times 2-5 \mu$; mycelial setae scattered, erect, flexuous, simple, continuous, numerous, acute, blackish-brown, $112-165 \mu$ long, $6-7.5 \mu$ wide at the base, sometimes covered with mycelic hyphae. Perithecia globose, then depressed, $140-190 \mu$ in diam., formed beneath the mycelial pellicle, brownish, Fig. 82, gregarious, membranous, pseudo-ostiolate, walls pseudoparenchymatic, outer layer composed of subglobose to polygonal cells $5.5-11 \times 2.5-$

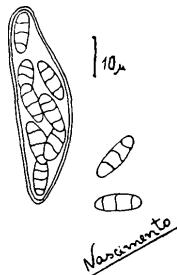

Fig. 81. *Vitalia ekmanii* (Petr. et Cif.) Bat. et Cif. — Ascus et spores.

9μ ; perithecial setae numerous, Fig. 82; they are erect, flexuous, about 25 for each perithecium, continuous, brownish, $44-150 \mu$ high, $10-12 \mu$ diam., at the base, $2-3.5 \mu$ diam., on the apex. Asci ellipsoid, 8-spored, bitunicate, sessile, $34.5-44.5 \times 13-16.5 \mu$, aparaphysate. Ascospores ellipsoid to fusoid, rotund, 1-4-septate, not constricted, hyaline, $14-22 \times 5.5-6.5 \mu$. Fig. 82.

On leaves of unknown host associated with Capnodiales. Jaboatão. Leg. Severino José da Silva, 19. 5. 56. Type 5595, Institute of Mycology, University of Recife.

Mycelium epiphyllum, superficiale, effusum, tenué, pelliculosum, ex hyphis olivaceis, elongatis, reticulatis, ex cellulis cylindraceis, non constrictis, $5.5-13.5 \times 2-5 \mu$, et ex setis mycelialibus sparsis, simplicibus, continuis, atro-brunneis, acutis, curvatis, $121-165 \times 6-7.5 \mu$ in basaliter diam., compositum. Perithecia evoluta in pelliculam mycelica, globose-depressa, $140-190 \mu$ diam., brunneae, pseudo-ostiolata, cum parietibus membranaceis, pseudo-parenchymaticis, ex cellulis subglobosis vel polygonalibus, $5.5-11 \times 2.5-9 \mu$ efformatis; setae myceliales in peritheciis evolutae, erectae, curvatae, circa 25 per perithecium, brunneae, $44-150 \mu$ alt. continuae, $10-12 \mu$ in basaliter diam. Asci ellipsoidei, 8-spored, bitunicati, sessiles, $34.5-44.5 \times 13-16.5 \mu$, aparaphysati. Ascosporae ellipsoideae vel fusoideae, 1-4 septatae, non constrictae, hyalinae, $14-22 \times 5.5-6.5 \mu$.

Ascospores fusoid, 1-2-septate, not constricted, monostichous to polystichous, hyaline, $9-12 \times 3-4.5 \mu$. Fig. 86.

On leaves of *Phormium tenax*. Dois Irmãos, Recife. Leg. Severino José da Silva, 21. 4. 56. Type 5466, Institute of Mycology, University of Recife.

Mycelium epiphyllum, superficiale, effusum, pelliculosum, atrobrunneum, ex hyphis elongatis, reticulatis, septatis, non constrictis, olivaceis, ex cellulis cylindraceis, $7-22 \times 2.5-4.5 \mu$, non hyphopodiatis, compositum. Setae myceliales rarae, erectae, continuae, atrae, usque $90 \times 5-7 \mu$. Perithecia in pelliculam mycelica evoluta, globosa vel subglobosa, $83-110 \mu$ diam., $85-120 \mu$ alt., gregaria vel non, atro-brunnea, pseudo-ostiolata, cum parietibus membranosis, subparenchymaticis, $12-20 \mu$ cr., ex cellulis polygonalibus, $5-10 \times 3.5-5 \mu$, efformata. Setae perithciales, erectae, atrae, continuae vel 1-2 septatae incurvatae, obtusae, $22-86 \times 5-7 \mu$. Ascii ellipsoidei, 2-tunicati, 8-spori, sessiles, $31-41 \times 6.5-10 \mu$, aparaphysati. Sporae fusoideae, 1-2-septatae, non constrictae, monostichae vel polystichae, hyalinæ, $9-12 \times 3-4.5 \mu$.

Vitalia plumierae Bat. & Matta n. sp.

Mycelium superficial, epiphyllous, thin membranous, dark brown, spread; hyphae irregularly branched, but lengthened, septate, little constricted having cylindrical cells, $27-41 \times 10-12 \mu$, not setose nor hyphopodiate. Perithecia developed beneath the mycelial membrane, scattered, globose-conoid to globose-depressed, $260-330 \mu$ diam., 249-350 in height, dark-brown, membranous, pseudo-ostiolate, pseudo-parenchymatic, the walls composed of sub-globose and polygonal cells, $14.5-17 \times 10-14.5 \mu$, setose, Fig. 87. Perithecial setae numerous, 8-30 in number, scattered, cylindrical, straight or curved, rarely septate, brownish, obtuse, $40-110 \times 7-17 \mu$. Ascii ellipsoid, 2-tunicate, sessile, 4-8-spores, $73-88 \times 24.5-29 \mu$, aparaphysate. Ascospores fusoid, at first 1-septate, then 3-septate, little constricted or not, hyaline, $34-49 \times 14.5-19.5 \mu$, polystichous, Fig. 87.

On leaves of *Plumiera tricolor* — Campo Gonçalo Muniz, Salvador, Bahia. Leg. Eurico A. F. Matta, 10-2-957. Zype, 11360, Institute of Mycology, University of Recife. Associated with *Tripospermum roupalae* (Syd.) Hughes, *Atichia glomerulosa* (Ach.) Flot., *Astragoxyphium plumieriae* nobis, and *Calyptera plumieriae* nobis.

Mycelium epiphyllum, superficiale, tenuiter membranosum, brunneum, effusum, ex hyphis irregulariter ramosis, elongatis, septatis, parum constrictis, ex cellulis cylindraceis, $27-41 \times 10-12 \mu$, non setosis, haud hyphopodiatis, compositum. Perithecia mycelio tecta, sparsa, globose-conoidea vel globose-depressa, $260-330 \mu$ diam., $240-350 \mu$ alt. brunnea, pseudo-ostiolata; paries membranosus, pseudo-parenchymaticus, ex cellulis sub-globosis vel polygonalibus $14.5-17 \times 10-14.5 \mu$, setosis, efformatus. Setae perithciales numerosae, 8-30, sparsae, cylindricae, obtusae, rare septatae, brunnescentes, $40-110 \times 7-17 \mu$. Ascii ellipsoidei, 2-tunicati, sessiles, 4-8 spori, $73-88 \times 24.5-29 \mu$, aparaphysati. Ascospores fusoideae, primo 1-septatae, dein 3-septatae, parum constrictae vel non, hyalinæ, polystichae, $34-49 \times 14.5-19 \mu$.

Vitalia rickiana (Theiss.) Bat. & Cif. n. comb.

Syn.: *Chaetothyrium rickianum* Theiss. in Ann. Mycol. XI: p. 493, 1913; Ann. Mycol. XV p. 474, 1913; Syll. Fung. XXIV p. 379, 1926.

Chaetothyrium fusisporum Fraser in Proc. Linn. Soc. N. S. Wales, vol. LXI, p. 283, 1936.

On *Acacia*, *Cryptocarya*, *Doryphora*, *Dodonaea*, *Synoum*, *Syncarpia*, *Tylophora*, *Smilax*, *Backhousia*, *Pleiococca*, *Rhipogonum*, *Ceratopetalum*, *Bosistoa*, *Eudiandra*, *Wilkiea*, Australia.

Mycelium epiphyllous, pelliculose, brownish, hyphae $3-5\ \mu$ thick; setae septate, $150-240\ \mu$ high, $6\ \mu$ wide at the base; perithecia

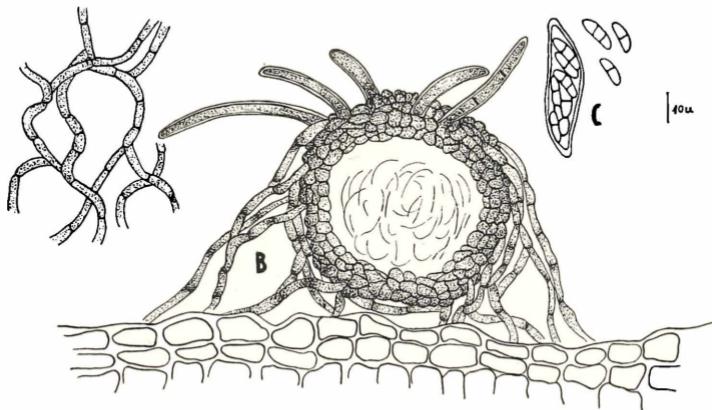

Fig. 86. *Vitalia phormicola* Bat. Nesc. et Cif. — A) Mycelium. — B) Histological cut of a perithecium. — C) Ascus and spores.

setose developed beneath the mycelial pellicle, globose-depressed, $150-250\ \mu$ diam., $100-150\ \mu$ high, pseudo-ostiolate; mycelial setae around the perithecia; ascii cylindric-clavate or oblong, $50-65\times 10-16\ \mu$, 8-spores, bitunicate, aparaphysate; ascospores fusiform to ellipsoid, 3-septate, hyaline, $11-16\times 3-4\ \mu$, Fig. 88.

***Vitalia setofasciculata* Bat., Vital & Cif. n. sp.**

Mycelium superficial epiphyllous, thin pelliculose, almost invisible, widely effuse, grayish, reticulate, hyphae indistinctly septate, $1.5-3.5\ \mu$ thick, with rare brownish setae, similar to the perithecial setae. Perithecia entirely superficial globose-flattened, $170-200\ \mu$ wide, $100-125\ \mu$ in height, brownish, formed below the mycelial pellicle, Fig. 97, scattered, pseudoparenchymatic, membranous, pseudo-ostiolate, upper walls, $10-20\ \mu$ in thickness, continuous with the pellicle, made up of cells subglobose, $5-8.5\ \mu$ diam., unilocular; the perithecia are completely covered with mycelial setae grouped in numerous fascicles, Fig. 98, the setae are erect, straight or curved, simple, cylindrical, obtuse, brownish, septate, fasciculate aggregate in 7 to 10 elements, each setae being $70-225\times 4-6.5\ \mu$. Ascii clavate to ellipsoid, thickened at the apex, sessile, 8-spored, $42.5-62.5\times$

22.5—27.5 μ , a paraphysate. Ascospores cylindric, 7—9 septate, not constricted, parallel, hyaline, $32—47.5 \times 5—6.5 \mu$. Fig. 89—90.

On leaves of *Centella asiatica* (L.) Urban. Dois Irmãos, Recife. Leg. Osvaldo Soares da Silva, 19. 5. 56. Type 5592, Institute of Mycology, University of Recife.

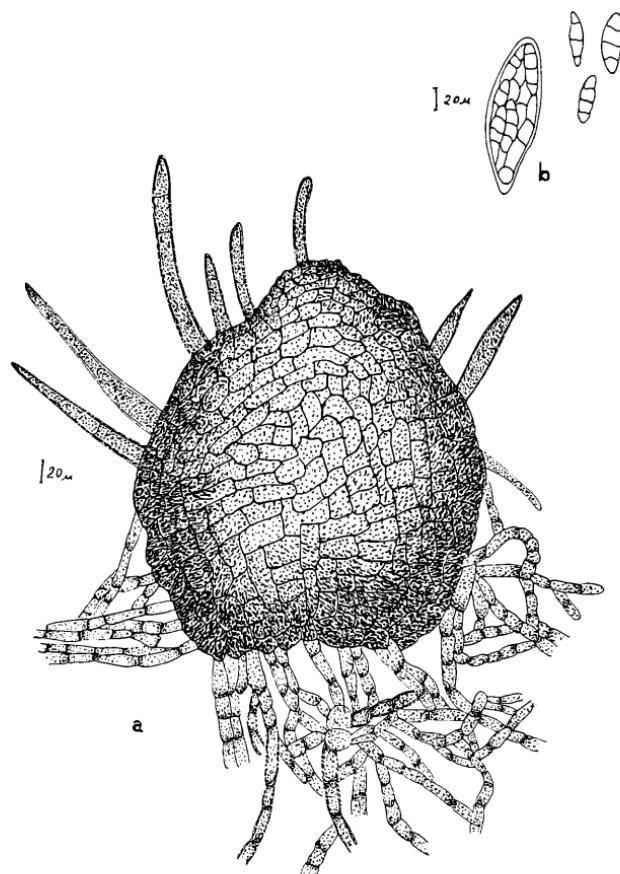

Fig. 87. *Vitalia plumierae* Bat. et Matta. — a) Perithecioid setose. — b) Ascus and spores.

This species is allied to *Chaetothyrium mysorensis* Hansf. but its fasciculate and brownish setae over the perithecia distinguish it very well, besides some other slight discrepancies.

We have found this species also on *Styrax ferrugineus* collected at Araxá, Ninas Gerais, Brazil. It is associated with *Parmularia hankei* (Nees) Rehm and *Chondropodiola spegazzinii* Petrak & Sydow.

For the examination of this material we are indebted to The University of Michigan, U.S.A.

Mycelium epiphyllum, tenué, pelliculosum, effusum, cinereum ex hyphis reticulatis, 1.5—3 μ diam., superficialibus, rare setosis, compositum. Perithecia globose-depressa, brunnea, uniloculata, superficialia, 170—200 μ diam., 100—125 μ evoluta in pellicula mycelica, sparsa, pseudo-ostiolata; paries superior 10—20 μ cr., ex cellulis subglobosis, 5—8.5 μ diam., setae in fasciculis vestentes perithecia, simplices, obtusae, brunnescentes, 70—225 \times 4—6.5 μ . Ascii clavati vel ellipsoidei, sessiles, 8-spori, 42.5—62.5 \times 27.5 μ , aparaphysati. Sporae cylindraceae, 7—9 septatae, non constrictae, paralleliae, hyalinae, 32—47.5 \times 5—6.5 μ .

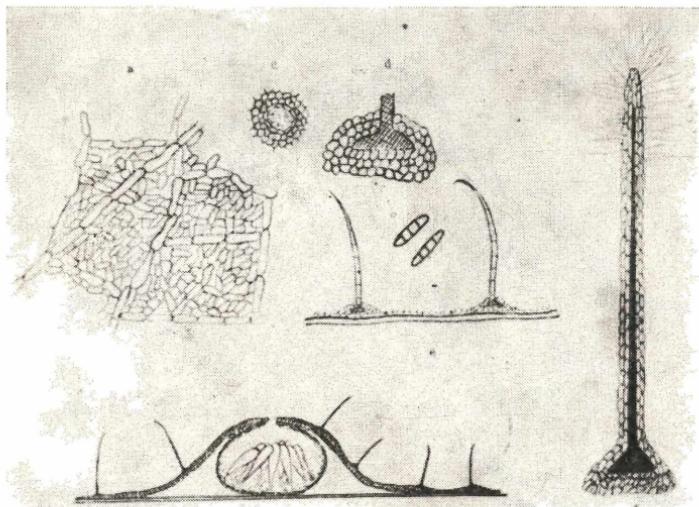

Fig. 88. *Vitalia rickiana* (Theiss.) Bat. et Cif. — From Theissen. Annal. Mycol. XV: 476, 1918.

Euceramiaceae Bat. & Cif. n. fam.

Mycelium dematioid membranous. Perithecia globose, developed beneath the mycelial pellicle, brown to black, plurilocular and glabrous. Type: *Euceramia* Bat. & Cif.

The family Euceramiaceae appears to be more complex than the Phaeosaccardinulaceae, possessing plurilocular ascocarps. This statement is based on the idea that the plurilocular Chaetothyriaceous ascocarp follows the formation of the unilocular ascocarp in the order Chaetothyriales. So, accepting the parallel evolution of the ascocarp in this order, we understand that it occurs as it happens with the mycelium of the Hyphomycetes; the development of these fungi gradually passes from the hyaline mycelium of the Chaetothyriaceae to the subhyaline and dark mycelium of the Phaeosaccardinulaceae and Euceramiaceae, the last one having plurilocular ascocarp.

Euceramia Bat. & Cif. n. gen.

Superficial mycelium pelliculose, not setose nor hyphopodiate,

hyphae branched, septate. Stromatic perithecia developed beneath the mycelial pellicle, globular, plurilocular, membranaceous, pseudo-ostiolate, glabrous, dull. Asci ellipsoid, 1-tunicate, 4—8 spores, sessile.

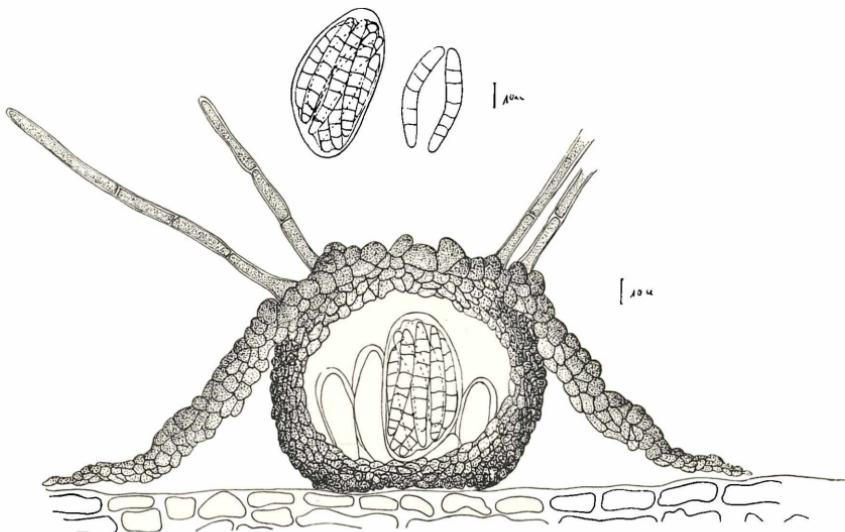

Fig. 89. *Vitalia setofasciculata* Bat., Vital et Cif.

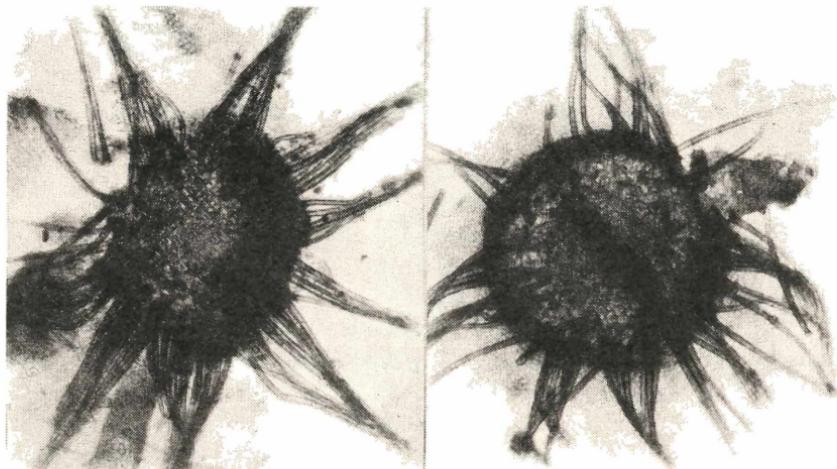

Fig. 90. *Vitalia setofasciculata* Bat., Vital et Cif. — Fascicles of setae over the perithecium.

pseudoparaphysoids septate, hyaline. Sporae clavate-fusoid to cylindric, pluriseptate, hyaline.

Mycelium epiphyllum, superficiale pelliculosum, ex hyphis septatis, ramosis, reticulatis, capnodiaceis, non setosis, non hyphopodiatis, brunneis, compositum. Perithecia stromatica, subpelliculosa mycelica evoluta, pluriloculata, mem-

branacea, pseudo-ostiolata, glabra, brunnea. Asci ellipsoidei, 1-tunicati, 4 spori, sessiles, pseudoparaphysoides, septata, hyalina. Sporae clavate-fusoideae vel cylindraceae, pluriseptatae, hyalinae. Typus *E. palmicola* Bat. & Cif.

This genus is pertaining to the monotypic family Euceramiaceae, which we discussed in the introductory part of this monograph. The mycelium is fully fumaginous in shape and texture, forming a more

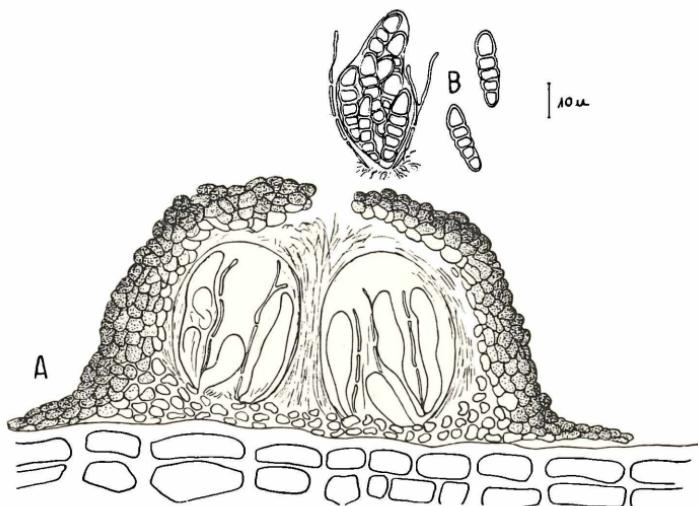

Fig. 91. *Euceramia palmicola* Bat. et Cif. — A) Superficial stromatic peritheciium, bilocular. — B) Ascus and spores.

or less continuous mycelial pellicle, beneath which the ascocarps are developed. These characteristics are, then, in full agreement with the feature of the Phaeosaccardinulaceae family. The structure of the ascocarps is unusual for the sooty-molds.

Euceramia palmicola Bat. & Cif. n. sp.

Superficial mycelium pelliculose brown, epiphyllous, not hyphopodiate, not setose, hyphae straight-walled or constricted, septate, composed of cylindrical cells, $4-13.5 \times 3-5.5 \mu$. Perithecia gregarious, membranaceous, stromatic, formed beneath the mycelial pellicle, globose-conoid, $73.5-135 \mu$ wide, $56-73.5 \mu$ high, bi or pluriloculate, each locule $39-50 \mu$ high, $26-37 \mu$ wide, separated by strong layer of paraphysoids; pseudo-ostiolate, Fig. 100, subparenchymatic, walls $20-24.5 \mu$ cr., composed of polygonal cells from $5-12.5 \times 6-7 \mu$ brown. Asci ellipsoid or pyriform, several for each locule, 1-tunicate, 8-spores, sessile, $31-49 \times 18-25 \mu$; paraphysoids filiform, septate, branched or not, hyaline, $1-1.5 \mu$ diam. Ascospores clavate-fusoid, 4-5-septate, constricted. episore distinct, hyaline, $18-22 \times 6-7.5 \mu$. Fig. 91.

Associated with some Capnodiaceae and with *Septonema longisporum* Bat. which, in many cases, through their conidiophores, give the impression of mycelial setae. On leaves of *Cocos nucifera*. Vitoria. Leg.: Prof. Washington Amorim, 1. 5. 1956. Type 4572, Institute of Mycology, University of Recife.

Mycelium epiphyllum, pelliculosum, brunneum, superficiale, ex hyphis constrictis vel non, septatis, brunneis, efformatum, et ex cellulis cylindraceis, $4-13.5 \times 3-5.5 \mu$, non setosis, non hyphopodiatis compositum. Perithecia

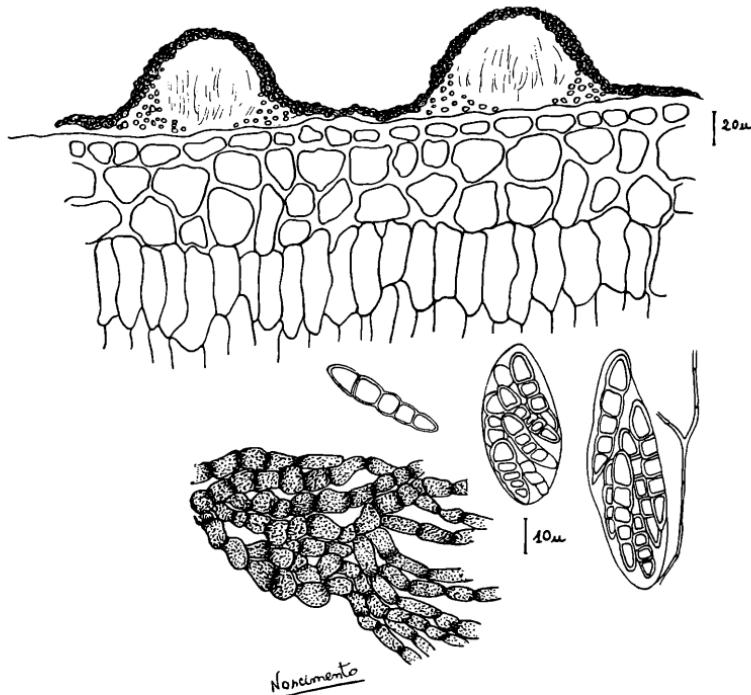

Fig. 92. *Euceramia palmicola* var. *macrasca* Bat. et Cif. = Upper-Sketch of two ascocarps covered by the mycelial pellicle. — Lower = Detail of the mycelium.

gregaria, membranacea, stomatica, sub pellicula myceliana evoluta, globoso-conoidea $73.5-135 \mu$ diam., $56-73.5 \mu$ alt., bi, vel pluriloculata, pseudo-ostiolata, cum parietibus subparenchymaticis, $20-24.5 \mu$ cr brunneis, ex cellulis polygonalibus, $5-12.5 \times 6-7.5 \mu$ efformatis. Asci ellipoidei vel pyriformes, 1-tunicati, 8-spori, sessiles, $31-49 \times 18-25 \mu$; cum paraphysibus filiformibus, septatis, ramosis vel non, hyalinis, $1-1.5 \mu$ diam. Sporae clavato-fusoideae, 4-5-septatae, constrictae hyalinæ, $18-22 \times 6-7.5 \mu$.

Euceramia palmicola var. *macrasca* Bat. & Cif. n. var.

Superficial mycelium thin pelliculose, brown, epiphyllous, not setose, not hyphopodiate, hyphae straight-walled, reticulate, not constricted, composed of short cylindrical cells $10.5-15.5 \times 6.5-$

7.5 μ . Perithecia stromatic developed beneath the mycelial pellicle, Fig. 101, globose-conoid, uni or pluriloculate, 78—225 μ in diam. and 60—82.5 high, not setose, membranaceous, blackish-brown, pseudo-ostiole 11—22.5 μ diam. with walls 12.5—15 μ cr. at the top, formed by polygonal or subglobose cells, 7.5—10 \times 5—7.5 μ , Fig. 102. Ascii ellipsoi, 4—8-spores, 1-tunicate, sessile, 79—96 \times 33.5—40 μ ; paraphysoids filiform, septate, hyaline, simple, 1—2 μ . Spores clavate-fusoid, 3—5-septate, constricted, hyaline, polystichous, 17.5—20 \times 4—5.5 μ . Fig. 92.

On leaves of *Psidium guajavae* Raddi associated with several Asbolisiaceae. Casa Amarely, Recife. Leg.: Severino José d Silva 21. 4. 56. Type 5461, Institute of Mycology, University of Recife. This specimen agrees with the type species, with the exception of a few minor characteristics; so, we are distinguishing it as a variety.

A typo recedit peritheciis usque 225 μ alt.; ascis etiam 4-wpored, majoribus: 79—96 \times 22.5—40 μ ; ascosporis usque 7.5 μ latis.

To the Subscribers and Contributors of the „Sydowia“

The ten volumes of „Sydowia“, published in continuation of Sydow's well known „Annales Mycologici“ have certainly proved their importance as an international periodical of mycology. According to the wishes of many contributing authors we have decided to publish each volume of „Sydowia“ beginning with vol. 12 in two or three parts which will appear in 6 to 4 months intervals. Thus the publication of manuscripts will be speeded up considerably.

Due to the high printing costs only those works can be printed in the „Sydowia“ which fulfill the following requirements:

1. The manuscripts have to be written out carefully, if possible in type and have to be composed in faultless language. 2. If in addition small corrections in the manuscript are made by handwriting, it is important that the Latin names of the plants, all technical terms and names of authors are written clearly. Manuscripts which have become difficult to read by additional insertions, erasings and other corrections cannot be printed. It is kindly requested to write the manuscripts double spaced. 3. Should authors make any alterations of the composition either in the brush-proofs or page-proofs subsequently, they will have to defray the additional costs incurred thereby. 4. Authors are requested to write their works in as concise a style as possible. All lengthy prefaces, explanations and repetitions should be avoided. With works of pure systematic contents summaries are absolutely superfluous and therefore cannot be printed. In case of any other than systematic works summaries may be given but these, should be written in a language other than the original text if possible. 5. Articles for Sydowia may be written in the Latin, English, French, Italian or Spanish languages. 6. In their own interest authors are requested to add to their articles only those illustrations which are absolutely necessary and true to nature. Due to the high production costs for plates and illustrations, these expenses have to be defrayed by the authors. 7. Authors are requested to consider the size of the page ($11 \times 18,5$ cm) when making their illustrations and plates. 8. Only the authors themselves are responsible for the style and contents of their works.

Works and treatises of which a review has to be printed in the „Sydowia“ as well as manuscripts and all inquiries to the editor should be addressed to the editor; orders and business communications should be sent to the publisher.

The price for the yearly subscription is 40 Swiss Francs.

Upon request up to 30 copies of the separata are granted to the authors. Except these free copies further separata will be supplied upon request if they have been ordered with the editor together with the definite proof at the latest.

Subsequent requests for missing or lost publications can be considered only if they are made at the receipt of the following publication at the latest.

Beihefte zur „Sydowia“

Für die rasche Veröffentlichung grösserer Arbeiten stehen den Autoren in Zukunft die neu begründeten „Beihefte zur Sydowia“ zur Verfügung, von denen das erste als „Festschrift für Franz Petrak“ bereits erschienen ist. In dieser neuen Serie sollen selbständige, grössere Arbeiten ohne Rücksicht auf ihren Umfang so schnell als möglich unter den für die Zeitschrift geltenden Bedingungen veröffentlicht werden, von denen nur Punkt 6 für die Beihefte folgendermassen abgeändert wird: 6. Die Kosten für Strichzeichnungen werden vom Verlag bestritten, die für Autotypien müssen von den Autoren getragen werden. Von den Beiheften werden den Autoren 10 Exemplare gratis, weitere 20 gegen Ersatz der Druck- und Papierkosten geliefert. Darüber hinaus können die Autoren weitere Exemplare ihrer Arbeit in beliebiger Anzahl, jedoch nur direkt vom Verlage, für den um 25% ermässigten Ladenpreis des betreffenden Beiheftes beziehen.

Für die Abonnenten der Sydowia, welche alle in Zukunft erscheinenden Beihefte beziehen, wird der Preis — je nach Umfang — festgesetzt und für den Druckbogen ö. Sch. 12.50 = schw. Fr. 2,25 = \$ —,50 betragen. Für jede Druckseite Strichzeichnungen wird ein Zuschlag von ö. Sch. 2,50, DM, sfr. —,45, \$ —,10 berechnet werden. Einzelne Beihefte können nur mit einem Zuschlag von 25% auf den oben genannten Abonnentenpreis abgegeben werden. Die Beihefte werden vorläufig allen Abonnenten der „Sydowia“ regelmässig sofort nach Erscheinen zugesendet, soferne sie den Bezug der Beihefte bis 1. Oktober 1958 nicht ausdrücklich ablehnen.

For publication of longer papers there will be edited the „Beihefte zur Sydowia“, the first volume of which has already appeared as „Festschrift für Franz Petrak“. In this supplementary series monographs and other extensive papers of importance will be published as quickly as possible disregarding their extent. Publication will take place under the same conditions as for „Sydowia“, changing only point 6 as follows: The costs for reproduction of line drawings will be paid by the publisher, the costs for autotypes by the authors. The authors will receive 10 copies of the „Beihefte“ free of charge, and twenty more copies at the net price of printing and paper. Moreover the authors may order any number of copies of their papers only directly from the publisher at the sales price less 25%.

For subscribers ordering all the volumes of „Beihefte“ to be edited in the future, the price of the single volumes will be fixed according to their size, i. e. per printing sheet (= 16 pages) Austrian Shillings = 12,50, Swiss Fr. = 2,25, U.S.\$ = 0,50. For each page of figures the price will be Austrian Shillings = 2,50, Swiss Fr. = 0,45, U.S.\$ = 0,10. Single volumes of the „Beihefte“ can be supplied only at the subscription price plus 25%. Immediately after publication the „Beihefte“ will be distributed regularly to all subscribers of „Sydowia“, as far as they do not decline expressively before Nov. 1 st., 1958.
