

Some note-worthy Ascomycetes from Maharashtra, India

By K. H. Anahosur

M. A. C. S. Research Institute, Poona 4 (India)

This paper presents an account of 4 new species and 3 new host records of Ascomycetes collected by the writer in the vicinity of Poona (India).

1. *Bagnisiella acaciae* sp. nov. Anahosur (Fig. 1).

Stromata subepidermalia, mox erumpentia, denique quasi superficialia nigra, elongata, rectangularia, interdum orbicularia, multiloculata, inferne sterilia, pseudoparenchymatica, $1-1.5 \times 1-1.2$ mm; loculi rectangulares, clausi, usque 8 in quoque stromate, quoad magnitudinem variabiles, $150-480 \mu$ lati, $120-160 \mu$ crassi; asci cylindraceo-clavati,

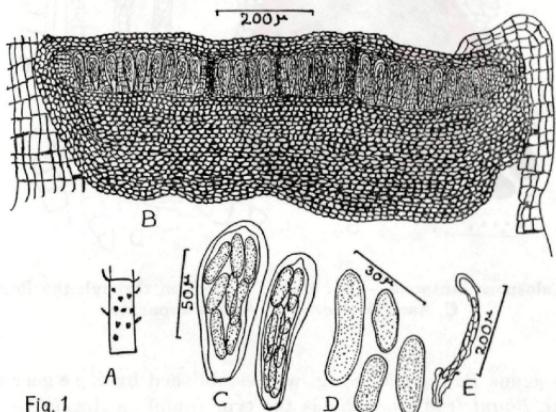

Fig. 1

Fig. 1. *Bagnisiella acaciae*. — A. Habit. B. Section through the Stroma. C. Ascii. D. Spores. E. Ascus dehiscenc

crasse tunicati, sessiles, apice perforati, $84-96 \times 30-40 \mu$; sporae distichiae, ellipsoideae vel breviter cylindraceae, utrinque late rotundatae, vix vel parum attenuatae, hyalinae vel subhyalinae, $28-38$

$\times 8-12 \mu$, episporio crassiusculo, paraphysoides fibrosae, breviter articulatae.

Ascostromata black, elongated, subepidermal, becoming erumpent and finally completely exposed, rectangular, sometimes circular, shrunken in the centre, multioculate, upper portion fertile and lower sterile, 1—1.5 \times 1—1.2 mm. Locules rectangular, nonostiolate, upto 8 in each stroma, 150—480 μ broad and 120—150 μ high. Asci cylindro-clavatis, bitunicate, sessile, with apical pore, in basal layers, parallel, 84—96 \times 30—40 μ . Ascospores ellipsoid to cylindrical, thick-walled, hyaline to subhyaline, biseriate, 1-celled, 28—38 \times 8—12 μ . Pseudoparaphyses and paraphyses lacking. Interthelial tissues present.

Saprophytic on the twigs of *Acacia arabica* Willd. collected by A n a h o s u r K. H. at Poona (India) on 12-12-1967. M. A. C. S. Herb. No. 680 (type).

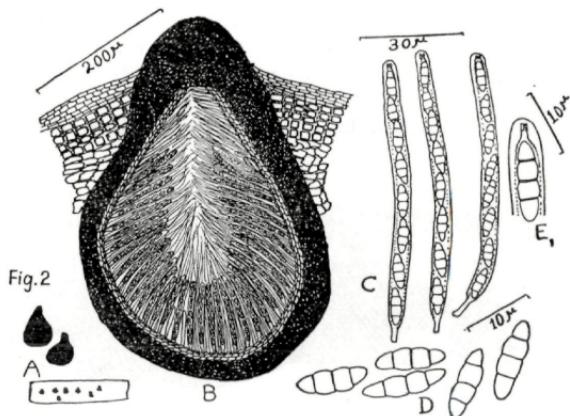

Fig. 2. *Calospora lantanae*. — A. Habit, B. Section through the Perithecium. C. Ascii. D. Spores. E. Apical apparatus

The genus *Bagnisiella* Speg. was established by S p e g a z z i n i in 1880 with *Bagnisiella australis* as the type found on *Acacia bonariensis*. *Acacia arabica* is a new host for *Bagnisiella*.

It is quite clear that the writer's collection differs from the type in having bigger ascostroma, smaller ascii and bigger ascospores and also collected on a new host and hence needs accommodation in a new taxon.

A species of *Haplosporella* Speg. with subhyaline, cylindrical to ellipsoid conidia, was found in association with this ascomycete. The

cultural studies are under progress to prove their true relationship which will be published in due course.

2. **Calospora lantanae** Anahosur sp. nov. (Fig. 2).

Perithecia singulata, innata, globosa, 320—568 μ diam., 400—570 μ alta, ostiolo crasse conico, in apice late rotundato, 50—60 \times 36—40 μ punctiformiter erumpentia; ascii numerosi, cylindracei, breviter stipitati, crassiuscule tunicati, 8-spori, 80—96 \times 4—6 μ ; sporae monostichiae, fusoideae, triseptatae, ad septa constrictae, hyalinae, 12—16 \times 2—4 μ ; paraphyses et periphyses numerosae, tenuiter filiformes.

Perithecia stromatic, separate, innate, beaked, ostiolate, globose, 320—568 μ broad and 400—570 μ high. Beak short, projecting outside the host, 50—60 \times 36—40 μ . Ascii cylindrical, thick-walled, pedicellate, in wall-layers, with apical apparatus, octosporous, unitunicate, paraphysate, 80—96 \times 4—6 μ . Ascospores fusoid, hyaline, 3 septate, constricted at the septum, uniseriate 12—16 \times 2—4 μ . Paraphyses and periphyses abundant, filiform, slender and hyaline.

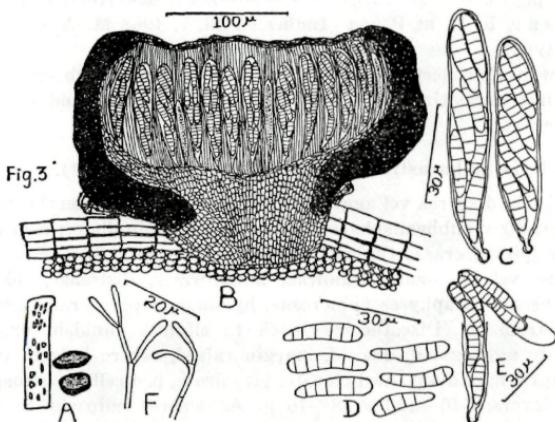

Fig. 3. *Patellaria caesalpinae*. — A. Habit. B. Section through the apothecium.
D. Spores. E. Ascus dehiscing

Saprophytic on the twigs of *Lantana camara* L. collected by A n a h o s u r, K. H. at Poona (India) an 2-8-1968. M. A. C. S. Herb. No. 683 (type).

The genus *Calospora* Sacc. was established by Saccardo in 1883 with the type *Calospora platanoides* (Pers.) Niessl. The writer's collection of *Calospora* Sacc. differs from the type in having uniloculate

stromata, cylindrical narrow ascospores which are arranged uniserially in the ascospores besides being collected on a new host.

3. *Patellaria caesalpiniae* Anahosur sp. nov. (Fig. 3).

Apothecia aggregata, nigrescentia, erumpentia, 240—400 μ longa, 192—240 μ lata, disco cupuliformi, 320—400 μ lato, 190—240 μ alto; ascospores clavati, stipitati, crasse tunicati, 8-spori, 64—90 \times 12—16 μ ; sporae distichae, oblongae, hyalinæ, 5-plerumque, 7-raro etiam 8-septatae, 20—26 \times 2—4 μ ; pseudoparaphyses septatae, hyalinæ, superne ramulosæ.

Discothecia black, with a wide cleft, aggregated, discoid, sessile, erumpent, 240—400 μ long and 192—240 μ broad. Locule cup-shaped, 320—400 μ broad and 190—240 μ high. Ascospores clavate, pedicellate, in basal layers, bitunicate, octosporous, 64—90 \times 12—16 μ . Ascospores oblong, hyaline, 5 to 8-celled, 8-celled rare, 7-celled abundant, biserrate, 20—26 \times 2—4 μ . Pseudoparaphyses branched at the tips, septate, hyaline and slender.

Saprophytic on the twigs of *Caesalpinia pulcherrima*, collected by A hanosur, K. H. at Poona (India) on 16. 7. 1968 M. A. C. S. Herb. No. 684 (type).

The writer's collection of *Patellaria* was compared with some species of *Patellaria* parasitizing the host family Leguminosæ and was found to be different.

4. *Tryblidaria maharastrensis* Anahosur sp. nov. (Fig. 4).

Apothecia dispersa vel aggregata, erumpentia, nigrescentia, margine subelevata; disco subhemisphaerico, usque ad 1.2 mm diam.; ascospores clavati, breviter stipitati, crasse tunicati, 8-spori, 140—160 \times 38—46 μ ; sporae ellipsoideæ vel oblongae, brunneæ, muriformes, distichæ, 40—50 \times 8—12 μ ; pseudoparaphyses numerosæ, hyalinæ, superne ramulosæ.

Ascostromata (Discothecia) black to slightly pinkish, erumpent, scattered to aggregated, discoid, margin raised, centre bulged, uniciliate, up to 1.2 mm. diam. Ascospores clavate, bitunicate, pedicellate, octosporous, in basal layers, 140—160 \times 38—46 μ . Ascospores ellipsoid to oblong, muriform, brown, biserrate, 40—50 \times 8—12 μ . Pseudoparaphyses abundant, branched at the apex, septate, and hyaline.

Saprophytic on the twigs of *Lantana camara* L. and *Rivina* sp. collected by A hanosur, K. H. on 2. 2. 1967. M. A. C. S. Herb. No. 685 & 686 (type).

The genus *Tryblidaria* Sacc. was established by Saccardo (1889) with *Tryblidaria fenestratum* (C. & E.) Rehm as type and was revised by Rehm in 1904. As the writer has collected the fungus on a new host it was compared with the type and was found to be significantly different in morphological characters and dimensions.

Tilak (1966) and Ramachandra Rao (1966) have described the ascocarp of this genus as an apothecium, interthelial threads as paraphyses and the remnants of stroma at the apex as epithecium. The recent investigations carried out by Muthappa (1967) and Seshadri & Muthappa (1968) on a closely allied fungus *Tryblidiella rufula*

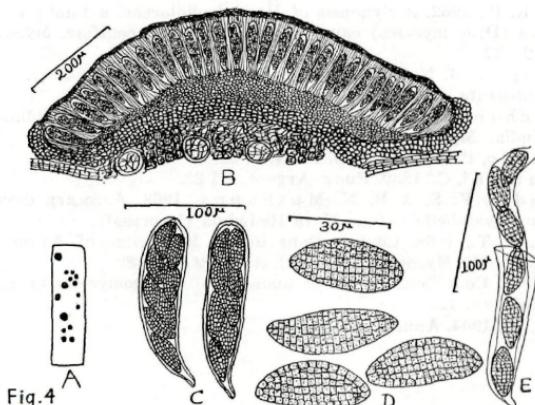

Fig. 4. *Tryblidaria maharastrensis*. — A. Habit. B. Section through the apothecium. C. Ascii. D. Spores. E. Ascus dehiscence

(Spreng.) Sacc. belonging to the family Patellariaceae prove very conclusively that the ascocarp in this family is in the nature of a Discothecium, as originally described by Korf (1962) and the interthelial threads as pseudoparaphyses continuous from top to the bottom with a 'pleospora' type of development. The stroma at the apex of the ascocarp is not a true epithecium but a thin layer made up of remnants of the stromatic cells along with the tips of the pseudoparaphyses termed as epistroma by Muthappa (1967).

New host records

1. *Bagnisiella acaciae* Ahanosur — Host: *Glyricidia* sp. M. A. C. S. Herb. No. 681.
2. *Bagnisiella australis* Speg. — Ref. Ann. Mycol. 13: 561, 1915. M. A. C. S. Herb. No. 682. Host: *Lantana camara* L.
3. *Valsa ceratophora* Tul. — Ref: Syll. Fung. 1: 108, 1882. M. A. C. S. Herb. No. 687. Host: *Cesalpinia pulcherrima*.

The materials of the new species are deposited at Herb. Orientalis, New Delhi, C. M. I., Kew, England and M. A. C. S.

A c k n o w l e d g e m e n t s

The writer is grateful to Prof. M. N. Kamat for his invaluable guidance and constant interest. My thanks are due to Dr. F. Petrák for Latin rendering.
