Based on : « Freshwater Mollusk Bibliography »

« This freshwater mollusk bibliography database is a collaborative effort by Kevin Cummings, Illinois Natural History Survey, Art Bogan, North Carolina Museum of Natural Sciences, Tom Watters, The Ohio State University Museum of Biological Diversity, and Christine Mayer, Illinois Natural History Survey. The project was funded by the National Fish & Wildlife Foundation.

The initial goal of the bibliography was to attempt to build a database of every published reference on freshwater mussels in North America. The project has grown to include freshwater mussels worldwide, gastropods, sphaeriids, corbiculids, and dreissenids. However, the references entered for those groups are far less comprehensive, particularly with respect to the literature pre-1980. All NABS bibliographies on freshwater mollusks since 1987 are included. The types of publications covered include: journals, books and book chapters, theses and dissertations, popular articles, and gray literature (government documents, consulting reports, etc.). Abstracts from symposia or conference proceedings have also been entered but are not exhaustive. To date the bibliography database includes nearly 18,000 references on freshwater mollusks.

It is hoped that this will be a dynamic database. If you see that a particular reference is incorrectly cited or missing please forward changes and additions to Kevin Cummings. Although we would like to be able to provide reprints or copies of papers to those without access to a good research library it is impossible to do that at this time ».

Although Ligumia recta is currently widespread and stable in the Mississippi Basin, recent surveys suggest it is extirpated from the Pearl River drainage and only small populations persist in isolated Mobile River Basin tributaries. We compared 504 base pairs of the cytochrome c oxidase 1 mitochondrial gene from two Mobile Basin L. recta specimens and found that the Mobile Basin appears to support an evolutionarily significant genotype that could warrant recognition as a cryptic and highly imperiled taxon. Genetic data are beginning to reveal the extent and magnitude of recent biodiversity losses in the southeastern US, and moreover, these data will be critical to tailoring conservation and management strategies.
